STANDARD WIRING PRACTICES MANUAL

Revision No. 40
Feb 01/2008

To: All holders of this Boeing Document D6-54446

Attached is the current revision to the 707, 727-787 Standard Wiring Practices Manual (SWPM).

This manual is available either as a printed manual, on microfilm, or digital products, or any combination of the three. This revision replaces all previous microfilm cartridges or digital products. All microfilm and digital products are reissued with all obsolete data deleted and all updated pages added.

For printed manuals, changes are indicated on the Effective Pages. The pages which are revised will be identified on the Effective Pages by an R (Revised), A (Added), O (Overflow, i.e. changes to the document structure and/or page layout), or D (Deleted). Each page in the Effective Pages is identified by Chapter-Section-Subject number, page number and page date. Pages replaced or deleted by this revision should be removed and destroyed.

All pages are included in this revision. Revision bars on the pages identify current revision changes.

NOTE: IF YOU RECEIVE PRINTED REVISIONS, PLEASE VERIFY THAT YOU HAVE RECEIVED AND FILED THE PREVIOUS REVISION. BOEING MUST BE NOTIFIED WITHIN 30 DAYS IF YOU HAVE NOT RECEIVED THE PREVIOUS REVISION. REQUESTS FOR REVISIONS OTHER THAN THE PREVIOUS REVISION WILL REQUIRE A COMPLETE MANUAL REPRINT SUBJECT TO REPRINT CHARGES SHOWN IN THE DATA AND SERVICES CATALOG.

It is Boeing's intent to maintain the wiring repair practices so that the necessary procedures are satisfactory for the operator to use. Please direct any comments, concerns, or suggestions to the Boeing Technical Publications focal.

Revision bars identify all technical changes, however, not all changes identified by revision bars are technical in nature. A description of the revised technical data is given in the HIGHLIGHTS section (next section).

STANDARD WIRING PRACTICES MANUAL

INTRODUCTION

This manual contains the procedures and data that are necessary for the maintenance of the electrical wires and electrical termination on these Boeing Commercial Airplane models:

- 707
- 727
- 737
- 747
- 757
- 767
- 777
- 787

This manual also gives the data and procedures that are necessary for the maintenance of the wiring of these 777 model power plants:

- The Pratt & Whitney PW4000/777
- The Rolls-Royce RB 211 Trent 800.

NOTE: The wiring of the 777 model GE90 power plant is specified as line replaceable and, if unserviceable, must be returned to General Electric for repair.

Unless it is specified differently, the data and procedures in this manual are applicable for airplane wiring that has a Boeing part number. For the remaining wiring with a manufacturer part number, refer to the manufacturer or the applicable manual.

STANDARD WIRING PRACTICES MANUAL

INTRODUCTION

The following is a list of the most used acronyms and abbreviations in Chapter 20.

Abbreviation	Term
Al	Aluminum
Al-Ch	Alumel-Chromel
APU	Auxiliary Power Unit
ARINC	Aeronautical Radio Incorporated
BMS	Boeing Material Standard
CAU	Circular Area Units
CMA	Circular Mil Area
Cn-Ch	Constantan-Chromel
CRES	Corrosion Resistant Steel
Cu	Copper
EMC	Electromagnetic Compatibility
ESDS	Electrostatic Discharge Sensitive
I.D.	Inside Diameter
LRU	Line Replaceable Unit
O.D.	Outside Diameter
QPL	Qualified Products List
WTC	Wire Type Code

DEFINITIONS

707, 727-787

STANDARD WIRING PRACTICES MANUAL

INTRODUCTION

This section gives the general instructions on how to find technical data in this manual.

1. CROSS REFERENCE INDEX

The Cross Reference Index is an alphanumeric list of the names, the part numbers, and the suppliers of the equipment in this manual. Each entry in the Cross Reference Index also gives the Chapter/Section/Subject where the assembly procedure or the maintenance data for the equipment can be found.

A usual entry in the Cross Reference Index can give this data about the equipment:

- The name, the part number, the supplier
- The part number, the supplier, the name
- The supplier, the part number, the name.

Other entries in the Cross Reference Index can give any of these:

- General maintenance data
- The name of an assembly or an installation procedure.

For example, to find the assembly procedure for a splice, look in the Cross Reference Index and find the word "Splice" that is followed by the part number for that splice. The assembly procedure can also be found by the part number first or by the supplier first.

2. CONTENTS OF A CHAPTER/SECTION/SUBJECT

Each Subject starts with a Table of Contents that gives:

- The major breakdown or subdivision
- The page number of the Subject where the major breakdown or subdivision starts.

The two types of Subjects in this manual are:

- The Subjects that give important maintenance data or conditions
- The Subjects that give the procedures for the assembly or the installation of equipment, or both.

For Subjects with the assembly or installation procedures give the part numbers and description of the equipment first, followed by the procedures.

3. IMPORTANT DATA TABLES

These are important data tables:

- Contact Crimp Tools in Subject 20-00-12
- Insulation Removal Tools in Subject 20-00-15
- Materials in Subject 20-00-11
- Wire Type Codes and Wire Part Numbers in Subject 20-00-13.

CHAPTER SECTION SUBJECT	TITLE
20-60	STANDARD CONNECTOR PROCESSES (continued)
20-60-03	SPECIAL PROTECTION OF ELECTRICAL CONNECTORS
20-60-06	INSTALLATION OF ELECTRICAL CONNECTORS
20-60-07	INSTALLATION OF LOCKWIRE AND SAFETY CABLE ON ELECTRICAL CONNECTORS, CONNECTOR BACKSHELL CABLE CLAMPS AND SWITCH GUARDS
20-60-08	SEALING OF ELECTRICAL CONNECTORS
20-60-09	ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION
20-61	FRONT RELEASE CIRCULAR CONNECTORS
20-61-00	ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS
20-61-11	MIL-C-26500 FRONT RELEASE CONNECTORS
20-61-12	ASSEMBLY OF AMPHENOL 67 SERIES AND CINCH CN0906 SERIES CONNECTORS
20-61-13	ASSEMBLY OF AMPHENOL 69 SERIES CONNECTORS
20-61-15	ASSEMBLY OF DEUTSCH DS SERIES CONNECTORS
20-61-16	ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS
20-61-17	ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS
20-61-18	ASSEMBLY OF AMPHENOL/BENDIX 10-244() SERIES CONNECTORS
20-61-19	ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS
20-61-20	ASSEMBLY OF BENDIX PT()CE AND PC()CE SERIES CONNECTORS
20-61-23	ASSEMBLY OF BURNDY MBG28 SERIES CONNECTORS
20-61-24	ASSEMBLY OF DEUTSCH DD SERIES CONNECTORS
20-61-26	ASSEMBLY OF WIRE-PRO 84-() SERIES CONNECTORS
20-61-28	VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS
20-61-29	CORY AND TRI-STAR CSLT2-21P() CONNECTORS
20-62	SPECIAL CONNECTORS
20-62-12	ASSEMBLY OF VEAM 115 SERIES CONNECTORS
20-62-13	ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS
20-62-14	ASSEMBLY OF FENWAL CONNECTORS
20-62-15	ASSEMBLY OF GRAVINER CONNECTORS
20-62-16	ASSEMBLY OF WALTER KIDDE CONNECTORS
20-62-17	ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS
20-62-18	ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS
20-62-19	ASSEMBLY OF AN3115 TYPE CONNECTORS
20-62-20	ASSEMBLY OF AVIBANK AV667 AND AV697 CONNECTORS
20-62-21	ASSEMBLY OF THE CINCH S345T002-156 CONNECTOR
20-62-22	ASSEMBLY OF AN3116 TYPE CONNECTORS
20-62-26	ITT CANNON CA()KR FIREWALL CONNECTORS
20-63	REAR RELEASE CIRCULAR CONNECTORS
20-63-00	ASSEMBLY OF CONNECTORS WITH REAR RELEASE CONTACTS
20-63-01	ASSEMBLY OF DEUTSCH DL TYPE CONNECTORS
20-63-13	ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

CHAPTER 20

CHAPTER SECTION SUBJECT	TITLE
20-63	REAR RELEASE CIRCULAR CONNECTORS (continued)
20-63-14	ASSEMBLY OF MIL-C-5015 TYPE CONNECTORS WITH REAR RELEASE CONTACTS
20-63-18	ASSEMBLY OF MIL-C-81511 SERIES 1 AND SERIES 2 CONNECTORS
20-63-19	ASSEMBLY OF MIL-C-38999 CONNECTORS
20-64	SMALL MODULAR CONNECTORS
20-64-11	CORY CTZ623-6CH MODULAR JACK ASSEMBLY
20-64-12	ITT CANNON XLR-() AND AXR-()CONNECTORS
20-64-13	ASSEMBLY OF MIL-J-641/8 TELEPHONE JACK CONNECTORS
20-64-14	J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS
20-64-15	ASSEMBLY OF ROSEMOUNT CERAMIC CONNECTORS
20-64-16	ASSEMBLY OF TRI-STAR CWC(), CORY CWC(), AND WALLACE-BLACK WB() CONNECTORS
20-64-17	MOLEX 03-06-(), 1625-(), AND AIRFONE AFP30-005()-AA CONNECTORS
20-64-18	ASSEMBLY OF M39029/57-() SOCKET CONTACTS FOR WINDOW HEAT CONNECTORS
20-71	RECTANGULAR RACK AND PANEL CONNECTORS
20-71-11	ITT CANNON DPX, DPD, AND DPA CONNECTORS
20-71-12	ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS
20-71-13	ASSEMBLY OF CANNON DPE-MA SERIES CONNECTORS
20-71-14	ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS
20-71-15	ASSEMBLY OF RADIALL DSX SERIES CONNECTORS
20-72	D-SUBMINIATURE CONNECTORS AND OTHER SMALL RECTANGULAR CONNECTORS
20-72-07	D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION
20-72-08	D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION
20-72-10	D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS
20-72-11	D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS
20-72-12	D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS
20-72-13	D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS
20-72-16	ASSEMBLY OF ITT CANNON D()U() D SUBMINIATURE CONNECTORS
20-72-17	ASSEMBLY OF BOEING 280U00()-() AND 284U1147-() CONNECTORS
20-72-18	WIRE WRAP CONNECTIONS
20-72-19	ASSEMBLY OF ARIZONA INTEGRATED ELECTRONICS APC() SERIES CONNECTORS
20-72-21	ASSEMBLY OF ITT CANNON SGA(), SOURIAU 30-00053-() AND 30-00054-() AND TRI-STAR C-06BC-01()-1112 RACK AND PANEL CONNECTORS
20-72-22	ASSEMBLY OF TRI-STAR CB()-(), CORY CB()-(), AND HUGHES 116706()-() SERIES CONNECTORS
20-72-23	TRI-STAR CQ() AND CORY CQ() RECTANGULAR CONNECTORS
20-72-24	ASSEMBLY OF BACC65AJ, BACC65AK, S280W557-1, AND S280W557-2 CONNECTORS
20-72-25	ASSEMBLY OF 002368-0802, BACC65AL, AND S280W557-8 CONNECTORS

20-CONTENTS

STANDARD WIRING PRACTICES MANUAL**CHAPTER 20**

CHAPTER SECTION SUBJECT	TITLE
20-72	D-SUBMINIATURE CONNECTORS AND OTHER SMALL RECTANGULAR CONNECTORS (continued)
20-72-26	ASSEMBLY OF VIKING ELECTRONICS ATM() CONNECTORS
20-73	FLAT CABLE CONNECTORS
20-73-00	REPAIR OF FLAT CABLE CONNECTOR ASSEMBLIES
20-73-01	ASSEMBLY OF BACC65() FLAT CABLE CONNECTORS
20-74	RECTANGULAR, REAR RELEASE CONNECTORS
20-74-02	ASSEMBLY OF BACI10AL, BACI10AM, AND BACI10AP RECTANGULAR CONNECTOR INSERTS
20-74-11	CINCH ACIS CONNECTORS, RAYCHEM MTC100, MTCPQ, AND MTCTQ CONNECTORS
20-74-12	ASSEMBLY OF BACC65AA AND BACC65AB CONNECTORS
20-74-13	ASSEMBLY OF BACC65AN, BACC65AP, BACC65AV, AND BACC65AW CONNECTORS
20-74-14	ASSEMBLY OF BACC65BJ AND BACC65BK CONNECTORS
20-74-16	ASSEMBLY OF BACC65BC AND BACC65BD CONNECTORS
20-81	FRONT AND REAR RELAY SOCKETS
20-81-11	ASSEMBLY OF 10-60450 FRONT RELEASE PLUG-IN RELAY SOCKETS
20-81-12	BACS16W AND BACS16X FRONT RELEASE RELAY SOCKETS
20-81-13	ASSEMBLY OF METHODE FRONT RELEASE RELAY SOCKETS
20-81-14	ASSEMBLY OF VIKING 000300-118() REAR RELEASE RELAY SOCKETS
20-81-16	ASSEMBLY OF LEACH SO-10()-() REAR RELEASE RELAY SOCKETS
20-81-17	ASSEMBLY OF LEACH SO-1057-8912 REAR RELEASE RELAY SOCKETS
20-81-18	ASSEMBLY OF LEACH SO-1048-8308 REAR RELEASE RELAY SOCKETS
20-81-19	ASSEMBLY OF BACS16A()1 REAR RELEASE RELAY SOCKETS
20-81-21	ASSEMBLY OF LEACH SO-1055-8690 REAR RELEASE RELAY SOCKETS
20-81-22	INSTALLATION OF RELAY SOCKETS
20-82	PRINTED WIRING BOARD CONNECTORS
20-82-11	AMP TAB-TERMINAL PRINTED CIRCUIT BOARD CONNECTORS
20-82-12	ASSEMBLY OF AMP 3-582151()-() PRINTED CIRCUIT CONNECTORS
20-82-13	BACC65K() AND BACC65L() PRINTED WIRING BOARD CONNECTORS
20-83	WIRING SYSTEM TERMINATION SYSTEMS AND TOGGLE SWITCHES
20-83-00	ASSEMBLY OF INTEGRATED WIRING TERMINATION SYSTEMS
20-83-01	ASSEMBLY OF THE M81714() SERIES I TERMINAL JUNCTION SYSTEM
20-83-02	ASSEMBLY OF THE M81714() SERIES II TERMINAL JUNCTION SYSTEM
20-83-11	ASSEMBLY OF MICRO SWITCH 10()TL() SERIES TOGGLE SWITCH
20-84	LIGHTS AND LIGHTED SWITCHES
20-84-00	ESTERLINE-MASON AND WESTERN INDICATOR LAMP SOCKETS AND CONNECTORS
20-84-10	ASSEMBLY OF GRIMES-HONEYWELL ELECTRIC LIGHTS
20-84-13	EATON 851-37()-() SERIES LIGHTED PUSH BUTTON SWITCHES
20-84-14	BOEING S231W240()-() AND KORRY ELECTRONICS 09-530()-() LIGHTED PUSHBUTTON SWITCHES

20-00-10 CONTENTS

STANDARD WIRING PRACTICES MANUAL**SAFETY PRACTICES**

Working on any high voltage electrical/electronic system presents hazards such as:

- Electrical shock on contact with energized wiring
- Short circuits caused by metal tools dropped across electrical connections/conductors
- Explosions caused by electrical sparks in the presence of flammable vapors.

1. GENERAL

Assessment of existing conditions, good judgement and common sense must be exercised by airline personnel.

A. Before Maintenance Work Starts

To prevent injury to personnel and damage to equipment during maintenance operations on electrically operated equipment or while performing maintenance on any part of the electrical/electronic systems, use these safety practices:

- (1) Identify the system that maintenance work is to be done on.
- (2) Open circuit breakers and switches to make sure that power has been cut off from system components.
- (3) Put this Warning Tag on the circuit breakers:

WARNING: DO NOT CLOSE THIS CIRCUIT BREAKER. THIS CIRCUIT BREAKER MUST REMAIN OPEN UNTIL COMPLETION OF MAINTENANCE WORK.

- (4) To make sure that a circuit breaker will remain open, install a circuit breaker collar. Refer to Table 1.

Table 1
CIRCUIT BREAKER COLLARS

Part Number	Supplier
10164	Paramount Plastics
10237	Paramount Plastics
20266	Paramount Plastics
G57NB-5	Nylon Molding Corp./Union Plastics
S-4933959	Paco Plastics

- (5) Put this Warning Tag on the switches:

WARNING: DO NOT MOVE THIS SWITCH FROM THE OFF POSITION UNTIL MAINTENANCE WORK HAS BEEN COMPLETED.

B. After Maintenance Work Ends

- (1) Make sure that all switches and controls are in a position that prevents the accidental operation of any component.
- (2) Remove the warning tags and close the circuit breakers and switches that were opened before the work started.
- (3) Energize the system.
- (4) Perform the required operational checks.
- (5) When the checks have been satisfactorily completed, return the switches and controls to their normal shutdown positions.

20-00-10

STANDARD WIRING PRACTICES MANUAL**SAFETY PRACTICES**

- (6) Before removing the external power connector at the external power panel, make sure that the external power source is switched off.

WARNING: BEFORE YOU REMOVE THE EXTERNAL POWER CONNECTOR, MAKE SURE THAT THE EXTERNAL POWER SOURCE IS SWITCHED OFF. FAILURE TO TURN OFF THE EXTERNAL POWER SOURCE CAN CAUSE INJURY TO PERSONNEL AND DAMAGE TO EQUIPMENT.

C. Circuit Breaker Reset

When a circuit breaker trips or opens, do not attempt to reset or close the breaker until the discrepancy or malfunction that caused the breaker to trip or open has been determined and corrected.

WARNING: DO NOT RESET A TRIPPED CIRCUIT BREAKER UNTIL YOU KNOW THE CAUSE OF THE TRIPPED CIRCUIT BREAKER AND YOU KNOW THAT THE CIRCUIT BREAKER CAN BE SAFELY RESET. DAMAGE TO THE AIRPLANE AND INJURY TO THE PERSON CAN OCCUR.

2. FUEL VAPOR LEVELS**A. Acceptable Fuel Vapor Level**

The vapor level considered safe for use of ignition-producing devices is essentially zero.

B. Fuel Vapor Measurement

Vapor level measurement may be accomplished with calibrated equipment such as Mine Safety Appliances Model 2 or Davis Model D-6 that give readings like:

- PERCENT LOWER EXPLOSIVE LIMIT
- PERCENT EXPLOSIVE.

Any fuel vapor level readable on these instruments is an indication of:

- A nearby liquid fuel or vapor source
- A local higher vapor concentrations
- Insufficient ventilation.

These instruments should be used to:

- Establish that initial vapor levels are sufficiently low
- Monitor the level during repairs.

3. IGNITION SOURCES

WARNING: UNDER NO CONDITIONS SHOULD ANY POTENTIAL IGNITION SOURCE BE USED IN THE VICINITY OF OPEN FUEL TANKS, FUEL VENTS OR SPILLED FUEL WHERE VAPOR CONCENTRATIONS ARE UNPREDICTABLE OR CANNOT BE CONTROLLED.

A. Fire Safety

If ignition-producing equipment is used anywhere on or near an airplane where smoking is not allowed, a member of the local fire fighting crew or a person responsible for airplane fire safety should stand by to observe the work and other nearby activities.

STANDARD WIRING PRACTICES MANUAL**SAFETY PRACTICES**

These safety practices are recommended:

- Work should never begin or continue on any fuel system component while ignition-producing equipment is present
- The number of maintenance and safety personnel involved should be kept to a minimum
- The amount of emergency or fire fighting equipment that should be at the work site must be determined by local fire fighting personnel, or other authorities, who are responsible for fire safety and are capable of judging the degree of risk associated with the work to be done.

4. HEAT GUNS, HOT AIR GUNS, SOLDERING GUNS, AND SOLDERING IRONS

This paragraph defines the minimum recommended safety practices to use when operating heat guns, hot air guns, soldering guns, or soldering irons on or near in-service airplanes.

A. General

It should be noted that these recommendations are written for use throughout the world and are general in nature.

Regulations established by local agencies and/or airline generated procedures may take precedence.

NOTE: Boeing can neither conceive nor document all potential sets of conditions which the airlines may encounter.

Airlines are responsible for the safe use of any of these heating devices.

B. Explosion Potential

Heat guns, hot air guns, soldering guns, and soldering irons are not considered to be explosion-proof.

The devices may contain:

- Elements that may operate at temperatures in excess of the fuel vapor flashpoint (450 degrees F)
- Electrical switches that can produce sparks capable of igniting fuel vapors.

C. Use in Fuel Tanks

A heat device must not be operated in a fuel tank that has not been purged of fuel and filled with an inert gas, such as nitrogen.

D. Use Near Fuel and Flammable Liquids

Heat guns, hot air guns, soldering guns, or soldering irons should not be used within 100 feet of:

- An airplane during refueling
- An airplane during defueling
- An airplane when fuel tanks are open
- Fuel vents
- Fuel spills
- Other flammable liquids.

E. Use in Smoking Areas

Heat guns, hot air guns, soldering guns, and soldering irons can be used when smoking is allowed on or near the airplane.

If it is necessary to use these devices where smoking is not allowed, it must be determined that unsafe quantities of fuel vapors are not present in the intended work area.

STANDARD WIRING PRACTICES MANUAL

MATERIALS

This subject gives the materials and the satisfactory alternatives that are recommended for maintenance work on all Boeing commercial airplanes.

1. GENERAL DATA

A. Material Suppliers

All materials are available from the manufacturer, the manufacturer's representative, or Boeing Spares Procurement.

B. Material Temperature Grades

The Temperature Grade of a material is identified by the maximum temperature of the material in continuous operation. Grade A is the lowest grade and Grade D is the highest grade. Refer to Table 1.

These conditions are applicable:

- When a procedure gives a Temperature Grade of a material, it is permitted to use only the materials of that Grade or a higher Grade
- When a procedure does not give the Temperature Grade of a material, the lowest Grade of the material that is available can be used.

**Table 1
MATERIAL TEMPERATURE GRADES**

Grade	Maximum Temperature		Superseded Type
	Degrees C	Degrees F	
A	100	212	Type I
B	135	275	Type II
C	180	356	Type III
D	260	500	Type IV

C. Material Classes

The Class of a material is identified by the material's resistance to BMS 3-11 fluid. Refer to Table 2.

These conditions are applicable:

- If the Class of the material is specified, then a material of the same Class must be used
- If the Class of the material is not specified, either Class can be used.

**Table 2
MATERIAL CLASSES**

Class	Description
1	Resistant to BMS 3-11 fluid
2	Not resistant to BMS 3-11 fluid

2. MATERIALS

A. Cements

NOTE: Cements are not put into general groups of Grade or Class.

STANDARD WIRING PRACTICES MANUAL

MATERIALS

**Table 3
CEMENTS**

Grade	Class	Part Number	Supplier	Description
-	-	Resbond 940	Cotronics	Ceramic Adhesive
		Sauereisen 1	Sauereisen Cement Co.	Strong inorganic adhesive
		Sauereisen 31	Sauereisen Cement Co.	Synthetic ceramic adhesive

B. Coating Materials

**Table 4
COATING MATERIALS**

Grade	Class	Part Number	Supplier	Description	
A	1	EC-776SR	3M Company	Insulation coating	
		683-3-2	Akso Coating of America, Inc.		
	2	PC18M	Hysol Division, Dexter Corp.	Polyurethane coating	
			No. 72-102		Rudd Paint and Varnish Co.
			Type No. 1A33		Humiseal Division, Chase Corp.
		Tartan	Rudd Paint and Varnish Co.	Acrylic coating	
			Krylon 1303		Krylon, Inc.
			Type No. 1B31		Humiseal Division, Chase Corp.
			Type 88		Nycote Laboratories
		Type 7-11	Nycote Laboratories	Nylon varnish	

STANDARD WIRING PRACTICES MANUAL

MATERIALS

C. Convoluted Teflon Tubing

**Table 5
CONVOLUTED TEFLON TUBING**

Grade	Class	Part Number	Supplier	Description
D	1	CFT-()-0-00	Icore	Tubing, Plastic, Flexible, Convoluted, PTFE, Standard Convolutions, Black
		ZCT-TS-()	Zeus	Tubing, Plastic, Flexible, Convoluted, PTFE, Standard Convolutions, Black
		C10000-()	Cooperative Industries	Tubing, Plastic, Flexible, Convoluted, PTFE, Standard Convolutions, Black
		AMS-T-81914/1-1()	QPL	Tubing, Plastic, Flexible, Convoluted, PTFE, Standard Convolutions, Black

D. Filler Rods

**Table 6
FILLER RODS**

Grade	Class	Part Number or Specification	Supplier	Description
A	2	BMS1-11 Type II Grade 60	Boeing	Rod, black synthetic rubber, extruded, nominal diameter 3/8 inch to 3/4 inch, 1/16 inch increments
C	1	BMS1-52	Boeing	Rod, synthetic rubber, high performance silicone, extruded; nominal diameter 1/16 inch to 3/16 inch, 1/16 inch increments
		K-1045N	Union Carbide	Rod, synthetic rubber, extruded; nominal diameter 1/16 inch to 3/16 inch, 1/16 inch increments
		K-1046N		
		L-P-410 Type 6/6	Cadillac Plastics	Rod, plastic, polyimide (nylon), rigid; natural color; specify size.
		L-P-410 Type 6/6	Professional Plastics	
		Silastic 52	Dow Corning	Rod, synthetic rubber, extruded; red, nominal diameter 1/16 inch to 3/16 inch, 1/16 inch increments
D	1	AMS 3656	Available source	Rod, PTFE (Teflon), natural color
		ASTM D 1710	Available source

E. Film Strips

Table 8

TEMPERATURE GRADE C CLASS 1 FILM STRIPS

Part Number	Supplier	Description
C1-1/2 Identastrip	General Plastics Corp.	Insulating strip, fiberglass, KEL-F, suspensoid treated; specify width as required

Table 9

TEMPERATURE GRADE D CLASS 1 FILM STRIPS

Part Number	Supplier	Description
E125-2	Fluorglas	Insulating film, PTFE (Teflon), natural type B electrical grade, 0.002 inch thick, 1.0 inch wide
	Saint-Gobain Performance Plastics	Insulating film, PTFE (Teflon), natural type B electrical grade, 0.002 inch thick, 1.0 inch wide
E125-3	Fluorglas	Insulating film, PTFE (Teflon), natural type B electrical grade, 0.003 inch thick, 1.0 inch wide
	Saint-Gobain Performance Plastics	Insulating film, PTFE (Teflon), natural type B electrical grade, 0.003 inch thick, 1.0 inch wide
GB-116T	Continental Diamond Fiber Co.	Insulating strip, non-pressure sensitive, glass cloth, PTFE (Teflon) impregnated; meets AMS 3652 requirements; 0.005 inch thick; width as required in 1/4 inch increments
GB-128T	Continental Diamond Fiber Co.	Insulating strip, non-pressure sensitive, glass cloth, PTFE (Teflon) impregnated; meets AMS 3652 requirements; 0.010 inch thick; width as required in 1/4 inch increments
GB116T	Continental Diamond Fiber Co.	Insulating strip (or film), PTFE (Teflon), unsupported, skived, virgin or reprocessed; natural or blue; 0.005, 0.010, 0.015, 0.020 inch thick; width as required in 1/4 inch increments
GB128T	Continental Diamond Fiber Co.	Insulating strip (or film), PTFE (Teflon), unsupported, skived, virgin or reprocessed; natural or blue; 0.005, 0.010, 0.015, 0.020 inch thick; width as required in 1/4 inch increments
P-412	Permacel	Insulating film, PTFE (Teflon), natural type B electrical grade, 0.003 inch thick, 1.0 inch wide

MATERIALS

G. Lubricants

NOTE: Lubricants are not put into general groups of Grade or Class.

**Table 12
LUBRICANTS**

Grade	Class	Part Number	Supplier	Description
-	-	-	Any Source	Cetyl Alcohol Paste; viscosity of 10 to 100 centistokes
-	-	-	Any Source	Isopropyl Alcohol

H. Potting Compounds

**Table 13
POTTING COMPOUNDS**

Grade	Class	Part Number	Supplier	Description
A	1	MIL-PRF-8516 Type II Class 2	QPL	Potting, flexible, electrical sealing, -65 degrees F to 225 degrees F
C	1	Silastic-738	Dow Corning	Potting, flexible, electrical sealing, -85 degrees F to 360 degrees F
		RTV-162	General Electric	Potting, flexible, electrical sealing, -75 degrees F to 480 degrees F
		DC-3145	Dow Corning	Potting, flexible, electrical sealing, 685 degrees F to 482 degrees F

I. Seal Plugs

**Table 14
SEAL PLUGS**

Grade	Class	Part Number	Supplier	Description
A	2	BACP20BA1	American United Seal, Stillman Seal Division	Plug, BMS 1-33 Grade 60 butyl rubber
			Kirkhill Rubber	
C	2	MS27488	Iconics	Seal Plug, FEP; specify material for Temperature Grade; for size and color, refer to Table 15
D	2	MS27488	Iconics	Seal Plug, PFA; specify material for Temperature Grade; for size and color, refer to Table 15

STANDARD WIRING PRACTICES MANUAL**CONTACT CRIMP TOOL CROSS REFERENCE****1. THE BOEING ST2220-() CRIMP TOOL****A. General Description**

The Boeing ST2220-() crimp tool is based on the MS3191-A crimp tool and has these features:

- The handle uses replaceable contact locators
- The locators are also identified with an ST2220-() part number
- The tool must be operated through a full cycle
- Crimp depth is controlled by the locator.

**ST2220-() CRIMP TOOL HANDLE AND LOCATOR****Figure 1****B. Locator Installation**

- (1) Close the handles fully to trip the ratchet, then release the pressure so the handles open fully. Refer to Figure 1.
- (2) Loosen the retaining latch locking screw.
- (3) Pull the latch to the open position.
- (4) Pull the locator release slide.
- (5) Remove the existing locator in the tool head.
- (6) Insert the new locator.

Make sure that the flat on the flange of the locator mates with the flat in the handle. The flange of the locator must be flush with the handle.

- (7) Push the latch to the close position and tighten the locking screw.
- The tool is ready to crimp, no adjustment is required.

STANDARD WIRING PRACTICES MANUAL

CONTACT CRIMP TOOL CROSS REFERENCE

2. THE M22520/1-01 CRIMP TOOL

A. General Description

The M22520/1-01 crimp tool has these features:

- The handle uses replaceable turret heads or locators
- The turret heads are identified with an M22520/1-() part number
- The turret head can be rotated to crimp different contacts or contact sizes without removing the head
- The tool must be operated through a full cycle
- Crimp depth is controlled by a selector on the tool.

B. Turret Head Assembly Removal

- (1) Loosen the socket head screws until the threads are disengaged from the retainer ring.
All heads (single position or turret) are attached by means of two socket head screws. Refer to Figure 2.
- (2) Remove the turret head with a straight lifting motion.

C. Turret Head Assembly Installation

- (1) With the tool in the open position, press the trigger which releases the turret to the indexing position.
Refer to Figure 2.

M22520/1-01 CRIMP TOOL HANDLE AND TURRET LOCATOR
Figure 2

20-00-12

STANDARD WIRING PRACTICES MANUAL

CONTACT CRIMP TOOL CROSS REFERENCE

- (2) Position the turret head assembly onto the retainer ring and line up the screws with the tapped holes.
- (3) After the turret head is seated against the retainer ring, tighten the socket head screws with a 9/64 inch allen wrench.

The turret should index easily without binding.

3. THE M22520/2-01 CRIMP TOOL

A. General Description

The M22520/2-01 basic crimp tool is designed with eight die closures that are changeable by a selector knob for AWG 20 through AWG 32 with positive ratchet action. The crimp tool has these features:

- The tool accommodates a wide variety of contacts
- The interchangeable locators are easily removed (rotate 90 degrees and pull out)
- Each locator positions the contact longitudinally and transversely in relation to the indentors
- Both the locator and crimp depth selector may be safety wire locked to provide the operator with a tool that cannot be adjusted and to assure crimp depth and location.

B. Locator Removal

- (1) With the tool in the open position, remove the spring clip lock wire.

Refer to Figure 3.

M22520/2-01 CRIMP TOOL HANDLE AND LOCATOR
Figure 3

- (2) Push and rotate the locator 90 degrees.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

CONTACT CRIMP TOOL CROSS REFERENCE

C. Locator Installation

- (1) Select the correct locator for the cable size and the contact to be crimped.
- (2) Insert the locator into the lock plate.
- (3) Push and rotate the locator 90 degrees.
- (4) Replace the spring clip lock wire.
- (5) Select the correct selector number on the crimp depth selector:
 - (a) Raise and rotate the crimp depth selector knob until the desired selector number is in line with "SEL. NO".
 - (b) Release the selector knob.

Make sure that the crimp depth selector knob drops against the tool handle.

4. EQUIVALENT CONTACT CRIMP TOOLS

A. M22520/1-01 Equivalent Crimp Tools

Table 1 gives the crimp tools and locators that are equivalent to the M22520/1-01 handle and M22520/1-02 head for the contacts in the specified Subject.

STANDARD WIRING PRACTICES MANUAL

WIRE TYPE CODES

This subject gives Wire Type Codes and Wire Specifications or Wire Part Numbers for the 727, 737, 747, 757, 767, and 777 model airplanes.

1. GENERAL DATA

A. Applicable Conditions for Wire Type Code Data

These conditions are applicable for the Wire Type Code data and the Wire Part Number data in Table 1 and Table 2:

- The primary purpose is to identify the Wire Part Number for the Wire Type Code that is specified in the Wire List of the Wiring Diagram Manual that is applicable for the airplane model
- The secondary purpose is to give a minimum description of the type of wire and its configuration
- An airplane model number for a Wire Type Code does not give approval to use that wire for electronic assembly wiring
- An airplane model number for a Wire Type Code does not give approval to use that wire for changes to airplane wiring that occur after the production of the airplane.

B. Wire Data

For the conditions that are applicable for Wire Type Code and Wire Part Number data, refer to Paragraph 1.A.

The primary data that is given in:

- Table 1 is the Wire Type Code (WTC) that is specified in the Wiring Diagram Manual (WDM)
- Table 2 is the Wire Specification or the Wire Part Number for the Wire Type Code (WTC) that is specified in the Wiring Diagram Manual (WDM)
- Table 3 is the alternative Wire Specification or Wire Part Number for the specified Wire Specification or the Wire Part Number and its alternative.

C. Wire Specification or Wire Part Number from the WTC

For the part number structure of Boeing Standard Wire Specifications, refer to Paragraph 4.A.

- (1) Find the WTC in Table 1.
- (2) Look in the Model WDM columns for the model or the models that are applicable for the WTC.
- (3) Find the Wire Specification or Wire Part Number for that WTC.
- (4) If that wire is not available, find an Alternative Wire in Table 3. Refer to Paragraph 3.B.

D. Wire Data from the Wire Specification or the Wire Part Number

This Paragraph gives the procedure to find the wire data if the Wire Type Code (WTC) is not known. The wire data is also specified in Table 1 by the Wire Type Code (WTC).

For the part number structure of Boeing Standard Wire Specifications, refer to Paragraph 4.A.

- (1) Find the Wire Specification or the Wire Part Number in Table 2.
- (2) Look in the Model WDM columns for the model or the models that are applicable for the Wire Specification or Wire Part Number.
- (3) Find the Wire Data for that Wire Specification or Wire Part Number.
- (4) If that wire is not available, find an Alternative Wire in Table 3. Refer to Paragraph 3.B.

3. ALTERNATIVE WIRES

A. Applicable Conditions for Alternative Wire Data

These conditions are applicable for the Alternative Wire Data in Table 3:

- An Alternative Wire is satisfactory when it is not possible to find or get the wire that is specified in the wire list of the Wiring Diagram Manual (WDM) that is applicable for the airplane model
- The replacement of a Specified Wire by a wire that is not given in Table 3 as an Alternative Wire is not recommended
- Each Alternative Wire is applicable for all models.

NOTE: Boeing Service Engineering can supply more data to answer questions about the Alternative Wires.

These conditions are applicable when a Specified Wire is replaced with an Alternative Wire:

- The Alternative Wire must have the same number of conductors
- The Alternative Wire must have the same size of conductor
- The Alternative Wire must have the same color of the insulation or the outer jacket, if a special color is specified.

B. Alternative Wire for a Specified Wire

For the conditions that are applicable for Alternative Wires, refer to Paragraph 3.A.

STANDARD WIRING PRACTICES MANUAL

WIRE TYPE CODES

CAUTION: THE REPLACEMENT OF A SPECIFIED WIRE BY A WIRE THAT IS NOT GIVEN IN TABLE 3 AS AN ALTERNATIVE WIRE IS NOT RECOMMENDED.

- (1) If it is necessary, find the Wire Specification or the Wire Part Number from the WTC. Refer to Paragraph 1.C.
- (2) Find the Specified Wire in Table 3.
- (3) Find an Alternative Wire for the Specified Wire.

Make sure that the special conditions for the Alternative Wire and the conditions of the system or circuit are obeyed.

C. Alternative Wires

For the conditions that are applicable for Alternative Wires, refer to Paragraph 3.A.

NOTE: The Specified Wire that is given in Table 3 is the Wire Specification or the Wire Part Number for the WTC that is specified in the wire list of the WDM.

CAUTION: THE REPLACEMENT OF A SPECIFIED WIRE BY A WIRE THAT IS NOT GIVEN IN TABLE 3 AS AN ALTERNATIVE WIRE IS NOT RECOMMENDED.

NOTE: Boeing Service Engineering can supply more data to answer questions about the Alternative Wires.

STANDARD WIRING PRACTICES MANUAL

STANDARD WIRE TYPE REPLACEMENT

This Subject gives:

- The general purpose BMS 13-48 and BMS 13-60 wire types that are equivalent
- The other general purpose wire types that can be replaced by BMS 13-48 and BMS 13-60 wire types
- The high temperature wire types that can be replaced by BMS 13-58 wire types.

1. ALTERNATIVE WIRES AND CABLES

A. Applicable Conditions for Wire Replacement

The Alternative Wire Data that is given in this Subject is also included in the Alternative Wire Data of Subject 20-00-13.

These conditions are applicable for the Alternative Wire Data and in Table 3, Table 4, Table 5, Table 6, and Table 7:

- An Alternative Wire is satisfactory when it is not possible to find or get the wire that is specified in the wire list of the Wiring Diagram Manual (WDM) that is applicable for the airplane model
- The replacement of a Specified Wire by a wire that is not given as an Alternative Wire is not recommended
- Each Alternative Wire is applicable for all models.

NOTE: Boeing Service Engineering can supply more data to answer questions about the Alternative Wires.

These conditions are also applicable when a Specified Wire is replaced with an Alternative Wire:

- The Alternative Wire must have the same number of conductors
- The Alternative Wire must have the same size of conductor
- The Alternative Wire must have the same color of the insulation or the outer jacket if a special color is specified.

For the replacement of standard wire types:

- Table 1 gives the equivalent BMS 13-60 wire types for the applicable BMS 13-48 wire types
- Table 2 gives the equivalent BMS 13-48 wire types for the applicable BMS 13-60 wire types
- Table 3, Table 4, and Table 5 give the other general purpose wire types that can be replaced by the applicable BMS 13-48 and BMS 13-60 wire types
- Table 6 and Table 7 give the high temperature wire types that can be replaced by the applicable BMS 13-58 wire types.

B. BMS 13-48 Wire Types

**Table 1
BMS 13-60 WIRE TYPES THAT HAVE EQUIVALENT BMS 13-48 WIRE TYPES**

BMS 13-48 Wire		Equivalent BMS 13-60 Wire	
Type	Description	Type	Description
Type 3	Insulation - 6 mil, Conductor - tin coated copper, Shield, Jacket	Type 13	Insulation - 6 mil, Conductor - tin coated copper, Shield, Jacket
Type 6	Insulation - 6 mil, Conductor - silver coated high strength copper alloy, Shield, Jacket	Type 15	Insulation - 6 mil, AWG 24 to AWG 16 conductors - nickel coated high strength copper alloy, AWG 14 to AWG 10 conductors - nickel coated copper, Shield, Jacket

20-00-15 CONTENTS

STANDARD WIRING PRACTICES MANUAL

WIRE INSULATION REMOVAL

This subject:

- Gives the conditions and the procedure for the removal of the necessary length of outer jacket from the end of a cable
- Gives the conditions and the procedure for the removal of the necessary length of insulation from the end of a wire
- Gives the outer jacket removal tools for cables that have an O.D. that is less than or equal to 0.3 inch
- Gives the insulation removal tools for AWG 10 through AWG 26 wire
- Does not give the cable preparation data for coax and triax cables.

1. GENERAL DATA

A. Necessary Conditions for the Removal of the Outer Jacket from the End of a Cable

These conditions are applicable after the outer jacket has been removed from the end of a cable that does not have a shield:

- The primary insulation of the wire does not have a hole or a crack
- The cable has no deformation near the end of the outer jacket
- The remaining jacket does not have a hole or a crack.

CONFIGURATION OF A CABLE WITHOUT A SHIELD CABLE
Figure 1

These conditions are applicable after the outer jacket has been removed from the end of a cable that has a shield:

- No strands of the shield are broken or missing
- The base metal of the strands of the shield cannot be seen
- The strands of shield are together
- The cable has no deformation near the end of the outer jacket
- The remaining jacket does not have a hole or a crack.

STANDARD WIRING PRACTICES MANUAL

WIRE INSULATION REMOVAL

CONFIGURATION OF A CABLE WITH A SHIELD
Figure 2

B. Necessary Conditions for the Removal of the Insulation from the End of a Wire

These conditions are applicable after the insulation has been removed from the end of a wire:

- No strand of the conductor is broken or missing
- The base metal of a strand of the conductor cannot be seen
- The strands of the conductor are in the initial, twisted configuration
- The wire has no deformation near the end of the insulation
- The remaining insulation does not have a hole or a crack.

CONFIGURATION OF A WIRE
Figure 3

2. CABLE JACKET AND WIRE INSULATION REMOVAL

A. Selection of a Removal Tool

- (1) For the selection of a cable jacket removal tool:
 - (a) Find the Wire Type Code (WTC) of the cable. Refer to the Wiring Diagram Manual.
 - (b) Find the wire specification or the wire part number of the cable. Refer to Subject 20-00-13.
 - (c) Make a selection of a cable jacket removal tool. Refer to:
 - Table 1 for a WTC with one wire specification or part number
 - Table 2 for a WTC with more than one wire specification or part number.
- (2) For the selection of an insulation removal tool:
 - (a) Find the Wire Type Code (WTC) of the cable. Refer to the Wiring Diagram Manual.
 - (b) Find the wire specification or the wire part number of the cable. Refer to Subject 20-00-13.

STANDARD WIRING PRACTICES MANUAL

WIRE INSULATION REMOVAL

- (c) Make a selection of an insulation removal tool. Refer to:
 - Table 3 for a WTC with one wire specification or part number
 - Table 4 for a WTC with more than one wire specification or part number.

B. Cable Jacket Removal

This paragraph gives the procedure to remove a length of the outer jacket from a cable that has an O.D. that is less than or equal to 0.3 inch.

NOTE: It is recommended that a test of the cable jacket removal tool is done with a sample of the cable, before the operation is done on a cable that is installed or must be installed in the airplane.

- (1) Put the end of the cable in the V-notch that is nearest the pivot and below the blade.
 Make sure that the blade is on the side of the cable jacket removal tool that is opposite to the hand that holds the cable.
- (2) Move the tool around the cable approximately three times.
- (3) Remove the cable from the tool.
- (4) Bend the cable on the line where the cable is cut to break the outer jacket loose.
- (5) If the length of jacket is long, cut the jacket longitudinally with the front blade of the tool.
- (6) Remove the length of jacket.
- (7) Examine the cable for damage. Refer to Paragraph 1.A.

C. Wire Insulation Removal

NOTE: It is recommended that a test of the insulation removal tool is done with a sample of the wire, before the operation is done on a wire that is installed or must be installed in the airplane.

- (1) Put the wire in the correct hole in the insulation removal tool.
- (2) Close the handles of the tool until the tool makes a click.
 Make sure the handles stay closed.
- (3) Remove the wire from the tool.
- (4) Release the handles of the tool.
- (5) Examine the wire for damage. Refer to Paragraph 1.B.

3. CABLE JACKET AND WIRE INSULATION REMOVAL TOOLS

A. Cable Jacket Removal Tools

Table 1 and Table 2 give the tools that are recommended for the removal of a length of the outer jacket from the end of a cable.

NOTE: Other tools are acceptable if the result of the removal operation agrees with the necessary conditions that are specified in Paragraph 1.A.

B. Wire Insulation Removal Tools

Table 3 and Table 4 give the tools that are recommended for the removal of a length of the insulation from the end of a wire.

NOTE: Other tools are acceptable if the result of the removal operation agrees with the necessary conditions that are specified in Paragraph 1.B.

STANDARD WIRING PRACTICES MANUAL

WIRE INSULATION REMOVAL

CAUTION: DO NOT USE THE TOOLS IN TABLE 3 AND TABLE 4 TO REMOVE THE OUTER JACKET FROM A CABLE OR A SHIELDED WIRE. DAMAGE TO THE SHIELD OR THE WIRES IN THE CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

OUTER DIAMETER OF WIRE

This Subject gives the range of the outer diameters of specified Boeing and Military standard wires.

1. OUTER DIAMETER OF WIRE

A. O.D. of a Wire

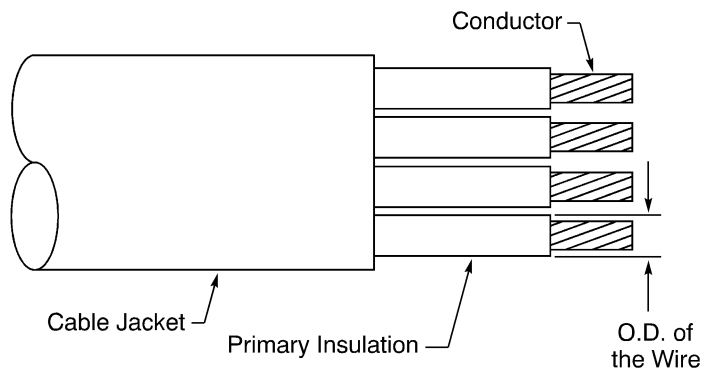

The O.D. of a wire is the distance from the outside edge of the insulation through the center of the conductor to the opposite, outside edge of the insulation.

Refer to:

- Figure 1 for the O.D. of one wire
- Figure 2 for the O.D. of a wire in a cable
- Figure 3 for the O.D. of one wire that has a shield and a jacket
- Figure 4 for the O.D. of a wire in a cable that has a shield and a jacket.

STANDARD WIRING PRACTICES MANUAL

AIRPLANE FLAMMABLE LEAKAGE ZONES

1. GENERAL DATA

A. Definition of a Flammable Leakage Zone

A flammable leakage zone is an area where leakage of flammable fluids or flammable vapors can occur as a result of:

- One failure
- Leakage during normal operation.

B. General Conditions

Refer to Subject 20-30-00 for the applicable conditions for protection of electrical connections in a flammable leakage zone.

C. Fire Safety Precautions

Refer to Subject 20-00-10 for the fire safety precautions in that apply to the electrical power of the circuits in a flammable leakage zone.

These conditions are applicable in an area where there are flammable vapors:

- All flames, smoking, sparks, and other sources of ignition must not occur
- Tools and test equipment that can make a spark must not be used
- A megohmmeter must not be used
- All electrical equipment, such as lights, motors, wiring, etc., must meet the necessary electrical and fire codes
- The accumulation of vapors must be prevented by sufficient ventilation.

STANDARD WIRING PRACTICES MANUAL**AIRPLANE VIBRATION AREAS****1. GENERAL DATA****A. General Conditions**

For the applicable conditions for the assembly and installation of wire harnesses in a high vibration area, refer to Subject 20-10-11.

2. LOCATION OF THE VIBRATION AREAS**A. Usual Locations of the Vibration Areas**

Table 1
VIBRATION LEVEL AND VIBRATION AREA TYPE

Vibration Level	Type
1	Not a high vibration area
2	A high vibration area
3	A high vibration area

The usual locations for vibration areas with Vibration Level 1 are:

- The cabin
- The EE bay
- The cargo area.

The usual locations for vibration areas with Vibration Level 2 are:

- The ECS bay
- The empennage
- The fuel tanks
- The horizontal stabilizer
- The leading edge of the wing
- The radome
- The rudder
- The struts
- The trailing edge of the wing
- The wheel wells
- The wing to body fairing.

The usual locations for vibration areas with Vibration Level 3 are:

- The engine core
- The engine nacelle
- The APU compartment.

Refer to Figure 1.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

CLEANING OF WIRE HARNESSSES

This Subject gives the procedures to the remove the contamination from these wire harness components:

- A wire
- A cable
- A wire harness support
- The external surface of a connector
- A connector backshell
- A strain relief clamp.

1. GENERAL DATA

A. Necessary Conditions for Fire Safety

Refer to Subject 20-00-10 for more safety conditions.

These conditions are applicable for a solvent or a flammable aqueous cleaner:

- The conditions for fire safety specified by the manufacturer must be obeyed
- The necessary local conditions for fire safety must be obeyed
- The airplane must be electrostatically grounded; refer to the Aircraft Maintenance Manual
- The material must be kept in an approved closed container
- Only the quantity of material that is necessary to clean the wire harness or wire harness components must be kept near the airplane
- A wiper or a cloth that is made from a synthetic material is not permitted.

WARNING: CAREFULLY READ THE INSTRUCTIONS AND CAUTIONS FROM THE MANUFACTURER OF THE MATERIAL FOR MORE SAFETY CONDITIONS. IF ALL OF THE SPECIFIED CONDITIONS ARE NOT OBEYED, INJURY TO PERSONNEL CAN OCCUR.

CAUTION: CAREFULLY READ THE INSTRUCTIONS AND CAUTIONS FROM THE MANUFACTURER OF THE MATERIAL FOR MORE SAFETY CONDITIONS. IF ALL OF THE SPECIFIED CONDITIONS ARE NOT OBEYED, DAMAGE TO EQUIPMENT CAN OCCUR.

B. Necessary Conditions for Personnel Safety

These conditions are applicable for a cleaning material:

- The conditions for personnel safety specified by the manufacturer must be obeyed
- The necessary local conditions for personnel safety must be obeyed
- A cleaner must not touch the skin or the eyes
- The vapors from a cleaner must not be breathed.

20-10-04

Page 1
Feb 01/2008

D6-54446

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESES**

WARNING: CAREFULLY READ THE INSTRUCTIONS AND CAUTIONS FROM THE MANUFACTURER OF THE MATERIAL FOR MORE SAFETY CONDITIONS. IF ALL OF THE SPECIFIED CONDITIONS ARE NOT OBEYED, INJURY TO PERSONNEL CAN OCCUR.

These equipment are recommended for protection:

- An apron
- Boots
- Coveralls
- Rubber gloves
- Chemical goggles
- An approved eye protection.

To make sure that fumes are not breathed, one of these conditions must occur:

- The area has a good airflow
- The personnel have sufficient respiratory protection.

C. General Conditions for Cleaning a Wire Harness

These conditions are applicable:

- Equipment or a component that is sensitive to contamination, solvents, or water and that is near the area that must be cleaned, must have satisfactory protection
- All disconnected connectors in the area must have protection
- A solvent, a cleaner, contamination, or water must not go into a connector
- A paint, a plastic, a polymeric material, or an adhesive must be fully cured before it can be cleaned.

CAUTION: FLUID OR CONTAMINATION IN A CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

D. General Conditions for Cleaning with a Solvent

These conditions are applicable:

- The mixture of the solvent and the contamination must be a safe mixture
- Different solvents must not be mixed
- A solvent must not be mixed with an aqueous cleaner
- The solvent must be a permitted cleaner for the materials in a wire harness
- The local environmental laws must be obeyed
- The solvent must be applied only with the procedure that is permitted or specified.

WARNING: IT CAN BE DANGEROUS TO MIX SOME TYPES OF SOLVENTS WITH SOME TYPES OF CONTAMINATION. MAKE SURE THAT THE MIXTURE OF THE SOLVENT AND THE CONTAMINATION IS PERMITTED. INJURY TO PERSONNEL CAN OCCUR.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE HARNESS MUST NOT BE APPLIED TO THE WIRE HARNESS. DAMAGE TO THE WIRE HARNESS CAN OCCUR.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESES****E. General Conditions for Cleaning with an Aqueous Cleaner**

These conditions are applicable:

- The mixture of the aqueous cleaner and the contamination must be a safe mixture
- The maximum permitted pH of a cleaner is 9.0
- Different cleaners must not be mixed
- An aqueous cleaner must not be mixed with a solvent
- The cleaner must be a permitted cleaner for the materials in a wire harness
- The area that must be cleaned must sufficiently drain large volumes of liquid
- The sensitive components in the area must have satisfactory protection; refer to the Aircraft Maintenance Manual
- The local environmental laws must be obeyed
- The cleaner must be applied only with the procedure that is permitted or specified.

WARNING: IT CAN BE DANGEROUS TO MIX SOME TYPES OF AQUEOUS CLEANERS WITH SOME TYPES OF CONTAMINATION. MAKE SURE THAT THE MIXTURE OF THE CLEANER AND THE CONTAMINATION IS PERMITTED. INJURY TO PERSONNEL CAN OCCUR.

CAUTION: AN AQUEOUS CLEANER THAT HAS A PH MORE THAN 9.0 MUST NOT BE APPLIED TO THE WIRE HARNESS. DAMAGE TO THE WIRE HARNESS AND OTHER EQUIPMENT CAN OCCUR.

CAUTION: AN AQUEOUS CLEANER THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE HARNESS MUST NOT BE APPLIED TO THE WIRE HARNESS. DAMAGE TO THE WIRE HARNESS CAN OCCUR.

CAUTION: A HIGH VOLUME OF AQUEOUS CLEANER MUST NOT BE APPLIED TO AN AREA UNLESS THE LIQUID CAN DRAIN SUFFICIENTLY. IF THE LIQUID DOES NOT DRAIN SUFFICIENTLY, DAMAGE TO THE EQUIPMENT OR A STRUCTURE CAN OCCUR.

F. Necessary Materials and Tools

Table 1
RECOMMENDED SOLVENTS

Solvent	Specification	Supplier
Alcohol, Isopropyl	TT-I-735 Grade A	Any Source
	TT-I-735 Grade B	Any Source
Alcohol, Denatured, Ethyl	O-E-760	Any Source
Naphtha, Aliphatic	TT-N-95, Type II	Any Source

20-10-04

STANDARD WIRING PRACTICES MANUAL

CLEANING OF WIRE HARNESSSES

**Table 2
NECESSARY TOOLS**

Material or Tool	Description	Part Number or Specification	Supplier
Brush	1. The bristles are soft and not abrasive; 2. The bristle retainer is not metal; 3. The cleaners do not cause damage to the brush materials	Specified by supplier	Any Source
Cloth, Cleaning	Cotton, non-woven	CCC-C-46	Any Source
Compressed Gas	Air, Clean and dry	Specified by supplier	Any Source
	Nitrogen, Clean and dry	Specified by supplier	Any Source
Swabs	Cotton, lint free	Specified by supplier	Any Source
Vacuum	The brush has soft bristles	Specified by supplier	Any Source
Wiper	Cotton, low lint	Specified by supplier	Any Source
	Cotton, non-woven Grade 142951	BMS15-5 Class A	BBA Nonwovens Walpole
	Cotton, cheesecloth No. 10, 20, 40	BMS15-5 Class A	American Fiber & Finishing
	Cotton, cheesecloth No. 9017	BMS15-5 Class A	DeRoyal Textiles
	Cotton, gauze sponge No. 582556	BMS15-5 Class A	American Fiber & Finishing
	Cotton, gauze sponge No. 9405	BMS15-5 Class A	DeRoyal Textiles
	Cotton, HAN SIN SANG SA Fabric Code No. 3030	BMS15-5 Class A	HO CHANG Medical Company
	Cotton, Hermitex No. 300, 400	BMS15-5 Class A	DeRoyal Textiles
	Cotton, Rymplecloth No. 201, 300, 301	BMS15-5 Class A	American Fiber & Finishing
	Cotton, Weston cloth No. 8000	BMS15-5 Class A	Nippon Weston Company

2. SELECTION OF A CLEANING PROCEDURE

A. Selection of an Applicable Cleaning Procedure

NOTE: Connectors can be environmentally sealed or unsealed. Each type has a different cleaning procedure. Environmentally sealed connectors are identified in Subject 20-60-08.

STANDARD WIRING PRACTICES MANUAL

CLEANING OF WIRE HARNESSSES

**Table 3
SELECTION OF A CLEANING PROCEDURE FOR THE PRESSURIZED AREA**

Contamination				Cleaning Procedure
Location	Form	State	Example	
A wire, a cable, or a wire harness support clamp	Fluid, petroleum based or a hydraulic fluid	Wet or dry	BMS3-11, chemical, chemical cleaner, corrosion inhibiting compound, fuel, hydraulic fluid, oil, paint	Paragraph 3.A.
	Fluid, not petroleum based	Wet or dry	Chemical, chemical cleaner, de-icing fluid, food products, lavatory waste water, urine, salt water, soft drink, solvent	Paragraph 3.D.
	Solid, not petroleum based	Dry	Dirt, fecal matter, food, soot	Paragraph 3.C.
	Solid, not petroleum based	Loose particles, abrasive	Dirt, foreign object, metal particle, corrosion particle that falls from a part, sand	Paragraph 3.C.
	Solid, not petroleum based	Loose particles, not abrasive	Dust, lint, food, foreign object	Paragraph 4.A.
	Semi-solid	Wet or dry	Adhesive, grease, mud, sealant	Paragraph 3.A.
	Mixture of fluid and solid, petroleum based or hydraulic fluid	Wet or dry	Oil and dirt	Paragraph 3.A.
	Mixture of fluid and solid, not petroleum based	Wet or dry	Lavatory waste water and dirt	Paragraph 3.D.
The external surface of an unsealed connector, a backshell, a strain relief clamp	Fluid; solid; mixture of a fluid and a solid; semi-solid	Wet or dry	All types	Paragraph 4.C.
The external surface of an environmentally sealed connector, a backshell, a strain relief clamp	Fluid; solid; mixture of a fluid and a solid; semi-solid	Wet or dry	All types	Paragraph 4.B.
The internal surface of a connector	Fluid; solid; mixture of a fluid and a solid; semi-solid	Wet or dry	All types	Subject 20-60-01

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES****3. CLEANING OF A WIRE HARNESS THAT HAS CONTAMINATION ON THE INTERNAL SURFACES****A. Removal of Heavy Contamination with a Solvent**

Heavy contamination can be:

- A petroleum based material
- A hydraulic fluid
- A wet or dried mixture of a fluid and a solid
- A wet or dried semi-solid.

Refer to Paragraph 2.A. for the conditions that are applicable for this procedure.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

- (3) Electrostatically ground the airplane. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and all components that are sensitive to contamination and solvents.

Make sure that all disconnected connectors in the area have sufficient protection.

- (5) Make a selection of:
 - An aliphatic naphtha from Table 1
 - An isopropyl alcohol from Table 1
 - A wiper or a cloth from Table 2.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE HARNESS MUST NOT BE APPLIED. DAMAGE TO THE WIRE HARNESS CAN OCCUR.

- (6) Disassemble a short length of the wire harness:
 - (a) Remove the necessary wire harness supports to get access to the contamination.
Make sure that the wire harness has sufficient support after the supports are removed.
 - (b) Remove the wire harness ties along the free length.
 - (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (7) Remove the contamination.

Refer to Paragraph 4. for the procedure to remove the contamination from:

- A backshell
- The external surface of the connector
- An area of a wire that is less than 6 inches from the end of a connector.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

CAUTION: MAKE SURE TO PREVENT THE MOVEMENT OF THE CONTAMINATION TO A DIFFERENT WIRE HARNESS COMPONENT. DAMAGE TO THE COMPONENT CAN OCCUR.

CAUTION: A WIRE MARK OR AN IDENTIFICATION TAPE MUST NOT BE CLEANED WITH TOO MUCH FORCE. DAMAGE TO THE WIRE IDENTIFICATION CAN OCCUR.

CAUTION: SURFACES WITH PROTECTIVE FINISHES MUST BE CLEANED CAREFULLY. REMOVAL OF THE PROTECTIVE FINISH CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE EQUIPMENT OR THE STRUCTURE.

(a) Put the sufficient quantity of aliphatic naphtha on the wiper to make it moist.

CAUTION: THE WIPER MUST NOT HAVE TOO MUCH ALIPHATIC NAPHTHA. THE NAPHTHA CAN GET INTO A WIRE HARNESS COMPONENT AND DAMAGE TO THE COMPONENT CAN OCCUR.

(b) Carefully remove the contamination from each component with the wiper.

NOTE: A moist brush can help loosen the particles.

CAUTION: ALIPHATIC NAPHTHA MUST NOT BE APPLIED ON CONTROL CABLES, ACRYLIC SURFACES, DECALS, OR FINISHES THAT ARE NOT MADE FROM CLASS 1 MATERIALS. DAMAGE TO THE COMPONENT CAN OCCUR.

CAUTION: ALIPHATIC NAPHTHA MUST NOT BE APPLIED ON A SURFACE THAT HAS A CORROSION INHIBITING COMPOUND UNLESS THE CORROSION INHIBITING COMPOUND MUST BE REMOVED AND THEN APPLIED AGAIN.

CAUTION: ALIPHATIC NAPHTHA MUST NOT STAY ON A WIRE HARNESS COMPONENT. REMAINING NAPHTHA CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE HARNESS COMPONENT.

(c) Dry the cleaned area with a new wiper.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining naphtha. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

(d) Do Step (a) through Step (c) again until all of the contamination is removed.

(e) Put the sufficient quantity of isopropyl alcohol on the wiper to make it moist.

(f) Carefully clean the areas where the naphtha was applied.

(g) Dry the cleaned area with a new wiper.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining naphtha. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

(8) Examine the wire harness components and supports.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

Make sure that the components and supports are clean and fully dry.

- (9) Assemble the wire harness to make it the same as the initial configuration.
- (10) Install the wire harness supports.
- (11) Do Step (6) through Step (10) again until all of the contamination on the wire harness is removed.

B. Removal of Heavy Contamination with an Aqueous Cleaner

This procedure is recommended for the unpressurized areas where a high volume of liquid can drain sufficiently. Refer to Paragraph 2.A.

CAUTION: A HIGH VOLUME OF AQUEOUS CLEANER MUST NOT BE APPLIED TO AN AREA UNLESS THE LIQUID CAN DRAIN SUFFICIENTLY. IF THE LIQUID DOES NOT DRAIN SUFFICIENTLY, DAMAGE TO THE EQUIPMENT OR A STRUCTURE CAN OCCUR.

Heavy contamination can be:

- A petroleum based material
- A hydraulic fluid
- A wet or dried mixture of a fluid and a solid
- A wet or dried semi-solid.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

- (3) Electrostatically ground the airplane. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and the components that are sensitive to contamination and cleaners. Refer to the Aircraft Maintenance Manual.

Make sure that all of the disconnected connectors in the area have sufficient protection.

CAUTION: COVERS, BLACK POLYETHYLENE SHEET, AND VINYL ADHESIVE TAPE MUST BE INSTALLED TO KEEP LIQUIDS OUT OF AREAS THAT CONTAIN MECHANICAL, ELECTRICAL, OR HYDRAULIC COMPONENTS. LIQUIDS THAT GO INTO THESE AREAS CAN CAUSE CORROSION, CAN FREEZE DURING AIRPLANE FLIGHT, OR CAN REMOVE NECESSARY LUBRICANTS.

- (5) Make a selection of:
 - An approved aqueous cleaner
 - A brush from Table 2
 - A wiper or a lint free cloth from Table 2.

WARNING: SOME CLEANERS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF A FLAMMABLE CLEANER NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

CAUTION: A CLEANER THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE HARNESS MUST NOT BE APPLIED. DAMAGE TO THE WIRE HARNESS CAN OCCUR.

- (6) Disassemble a short length of the wire harness:
 - (a) Remove the necessary wire harness supports to get access to the contamination.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

Make sure that the wire harness has sufficient support after the supports are removed.

- (b) Remove the wire harness ties along the free length.
- (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (7) Make a mixture of the cleaner and water. Refer to the instructions of the manufacturer of the cleaner.
- (8) Measure the pH level of the mixture.
Make sure the pH level is 9.0 or less.

CAUTION: AN AQUEOUS CLEANER MIXTURE WITH A PH THAT IS MORE THAN 9.0 MUST NOT BE APPLIED. DAMAGE FROM CORROSION CAN OCCUR.

- (9) Remove the contamination.

Refer to Paragraph 4. for the procedure to remove the contamination from:

- A backshell
- The external surface of the connector
- An area of a wire that is less than 6 inches from the end of a connector.

CAUTION: MAKE SURE TO PREVENT THE MOVEMENT OF THE CONTAMINATION TO A DIFFERENT WIRE HARNESS COMPONENT. DAMAGE TO THE COMPONENT CAN OCCUR.

CAUTION: A WIRE MARK OR AN IDENTIFICATION TAPE MUST NOT BE CLEANED WITH TOO MUCH FORCE. DAMAGE TO THE WIRE IDENTIFICATION CAN OCCUR.

CAUTION: SURFACES WITH PROTECTIVE FINISHES MUST BE CLEANED CAREFULLY. REMOVAL OF THE PROTECTIVE FINISH CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE EQUIPMENT OR THE STRUCTURE.

- (a) Apply the mixture with one of these tools:
 - A hose
 - A wiper
 - A brush.

CAUTION: THE FLOW OF CLEANING MIXTURE MUST NOT BE APPLIED LESS THAN 6 INCHES FROM A CONNECTOR. THE MIXTURE CAN GO INTO THE CONNECTOR AND DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: WATER PRESSURE OF 80 PSI OR LESS MUST BE APPLIED. HIGHER PRESSURE WATER CAN MOVE MOISTURE INTO THE COMPOSITE PARTS OR ELECTRICAL COMPONENTS THAT DO NOT HAVE SUFFICIENT PROTECTION AND CAUSE DAMAGE.

- (b) Let the cleaner stay on wire harness components for approximately ten minutes.
Make sure that the cleaner does not dry on the surface of a component.
- (c) If the contamination is not removed with the flow of the mixture, loosen the contamination with a brush or a wiper.

NOTE: To prevent scratches on the surfaces, the brush can be soaked in the cleaner.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESES**

- (d) Flush the areas with clean warm water that is 160 degrees F or less.
Make sure that all of the mixture is removed.

CAUTION: THE SURFACES MUST BE SUFFICIENTLY FLUSHED TO REMOVE ALL OF THE MIXTURE. IF ALL OF THE MIXTURE IS NOT REMOVED, DAMAGE FROM CORROSION CAN OCCUR.

- (e) Let the wire harness dry.

NOTE: As an alternative, compressed gas at 30 PSI can be applied or the harness can be dried with wipers. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

- (10) Make an inspection of the wire harness for remaining contamination.
- (11) If all of the contamination is not removed with the mixture, remove the contamination with solvent. Refer to Paragraph 3.A.
- (12) Examine the wire harness components and supports.
Make sure that the components and supports are clean and fully dry.
- (13) Assemble the wire harness to make it the same as the initial configuration.
- (14) Install the wire harness supports.
- (15) Do Step (6) through Step (14) again until all of the contamination on the wire harness is removed.

C. Removal of Solid Contamination

Contamination from solids can be:

- An abrasive particle
- A small foreign object
- A particle with a sharp edge.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

- (3) Electrostatically ground the airplane. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and all components that are sensitive to contamination.

Make sure that all of the disconnected connectors in the area have sufficient protection.

- (5) Make a selection of these tools from Table 2:

- A brush
- A vacuum
- A wiper or a cloth.

- (6) Remove the loose particles on the external surface of the wire harness.
- (7) Disassemble a short length of the wire harness.

- (a) Remove the necessary wire harness supports to get access to the contamination.

Make sure that the wire harness has sufficient support after the supports are removed.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

- (b) Remove the wire harness ties along the free length.
- (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (8) Remove the remaining contamination.

CAUTION: MAKE SURE TO PREVENT THE MOVEMENT OF THE CONTAMINATION TO A DIFFERENT WIRE HARNESS COMPONENT. DAMAGE TO THE COMPONENT CAN OCCUR.

- (a) Put the sufficient quantity of water on the wiper to make it moist.
- (b) Carefully remove the contamination from each component with the wiper.

NOTE: A moist brush can help loosen the particles.

- (c) Dry the cleaned area with a new wiper.

NOTE: As an alternative, compressed gas at 30 PSI can be applied or the harness can be dried with wipers. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

- (9) Examine the wire harness components and supports.
Make sure that the components and supports are clean and fully dry.
- (10) Assemble the wire harness to make it the same as the initial configuration.
- (11) Install the wire harness supports.
- (12) Do Step (7) through Step (11) again until all contamination on the wire harness is removed.

D. Removal of Light Fluid Contamination

A light fluid is a fluid that is not petroleum based or a hydraulic fluid. The contamination can be a wet or dried mixture of the fluid and a solid.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

- (3) Electrostatically ground the airplane. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and all components that are sensitive to contamination.

Make sure that all of the disconnected connectors in the area have sufficient protection.

- (5) Make a selection of a wiper or a lint free cloth from Table 2.
- (6) Disassemble a short length of the wire harness.

- (a) Remove the necessary wire harness supports to get access to the contamination.

Make sure that the wire harness has sufficient support after the supports are removed.

- (b) Remove the wire harness ties along the free length.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

- (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (7) Remove the contamination.

Refer to Paragraph 4. for the procedure to remove contamination from:

- A backshell
- The external surface of the connector
- An area of a wire that is less than 6 inches from the end of a connector.

CAUTION: MAKE SURE TO PREVENT THE MOVEMENT OF THE CONTAMINATION TO A DIFFERENT WIRE HARNESS COMPONENT. DAMAGE TO THE COMPONENT CAN OCCUR.

CAUTION: A WIRE MARK OR AN IDENTIFICATION TAPE MUST NOT BE CLEANED WITH TOO MUCH FORCE. DAMAGE TO THE WIRE IDENTIFICATION CAN OCCUR.

CAUTION: SURFACES WITH PROTECTIVE FINISHES MUST BE CLEANED CAREFULLY. REMOVAL OF THE PROTECTIVE FINISH CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE EQUIPMENT OR THE STRUCTURE.

- (a) Put the sufficient quantity of water on the wiper to make it moist.
(b) Carefully remove the contamination from each component with the wiper.

NOTE: A moist brush can help loosen the particles.

- (8) If the contamination is not removed with the water:

- (a) Make a selection of an isopropyl alcohol from Table 1

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

- (b) Put the sufficient quantity of the alcohol on a new wiper to make it moist.
(c) Carefully remove the contamination from each component with the wiper.

NOTE: A moist brush can help loosen the particles.

- (9) If the contamination is not removed with the water followed by the alcohol:

- (a) Make a selection of an aliphatic naphtha from Table 1.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

- (b) Put the sufficient quantity of aliphatic naphtha on a new wiper to make it moist.

CAUTION: THE WIPER MUST NOT HAVE TOO MUCH ALIPHATIC NAPHTHA. THE NAPHTHA CAN GET INTO A WIRE HARNESS COMPONENT AND DAMAGE TO THE COMPONENT CAN OCCUR.

- (c) Carefully remove the contamination from each component with the wiper.

NOTE: A moist brush can help loosen the particles.

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

CAUTION: ALIPHATIC NAPHTHA MUST NOT BE APPLIED ON CONTROL CABLES, ACRYLIC SURFACES, DECALS, OR FINISHES THAT ARE NOT MADE FROM CLASS 1 MATERIALS. DAMAGE TO THE COMPONENT CAN OCCUR.

CAUTION: ALIPHATIC NAPHTHA MUST NOT BE APPLIED ON A SURFACE THAT HAS A CORROSION INHIBITING COMPOUND UNLESS THE CORROSION INHIBITING COMPOUND MUST BE REMOVED AND THEN APPLIED AGAIN.

CAUTION: ALIPHATIC NAPHTHA MUST NOT STAY ON A WIRE HARNESS COMPONENT. REMAINING NAPHTHA CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE HARNESS COMPONENT.

(d) Dry the cleaned area with a new wiper.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining water or solvent. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

(e) Put the sufficient quantity of isopropyl alcohol on a wiper to make it moist.

(f) Carefully clean the areas where the naphtha was applied.

(10) Dry the cleaned area with a new wiper.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining water or solvent. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

(11) Examine the wire harness components and supports.

Make sure that the components and supports are clean and fully dry.

(12) Assemble the wire harness to make it the same as the initial configuration.

(13) Install the wire harness supports.

(14) Do Step (7) through Step (13) again until all of the contamination on the wire harness is removed.

4. CLEANING OF A WIRE HARNESS THAT HAS CONTAMINATION ON THE EXTERNAL SURFACE**A. Removal of Light Particle Contamination**

Contamination from light particles is made of loose particles that are not too abrasive.

(1) Identify the electrical system that must be cleaned.

(2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

(3) Install the necessary protection for all equipment and all components that are sensitive to contamination.

Make sure that all disconnected connectors in the area have sufficient protection.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESES**

- (4) Make a selection of these tools from Table 2:
- A brush
 - A vacuum
 - A wiper or a lint free cloth.
- (5) If it is necessary to get access to the contamination, remove the wire harness supports from a short length of the wire harness.
- Make sure that the wire harness has sufficient support after the supports are removed.
- CAUTION:** A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.
- (6) Remove the loose particles on the external surface of the wire harness.
- CAUTION:** MAKE SURE TO PREVENT THE MOVEMENT OF THE CONTAMINATION TO A DIFFERENT WIRE HARNESS COMPONENT. DAMAGE TO THE COMPONENT CAN OCCUR.
- (7) Examine the wire harness components and supports.
- Make sure that the components and supports are clean.
- (8) If the wire harness supports are removed, install them again.

B. Removal of Contamination on or near Environmentally Sealed Connectors

This paragraph gives the procedure to remove all types of contamination from:

- The external surface of an environmentally sealed connector
- A connector grommet
- A backshell
- A strain relief clamp
- An area of wire that is less than 6 inches from the end of an environmentally sealed connector.

NOTE: Connectors can be environmentally sealed or unsealed. Each type has a different cleaning procedure. Environmentally sealed connectors are identified in Subject 20-60-08.

CAUTION: IF THE CONTAMINATION GOES INTO A CONNECTOR, THE INTERNAL SURFACES MUST BE CLEANED. REFER TO SUBJECT 20-60-01.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.
- Make sure that the applicable wire harness or wire harnesses are de-energized.
- (3) Electrostatically ground the aircraft. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and all components that are sensitive to contamination and solvents.

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES**

Make sure that:

- If a connector must be cleaned, it is connected
- All disconnected connectors in the area have sufficient protection.

(5) Make a selection of:

- An isopropyl alcohol from Table 1
- A brush from Table 2
- A swab from Table 2
- A wiper or a lint free cloth from Table 2.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

(6) If it is necessary to get access to the contamination:

- (a) Remove all wire harness ties from the wire harness near the rear end of the connector.
- (b) Remove the backshell or the strain relief clamp.
- (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

(7) Remove the contamination.

Make sure that:

- The contamination does not go into an empty contact cavity
- The grommet holes are not opened by the movement of the wires.

CAUTION: CONTAMINATION IN AN EMPTY CONTACT CAVITY OR ON A WIRE IN THE GROMMET HOLE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (a) If a contact cavity is empty, seal the contact cavity. Refer to Subject 20-60-08.
- (b) Carefully apply the isopropyl alcohol until the contamination is loosened.
- (c) Flush the area with the sufficient quantity of alcohol to remove the contamination.
- (d) Examine the grommet and the wires for remaining contamination.
- (e) If the contamination is not removed, do Step (b) through Step (d) again.
- (f) Dry the components with a new wiper or a new swab.
- (g) Let the connector dry for one hour.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining solvent. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

(8) Examine the connector assembly components and wires.

Make sure that the components are clean and fully dry.

(9) If the connector components or wire harness ties are disassembled, assemble them again.

20-10-04

STANDARD WIRING PRACTICES MANUAL**CLEANING OF WIRE HARNESSSES****C. Removal of Contamination on or near Unsealed Connectors**

This paragraph gives the procedure to remove all types of contamination from:

- The external surface of an unsealed connector
- A connector grommet
- A backshell
- A strain relief clamp
- An area of wire that is less than 6 inches from the end of an unsealed connector.

NOTE: The environmentally sealed connectors are identified in Subject 20-60-08. If a connector is not specified in Subject 20-60-08, the connector is unsealed.

CAUTION: IF THE CONTAMINATION GOES INTO A CONNECTOR, THE INTERNAL SURFACES MUST BE CLEANED. REFER TO SUBJECT 20-60-01.

- (1) Identify the electrical system that must be cleaned.
- (2) Open all circuit breakers and all switches for the wire harness and the equipment in the area that must be cleaned. Refer to Subject 20-00-10.

Make sure that the applicable wire harness or wire harnesses are de-energized.

- (3) Electrostatically ground the aircraft. Refer to the Aircraft Maintenance Manual.
- (4) Install the necessary protection for all equipment and all components that are sensitive to contamination and solvents.

Make sure that all disconnected connectors in the area have sufficient protection.

- (5) Make a selection of:
 - An isopropyl alcohol from Table 1
 - A swab from Table 2
 - A wiper or a lint free cloth from Table 2.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE HARNESS.

- (6) If it is necessary to get access to the contamination:
 - (a) Remove all wire harness ties from the wire harness near the rear end of the connector.
 - (b) Remove the backshell or the strain relief clamp.
 - (c) Move the wires apart.

CAUTION: A WIRE OR A CABLE MUST NOT BE MOVED MORE THAN IT IS NECESSARY TO CLEAN IT. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (7) Remove the contamination.

Make sure that the contamination does not go into an empty contact cavity.

CAUTION: CONTAMINATION IN AN EMPTY CONTACT CAVITY CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (a) Carefully apply the isopropyl alcohol until the contamination is loosened.
- (b) Remove the contamination and the remaining isopropyl alcohol with a new wiper or a new swab.

20-10-04

STANDARD WIRING PRACTICES MANUAL

CLEANING OF WIRE HARNESSSES

- (c) Examine the components for remaining contamination.
- (d) If the contamination is not removed, do Step (a) through Step (c) again.
- (e) Let the connector dry for one hour.

NOTE: As an alternative, compressed gas at 30 PSI can be applied to remove the remaining solvent. Refer to Table 2.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN A DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

- (8) Examine the connector assembly components and wires.
Make sure that the components are clean and fully dry.
- (9) If the connector components or wire harness ties are disassembled, assemble them again.

STANDARD WIRING PRACTICES MANUAL

INSPECTION OF WIRING

1. GENERAL DATA

A. Applicable Conditions

These conditions are applicable:

- The components, materials, and installation equipment must be sufficiently clean for visual inspection; refer to Subject 20-10-04 for the procedure to clean a wire harness
- Before a wire harness is examined, it must be de-energized
- When damage of a wiring component is seen, the cause of the damage must be removed and the component must be repaired
- When a condition that can cause damage of a wiring component is seen, the condition must be removed.

WARNING: THE WIRING MUST BE DE-ENERGIZED BEFORE AN INSPECTION. IF THE WIRING IS NOT DE-ENERGIZED, INJURY TO PERSONNEL CAN OCCUR.

CAUTION: THE WIRING MUST BE DE-ENERGIZED BEFORE AN INSPECTION. IF THE WIRING IS NOT DE-ENERGIZED, DAMAGE TO EQUIPMENT OR THE AIRPLANE CAN OCCUR.

2. CIRCULAR CONNECTORS

A. Special Conditions

Some connectors must have special protection from corrosion. Refer to Subject 20-60-03.

B. Visual Inspection - Corrosion

- (1) If it is necessary to remove dirt or other contamination to examine the external surfaces for corrosion, clean the connector. Refer to Subject 20-10-04.

CAUTION: MAKE SURE TO REMOVE ONLY THE CONTAMINATION THAT PREVENTS THE INSPECTION FOR CORROSION. THE CORROSION MATERIAL MUST NOT BE REMOVED AT THIS TIME.

- (2) Examine the external surface of the connector for:
 - Corrosion material
 - Damage to the plated finish
 - Damage to the base metal
 - Damage to the threads or coupling mechanism.
- (3) Find the damage conditions and the repair conditions of the external surface of the connector. Refer to Table 1.
- (4) If the connector has a backshell, then disconnect the backshell. Refer to the applicable connector subject.

NOTE: Corrosion can make the operation of the backshell threads or coupling mechanism difficult or impossible.

20-10-06

Page 1
Feb 01/2008

D6-54446

STANDARD WIRING PRACTICES MANUAL**INSPECTION OF WIRING**

- (5) Examine the internal and the external surfaces of the backshell for:
 - Corrosion material
 - Damage to the plated finish
 - Damage to the base metal
 - Damage to the threads.
- (6) Find the damage condition and the repair condition of the coupling mechanism. Refer to Table 3.
- (7) Find the damage conditions and the repair conditions of the internal and external surfaces of the backshell. Refer to Table 3.
- (8) Disconnect the plug and the receptacle. Refer to the applicable subject for the connector and the AMM.

NOTE: Corrosion can make the operation of the connector coupling mechanism impossible.
- (9) Find the damage condition and the repair condition of the connector coupling mechanism. Refer to Table 1.
- (10) Examine the internal surface of the connector receptacle for:
 - Corrosion materials
 - Damage to the plated finish
 - Damage to the base metal.
- (11) Examine the connector contacts in the receptacle for:
 - Base metal that can be seen
 - Blue-green deposits
 - Black stains or red stains
 - Pits in the base metal.
- (12) Examine the internal surface of the connector plug for:
 - Corrosion materials
 - Damage to the plated finish
 - Damage to the base metal.
- (13) Examine the connector contacts in the plug for:
 - Base metal that can be seen
 - Blue-green deposits
 - Black stains or red stains
 - Pits in the base metal.
- (14) Examine the internal surfaces of the connector for moisture.
- (15) Find the damage condition and the repair condition for the internal surfaces of the connector. Refer to Table 2.

20-10-11 CONTENTS

707, 727-787

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

1. GENERAL DATA

A. High Vibration Areas

Refer to Subject 20-02-30 for the locations of the high vibration areas by their specified Vibration Level.

2. CAUSES OF DAMAGE

A. Damage by Vibration from a Mechanical Source

Damage to a wire harness can occur by vibration from these sources:

- An engine
- A flap drive motor
- A fuel pump
- A gear mechanism
- Turbulence from the wind.

B. Damage from Environmental Conditions

Damage to a wire harness can occur from:

- Heat
- Cold
- Fuel
- Dirt
- Moisture
- Hydraulic fluid.

C. Damage from an Incorrect Installation

Damage to a wire harness can occur from:

- A clamp that is loose
- A clamp that is the incorrect size
- A wire harness branch that is made incorrectly
- The incorrect quantity of wire harness ties or installed plastic tie straps
- Wire harness tension that is too loose or too tight.

3. APPLICABLE CONDITIONS FOR WIRE HARNESS ASSEMBLY

A. General Conditions

This paragraph gives the general conditions that are applicable:

- During the assembly of a wire harness
- When a wire harness is moved from one location to a different location
- While a wire harness is kept in storage.

For the assembly of a wire harness, these conditions are applicable:

- Strain must not be put on the terminations of the wires or the cables
- A bend that is less than the minimum bend radius must not occur; refer to Paragraph 3.B.

For the general conditions that are applicable for a wire harness that has a BACC69A fiber optic cable assembly, refer to Paragraph 3.G.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****B. Bend Radius**

This paragraph gives the values of the minimum bend radius for a wire, a cable, a coax cable, and a wire harness. For the minimum bend radius of the fiber optic cable of the BACC69A fiber optic cable assembly, refer to Paragraph 3.G.

The minimum bend radius of:

- A wire or cable is ten times the O.D. of the wire or the cable
- A coax cable is the larger value of 1.5 inches or six times the O.D. of the cable
- A wire harness is the same as the minimum bend radius of the wire or cable that has the largest diameter
- A wire harness with an overall shield is the larger value of 1.5 inches or six times the outer diameter of the harness
- A harness that contains two or more wire harnesses is the larger value of 1.5 inches or six times the outer diameter of the harness.

BEND RADIUS OF A WIRE, A CABLE, OR A WIRE HARNESS

Figure 1

C. Wire Harness Ties

These general conditions are applicable:

- If it is possible, all wires must be parallel before a wire harness tie is assembled on the wire harness
- A wire harness tie must be made from colored tie material when the identification of the wire harness separation is necessary; refer to Subject 20-10-19
- If it is necessary to replace a plastic tie strap wire harness tie on a wire harness in the unpressurized area, only a lacing tape wire harness tie is permitted; refer to Paragraph 4.C.

These conditions are applicable for the location of a wire harness tie on the wire harness:

- If it is possible, a wire harness tie must not be assembled where wires go across each other
- A wire harness tie must not be assembled on a repair of a wire or a cable unless it is assembled on top of the metal conductor splice of a splice assembly
- A wire harness tie must be assembled on a splice assembly that has more than one AWG 16 or smaller wire if the splice assembly does not have the support of a protection sleeve or insulation sleeve that is installed on the wire harness
- A wire harness tie can be assembled on a shield ground wire assembly.

NOTE: Wire harness ties are not necessary between the external surface of the wire harness and an insulation sleeve or a protection sleeve that is installed on the harness.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****D. Wire Harness Ties in a High Vibration Area**

The conditions in this paragraph apply only to the outer wire harness ties on the harness.

For the locations of the high vibration areas, refer to Subject 20-02-30.

These conditions are applicable for the wire harness in a high vibration area, Vibration Level 3 and those parts of the wire harnesses that go from the wing seal rib into the strut or the sailboat areas:

- For a wire harness that goes through the leading edge gap, but does not go into the strut, the conditions for all other high vibration areas are applicable
- Lacing tape wire harness ties must be assembled at intervals of a maximum of 2 inches
- The necessary number of lacing tape wire harness ties must be assembled on the wire harness to make sure that the wires harness does not bend between the wire harness ties; refer to Figure 2
- The necessary number of lacing tape wire harness ties must be assembled on the wire harness to make sure that the outer diameter of the wire harness does not become larger between the wire harness ties; refer to Figure 2

For a high vibration area, Vibration Level 2, these conditions are applicable:

- For the 737 model only, the lacing tape wire harness ties on a power feeder wire harness on the leading edge of the wing must be assembled at intervals of a maximum of 2 inches
- Lacing tape wire harness ties must be assembled at intervals between 6 inches and 8 inches
- The necessary number of lacing tape wire harness ties must be assembled on the wire harness to make sure that the wires harness does not bend between the wire harness ties; refer to Figure 2
- The necessary number of lacing tape wire harness ties must be assembled on the wire harness to make sure that the outer diameter of the wire harness does not become larger between the wire harness ties; refer to Figure 2

Not Acceptable

Acceptable

INTERVALS FOR WIRE HARNESS TIES**Figure 2****E. Plastic Tie Strap Wire Harness Ties**

For the conditions that are applicable for a plastic tie strap wire harness ties on a wire harness with coax cable, refer to Paragraph 3.F.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Plastic tie strap wire harness ties are not permitted:

- In a fuel tank
- In the unpressurized area
- In a high vibration area; refer to Subject 20-02-30
- On a wire harness that has a Temperature Grade C or Temperature Grade D
- Where a broken tie strap can let the wire harness move against an abrasive surface
- Where a broken tie strap can let the wire harness cause an interference with mechanical linkage.

Plastic tie strap wire harness ties are a satisfactory alternative to lacing tape wire harness ties when these conditions occur:

- The wire harness is installed in the pressurized area of the airplane
- The wire harness has a Temperature Grade A or Temperature Grade B.

NOTE: Boeing Service Engineering can supply more data about the temperature grade of a wire harness.

NOTE: In the production of some airplanes, plastic tie strap wire harness ties have been installed on wire harnesses in the unpressurized area and in high vibration areas. These installations are satisfactory. If it is necessary to replace a plastic tie strap wire harness tie on one of these wire harnesses, only a lacing tape wire harness tie is permitted.

F. Wire Harnesses with Coax Cable

These conditions are applicable:

- The head of a plastic tie strap must be not be against a coax cable
- When a coax cable or a wire harness that a contains a coax cable is added to a wire harness that has a plastic tie strap, it is not necessary to remove the plastic tie strap.

PERMITTED CONFIGURATIONS OF PLASTIC TIE STRAPS WITH COAX CABLES THAT ARE ADDED

Figure 3

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

G. Wire Harnesses with a BACC69A Fiber Optic Cable Assembly

CAUTION: A HEAT GUN OR A HOT AIR GUN MUST NOT BE USED NEAR THE CABLE ASSEMBLY. IF TOO MUCH HEAT IS APPLIED TO THE CABLE, DAMAGE TO THE CABLE CAN OCCUR.

For the configuration of the fiber optic cable in a wire harness:

- The cable must not have a bend radius that is less than 0.75 inch
- The cable must not make a loop unless the cable is held in its position with a wire harness tie
- The wire harness tie at the point of a wire harness branch must not go on the fiber optic cable; refer to Figure 4
- A wire harness tie must be a minimum of 1.5 inches from the center of the bend radius of a wire harness branch where it makes a curve from the wire harness; refer to Figure 4.

CAUTION: IF THE BEND RADIUS IS LESS THAN 0.75 INCH, THE BEND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

CAUTION: AS THE BEND RADIUS OF THE CABLE BECOMES MUCH LESS THAN 0.75 INCH, THE RISK OF DAMAGE TO THE CABLE INCREASES.

LOCATION OF THE WIRE HARNESS TIES AT A BRANCH
Figure 4

A deformation of the jacket of the cable from an assembled wire harness tie or plastic tie strap is permitted, if each of these conditions occur:

- The deformation does not go through the surface of the jacket
- The diameter of the cable at the maximum depth of the deformation is more than 85 percent of the diameter of the cable.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****H. Wire Harness Branches**

These conditions are applicable:

- If it is possible, a wire harness branch must make a smooth curve from the harness in the same plane as the centerline of the wire harness; refer to Figure 5
- If it is possible, all wires must be parallel and adjacent to each other and the wire harness before the wire harness branch is made
- If it is possible, a wire harness tie must be assembled or a plastic tie strap installed a maximum of 1 inch in front of the wire harness branch
- If it is possible, a wire harness tie must be assembled or a plastic tie strap installed a maximum of 1 inch behind the wire harness branch
- If it is possible, the wire harness branch must not go across other wires when it makes a curve from the wire harness; refer to Figure 6
- When a wire harness has a small number of wires that go to the branch point from opposite directions, a wire harness tie must be assembled or a plastic tie strap installed on the wire harness and the wires at the point of the branch; refer to Figure 7
- If the wire harness branch must go across the wire harness, the wire harness must have protection; refer to Figure 8 and Figure 9.

WIRE HARNESS PROTECTION WITH A SLEEVE
Figure 9

I. Wire Harnesses in Conduits or Tubes

These conditions are applicable for a wire harness assembled in a conduit or a tube:

- The wires must be parallel
- The wire harness must not have a wire harness tie
- The wire harness must not have a plastic tie strap.

For the procedures to repair a flexible conduit on the landing gear, refer to Subject 20-10-91.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

SURGICAL KNOT OF A WIRE HARNESS TIE
Figure 13

- (1) Make a selection of a a lacing tape from Table 1.
 Make sure that the temperature grade of the lacing tape is applicable for the location on the airplane.
- (2) Make a clove hitch knot on the wire harness. Refer to Figure 14.
 Make sure that:
 - All of the wires are parallel
 - The knot is tight.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

CAUTION: DO NOT CAUSE DEFORMATION OF THE INSULATION OF THE WIRE OR THE CABLE DURING THE ASSEMBLY OF THE CLOVE HITCH. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

CLOVE HITCH KNOT
Figure 14

- (3) Make one of these knots on top of the clove hitch:
 - A square knot; refer to Figure 12
 - A surgical knot; refer to Figure 13.
- (4) Cut the free ends of the lacing tape.

D. Assembly of a Lacing Tape Wire Harness Tie - High Vibration Area

For the conditions that are applicable for this procedure, refer to Paragraph 4.B.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

SQUARE AND SURGICAL KNOTS OF A WIRE HARNESS TIE

Figure 15

- (1) Make a selection of a lacing tape from Table 1.
Make sure that the temperature grade of the lacing tape is applicable for the location on the airplane.
- (2) Make a special clove hitch knot on the wire harness. Refer to Figure 16.
Make sure that:
 - A loop is made around a minimum of one of the wires of the harness
 - All of the wires are parallel
 - The knot is tight.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

CAUTION: DO NOT CAUSE DEFORMATION OF THE INSULATION OF THE WIRE OR THE CABLE DURING THE ASSEMBLY OF THE CLOVE HITCH. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

SPECIAL CLOVE HITCH KNOT

Figure 16

- (3) Make one of these knots on top of the clove hitch:
 - A square knot; refer to Figure 15
 - A surgical knot; refer to Figure 15.
- (4) Cut the free ends of the lacing tape.

E. Assembly of a Plastic Tie Strap Wire Harness Tie

For the conditions that are applicable for this procedure, refer to Paragraph 4.B.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

- (1) Make a selection of a plastic tie strap from Table 4.
- (2) Make a selection of a tie strap tool from Table 7.

NOTE: A pair of long nose pliers is a satisfactory alternative to a tie strap tool when the clearance is not sufficient for the tie strap tool.

- (3) Put the tie strap on the wire harness.
Make sure that all of the wires are parallel to each other.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (4) If the head of a plastic tie strap is against an adjacent coax cable, turn the head of the plastic tie strap away from the coax cable.

CAUTION: THE HEAD OF A PLASTIC TIE STRAP MUST NOT TOUCH A COAX CABLE. DAMAGE TO THE CABLE CAN OCCUR.

- (5) Tighten the tie strap sufficiently.

CAUTION: DO NOT TIGHTEN THE TIE STRAP MORE THAN THE NECESSARY AMOUNT TO HOLD THE HARNESS TOGETHER. IF THE TIE STRAP IS TOO TIGHT, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (6) Cut the unwanted length from the end of the tie strap at the head.

Make sure that the end of the tie strap:

- Is a maximum of 0.01 inch from the head of the strap
- Does not have sharp edges.

5. APPLICABLE CONDITIONS - INSTALLATION OF A WIRE HARNESS**A. General Conditions**

This paragraph gives the general conditions that are applicable:

- While a wire harness is kept in storage
- When a wire harness is moved from one location to a different location
- During the installation of a wire harness
- After a wire harness is installed.

For the installation of a wire harness, these conditions are applicable:

- Strain must not be put on the terminations of the wires or the cables
- A bend that is less than the minimum bend radius must not occur; refer to Paragraph 3.B.

For the general conditions that are applicable for a wire harness that has a BACC69A fiber optic cable assembly, refer to Paragraph 6.A.

For the general conditions that are applicable for Critical Design Configuration Control Limitation (CDCCL) wiring, refer to Paragraph 5.B.

B. Airworthiness Limitations

These types of wiring configurations are specified as Critical Design Configuration Control Limitations (CDCCL):

- Fuel System Wiring
- Wiring that is installed adjacent to the fuel tank.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

WARNING: IT IS MANDATORY THAT THE SPECIFIED MAINTENANCE PROCEDURES BE OBEYED FULLY.

To find more data about CDCCL wiring, refer to Table 8 for the document that is applicable for the airplane model.

**Table 8
BOEING DOCUMENTS FOR AIRWORTHINESS LIMITATIONS**

Boeing Document	Airplane Model
D6-7552-AWL	707
D6-8766-AWL	727

	747-400 and later 747 models
	757
	767
	777

C. Wire Harness Clearance

This paragraph gives the minimum clearance between a wire harness and:

- An airplane structure
- A piece of equipment
- Other components.

Refer to Table 9.

If it is possible, the clearance between the wire harness and a flammable material line must be the maximum possible distance.

**Table 9
MINIMUM CLEARANCE**

Airplane Component	Minimum Clearance (inch)	Special Instructions
Side of Bleed Air Duct	1	None
Top of Bleed Air Duct	2	None
Control Cable	2	If positive separation is made sure by mechanical support, the minimum clearance can be decreased.
Fuel Line	2	If positive separation is made sure by mechanical support, the minimum clearance can be decreased. Refer to Figure 17.
Heat Equipment	0.2	Fiberglass conduit must have the minimum clearance specified.
Hydraulic Fluid Line	0.5	If positive separation is made sure by mechanical support, the minimum clearance can be decreased. Refer to Figure 17.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Table 9 (continued)

Airplane Component	Minimum Clearance (inch)	Special Instructions
Oxygen Line	2	If positive separation is made sure by mechanical support, the minimum clearance can be decreased. Refer to Figure 17.
Pitot Static Line	0.5	If positive separation is made sure by mechanical support, the minimum clearance can be decreased. Refer to Figure 17.
Sharp Edge of Structure and Equipment	0.13	As an alternative to the minimum clearance, use a continuous Teflon or Expando sleeve for protection.
Smooth Metal or Plastic with 0.13 inch minimum radius	0.0	In pressurized areas only, the length of the wire harnesses between clamps can touch smooth flat surfaces and smooth 0.13 inch minimum radius.
Water Line	0.5	If positive separation is made sure by mechanical support, the minimum clearance can be decreased. Refer to Figure 17.

POSITIVE SEPARATION
Figure 17

D. Support of a Wire Harness

These conditions are applicable:

- Many wire harnesses can be put in the same raceway or in one clamp if the separation conditions are satisfactory; refer to Subject 20-10-19
- All channel separation conditions must be obeyed; refer to Subject 20-10-19
- A wire harness must be perpendicular to the longitudinal axis of the clamp
- More than one wire harness must not be attached with a wire harness tie unless support for a small wire harness is necessary
- An unshielded AWG 22 or smaller wire must be attached to the structure with a clamp at intervals of 6 inches or less
- Three or more AWG 22 or smaller wire wires can be put into a harness
- A 66-3539-() insulated retainer ring must not be installed where an electrical wire harness has a routing through an insulation blanket.

Refer to Subject 20-10-12 for:

- The general conditions for the selection of a clamp
- The conditions that are applicable for the replacement of a clamp
- The conditions that are applicable for the installation of a clamp.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

E. Control of Wire Harness Slack

These conditions are applicable:

- A wire harness must have sufficient slack, but not too much
- A wire harness must have slack that is equal along the length of the harness; refer to Figure 18
- A wire harness must have sufficient slack in the first 6 feet from the connector or other terminations
- If a wire harness has too much slack between the wire harness supports, more wire harness supports must be installed.

NOTE: In production, the design of a wire harness usually includes 1 inch to 1-1/2 inches of slack to make sure that a wire can be terminated a minimum of two times in service.

CAUTION: THE CONTROL OF SLACK IN A WIRE HARNESS IS VERY IMPORTANT IN A HIGH VIBRATION AREA BECAUSE:

- A WIRE CAN BE BROKEN IF THE SLACK IS NOT SUFFICIENT
- A WIRE CAN BE BROKEN IF THE WIRE HARNESS HAS TOO MUCH SLACK
- A WIRE CAN HAVE DAMAGE FROM ABRASION IF THE WIRE HARNESS HAS TOO MUCH SLACK.

A wire harness has sufficient slack when:

- Connectors can be connected and disconnected easily
- Strain is not put on a wire, a cable, or a wire harness
- Strain is not put on the termination of a wires or a cable
- Strain does not pull a connector grommet out of its shape
- Hinge joints can move freely
- Equipment can be removed easily
- The expansion of the airframe does not put strain on the wire, the cable, or the wire harness.

SLACK BETWEEN WIRE HARNESS CLAMPS

Figure 18

F. Drip Loops

A drip loop is assembled on a wire harness to make sure that water does not go down the wires of the harness and in the connector. Refer to Figure 19.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

These conditions are applicable:

- A drip loop must be assembled correctly to decrease the movement of the loop
- A drip loop must not rub an adjacent structure or equipment
- If the drip loop can rub against an adjacent structure or equipment, the wire harness must have protection
- A drip loop must not be assembled to control wire slack; refer to Paragraph 5.E. for the general conditions to control slack.

A satisfactory sleeve or tape for wire harness protection is:

- A Ben-Har 1151-FRB sleeve
- A perforated Teflon sleeve or an equivalent sleeve
- Scotch 70 tape or an equivalent tape.

DRIP LOOP
Figure 19

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****G. Wire Harnesses that Touch at an Intersection**

These conditions are applicable:

- Usually, if two wire harnesses touch at an intersection, they must have positive separation with clamps and spacers to prevent damage from abrasion
- Wire harnesses that touch at an intersection in the unpressurized area must have positive separation
- When positive separation is not possible in the pressurized area, wire harness ties must be assembled at the intersection of the harnesses
- If two wire harnesses touch, the necessary conditions for circuit separation must be obeyed. Refer to Subject 20-10-19.

For two wire harnesses that are attached at an intersection, these conditions are applicable:

- The wire harnesses must have two wire harness ties at the intersection of the wire harnesses; refer to Figure 20
- The wire harness ties must prevent the movement of the harnesses
- The harnesses must be in a position that is 90 degrees from each other; refer to Figure 20
- One of the harnesses must have a protective sleeve or layer of tape at the intersection; refer to Figure 20
- If plastic tie straps are installed, each wire harness must have a protective sleeve or layer of tape at the intersection; refer to Figure 21
- If one harness has a fiberglass sleeve, the other harness must also have a protective sleeve or layer of tape
- For harnesses that touch in a panel or on a shelf, only one wire harness tie is necessary; refer to Figure 22.

PROTECTION FROM ABRASION DAMAGE FOR HARNESSES THAT TOUCH
Figure 20

20-10-11

Page 20
Feb 01/2008

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****PROTECTION FOR WIRE HARNESSES ATTACHED WITH PLASTIC TIE STRAPS****Figure 21****TWO WIRE HARNESSES THAT TOUCH IN A PANEL OR ON A SHELF****Figure 22****H. Protection from Abrasion in a High Vibration Area**

Protection is necessary for:

- A wire harness that is near the aircraft structure; refer to Figure 23
- A wire harness that is near a maintenance traffic area
- An uninsulated ground lug unless it is a flag terminal lug.

Satisfactory protection can be:

- A fiberglass protective sleeve for a wire harness
- A perforated Teflon sleeve or an equivalent sleeve for a wire harness
- A TFE heat shrinkable sleeve for an uninsulated ground lug.

Refer to Subject 20-00-11 for the specified sleeves.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****PROTECTION FROM ABRASION FOR A WIRE HARNESS NEAR THE STRUCTURE**

Figure 23

6. APPLICABLE CONDITIONS - INSTALLATION OF A WIRE HARNESS THAT HAS A BACC69A FIBER OPTIC CABLE ASSEMBLY**A. General Conditions**

For the configuration of the fiber optic cable in the wire harness, the cable:

- Must not have a bend radius that is less than 0.75 inch
- Must not make a loop unless the cable is held in its position with a wire harness tie
- Must have a drip loop at the rear of the connector
- Must not have strain where the cable is attached to the backshell or the connector
- Can have a BACS38W2 or a BACS38W3 plastic tie strap wire harness support.

CAUTION: IF THE BEND RADIUS IS LESS THAN 0.75 INCH, THE BEND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

CAUTION: AS THE BEND RADIUS OF THE CABLE BECOMES MUCH LESS THAN 0.75 INCH, THE RISK OF DAMAGE TO THE CABLE INCREASES.

7. APPLICABLE CONDITIONS - INSTALLATION OF A POWER FEEDER WIRE HARNESS**A. General Conditions**

A power feeder wire harness must have clamps installed at a maximum interval of:

- 6 inches from the end of a splice in the unpressurized area; refer to Figure 24
- 18 inches in the pressurized area.

For the configuration of splices on adjacent wires of an aluminum power feeder wire harness, refer to Subject 20-30-13.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

POSITION OF THE CLAMPS NEAR THE SPLICE

Figure 24

B. Splices at Intervals

Splices at intervals must be held with a clamp between each splice. Refer to Figure 25.

POSITION OF THE CLAMP FOR POWER FEEDER SPLICES AT INTERVALS

Figure 25

C. Splices That Have 100 Percent Overlap

Adjacent wires with splices that have 100 percent overlap must:

- Be held together with clamps and wire harness ties
- Have positive separation between the splices.

These conditions are applicable:

- The minimum distance for positive separation between each splice is 0.1 inch
- Positive separation is done with spacers; refer to Figure 26 and Table 10
- The temperature grade and the class of the spacers is equal to or higher than the grade and the class of the wire harness.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

POSITIVE SEPARATION OF ADJACENT SPLICES THAT HAVE 100 PERCENT OVERLAP

	TFE 4X	Chemplast
	TFE 4X	Zeus Industrial Products
	TFE Perforated	Zeus Industrial Products

B. Installation of a Split Sleeve For Protection of a Wire Harness

- (1) Make a selection of a sleeve from Table 11.

NOTE: The sleeve must have the sufficient diameter to make a 0.5 inch minimum overlap on the wire harness.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Cut the sleeve longitudinally in a straight line.
- (3) Put the sleeve around the wire harness.

If the diameter of the wire harness is larger than 0.32 inch, make sure one edge of the sleeve makes a 0.5 inch minimum overlap with the other edge of the sleeve.

If the diameter of the wire harness is 0.32 inch or smaller, make sure that the longitudinal edges of the sleeve make an overlap of not less than 50 percent of the circumference of the wire harness.

- (4) Assemble a wire harness tie at the center of the sleeve. Refer to Paragraph 4.

Make sure that the overlap of the sleeve stays in its position. Refer to Step (3).

- (5) Assemble wire harness ties at 2.00 inches \pm 0.25 inch intervals from the center wire harness tie to each end of the sleeve. Refer to Paragraph 4.

Make sure that:

- The last wire harness tie on each end of the sleeve is a maximum of 0.5 inch from the end of the sleeve
- The overlap of the sleeve stays in its position. Refer to Step (3).

C. Installation of a Split Sleeve For Wire or Cable Separation

For the conditions that are applicable for wire and cable separation, refer to Subject 20-10-19.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

(1) Make a selection of a sleeve:

NOTE: The sleeve must have the sufficient diameter to make a 0.5 inch minimum overlap on the wire harness.

- (a) If the sleeve is specified, use the specified sleeve.
- (b) If the sleeve is not specified, refer to Subject 20-10-19 for the applicable conditions for the selection of a sleeve.

(2) Cut the sleeve longitudinally in a straight line.

(3) If the sleeve is made of fiberglass:

- (a) Make a selection of a nylon varnish from Table 11.
- (b) Apply the nylon varnish to the ends of the sleeve that have been cut.

(4) Put the sleeve around the wire harness.

If the diameter of the wire harness is larger than 0.32 inch, make sure one edge of the sleeve makes a 0.5 inch minimum overlap with the other edge of the sleeve.

If the diameter of the wire harness is 0.32 inch or smaller, make sure that the longitudinal edges of the sleeve make an overlap of not less than 50 percent of the circumference of the wire harness.

(5) Assemble a wire harness tie at the center of the sleeve. Refer to Paragraph 4.

Make sure that the overlap of the sleeve stays in its position. Refer to Step (4).

(6) Assemble wire harness ties at 4 inch intervals from the center wire harness tie to each end of the sleeve. Refer to Paragraph 4.

Make sure that:

- The last wire harness tie on each end of the sleeve is a maximum of 0.5 inch from the end of the sleeve
- The overlap of the sleeve stays in its position. Refer to Step (4).

10. CHANGE OF WIRING

A. Selection of a Configuration of a New Wire Installation

For the conditions that are applicable for the data in this paragraph, refer to Paragraph 5.B.

A new wire:

- Must have the correct wire identification
- Must have EMI protection if it is necessary
- Can be installed on top of a wire harness tie, a plastic ties strap, a tape, or an identification marker that is installed on a wire harness
- Must be installed in the same clamps as the those of the main wire harness.

Table 12

SELECTION OF A CONFIGURATION OF A NEW WIRE INSTALLATION

Applicable Conditions	Configuration	Installation Procedure
The main wire harness does not have an overall shield.	The new wire is installed on top of the main wire harness.	Paragraph 10.C.
The main wire harness has an overall shield and EMI protection for the new wire is not necessary.	The new wire is installed on top of the overall shield of the main wire harness.	Paragraph 10.D.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Table 12 (continued)

Applicable Conditions	Configuration	Installation Procedure
The main wire harness has an overall shield and the new wire must have EMI protection.	The new wire is installed between the external surface of the wire harness and the overall shield.	Paragraph 10.E.
	An overall shield is installed on the new wire and the new wire is installed on top of the overall shield of the main wire harness.	Paragraph 10.F.

B. Identification of a New Wire

NOTE: A new wire can be identified by one of these types of a wire identification:

- A direct mark
 - An indirect mark.
- (1) If the new wire has an old identification that is a direct mark, install a sleeve or a tape with the new identification:
 - On each end of the harness
 - On all branches that are longer than two feet.

Refer to Table 13

- (2) If the wire has an old identification that is an indirect mark, replace the identification sleeve or tape with a sleeve or tape that has the new identification.

Refer to Table 13

- (3) If the new wire does not have an old identification mark, put the full identification on the wire. Refer to Table 13

The full identification includes:

- The wire harness number
- The wire number
- The color code
- The wire size.

C. Installation of a New Wire on Top of a Wire Harness without an Overall Shield

For the conditions that are applicable for the data in this paragraph, refer to Paragraph 10.A.

- (1) Put the correct identification on the new wire. Refer to Paragraph 10.B.
- (2) Remove the necessary clamps along the main wire harness where the wire must be installed.
- (3) Install the wire on the external surface of the main harness.

Refer to Paragraph 3. for the general conditions that are applicable for wire harness assembly.

NOTE: The wire can be installed on top of a wire harness tie, a plastic tie strap, a tape, or a marker that is installed on the wire harness.

- (4) If the harness is installed in the airplane, assemble wire harness ties or install plastic tie straps at approximately one foot intervals between the clamps. Paragraph 4.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

- (5) If the harness is not installed in the airplane, assemble wire harness ties or install plastic tie straps at the same intervals as the intervals of the wire harness ties on the harness. Paragraph 4.
- (6) Put the wire in the same clamps as those of the main harness.
- (7) Install the clamps in their initial configuration. Refer to Subject 20-10-12.

D. Installation of a New Wire on Top of a Wire Harness with an Overall Shield

For the conditions that are applicable for the data in this paragraph, refer to Paragraph 10.A.

- (1) Put the correct identification on the new wire. Refer to Paragraph 10.B.
- (2) Remove the necessary clamps along the main wire harness where the wire must be installed.
- (3) Install the wire on top of the overall shield.

Refer to Paragraph 3. for the general conditions that are applicable for wire harness assembly.

NOTE: The wire can be installed on top of a wire harness tie, a plastic tie strap, a tape, or a marker that is installed on the wire harness.

- (4) Install a wire harness tie or a plastic strap on the new wire and the main harness at four inch intervals. Refer to Paragraph 4.
- (5) Put the wire in the same clamps as those of the main harness.
- (6) Install the clamps in their initial configuration. Refer to Subject 20-10-12.

E. Installation of a New Wire between the Overall Shield and the Wire Harness

For the conditions that are applicable for the data in this paragraph, refer to Paragraph 10.A.

- (1) Put the correct identification on the new wire. Refer to Paragraph 10.B.
- (2) Remove the necessary clamps along the main wire harness where the wire must be installed.
- (3) If it is necessary, remove the overall shield from the wire harness.
- (4) Install the wire between the external surface of the harness and the shield.

Refer to Paragraph 3. for the general conditions that are applicable for wire harness assembly.

NOTE: The wire can be installed on top of a wire harness tie, a plastic tie strap, a tape, or a marker that is installed on the wire harness.

- (5) If the harness is installed in the airplane, assemble wire harness ties or install plastic tie straps at approximately one foot intervals between the clamps. Refer to Paragraph 4.
- (6) If the harness is not installed in the airplane, assemble wire harness ties or install plastic tie straps at the same interval as the interval of the wire harness ties on the harness. Refer to Paragraph 4.
- (7) Put the overall shield of the harness in its initial configuration.
- (8) Install the clamps in their initial configuration. Refer to Subject 20-10-12.

F. Installation of a New Wire and an Overall Shield on Top of a Wire Harness with an Overall Shield

For the conditions that are applicable for the data in this paragraph, refer to Paragraph 10.A.

- (1) Put the correct identification on the new wire. Refer to Paragraph 10.B.
- (2) Remove the necessary clamps along the main wire harness where the wire must be installed.
- (3) Remove the wire harness ties along the harness where the wire is to be added.

NOTE: Do not remove the wire harness ties from the area of the harness near the shield ground wire of the overall shield.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

- (4) Install an overall shield on the wire. Refer to Subject 20-25-11.
- (5) Install the wire on top of the overall shield of the main harness.

Refer to:

- Paragraph 3. for the general conditions that are applicable for wire harness assembly
- Subject 20-25-11 for the modification of a wire harness with an overall shield.

NOTE: The wire can be installed on top of a wire harness tie, a plastic tie strap, a tape, or a marker that is installed on the wire harness.

- (6) Put the wire in the same clamps as those of the main harness.
- (7) Install the clamps in their initial configuration. Refer to Subject 20-10-12.

G. Removal of a Wire or Wire Harness from Operation

CAUTION: FLUID OR CONTAMINATION ON THE FREE END OF A WIRE, A CABLE, OR A WIRE HARNESS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE, THE CABLE, OR THE CONNECTOR.

CAUTION: UNWANTED MOVEMENT OF THE FREE END OF A WIRE, A CABLE, OR A WIRE HARNESS CAN CAUSE DAMAGE TO ADJACENT WIRES OR EQUIPMENT.

If the removal, or the removal of the function of a wire, a cable, or a wire harness from the airplane is specified and the removal of the wire, cable or wire harness can cause damage to adjacent wires or equipment, these precautions are recommended:

- Removal of all the termination points on the wire, cable, or wire harness.
- Installation of the necessary insulation on the end of the wire, the cable, or the wire harness; refer to Paragraph 12.
- The stow of the free end of the wire, the cable, or the wire harness; refer to Paragraph 13.

11. REPAIR OR REPLACEMENT OF WIRE HARNESS IDENTIFICATION

This paragraph gives:

- The general conditions for wire identification marks
- The procedures to make an indirect mark for wire identification.

A. General Data

These types of marks can make wire identification:

- A direct mark which is a mark that is printed directly on the wire insulation
- An indirect mark which is a mark that is printed on a sleeve, a tape, or a boot that is installed on the wire, the cable, or the wire harness.

A direct mark can be used to identify:

- A wire
- A cable that is not a coax cable or a BMS13-71 fiber optic cable.

An indirect mark can be used to identify:

- A wire
- A cable
- A coax cable
- A fiber optic cable
- A wire harness.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

CAUTION: A DIRECT MARK MUST NOT BE PUT ON A COAX CABLE. DAMAGE TO THE CABLE CAN OCCUR AND CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

CAUTION: A DIRECT MARK MUST NOT BE PUT ON A BMS13-71 FIBER OPTIC CABLE. DAMAGE TO THE CABLE CAN OCCUR AND CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

CAUTION: A DIRECT MARK MUST NOT CAUSE DAMAGE TO THE WIRE OR CABLE INSULATION. DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE OR CABLE.

B. General Conditions for Wire Identification Marks

A wire identification mark:

- Must be in upper case letters and Arabic numerals
- Must be easily read at a distance of 15 inches with ambient room light
- Must have a minimum contrast measurement of 55 percent
- Is not necessary on a wire that is less than 6 inches long.

These conditions are applicable for indirect marks:

- The maximum interval for the mark is 72 inches ± 1 inch
- The mark must be installed approximately 4 inches from the end of a wire, a cable, or a wire harness
- The mark must be installed approximately 4 inches from the end of a wire harness branch, if the branch is longer than 6 feet.

C. Wire Identification Materials

**Table 13
SLEEVES FOR WIRE IDENTIFICATION**

Temperature Grade	Class	Specification or Part Number	Description	Supplier

E. Repair of an Indirect Wire Identification Mark

This paragraph gives the procedure to repair an indirect mark that cannot be read easily. For all other conditions, the wire identification mark must be replaced; refer to Table 18.

- (1) Make a selection of a pen or an ink. Refer to Subject 20-00-11.
- (2) If it is necessary, find the specified wire identification.

Refer to:

- The Wire List in the Wiring Diagram Manual (WDM)
- The Equipment Hookup List in the WDM.

- (3) Make the necessary correction of the mark.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

F. Wire Identification with an Indirect Mark

**Table 20
CHARACTER HEIGHTS FOR DIFFERENT MATERIALS**

Material	Character Height (inch)	
	Minimum	Maximum
Boot	0.10	0.25
Sleeve	0.10	0.25
Tape	0.13	0.50

**Table 21
APPLICABLE CONDITIONS FOR AN OVERCOAT**

Material	Type of Mark	Applicable Condition
Boot	Rubber Stamp	An overcoat is necessary
Sleeve	All types that are not made by a thermal transfer or a rubber stamp	An overcoat is necessary
	Thermal Transfer	An overcoat is not necessary
Tape	All types that are not made by a thermal transfer or a rubber stamp	An overcoat is optional
	Thermal Transfer	An overcoat is not necessary

**Table 22
OVERCOAT MATERIALS**

Material	Part Number or Specification	Supplier
Aerosol spray	Acrylic	Krylon
Top Coat	Tartan Clear	Rudd Paint and Varnish Co.
Top Coat	EC-776-SR	3M

(1) Make a selection of one of these identification materials:

- A sleeve from Table 13
- A tape from Table 15.

Make sure that:

- The temperature grade and the class of the sleeve or the tape is equal to or higher than the temperature grade and the class of the wire harness
- If the material is a sleeve, the sleeve is a size that can be moved easily on the wire or wire harness.

NOTE: As an alternative, the selection can be a larger sleeve that can be held in position with wire harness ties.

(2) Make a selection of the equipment and the applicable material to make a mark.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

Refer to:

- Table 17 for the necessary equipment and material to make a mark on a boot
- Table 18 for the necessary equipment and material to make a mark on a sleeve
- Table 19 for the necessary equipment and material to make a mark on a tape.

Make sure that the class of the mark is equal to or higher than the class of the wire harness.

- (3) Make a mark on the material.

Refer to Table 20 for the necessary character height of the mark.

NOTE: For a small component, a 0.06 inch character height is satisfactory.

- (4) If the material is a tape:

- (a) For a wire harness or a cable, cut a minimum 6 inch length.
- (b) For one wire or one cable, cut a length that is equal to 1.5 or 2 times the wire circumference.

- (5) If an overcoat is necessary, apply an overcoat. Refer to Table 21.

- (a) Make a selection of an overcoat material from Table 22.
- (b) Apply a thin layer of overcoat on the wire mark.
- (c) Let the overcoat dry for a minimum of 10 minutes.
- (d) When the overcoat is not tacky, apply one more layer.

- (6) Put the wire identification on the wire, the cable, or the wire harness.

Make sure that a clamp, a shield, a tie, or a piece of equipment does not have to be removed to read the mark.

- (a) If the material is a sleeve, shrink the sleeve in position. Refer to Subject 20-10-14.

Make sure that the sleeve cannot be moved.

NOTE: As an alternative, the sleeve can be cut and held in position with wire harness ties.

CAUTION: DO NOT APPLY HEAT TO A SLEEVE NEAR A PRESSURE SEAL OR VAPOR SEAL. DAMAGE TO THE SEAL CAN OCCUR.

CAUTION: DO NOT USE A HEAT GUN OR A HOT AIR GUN TO INSTALL HEAT SHRINKABLE MATERIALS ON A FIBER OPTIC CABLE. DAMAGE TO THE CABLE ASSEMBLY CAN OCCUR AND CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE ASSEMBLY.

- (b) If the material is a heat shrinkable boot, shrink the boot in position. Refer to Subject 20-10-14.

CAUTION: DO NOT APPLY HEAT TO A BOOT NEAR A PRESSURE SEAL OR VAPOR SEAL. DAMAGE TO THE SEAL CAN OCCUR.

- (c) If the material is a tape, fold the tape around the wire, the cable, or the wire harness.
- (d) If the material is a wrap around identification tape, assemble a wire harness tie 0.25 inch from each end of the tape. Refer to Paragraph 4.C.

G. Identification of a BACC69A Fiber Optic Cable Assembly with an Indirect Mark

The indirect mark must be made with a tape. Refer to Paragraph 11.F.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****12. INSULATION OF THE FREE END OF A WIRE OR CABLE**

This paragraph gives the procedures to install insulation on these configurations of wire harness components:

- The free end of a wire
- The free end of a wire with an assembled contact or terminal
- The free end of a wire with an overall shield
- The free end of a shielded wire or a cable
- The free end of a coax cable
- The free end of a wire harness with an assembled connector.

A. Conditions for the Insulation of a Free End of a Wire or Cable

The temperature grade and the class of the insulation material must be applicable for the location on the airplane. Refer to Subject 20-00-11.

These types of insulation can be installed:

- A flexible sleeve
- A heat shrinkable sleeve
- A crimp type end cap
- A heat shrinkable end cap
- A dust cap with a polyethylene bag
- A polyethylene bag.

B. Insulation of the Free End of a Wire

- (1) Move each wire away from the wire harness.
- (2) Install the insulation.

For the installation of:

- A crimp type end cap, refer to Subject 20-30-16
- A flexible sleeve, refer to Paragraph 12.K.
- A heat shrinkable end cap, refer to Subject 20-30-16
- A heat shrinkable sleeve, refer to Paragraph 12.L.

C. Insulation of the Free End of a Wire with an Assembled Contact or Terminal

- (1) Move each wire away from the wire harness.
- (2) Install the insulation.

For the installation of:

- A flexible sleeve, refer to Paragraph 12.K.
- A heat shrinkable sleeve, refer to Paragraph 12.L.

D. Insulation of the Free End of a Shielded Wire or Cable

- (1) Move each wire or cable away from the wire harness.
- (2) Assemble a shield dead end 3.00 inches ± 0.25 inch from the end of the wire or the cable that is disconnected. Refer to Subject 20-10-15.
- (3) Install the insulation.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

For the installation of:

- An end cap, refer to Subject 20-30-16
- A flexible sleeve, refer to Paragraph 12.K.
- A heat shrinkable sleeve, refer to Paragraph 12.L.

E. Insulation of the Free End of a Coax Cable

- (1) Move each cable away from the wire harness.
- (2) If the coax cable has an assembled connector, install the insulation. Refer to Paragraph 12.F.
- (3) If the coax cable does not have an assembled connector, install the insulation.

For the installation of:

- A flexible sleeve, refer to Paragraph 12.K.
- A heat shrinkable sleeve, refer to Paragraph 12.L.
- A heat shrinkable end cap, refer to Subject 20-30-16.

F. Insulation of the Free End of a Wire Harness with an Assembled Connector

- (1) Identify the ESD sensitivity of the equipment that is attached to the other end of the wire harness. Refer to Subject 20-41-01.
- (2) If the equipment is ESD sensitive:
 - (a) Make a selection of a ESDS protective dust cap that has a tight fit on the connector. Refer to Subject 20-41-01.

NOTE: A satisfactory alternative for a dust cap is an ESDS protective bag. These conditions are applicable:

- The bag is the smallest size bag that can go on the connector
- A wire harness tie is assembled on the bag and the connector shell to hold the bag tightly.

- (b) Install the dust cap.

Refer to:

- A circular connector, refer to Paragraph 12.G.
- An ARINC 600 connector, refer to Paragraph 12.H.
- Other rectangular connectors, refer to Paragraph 12.I.

- (3) If the equipment is not ESD sensitive:
 - (a) Make a selection of a dust cap that has a tight fit on the connector.

NOTE: A satisfactory alternative for a dust cap is a 0.012 inch thick polyethylene bag. These conditions are applicable:

- The bag is the smallest size bag that can go on the connector
- A wire harness tie is assembled on the bag and the connector shell to hold the bag tightly.

- (b) Install the dust cap.

Refer to:

- A circular connector, refer to Paragraph 12.G.
- An ARINC 600 connector, refer to Paragraph 12.H.
- Other rectangular connectors, refer to Paragraph 12.I.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****G. Insulation of the Free End of a Wire Harness with a Circular Connector**

- (1) Push the dust cap on the connector until it stops.

CAUTION: DO NOT PUSH THE PLASTIC DUST CAP AGAINST THE INNER SURFACE OF THE CONNECTOR COUPLING RING. DAMAGE TO THE GROUND SPRINGS THAT ARE IN THE COUPLING RING CAN OCCUR.

- (2) Make a selection of a 0.012 inch thick polyethylene bag.
Make sure that the bag is the smallest size that can go on the connector.
- (3) Put the bag on the connector and the wire harness.
- (4) Assemble a wire harness tie to hold the bag tightly in position. Refer to Paragraph 4.C.
Make sure that the tie is assembled on the bag and the connector shell.

H. Insulation of the Free End of a Wire Harness with an ARINC 600 Connector

- (1) Align the walls of the cap with the connector inserts.
- (2) With light, equal pressure on all sides of the dust cap, push the dust cap forward against the connector shell.

CAUTION: MORE THAN THE NECESSARY FORCE TO INSTALL THE DUST CAP MUST NOT BE APPLIED. IF THE CONNECTOR HAS GROUND SPRINGS, DAMAGE TO THE GROUND SPRINGS CAN OCCUR.

- (3) Assemble a wire harness tie tightly on the dust cap between the rear grommets of the inserts of the connector. Refer to Figure 30 and Paragraph 4.C.

INSTALLATION OF A DUST CAP ON AN ARINC 600 CONNECTOR
Figure 30

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Make sure that:

- The tie is between the rear grommets of the top and bottom inserts
- The tie is not on the rear grommets.

CAUTION: DO NOT USE A PLASTIC TIE STRAP TO ATTACH THE DUST CAP TO THE CONNECTOR. DAMAGE TO THE REAR GROMMET OF THE CONNECTOR CAN OCCUR.

- (4) Make a selection of a 0.012 inch thick polyethylene bag.
Make sure that the bag is the smallest size that can go on the connector.
- (5) Put the bag on the connector and the wire harness.
- (6) Assemble a wire harness tie to hold the bag tightly in position. Refer to Paragraph 4.C.
Make sure that the tie is assembled on the bag and the connector shell.

I. Insulation of the Free End of a Wire Harness a with a Rectangular Connector

For the installation of an ARINC 600 connector, refer to Paragraph 12.H.

- (1) Push the dust cap on the connector until it stops.
 - (a) For a plug connector, install the dust cap on the outer surface of the shell.
 - (b) For a receptacle connector, install the dust cap into the inner surface of the shell.
- (2) Make a selection of a 0.012 inch thick polyethylene bag.
Make sure that the bag is the smallest size that can go on the connector.
- (3) Put the bag on the connector and the wire harness.
- (4) Assemble a wire harness tie to hold the bag tightly in position. Refer to Paragraph 4.C.
Make sure that the tie is assembled on the bag and the connector shell.

J. Insulation of the Free End of a Splice Plug

**Table 23
SPLICE RECEPTACLE PART NUMBERS**

Splice Plug		Splice Receptacle	
Part Number	Supplier	Part Number	Supplier
48-7190-()	Amphenol	48-7191-()	Amphenol
AIS16P-()	AIE	AIS16R-()	AIE

- (1) Make a selection of the applicable splice receptacle from Table 23.
- (2) Make a selection of a 0.012 inch thick polyethylene bag.
- (3) Engage the splice receptacle and the splice plug:
 - (a) Align the keys of the plug with the keyways of the receptacle.
 - (b) Push the plug forward into the receptacle until it is fully latched.
- (4) Put the bag on the splice assembly.
Make sure that the bag is the smallest size that can move over the splice plug.
- (5) Assemble a wire harness tie to hold the bag tightly in position. Refer to Paragraph 4.C.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

K. Installation of a Flexible Sleeve

- (1) Make a selection of a heat shrinkable sleeve or a sleeve that is flexible.
Refer to Subject 20-00-11.
- (2) Examine the end of the wire.
Make sure that the end of the wire is flat.
- (3) For an AWG 14 and smaller wire without an assembled terminal or contact, install the sleeve. Refer to Figure 31.

POSITION OF THE FLEXIBLE SLEEVE ON THE WIRE
Figure 31

- (a) Cut a 2.7 inch length of sleeve.
 - (b) Put the sleeve on the wire.
Make sure that the distance from the end of the wire to the forward end of the sleeve is a minimum of 0.50 inch.
 - (c) Fold the end of the wire back.
Make sure that the distance from the end of the wire to the outer curve of the wire is a minimum of 0.75 inch.
 - (d) Assemble a wire harness tie to hold the sleeve in position. Refer to Paragraph 4.C.
- (4) For an AWG 12 and larger wire without an assembled terminal or contact, install the sleeve. Refer to Figure 32.

POSITION OF THE FLEXIBLE SLEEVE ON THE WIRE
Figure 32

- (a) Cut the necessary length of sleeve.
Make sure that the sleeve has the sufficient length to extend 1.0 inch from the end of the wire to the rear end of the sleeve after the sleeve is installed and folded in half.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

- (b) Put the sleeve on the wire.
Make sure that the distance from the end of the wire to the rear end of the sleeve is a minimum of 1.0 inch.
 - (c) Fold the sleeve and align the ends.
 - (d) Assemble a lacing tape wire harness tie to hold the sleeve in its position. Refer to Paragraph 4.C.
- (5) For a wire with an assembled terminal or contact, install the sleeve. Refer to Figure 33.

**POSITION OF THE FLEXIBLE SLEEVE ON THE ASSEMBLED TERMINAL****Figure 33**

- (a) Cut the necessary length of sleeve.
Make sure that the sleeve has the sufficient length to extend 0.50 inch from the rear end of a terminal or contact after the sleeve is installed and folded in half.
- (b) Put the sleeve on the wire.
Make sure that the distance from the rear of terminal or contact to the rear end of the sleeve is a minimum of 0.50 inch.
- (c) Fold the sleeve and align the ends.
- (d) Assemble a lacing tape wire harness tie to hold the sleeve in its position. Refer to Paragraph 4.C.

L. Installation of a Heat Shrinkable Sleeve

- (1) Make a selection of a heat shrinkable sleeve.
Refer to Subject 20-00-11.
- (2) Examine the end of the wire.
Make sure that the end of the wire is flat.
- (3) For an AWG 14 and smaller wire without an assembled terminal or contact, install the sleeve. Refer to Figure 34.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE

Figure 34

- (a) Cut the necessary length of sleeve.
 Make sure that:
 - The sleeve has the sufficient length to extend a minimum of 1.0 inches from the end of the folded wire to the rear end of the sleeve
 - The sleeve has the sufficient length to make a seal on the forward end of the sleeve.
- (b) Fold the end of the wire back.
 Make sure that the distance from the end of the wire to the outer curve of the wire is a minimum of 0.75 inch.
- (c) Put the sleeve on the wire.
 Make sure that the distance from the end of the wire to the rear end of the sleeve is a minimum of 0.25 inch.
- (4) For AWG 12 and larger wire without an assembled terminal or contact, install the sleeve. Refer to Figure 35.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE

Figure 35

- (a) Cut the necessary length of sleeve.
 Make sure that:
 - The sleeve has the sufficient length to make a seal on the forward end of the sleeve
 - The sleeve has the sufficient length to extend a minimum of 1.0 inch from the end of the wire to the rear end of the sleeve.
- (b) Put the sleeve on the wire.
 Make sure that the distance from the end of the wire to the rear end of the sleeve is a minimum of 1.0 inch.
- (5) For all wires with an assembled terminal or contact, install the sleeve.

20-10-11

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

POSITION OF THE HEAT SHRINKABLE SLEEVE ON A TERMINAL
Figure 36

- (a) Cut the necessary length of sleeve.

Make sure that:

- The sleeve has the sufficient length to make a seal on the forward end of the sleeve
- The sleeve has the sufficient length to extend 0.25 inch from the rear end of a terminal or contact.

- (b) Put the sleeve on the wire.

Make sure that the distance from the rear end of the terminal or contact to the rear end of the sleeve is a minimum of 0.25 inch.

- (6) Shrink the sleeve into position. Refer to Subject 20-10-14.

- (7) Compress the forward end of the sleeve with flat jawed pliers or an equivalent tool while the sleeve is hot. Refer to Figure 36.

Make sure that the end of the sleeve is closed.

SEAL OF THE HEAT SHRINKABLE SLEEVE

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

13. STOW OF THE FREE END OF A WIRE OR CABLE

This paragraph gives the procedures for the stow of the free end of:

- A wire or a cable without a contact, a terminal lug, or a connector
- A wire or a cable in a wire harness that has an overall shield
- A wire or cable with an contact or a terminal lug
- A cable or a wire harness with a connector.

A. Selection of a Stow Configuration

CAUTION: THE STOW OF A WIRE OR CABLE IN A CONDUIT IS NOT PERMITTED. DAMAGE FROM ABRASION CAN OCCUR.

**Table 24
SELECTION OF A STOW CONFIGURATION**

Wiring		Stow		
Configuration	Applicable Conditions	Configuration Selection	Configuration	Procedure
A wire or a cable without a contact, a terminal, or a connector	The end of the wire or cable must have the necessary insulation; refer to Paragraph 12..	Recommended	Parallel configuration; end of the wire or cable attached to the wire harness	Paragraph 13.B.
	1. The end of the wire or cable must have the necessary insulation; refer to Paragraph 12.. 2. The wire or cable has too much length for a parallel stow.	Alternative	Wire coil configuration; end of the wire or cable attached to the wire harness	Paragraph 13.C.
	1. The end of the wire or cable must have the necessary insulation; refer to Paragraph 12.. 2. The wire or cable has too much length for a parallel stow. 3. The cable is not a coax cable.	Alternative	Folded wire configuration; end of the wire or cable attached to the wire harness	Paragraph 13.D.
AWG 16 or smaller wire with a contact or a terminal lug	The end of the wire must have the necessary insulation; refer to Paragraph 12..	Recommended	Parallel configuration; end of the wire attached to the wire harness	Paragraph 13.B.
	1. The end of the wire must have the necessary insulation; refer to Paragraph 12.. 2. The wire has too much length for a parallel stow.	Alternative	Wire coil configuration; end of the wire attached to the wire harness	Paragraph 13.C.
	1. The end of the wire must have the necessary insulation; refer to Paragraph 12.. 2. The wire has too much length for a parallel stow.	Alternative	Folded wire configuration; end of the wire attached to the wire harness	Paragraph 13.D.

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Table 24 (continued)

Wiring		Stow		
Configuration	Applicable Conditions	Configuration Selection	Configuration	Procedure
AWG 14 or larger wire or a cable in a wire harness that has an overall shield	The end of the wire or cable must have the necessary insulation; refer to Paragraph 12..	Recommended	Parallel configuration; end of the wire or cable attached to the wire harness	Paragraph 13.E.

B. Wire or Cable in a Parallel Configuration with the End Attached to the Wire Harness

PARALLEL STOW CONFIGURATION
Figure 38

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) If the wire harness has an overall shield, push the shield away from the end of the wire.
- (2) Move the wire away from the wire harness.
- (3) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the wire harness.
- (4) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.
Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (5) Align the wire with the longitudinal axis of the wire harness. Refer to Figure 39.

ALIGNMENT OF THE WIRE AND THE WIRE HARNESS
Figure 39

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

- (6) Assemble the necessary wire harness ties at intervals along the wire harness and near the end of the wire. Refer to Figure 38.

Make sure that:

- The intervals between wire harness ties on the wire are the same as the intervals of the ties on the wire harness
- Fluids cannot drain into the insulation on the end of the wire
- Contamination cannot go into the insulation on the end of the wire or cable
- The end of the wire or cable cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE END OF A WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the wire harness has an overall shield, push the overall shield back into the initial position.

C. Wire or Cable in a Wire Coil Configuration with the End Attached to the Wire Harness

WIRE COIL STOW CONFIGURATION
Figure 40

ALTERNATIVE WIRE COIL STOW CONFIGURATION
Figure 41

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the wire away from the wire harness.
- (2) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (3) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.

Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (4) Put the wire in the coil configuration. Refer to Figure 40 and Figure 41.

Make sure that the diameter of the coil is a minimum of six times larger than the diameter of the largest wire in the coil.
- (5) Assemble the necessary wire harness ties at intervals along the coil. Refer to Figure 40.

Make sure that the intervals between the wire harness ties on the coil are the same as the intervals of the ties on the wire harness.

NOTE: More wire harness ties can be assembled to hold the shape of the coil.

- (6) Attach the coil at the location of the nearest clamp on the wire harness. Refer to Figure 40.

NOTE: A satisfactory alternative is to put the coil against the wire harness and assemble the necessary wire harness ties. Refer to Figure 41.

- (7) Assemble the necessary wire harness ties near the end of the wire and the wire coil.

Make sure that:

- Fluids cannot drain into the insulation on the end of the wire or cable
- Contamination cannot go into the insulation on the end of the wire or cable
- The end of the wire or cable cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE END OF A WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

D. Wire or Cable in a Folded Wire Configuration with the End Attached to the Wire Harness

CAUTION: A COAX CABLE MUST NOT BE FOLDED BACK. DAMAGE TO THE COAX CABLE OCCURS.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

FOLDED WIRE STOW CONFIGURATION

Figure 42

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) If the wire harness has an overall shield, push the shield away from the end of the wire.
- (2) Move the wire away from the wire harness.
- (3) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires a maximum of 5 inches from the point where the wires make an exit from the wire harness; refer to Figure 42.
- (4) Assemble a wire harness tie on the wire harness and the wire where the wire makes an exit from the wire harness. Refer to Figure 42.
- (5) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.
 Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (6) Fold the wire back against the wire harness. Refer to Figure 43 and Figure 44.

Make sure that:

- The diameter of the inner curve of the wire or wires is a minimum of six times larger than the diameter of the largest wire
- The outer curve of the wire is a minimum of 3.0 inches and a maximum of 6.0 inches from the rear of the cable clamp for a folded wire on a wire harness that has an overall shield.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

POSITION OF THE FOLDED WIRE

Figure 43

POSITION OF THE FOLDED WIRE ON A WIRE HARNESS WITH AN OVERALL SHIELD

Figure 44

- (7) Assemble the necessary wire harness ties at intervals along the wire harness and near the end of the wire. Refer to Figure 42.

Make sure that:

- The intervals between wire harness ties on the wire are the same as the intervals of the ties on the wire harness
- Fluids cannot drain into the insulation on the end of the wire or cable
- Contamination cannot go into the insulation on the end of the wire or cable
- The end of the wire or cable cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE END OF A WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the wire harness has an overall shield, push the overall shield back into the initial position.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

E. AWG 14 and Larger Wire in a Parallel Configuration with the End Attached to the Wire Harness

PARALLEL STOW CONFIGURATION

Figure 45

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) If the wire harness has an overall shield, push the overall shield away from the end of the wire.
- (2) Move the wire away from the wire harness.
- (3) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (4) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.
Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (5) Align the wire with the longitudinal axis of the wire harness. Refer to Figure 46.

ALIGNMENT OF THE WIRE AND THE WIRE HARNESS

Figure 46

- (6) Make a selection of a tape. Refer to Subject 20-00-11.
- (7) Put a layer of tape on the wire harness where the contact or terminal lug is against the wire harness. Refer to Figure 45.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

Make sure that the layer of tape:

- Makes a 50 percent overlap
- Extends approximately 0.5 inches farther than the forward end and the rear end of the contact or terminal lug.

(8) Assemble the necessary wire harness ties:

- At intervals along the wire harness
- On the contact or terminal lug.

Refer to Figure 45.

NOTE: A satisfactory alternative to the wire harness ties on the connector is one wire harness tie 2 to 3 inches from rear of the contact or terminal lug.

Make sure that:

- The intervals between wire harness ties on the wire are the same as the intervals of the ties on the wire harness
- Fluids cannot drain into the insulation on the end of the wire
- Contamination cannot go into the insulation on the end of the wire
- The end of the wire cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE END OF A WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

(9) If the wire harness has an overall shield, push the overall shield back into the initial position.

WIRE COIL STOW CONFIGURATION

Figure 47

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

ALTERNATIVE WIRE COIL STOW CONFIGURATION

Figure 48

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the wire away from the wire harness.
- (2) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (3) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.

Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.

- (4) Put the wire in a coil configuration. Refer to Figure 47 and Figure 48.

Make sure that:

- The diameter of the coil is a minimum of six times larger than the diameter of the largest wire or cable in the coil
- The end of the wire is in the position where it can be attached to the wire harness.

NOTE: A satisfactory alternative is to put the end of the wire against the wire coil. Refer to Figure 48.

- (5) Assemble the necessary wire harness ties at intervals along the coil. Refer to Figure 47.

Make sure that the intervals between the wire harness ties on the coil are the same as the intervals of the ties on the wire harness.

NOTE: More wire harness ties can be assembled to hold the shape of the coil.

- (6) Make a selection of a tape. Refer to Subject 20-00-11.
- (7) Put a layer of tape on the coil or the wire harness where the contact or terminal lug is against the coil or the wire harness. Refer to Figure 47 and Figure 48.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

Make sure that the layer of tape:

- Makes a 50 percent overlap
- Extends approximately 0.5 inches farther than the forward end and the rear end of the contact or terminal lug.

(8) Attach the coil at the location of the nearest clamp on the wire harness.

NOTE: A satisfactory alternative is to put the coil against the wire harness and assemble the necessary wire harness ties. Refer to Figure 47 and Figure 48.

(9) Assemble two wire harness ties on the contact or the terminal lug. Refer to Figure 47 and Figure 48.

NOTE: A satisfactory alternative is to assemble a wire harness tie 2 to 3 inches from the rear of the contact or the terminal lug. Refer to Figure 49.

Make sure that:

- Fluids cannot drain into the insulation on the end of the wire
- Contamination cannot go into the insulation on the end of the wire
- The end of the wire cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE END OF A WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (1) If the wire harness has an overall shield, push the overall shield away from the end of the wire.
- (2) Move the cable away from the wire harness.
- (3) If more than one cable makes an exit from the same area of the wire harness:
 - (a) Put the cables together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (4) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the cable.
 Make sure that the sleeve extends from the point where the cable makes an exit from the wire harness to a maximum of 2 inches from the end of the cable.
- (5) Align the cable with the longitudinal axis of the wire harness. Refer to Figure 51.

ALIGNMENT OF THE WIRE AND THE WIRE HARNESS

Figure 51

- (6) Make a selection of a tape. Refer to Subject 20-00-11.
- (7) Put a layer of tape on the wire harness where the connector is against the wire harness. Refer to Figure 50.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Make sure that the layer of tape:

- Makes a 50 percent overlap
- Extends approximately 0.5 inches farther than the forward end and the rear end of the connector.

(8) Assemble the necessary wire harness ties:

- At intervals along the wire harness
- On the connector.

Refer to Figure 50.

NOTE: A satisfactory alternative to the wire harness ties on the connector is one wire harness tie 2 to 3 inches from rear of the connector.

Make sure that:

- The intervals between wire harness ties on the cable are the same as the intervals of the ties on the wire harness
- Fluids cannot drain into the insulation on the connector
- Contamination cannot go into the insulation on the connector
- The connector cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION IN THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

(9) If the wire harness has an overall shield, push the overall shield back into the initial position.

WIRE COIL STOW CONFIGURATION

Figure 52

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

ALTERNATIVE WIRE COIL STOW CONFIGURATION

Figure 53

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the cable away from the wire harness.
- (2) If more than one cable makes an exit from the same area of the wire harness:
 - (a) Put the cables together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (3) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the cable.
 Make sure that the sleeve extends from the point where the cable makes an exit from the wire harness to a maximum of 2 inches from the end of the cable.

- (4) Put the cable in a coil configuration. Refer to Figure 52 and Figure 53.

Make sure that:

- The diameter of the coil is a minimum of six times larger than the diameter of the largest cable in the coil
- The connector is in the position where it can be attached to the wire harness.

NOTE: A satisfactory alternative is to put the connector against the wire coil. Refer to Figure 53.

- (5) Assemble the necessary wire harness ties at intervals along the coil. Refer to Figure 52.
 Make sure that the intervals between the wire harness ties on the coil are the same as the intervals of the ties on the wire harness.

NOTE: More wire harness ties can be assembled to hold the shape of the coil.

- (6) Make a selection of a tape. Refer to Subject 20-00-11.
- (7) Put a layer of tape on the coil or the wire harness where the connector is against the coil or the wire harness. Refer to Figure 52 and Figure 53.

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Make sure that the layer of tape:

- Makes a 50 percent overlap
- Extends approximately 0.5 inches farther than the forward end and the rear end of the connector.

(8) Attach the coil at the location of the nearest clamp on the wire harness.

NOTE: A satisfactory alternative is to put the coil against the wire harness and assemble the necessary wire harness ties. Refer to Figure 52 and Figure 53.

(9) Assemble two wire harness ties on the connector. Refer to Figure 52 and Figure 53.

NOTE: A satisfactory alternative is to assemble a wire harness tie 2 to 3 inches from the rear of the connector. Refer to Figure 54.

Make sure that:

- Fluids cannot drain into the insulation on the connector
- Contamination cannot go into the insulation on the connector
- The connector cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION IN THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

ALTERNATIVE POSITION OF THE WIRE HARNESS TIE

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION****I. Wire or Cable in a Parallel Configuration with the End Attached to the Structure**

PARALLEL STOW CONFIGURATION
Figure 55

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the wire away from the wire harness.
- (2) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (3) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.

Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (4) Put the end of the wire against the applicable structure. Refer to Figure 55.

Make sure that the end of the wire is pointed up.
- (5) Assemble a wire harness tie on the contact, the terminal lug, or the connector and the applicable structure. Refer to Figure 55.

NOTE: For a large contact, a large terminal lug, or a large connector, two wire harness ties are necessary.

Make sure that:

- Fluids cannot drain into the insulation on the end of the wire
- Contamination cannot go into the insulation on the end of the wire
- The end of the wire cannot be moved easily.

J. Wire or Cable in a Wire Coil Configuration with the End Attached to the Structure

WIRE COIL STOW CONFIGURATION
Figure 56

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the wire away from the wire harness.
- (2) If more than one wire makes an exit from the same area of the wire harness:
 - (a) Put the wires together.
 - (b) Assemble a wire harness tie on the wires near the point where the wires make an exit from the wire harness.
- (3) If the wire harness has a sleeve:
 - (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
 - (b) Put the necessary length of sleeve on the wire.
 Make sure that the sleeve extends from the point where the wire makes an exit from the wire harness to a maximum of 2 inches from the end of the wire.
- (4) Put the wire in a coil configuration. Refer to Figure 56.
 Make sure that:
 - The diameter of the coil is a minimum of six times larger than the diameter of the largest wire or cable in the coil
 - The wire coil is in a position where it can be attached with a clamp
 - The end of the wire has the sufficient length to be attached to the applicable structure.
- (5) Assemble the necessary wire harness ties at intervals along the coil.

20-10-11

STANDARD WIRING PRACTICES MANUAL

WIRING ASSEMBLY AND INSTALLATION CONFIGURATION

Make sure that the diameter of the coil is a minimum of six times larger than the diameter of the largest wire or cable in the coil.

NOTE: More wire harness ties can be assembled to hold the shape of the coil.

- (6) Attach the coil at the location of the nearest clamp on the wire harness.

NOTE: A satisfactory alternative is to put the coil against the wire harness and assemble the necessary wire harness ties.

- (7) Put the end of the wire against the applicable structure. Refer to Figure 56.

Make sure that the end of the wire is pointed up.

- (8) Assemble a wire harness tie on the contact, the terminal lug, or the connector and the applicable structure. Refer to Figure 56.

NOTE: For a large contact, a large terminal lug, or a large connector, two wire harness ties are necessary.

Make sure that:

- Fluids cannot drain into the insulation on the end of the wire
- Contamination cannot go into the insulation on the end of the wire
- The end of the wire cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION ON THE CONTACT, THE TERMINAL LUG, OR THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE PART.

K. Cable or a Wire Harness in a Folded Wire Configuration with the End Attached to the Structure

CAUTION: A COAX CABLE MUST NOT BE FOLDED BACK. DAMAGE TO THE COAX CABLE OCCURS.

FOLDER WIRE STOW CONFIGURATION

Figure 57

Refer to Paragraph 4. for the procedure to assemble a wire harness tie.

- (1) Move the cable away from the wire harness.
- (2) If more than one cable makes an exit from the same area of the wire harness:
 - (a) Put the cables together.

STANDARD WIRING PRACTICES MANUAL**WIRING ASSEMBLY AND INSTALLATION CONFIGURATION**

- (b) Assemble a wire harness tie on the cables a maximum of 5 inches from the point where the cables make an exit from the wire harness.
- (3) Assemble a wire harness tie on the wire harness and the cable where the cable makes an exit from the wire harness. Refer to Figure 57.
- (4) If the wire harness has a sleeve:
- (a) Make a selection of a sleeve that is the same material as the sleeve on the wire harness. Refer to Subject 20-00-11.
- (b) Put the necessary length of sleeve on the cable.
- Make sure that the sleeve extends from the point where the cable makes an exit from the wire harness to a maximum of 2 inches from the end of the cable.
- (5) Fold the cable back against the wire harness. Refer to Figure 57.
- Make sure that the diameter of the inner curve of the cable or cables is a minimum of six times larger than the diameter of the largest cable.
- (6) Put the end of the cable against the applicable structure. Refer to Figure 57.
- Make sure that the end of the cable is pointed up.
- (7) Assemble a wire harness tie on the connector and the applicable structure. Refer to Figure 57.

NOTE: For a large connector, two wire harness ties are necessary.

Make sure that:

- Fluids cannot drain into the insulation on the connector
- Contamination cannot go into the insulation on the connector
- The connector cannot be moved easily.

CAUTION: FLUID OR CONTAMINATION IN THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS****1. GENERAL DATA****A. Necessary Conditions for Selection of a Clamp**

For the necessary conditions for clamp replacement, refer to Paragraph 2.A.

These conditions are applicable for all wire and cable:

- The clamp must be the correct type of clamp
- The maximum diameter of a wire harness that can be supported with a nylon loop clamp is 1.25 inches
- Only a metal loop clamp with a cushion is permitted for a wire harness with a diameter greater than 1.25 inches
- The clamp must have the correct size; refer to Paragraph 1.B. for the necessary conditions for selection of a clamp size

For coax cable in the unpressurized area, only a BACC10GE clamp is permitted.

B. Necessary Conditions for Selection of a Clamp Size

For the identification of the correct size of a clamp, refer to Paragraph 1.D.

These conditions are applicable for all wire and cable:

- The clamp must hold the wire harness tightly
- If the clamp crushes or pinches the wires, a larger clamp must be installed
- A clamp must not let the wire harness move laterally in the clamp; refer to Figure 2
- A block clamp must not let the wire harness move or turn in the clamp
- If the smallest possible size of clamp lets the harness move laterally in the clamp, the diameter of the harness must be increased with a filler material
- For a loop clamp with a cushion, if the distance between the ends of the cushion is more than 0.03 inch, a larger clamp must be installed; refer to Figure 1.

For a wire harness in a loop clamp, these conditions are applicable:

- The wire harness is permitted to move in the longitudinal direction
- The wire harness is permitted to turn clockwise and counterclockwise.

Refer to Figure 2.

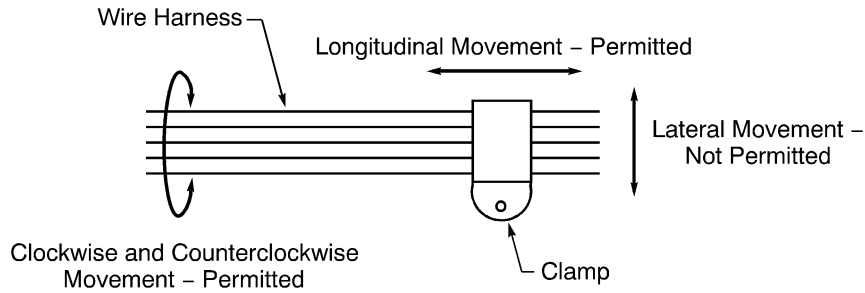

CORRECT FIT OF A LOOP CLAMP WITH A CUSHION

Figure 1

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

PERMITTED MOVEMENT OF A WIRE HARNESS IN A CLAMP

Figure 2

C. General Conditions for Clamp Installation

For the conditions that are applicable for wire harness installation, refer to Subject 20-10-11.

These conditions are applicable for all wire and cable:

- The clamp must be the correct size; refer to Paragraph 1.B. for the conditions for the selection of a clamp size
- The clamp must be perpendicular to the wire harness; refer to Figure 3
- A clamp must not be installed on a wire harness where the wires go across each other
- A clamp must not be installed on a repair of a wire or a cable
- A clamp must not be installed on a lacing tape or a plastic tie strap wire harness tie
- A clamp must not be installed on a shield ground wire assembly
- If a spacer is used for a standoff to install a nylon clamp, only an NAS42() spacer is permitted.

POSITION OF THE CLAMP IN RELATION TO THE WIRE HARNESS

Figure 3

These are more conditions that are applicable for coax cable:

- A clamp must not be installed on the bend of a coax cable if radius of the bend is less than 6 inches
- When two coax cables are installed in a 287T0011 clamp, a BACC10DK clamp, or BACC10GE clamp, the diameter of the wire harness must be increased with one or more BMS1-52 or 69B47961-() filler rods

D. Identification of the Correct Size of a Loop Clamp or a Block Clamp

DIMENSIONS OF THE ST2323B TOOL

Figure 4

**Table 1
COLOR CODES OF THE ST2323B TOOL**

Code	Color
R	Red
B	Blue
O	Orange
G	Green
Y	Yellow

20-10-12

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

NOTE: If an ST2323B tool is not available, make an equivalent tool. Refer to Figure 4 and Table 1.

- (1) Wind the ST2323B tool around the wire harness at the location of the installation of the clamp.
- (2) Pull the tool tight around the wire harness and align the index line with one of the color code bands. Refer to Figure 5.

POSITION OF THE ST2323B TOOL ON THE WIRE HARNESS
Figure 5

- (3) Read the approximate diameter of the wire harness and the color from the tool. Refer to Figure 4 and Table 1.

NOTE: If the index is aligned between two of the color bands, read the smaller size and the color.

- (4) If the clamp is identified with a color, use the color for selection.
- (5) If the clamp is not identified with a color, use the diameter for selection.

E. Damage Conditions for BACS31H Ring Posts and BACS31J Support Assemblies

The ring post or the support assembly must be replaced if one of these conditions occur:

- A sharp edge is against a wire harness
- The integral screw of a ring post has a crack or is broken.

2. WIRE HARNESS SUPPORT REPLACEMENT**A. Necessary Conditions for Clamp Replacement**

These conditions are applicable when a clamp must be replaced:

- The clamp must be replaced with a clamp that has the same part number unless an alternative wire harness support is specified
- The clamp must be replaced with a clamp that has the same part number unless the specified clamp is too small to make a correct fit
- If the specified clamp is too small to make a correct fit, a clamp that is the same type and is one size larger can be installed.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

B. Necessary Conditions for Replacement of a Wire Harness Support with a BACS31H Ring Post

A wire harness support can be replaced with a BACS31H ring post if these conditions are applicable:

- The ring post is a specified alternative; refer to Paragraph 3.L.
- The location of the support is a pressurized area
- The wire harness is Temperature Grade A or Temperature Grade B
- The wire harness has a maximum diameter of 1.25 inches.

A wire harness support must not be replaced with a BACS31H ring post if the support:

- Is in a fuel tank
- Is in a high vibration area
- Holds a power feeder wire.

These conditions must occur after the wire harness is installed on the ring post:

- The wire harness separation is satisfactory; refer to Subject 20-10-19
- The clearance between the wire harness and a structure, equipment and other items is satisfactory; refer to Subject 20-10-11.

C. Necessary Conditions for Replacement of a Wire Harness Support with a BACS31J Support Assembly

A wire harness support can be replaced with a BACS31J support assembly if these conditions are applicable:

- The support assembly is a specified alternative; refer to Paragraph 3.M.
- The location of the support is a pressurized area
- The wire harness is Temperature Grade A or Temperature Grade B
- The wire harness has a maximum diameter of 1.25 inches
- The support assembly is installed on a BAC1510-407 channel bracket.

A wire harness support must not be replaced with a BACS31J support assembly if the support:

- Is in a fuel tank
- Is in a high vibration area
- Holds a power feeder wire.

These conditions must occur after the wire harness is installed on the support assembly:

- The wire harness separation is satisfactory; refer to Subject 20-10-19
- The clearance between the wire harness and a structure, equipment and other items is satisfactory; refer to Subject 20-10-11.

B. 287T0011 Loop Clamps

The 287T0011 clamp:

- Is a general purpose loop clamp made of nylon
- Is held closed with a wire harness tie
- Must not be installed in a fuel cell
- Is a satisfactory alternative for the BACC10DK clamp.

The 287T0011 loop clamp is installed in the pressurized area of the airplane to hold:

- A wire harness that is less than 1.25 inches in diameter
- A wire harness that is installed in an area where the temperature is 275 degrees F or less.

E. BACC10DK Loop Clamps

The BACC10DK clamp:

- Is a general purpose loop clamp made of nylon
- Can be installed in a fuel cell.

The BACC10DK loop clamp is installed in the pressurized area of the airplane to hold:

- A wire harness that is less than 1.25 inches in diameter
- A wire harness that is in an area where the temperature is 275 degrees F or less.

NOTE: These clamps are satisfactory alternatives for the BACC10DK clamp:

- The BACC10GE clamp
- The 287T0011 clamp.

F. BACCC10DR Wire Harness Channel and BACC10DS Raceway Clamp

The BACC10DS raceway clamp and the BACC10DR wire harness channel are:

- The two parts that make a wire harness support
- Installed in the pressurized area of the airplane.

G. BACC10GE Loop Clamps

The BACC10GE clamp:

- Is a general purpose loop clamp
- Must not be installed in a fuel cell
- Is a satisfactory alternative for the BACC10BU clamp
- Is a satisfactory alternative for the BACC10DK clamp.

The BACC10GE loop clamp is installed in the pressurized area of the airplane to hold:

- A wire harness that is less than 1.25 inches in diameter
- A wire harness in an area where the temperature is 275 degrees F or less
- A power feeder wire harness where a BACC10KL clamp cannot be installed
- A wire harness that goes across a hinge point
- A wire harness that has a routing on an electronic shelf
- A wire harness that is installed in a panel of electrical equipment
- A flexible conduit.

The BACC10GE loop clamp is installed in these areas to hold a coax cable:

- The unpressurized area
- A high vibration area.

K. BACC10KL Three Wire Clamps

The BACC10KL loop clamp is installed as a support for:

- A power feeder wire harness with three wires
- A power feeder wire harness that has a straight routing through the clamp.

The BACC10KL loop clamp with a support tab is installed:

- In a high vibration area
- On the leading edge of the wing.

L. BACS31H Ring Posts

The BACS31H ring post:

- Is made of nylon
- Uses a BACS38W3 plastic tie strap to hold the wire harness
- Can hold a wire harness that is 1.25 inches or less in diameter
- Can be installed with other ring posts that are the same type.

The BACS31H ring post can replace:

- A spacer that is the same length
- A BACC10DK clamp
- A BACC10GE clamp
- A BACC10GU clamp
- A 287T0011 clamp.

Refer to Paragraph 2.B. for the necessary conditions to replace a clamp.

M. BACS31J Support Assemblies

The BACS31J support assembly:

- Is a made of nylon
- Uses a BACS38W3 plastic tie strap to hold the wire harness
- Is installed on a channel bracket made to the BAC1510-407 specification.

The BACS31J support assembly has these components:

- A support
- A clip.

The BACS31J support assembly can replace:

- A spacer that is the same length
- A BACC10DK clamp
- A BACC10GE clamp
- A BACC10GU clamp
- A 287T0011 clamp.

Refer to Paragraph 2.C. for the necessary conditions to replace a clamp.

N. BACS38J Stringer Clips

A BACS38J stringer clip assembly is made from these two parts:

- A support attachment
- A strap.

Refer to Figure 22 and Table 23.

The stringer clip is installed to hold a wire harness or an insulation blanket on an airframe stringer.

P. TA025097 Loop Clamps

The TA025097 loop clamp is installed to hold:

- A power feeder wire harness that does not have a straight routing through the clamp
- A power feeder wire harness that has more than or less than three power feeder wires.

A replacement clamp must have the same part number as the clamp of the initial installation.

4. REMOVAL OF WIRE HARNESS SUPPORTS

A. Removal of a BACS31J Support Assembly

- (1) At the same time, push the ends of the clip together and push the clip back through the slots in the side of the support. Refer to Figure 25 and Figure 26.

NOTE: It is not necessary to fully remove the clip from the support assembly.

INITIAL POSITION OF THE CLIP

Figure 25

20-10-12

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

FINAL POSITION OF THE CLIP
Figure 26

- (2) At the same time, pull one leg of the support out from the bracket and turn the support on the bracket. Refer to Figure 27.

REMOVAL OF THE SUPPORT
Figure 27

B. Removal of a Raceway Clamp

REMOVAL OF THE RACEWAY CLAMP
Figure 28

Refer to Figure 28.

- (1) Put the end of a flat blade screwdriver or an equivalent tool between the clamp and the top edge of the channel.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

- (2) Push one side of the channel away from the clamp until the clamp hook disengages from the slot in the side of the channel.
- (3) Pull clamp out from the slot on the other side of the clamp.

C. Removal of a Stringer Clip

- (1) Make a selection of a shim that is 0.032 inch thick and 0.5 inch wide.
- (2) Push the shim between the strap and the support attachment. Refer to Figure 29.

POSITION OF THE SHIM TO REMOVE THE STRINGER CLIP
Figure 29

- (3) Pull the strap out of the support attachment.
- (4) Discard the stringer clip assembly to make sure that it is not installed again.

5. REMOVAL OF PLASTIC TIE STRAPS

A. Removal of a Plastic Tie Strap with an ST2318PC(-) Tool

Table 26
PLASTIC TIE STRAP REMOVAL TOOLS

Part Number	Description
ST2318PC-6	Regular Length
ST2318PC-13	Short Length

- (1) Make a selection of a plastic tie strap removal tool from Table 26.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

PLASTIC TIE STRAP REMOVAL TOOL
Figure 30

(2) Put the tool on the head of the tie. Refer to Figure 30 and Figure 31.

Make sure that:

- The tool is level with the tie strap head
- The end of the tie that is cut off is pointed to the handle of the tool
- The center of the blade is aligned with the rear center of the tie strap head.

POSITION OF THE REMOVAL TOOL
Figure 31

(3) Close the handle until it stops.

(4) Remove the tool.

(5) Remove the tie strap.

NOTE: A soft tool can be used to open the tie strap if the strap does not open easily.

B. Removal of a Plastic Tie Strap with a Wire Cutter

(1) Cut one side of the tie strap head. Refer to Figure 32.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

POSITION OF THE WIRE CUTTER
Figure 32

- (2) Twist the tie strap head to release the tie strap.
- (3) Pull the tie strap off the wire harness.

6. INSTALLATION OF WIRE HARNESS SUPPORTS

B. Installation of a 69B90483-() Block Clamp

(1) If the clamp size is not specified, make a selection of a clamp that has the correct size.

(a) Find the correct clamp size.

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp or a block clamp.

(b) Make a selection of a clamp from Table 5.

(2) Put the wire harness in the clamp. Refer to Figure 33.

Make sure that the wires and cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE WIRES OR CABLES GO ACROSS EACH OTHER, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR. THIS CONDITION IS NOT APPLICABLE FOR MULTIPLE CONDUCTOR, TWISTED WIRE CABLES.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS****POSITION OF THE WIRE HARNESS IN THE BLOCK CLAMP****Figure 33**

- (3) Tighten the clamp screws.

Make sure that these conditions occur:

- The necessary conditions for the selection of a clamp size, refer to Paragraph 1.B.
- The necessary conditions for clamp installation, refer to Paragraph 1.C.

- (4) If the clamp does not hold the wire harness tightly, increase the diameter of the wire harness with tape. Refer to Figure 33.

- (a) Remove the wire harness from the clamp.
(b) Make a selection of a tape from Table 27.

NOTE: For an equivalent tape, refer to Subject 20-00-11.

Make sure that the Temperature Grade and the Class of the material are equal to or higher than the Temperature Grade and the Class of the wire harness. Refer to Subject 20-00-11.

- (c) Wind one or more layers of tape around the clamp area on the wire harness.

Make sure that each layer:

- Extends a minimum of 1 inch farther than the edge of the block clamp cushion
- Has a minimum 50 percent overlap.

- (d) Assemble a wire harness tie on each end of the layers of tape.

C. Installation of a Loop Clamp or a Three Wire Clamp

For the installation of:

- Two coax cables in a loop clamp, refer to Paragraph 6.D.
- A 287T0011 loop clamp, refer to Paragraph 6.E.
- Two coax cables in a 287T0011 loop clamp, refer to Paragraph 6.F.
- A BACC10DK loop clamp, refer to Paragraph 6.G.

- (1) If the clamp size is not specified, make a selection of a clamp that has the correct size.

- (a) Find the correct clamp size.

20-10-12

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp or a block clamp.

(b) Make a selection of a clamp from:

- Table 6 for a BACC10BU() clamp
- Table 11 for a BACC10GE() clamp
- Table 12 for a BACC10GU() clamp
- Table 13 for a BACC10HS() clamp
- Table 14 or a BACC10JU() clamp
- Table 15 for a BACC10KL() clamp
- Table 24 for a TA025041-() clamp
- Table 25 for a TA025097() clamp.

(2) Put the wire harness in the clamp.

Make sure that the wires and cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE WIRES OR CABLES GO ACROSS EACH OTHER, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR. THIS CONDITION IS NOT APPLICABLE FOR MULTIPLE CONDUCTOR, TWISTED WIRE CABLES.

(3) Attach the clamp to the structure.

(a) If it is necessary, install a spacer.

Refer to:

- Paragraph 1.C. for the general conditions for clamp installation
- Subject 20-10-11 for the necessary conditions for wire harness installation.

(b) Put a washer between the structure and the nut or the screw head to give protection to the structure.

(c) Tighten the screw.

Make sure that these conditions occur:

- The necessary conditions for the selection of a clamp size, refer to Paragraph 1.B.
- The necessary conditions for clamp installation, refer to Paragraph 1.C.

(4) If the clamp does not hold the wire harness tightly, increase the diameter of the wire harness with a filler material.

Refer to:

- Figure 34 for the position of a filler rod
- Figure 35 for the position of a film strip or a tape.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

POSITION OF A FILLER ROD

Figure 34

POSITION OF A FILM STRIP OR A TAPE

Figure 35

(a) Make a selection of one of these filler materials from Table 27:

- A filler rod
- A film strip
- A grommet
- A tape.

NOTE: For an equivalent film strip or an equivalent tape, refer to Subject 20-00-11.

Make sure that the Temperature Grade and the Class of the material are equal to or higher than the Temperature Grade and the Class of the wire harness. Refer to Subject 20-00-11.

(b) Install the filler material.

Make sure that:

- For coax cable, the distance from the edge of the clamp to the end of a layer of film strip or a layer of tape is 0.0 inch to 0.5 inch
- The distance from the edge of the clamp to the end of a filler rod, a layer of film strip, or a layer tape is 0.0 inch to 0.125 inch
- For U shaped filler tape, each layer of tape makes a 100 percent overlap; refer to Figure 36.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

CONFIGURATION OF THE LAYERS OF THE U SHAPED FILLER TAPE

Figure 36

D. Installation of a Two Coax Cables in a Loop Clamp

For the installation of two coax cables in a 287T0011 loop clamp, refer to Paragraph 6.F.

(1) If the clamp size is not specified, make a selection of a clamp that has the correct size.

(a) Find the correct clamp size.

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp or a block clamp.

(b) Make a selection of a clamp from:

- Table 6 for a BACC10BU() clamp
- Table 7 for a BACC10DK() clamp
- Table 11 for a BACC10GE() clamp
- Table 12 for a BACC10GU() clamp
- Table 13 for a BACC10HS() clamp
- Table 14 or a BACC10JU() clamp
- Table 15 for a BACC10KL() clamp
- Table 24 for a TA025041(-) clamp
- Table 25 for a TA025097() clamp.

(2) Make a selection of a filler rod from Table 27.

(3) Put the wire harness in the clamp.

Make sure that the cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE CABLES GO ACROSS EACH OTHER, DAMAGE TO THE CABLES CAN OCCUR.

(4) Install the necessary quantity of filler rod to make a tight fit in the clamp.

Make sure that the distance from the edge of the clamp to the end of the filler rod is 0.0 inch to 0.125 inch.

(5) Attach the clamp to the structure.

(a) If it is necessary, install a spacer.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

Refer to:

- Paragraph 1.C. for the general conditions for clamp installation
 - Subject 20-10-11 for the necessary conditions for wire harness installation.
- (b) Put a washer between the structure and the nut or the screw head to give protection to the structure.
- (c) Tighten the screw.

Make sure that these conditions occur:

- The necessary conditions for the selection of a clamp size, refer to Paragraph 1.B.
- The necessary conditions for clamp installation, refer to Paragraph 1.C.

E. Installation of a 287T0011 Loop Clamp

For the installation of two coax cables in a 287T0011 clamp, refer to Paragraph 6.F.

CAUTION: THE 287T0011 CLAMP MUST NOT BE INSTALLED IN A FUEL CELL. IF A PLASTIC TIE STRAP, A LENGTH OF LACING TAPE, OR A FILLER ROD BECOMES FREE, A FUEL FILTER CAN BECOME CLOGGED.

- (1) If the clamp size is not specified, make a selection of a clamp that has the correct size.
- (a) Find the correct clamp size.

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp.

- (b) Make a selection of a clamp from Table 4.
- (2) Attach the clamp to the structure.

NOTE: Washers are not necessary.

- (3) Put the wire harness in the clamp.

Make sure that the wires and cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE WIRES OR CABLES GO ACROSS EACH OTHER, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR. THIS CONDITION IS NOT APPLICABLE FOR MULTIPLE CONDUCTOR, TWISTED WIRE CABLES.

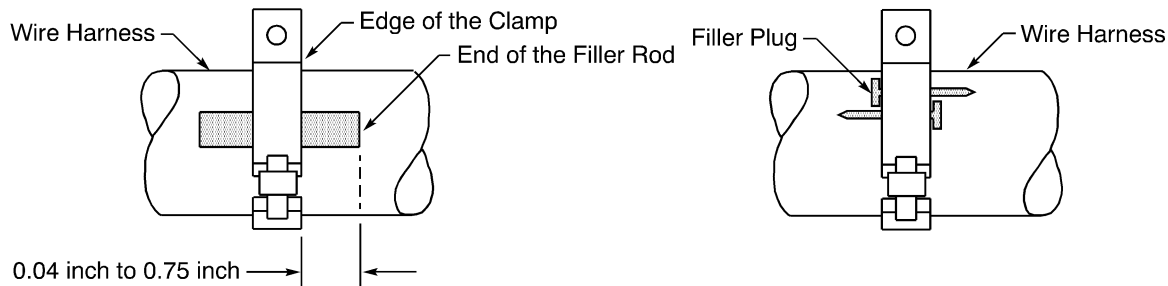

- (4) Close the clamp.
- (5) Assemble a wire harness tie through the holes in the ends of the clamp. Refer to Subject 20-10-11.
- (6) If the clamp does not hold the wire harness tightly in the clamp, increase the diameter of the wire harness with a filler material.

Refer to:

- Figure 37 for the position of a filler rod or a filler plug
- Figure 38 for the position of a film strip or a tape.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

POSITION OF A FILLER ROD OR A FILLER PLUG

Figure 37

Figure 38

- (a) Make a selection of a filler material from Table 27.
Make sure that the Temperature Grade and the Class of the material are equal to or higher than the Temperature Grade and the Class of the wire harness. Refer to Subject 20-00-11.
- (b) Remove the tie at the ends of the clamp.
- (c) Install the filler material.
Make sure that:
 - For a filler rod, the filler rod is on the same side as the ears of the clamp
 - For a filler rod, the distance from the edge of the clamp to the end of the filler rod is 0.40 inch to 0.75 inch
 - For coax cable, the distance from the edge of the clamp to the end of the layer of tape is 0.0 inch to 0.5 inch
 - The distance from the edge of the clamp to the end of the layer of film strip or layer of tape is 0.0 inch to 0.125 inch
 - For U shaped filler tape, each layer of tape makes a 100 percent overlap; refer to Figure 39.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS****CONFIGURATION OF THE LAYERS OF U SHAPED FILLER TAPE****Figure 39**

(7) Do Step (3) through Step (4) again.

F. Installation of Two Coax Cables in a 287T0011 Loop Clamp

For the installation of two coax cables in a loop clamp, refer to Paragraph 6.D.

(1) If the clamp size is not specified, make a selection of a clamp that has the correct size.

(a) Find the correct clamp size.

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp.

(b) Make a selection of a clamp from Table 4.

(2) Make a selection of a filler rod from Table 27.

(3) Attach the clamp to the structure.

NOTE: Washers are not necessary.

(4) Put the wire harness in the clamp.

Make sure that the cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE CABLES GO ACROSS EACH OTHER, DAMAGE TO THE CABLES CAN OCCUR.

(5) Install the necessary quantity of filler rod to make a tight fit in the clamp.

Make sure that:

- The rod is on the same side as the ears of the clamp
- The distance from the edge of the clamp to the end of the rod is 0.40 inch to 0.75 inch.

Refer to:

- Figure 40
- Paragraph 1.C. for the applicable conditions for installation of a clamp.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

POSITION OF A FILLER ROD

Figure 40

- (6) Close the clamp.
- (7) Assemble a wire harness tie through the holes in the ends of the clamp. Refer to Subject 20-10-11.

G. Installation of a BACC10DK Loop Clamp

- (1) If the clamp size is not specified, make a selection of a clamp that has the correct size.
 - (a) Find the correct clamp size.

Refer to:

- Paragraph 1.B. for the necessary conditions for the selection of a clamp size
- Paragraph 1.D. for the procedure for the identification of the correct size of a loop clamp or a block clamp.

- (b) Make a selection of a clamp from Table 7.
- (2) Put the clamp on the wire harness.

Make sure that the wires and cables in the harness are parallel to each other at the location of the clamp.

CAUTION: IF A CLAMP IS INSTALLED WHERE WIRES OR CABLES GO ACROSS EACH OTHER, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR. THIS CONDITION IS NOT APPLICABLE FOR MULTIPLE CONDUCTOR, TWISTED WIRE CABLES.

- (3) Attach the clamp to the structure.
 - (a) If it is necessary, install a spacer.

Refer to:

- Paragraph 1.C. for the general conditions for clamp installation
- Subject 20-10-11 for the necessary conditions for wire harness installation
- Paragraph 6.M. for the installation of a spacer.

- (b) Tighten the screw.

Make sure that these conditions occur:

- The necessary conditions for the selection of a clamp size, refer to Paragraph 1.B.
- The necessary conditions for clamp installation, refer to Paragraph 1.C.

- (4) If the clamp does not hold the wire harness tightly, increase the diameter of the wire harness with a filler material.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

Refer to:

- Figure 41 for the installation configurations of a filler plug
- Figure 42 for the position of a filler rod
- Figure 43 for the position of a film strip or a tape.

INSTALLATION CONFIGURATIONS OF A FILLER PLUG

Figure 41

POSITION OF A FILLER ROD

Figure 42

POSITION OF A FILM STRIP OR A TAPE

Figure 43

(a) If the clamp installation is in a fuel cell, make a selection of a seal ring from Table 27.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

CAUTION: A SEAL RING IS THE ONLY MATERIAL TO INCREASE THE DIAMETER OF THE WIRE HARNESS THAT IS PERMITTED IN A FUEL CELL. A BUSHING, A FILM STRIP, A GROMMET, A FILLER PLUG, A FILLER ROD, OR TAPE ARE NOT PERMITTED IN THE FUEL CELL. IF ONE OF THESE MATERIALS BECOMES FREE, A FUEL FILTER CAN BECOME CLOGGED.

- (b) If the clamp installation is not in a fuel cell, make a selection of one of these filler materials from Table 27:
- A filler plug
 - A filler rod
 - A film strip
 - A tape.

NOTE: For an equivalent film strip or an equivalent tape, refer to Subject 20-00-11.

Make sure that the Temperature Grade and the Class of the material are equal to or higher than the Temperature Grade and the Class of the wire harness. Refer to Subject 20-00-11.

- (c) Install the filler material.

Make sure that:

- For a seal ring, the seal ring is installed on the side of the clamp that is opposite from the feet of the clamp
- For coax cable, the distance from the edge of the clamp to the end of the layer of tape is 0.0 inch to 0.5 inch
- The distance from the edge of the clamp to the end of the filler rod, layers of film strip, or layers of tape is 0.0 inch to 0.125 inch
- For a filler rod, the filler rod is on the same side as the feet of the clamp
- For U shaped filler tape, each layer of tape makes a 100 percent overlap; refer to Figure 39.

CONFIGURATION OF THE LAYERS OF U SHAPED FILLER TAPE

Figure 44

H. Installation of a BACS31H1A Ring Post

NOTE: The maximum recommended number of BACS31H1A ring posts that can be assembled as one wire support is six.

20-10-12

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

CAUTION: THE BACS31H RING POST MUST NOT BE USED AS A SPACER IF A SPACER THAT HAS A DIFFERENT LENGTH IS SPECIFIED. IF THE WIRE HARNESS CLEARANCE IS NOT SATISFACTORY, DAMAGE TO THE WIRE HARNESS CAN OCCUR.

**Table 29
PLASTIC TIE STRAP INSTALLATION TOOLS**

Part Number	Tool Description
GS4H	Heavy Duty
GTS	Standard Duty, Ergonomic

- (1) Make a selection of a washer from Table 18.
- (2) If a spacer is necessary or specified, make a selection of a spacer. Refer to Table 18.
- (3) If the bracket does not have a nut plate, make a selection of a nut from Table 18.
- (4) Make a selection of a screw from Table 18. Refer to Figure 45.

Make sure that the length of the screw:

- Is sufficient to engage the nut correctly
- Can not make an interference with a structure or other items when the ring post is fully installed.

- (5) Make a selection of a plastic tie strap from Table 17.
- (6) Make a selection of a tie strap installation tool from Table 29.
- (7) Install the ring post or ring posts. Refer to Figure 45.

**RING POST INSTALLATION
Figure 45**

- (a) Put the washer on the on the screw.
- (b) Put the necessary number of ring posts and the spacers on the screw.
- (c) Engage the threads of the screw and the installation hole.
- (d) Tighten the screw until the ring post is tight against the bracket.

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

Make sure that the end of the screw does not make an interference with structure, a part, or equipment.

CAUTION: DO NOT APPLY TOO MUCH TORQUE. DAMAGE TO THE RING POST CAN OCCUR.

- (8) Attach the wire harness to the ring post. Refer to Figure 46.

**WIRE HARNESS INSTALLATION****Figure 46**

- (a) Put a plastic tie strap through the applicable slot in the ring or rings.

If the tie strap goes through two rings, make sure that:

- The minimum diameter of the wire harness is 0.75 inch
- The slots in the top ring post are approximately aligned with the slots in the bottom ring post
- The ribbed side of the tie strap is pointed away from the wire harness.

- (b) Put the tie strap around the wire harness.

Make sure that all of the wires are parallel.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER WHERE THE PLASTIC TIE STRAP GOES AROUND THE WIRE HARNESS. DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (c) Put the end of the tie strap through the tie strap head.

- (d) Tighten the tie strap.

Make sure that the wire harness is held tightly.

CAUTION: THE TIE STRAP MUST HOLD THE WIRE HARNESS TIGHTLY, BUT IT MUST NOT CRUSH THE WIRES. IF THE TIE STRAP IS TOO TIGHT OR TOO LOOSE, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (9) Examine the plastic tie strap.

Make sure that:

- The end of the strap does not have a sharp edge
- The end of the strap is a maximum of 0.01 inch from the head of the strap.

- (10) If the wire harness cannot be held tightly with the plastic tie strap, increase the diameter of the wire harness:

- (a) Remove the tie strap. Refer to Paragraph 5.

20-10-12

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

- (b) Make a selection of a filler rod from Table 27.
- (c) Install the necessary quantity of the filler rod to make a tight fit.
Make sure that the distance from the edge of the tie strap to the end of the filler rod is between 0.0 inch and 0.125 inch.
- (d) Do Step (8) and Step (9) again.

I. Installation of a BACS31H()B Ring Post

NOTE: The maximum recommended number of BACS31H1A ring posts that can be assembled as one wire support is six.

CAUTION: THE BACS31H RING POST MUST NOT BE USED AS A SPACER IF A SPACER THAT HAS A DIFFERENT LENGTH IS SPECIFIED. IF THE WIRE HARNESS CLEARANCE IS NOT SATISFACTORY, DAMAGE TO THE WIRE HARNESS CAN OCCUR.

**Table 30
PLASTIC TIE STRAP INSTALLATION TOOLS**

Part Number	Tool Description
GS4H	Heavy Duty
GTS	Standard Duty, Ergonomic

**Table 31
RING POST INSTALLATION TOOLS**

Tool Description	Size (inch)
Allen Wrench	7/32
Hex Head Driver	7/32

- (1) If the bracket does not have a nut plate, make a selection of a nut from Table 18.
- (2) Make a selection of a plastic tie strap from Table 17.
- (3) Make a selection of a tie strap installation tool from Table 30.
- (4) Make a selection of a ring post installation tool from Table 31.
- (5) Engage the threads of the screw with the installation hole.
- (6) Tighten the screw with the ring post installation tool until the ring post is tight against the bracket.
Make sure that the length of the integral screw:
 - Is sufficient to engage the nut correctly
 - Can not make an interference with a structure or other items when the ring post is fully installed.

CAUTION: DO NOT APPLY TOO MUCH TORQUE. DAMAGE TO THE RING POST CAN OCCUR.

- (7) If more ring posts are necessary:
 - (a) Engage the threads of a new ring post with the threads of the top ring post. Refer to Figure 47.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

RING POST INSTALLATION

Figure 47

- (b) Tighten the screw until the ring post is tight.

Make sure that the end of the screw does not make an interference with structure, a part, or equipment.

CAUTION: DO NOT APPLY TOO MUCH TORQUE. DAMAGE TO THE RING POST CAN OCCUR.

- (8) Attach the wire harness to the ring post or ring posts. Refer to Figure 48.

WIRE HARNESS INSTALLATION

Figure 48

- (a) Put a plastic tie strap through the applicable slot in the ring or rings.

If the tie strap goes through two rings, make sure that:

- The minimum diameter of the wire harness is 0.75 inch
- The slots in the top ring post are approximately aligned with the slots in the bottom ring post
- The ribbed side of the tie strap is pointed away from the wire harness.

- (b) Put the tie strap around the wire harness.

Make sure that all of the wires are parallel.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER WHERE THE PLASTIC TIE STRAP GOES AROUND THE WIRE HARNESS. DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (c) Put the end of the tie strap through the tie strap head.

- (d) Tighten the tie strap.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

CAUTION: THE TIE STRAP MUST HOLD THE WIRE HARNESS TIGHTLY, BUT IT MUST NOT CRUSH THE WIRES. IF THE TIE STRAP IS TOO TIGHT OR TOO LOOSE, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

(9) Examine the plastic tie strap.

Make sure that:

- The end of the tie strap does not have a sharp edge
- The end of the strap is a maximum of 0.01 inch from the head of the strap.

(10) If the wire harness cannot be held tightly with the plastic tie strap, increase the diameter of the wire harness:

- (a) Remove the tie strap. Refer to Paragraph 5.
- (b) Make a selection of a filler rod from Table 27.
- (c) Install the necessary quantity of the filler rod to make a tight fit.

Make sure that the distance from the edge of the tie strap to the end of the filler rod is between 0.0 inch and 0.125 inch.

(d) Do Step (8) and Step (9) again.

J. Installation of a BACS31J Support Assembly

**Table 32
PLASTIC TIE STRAP INSTALLATION TOOLS**

Part Number	Tool Description
GS4H	Heavy Duty
GTS	Standard Duty, Ergonomic

(1) Make a selection of a plastic tie strap from Table 21.

(2) Make a selection of a tie strap installation tool from Table 32.

(3) Install the support:

(a) Align the knob on the support with the hole in the bracket. Refer to Figure 49.

**ALIGNMENT OF THE SUPPORT AND THE BRACKET
Figure 49**

(b) Push the support against the channel bracket until the legs of the support engage the bracket. Refer to Figure 50.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

Make sure that the knob goes into the hole in the bracket.

POSITION OF THE SUPPORT
Figure 50

- (c) Push the clip into the support. Refer to Figure 51 and Figure 52.
Make sure that the hooks on side of the clip engage with the holes in the support.

POSITION OF THE CLIP
Figure 51

INCORRECT POSITION

CORRECT POSITION

POSITION OF THE HOOKS IN THE SUPPORT
Figure 52

- (4) Attach the wire harness to the support. Refer to Figure 53.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

WIRE HARNESS INSTALLATION

Figure 53

- (a) Put a plastic tie strap through the applicable slots in the support.

Make sure that:

- The ribbed side of the tie strap is pointed away from the wire harness
- The plastic tie strap has the correct routing.

- (b) Put the tie strap around the wire harness.

Make sure that all of the wires are parallel.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER WHERE THE PLASTIC TIE STRAP GOES AROUND THE WIRE HARNESS. DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (c) Put the end of the tie strap through the tie strap head.

- (d) Tighten the tie strap.

Make sure the wire harness is held tightly.

CAUTION: THE TIE STRAP MUST HOLD THE WIRE HARNESS TIGHTLY, BUT IT MUST NOT CRUSH THE WIRES. IF THE TIE STRAP IS TOO TIGHT OR TOO LOOSE, DAMAGE TO THE WIRES OR THE CABLES CAN OCCUR.

- (e) Examine the plastic tie strap.

Make sure that:

- The end of the strap does not have a sharp edge
- The end of the strap is a maximum of 0.01 inch from the head of the strap.

- (5) If the wire harness cannot be held tightly with the plastic tie strap, increase the diameter of the wire harness:

- (a) Remove the tie strap. Refer to Paragraph 5.

- (b) Make a selection of a filler rod from Table 27.

- (c) Install the necessary quantity of the filler rod to make a tight fit.

Make sure that the distance from the edge of the tie strap to the end of the filler rod is between 0.0 inch and 0.125 inch.

- (d) Do Step (4) again.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

K. Installation of a Raceway Clamp

POSITION OF THE WIRES OR CABLES IN A RACEWAY CLAMP

Figure 54

Refer to Figure 54.

- (1) Put the wires or cables in the wire harness channel.

Make sure that:

- The wire harness is straight
- The wires or cables of the wire harness are parallel with the longitudinal axis of the channel.

- (2) Put the raceway clamp on the channel.

Make sure that:

- The cushion of the clamp is against the wires
- The center of the clamp is aligned with the center of the channel
- A wire or a cable is not between the end of the clamp cushion and the side of the channel.

- (3) Push the center of the clamp in the direction of the channel until the hooks move into the slots on each side of the channel.

- (4) Examine the installation.

Make sure that:

- The distance from the largest wire or cable to the clamp is 0.25 inch minimum for wire
- The distance from the largest cable to the clamp is 0.375 inch minimum for coax cable
- The wires or cables in the channel cannot be moved
- The clamp cushion does not extend farther than each edge of the clamp.

L. Installation of a Stringer Clip

- (1) Make a selection of a stringer clip from Table 22.

CAUTION: DO NOT USE A STRINGER CLIP THAT HAS BEEN INSTALLED BEFORE. IT IS POSSIBLE THE CLIP CANNOT HOLD THE WIRE OR INSULATION BLANKET.

- (2) Put the end of the strap into the support attachment.
- (3) Put the ends of the strap with hooks and the support attachment over each edge of stringer. Refer to Figure 55.

STANDARD WIRING PRACTICES MANUAL

WIRE HARNESS SUPPORTS

POSITION OF THE STRINGER CLIP ON THE STRINGER
Figure 55

(4) Pull the strap through the support attachment. Refer to Figure 22.

M. Installation of an NAS42() Spacer with a BACC10DK Loop Clamp

Table 33
WASHER PART NUMBERS

Washer	Supplier

NAS1149D0316H	QPL
NAS1149D0363H	QPL

NAS42() SPACER INSTALLATION WITH A NYLON LOOP CLAMP
Figure 56

Refer to Figure 56.

- (1) Make a selection of an NAS42() spacer.
- (2) Make a selection of two washers from Table 33.

20-10-12

STANDARD WIRING PRACTICES MANUAL**WIRE HARNESS SUPPORTS**

CAUTION: A NYLON WASHER MUST NOT BE INSTALLED IN A FUEL TANK. IF THE WASHER BECOMES FREE, A FUEL FILTER CAN BECOME CLOGGED.

- (3) Put a washer on the screw.
- (4) Put the screw through the hole in the clamp.
- (5) Put the other washer on the screw.
- (6) Put the screw through the hole in the spacer.
- (7) Engage the threads of the screw with the threads of the nut.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

This Subject gives:

- The damage conditions of wire, cable, coax cable, and cable assemblies
- The repair conditions for damaged wire, cable, coax cable, and cable assemblies
- The repair procedures for damaged wire, cable, and coax cable.

1. GENERAL DATA

A. Applicable Repair Conditions for Wire and Cable

For the general conditions that are applicable for:

- The repair of wire and cable, refer to Paragraph 1.B.
- The repair of Airworthiness Limitation wiring, refer to Paragraph 1.C.
- The repair of Fuel System wiring that has Airworthiness Limitations, refer to Paragraph 1.C.
- The repair of wiring that is adjacent to a fuel tank, refer to Paragraph 1.C.
- The selection of parts and materials for a repair, refer to Paragraph 1.D.
- The repair of wire and cable with a splice, refer to Paragraph 1.E.

For the applicable damage and repair conditions of:

- Wire and cable in special systems, refer to Table 1
- Special wire and cable, refer to Table 2
- Other types of wire and cable, refer to Table 3.

**Table 1
WIRE AND CABLE IN SPECIAL SYSTEMS**

System Wire and Cable	Damage and Repair Conditions
Engine Wire Harness	Paragraph 2.T.
Fuel Quantity Indicator System that is in the Fuel Tank	Paragraph 2.V.
Fuel Quantity Indicator System that is not in the Fuel Tank	Paragraph 2.W.
Other Fuel System Wiring	Paragraph 2.U.
777 Primary Flight Control System	Subject 20-14-11

**Table 2
SPECIAL WIRE AND CABLE**

Special Wire or Cable	Damage and Repair Conditions
Aluminum Wire	Paragraph 2.J.
Bond and Ground Jumper Assembly	Paragraph 2.L.
Coax Cable	Paragraph 2.M.
Copper Power Feeder Wire	Paragraph 2.K.
Fire Resistant Wire	Paragraph 2.N.
Flat Conductor Cable Assembly	Paragraph 2.O.
S280W502-1 ARINC 629 Stanchion to LRU Stub Cable	Paragraph 2.P.

S280W651-() ARINC 629 Data Bus Cable Assembly	Paragraph 2.Q.
Shield Pull Through Shield Ground Wire	Paragraph 2.R.
Thermocouple Wire	Paragraph 2.S.

**Table 3
WIRE AND CABLE TYPES**

Wire or Cable Type	Damage and Repair Conditions
Unshielded Wire	Paragraph 2.A.
Unshielded Cable	Paragraph 2.B.
Shielded Wire	Paragraph 2.C.
Shielded Wire - Two Adjacent Shields	Paragraph 2.D.
Shielded Wire - Two Shields That Are Not Adjacent	Paragraph 2.E.
Shielded Cable	Paragraph 2.F.
Shielded Cable - Two Adjacent Shields	Paragraph 2.G.
Shielded Cable - Two Shields That Are Not Adjacent	Paragraph 2.H.
Wire or Cable with a Non-Metallic Braid	Paragraph 2.I.

B. General Conditions for the Repair of Wire and Cable

These conditions are applicable for all repairs:

- The condition that is the cause of the damage must be removed to prevent subsequent damage
- A repair must be done with clean hands and clean tools to prevent contamination that can cause a bad seal of the insulation materials
- The repair is permanent, unless it is specified differently in the applicable repair conditions or in the applicable repair procedure
- A repair done in a fuel vapor area must be applicable for a fuel vapor area.

NOTE: A fuel vapor area is an area where fuel vapors are present. Refer to Subject 20-00-10 for safety practices for fuel vapors.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

WARNING: HEAT SOURCES OR OTHER IGNITION SOURCES MUST NOT BE USED WHEN FUEL VAPORS ARE PRESENT. INJURY TO PERSONNEL FROM FIRE OR EXPLOSION CAN OCCUR.

CAUTION: HEAT SOURCES OR OTHER IGNITION SOURCES MUST NOT BE USED WHEN FUEL VAPORS ARE PRESENT. DAMAGE TO EQUIPMENT FROM FIRE OR EXPLOSION CAN OCCUR.

These conditions are applicable for the location of the repair:

- A repair must not be put in a conduit
- A repair must not be put in a connector backshell or a backshell adapter
- A repair must not be put on a bend of a wire or a cable
- A repair must not be put on a wire harness where the wire harness is frequently bent; for example, an instrument panel or a hinged door.

C. Airworthiness Limitations

These types of wiring configurations are specified as Critical Design Configuration Control Limitations (CDCCL):

- Fuel System Wiring that has Airworthiness Limitations
- Wiring that is installed adjacent to the fuel tank. Refer to Subject 20-10-11.

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

To find more data about CDCCL wiring, refer to Table 4 for the document that is applicable for the airplane model.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

D. General Conditions for the Selection of Parts and Materials for a Repair

These conditions are applicable for the selection of the parts and materials for a repair:

- The Temperature Grade of the insulation materials for the repair the insulation of a wire or the jacket of a cable must be the same as or higher than the Temperature Grade of the wire or the cable
- The Temperature Grade of the metal components for the repair of a wire or a cable must be the same as the Temperature Grade of the wire or the cable
- The Temperature Grade of the materials used for the repair of a wire or a cable in a high temperature area must be Temperature Grade D; refer to Subject 20-02-20
- If it is necessary to repair damage of a wire or a cable with a segment of wire or cable, the segment must have the same part number as the damaged wire or cable.

E. General Conditions for the Repair of Wire and Cable with a Splice

The replacement of a damaged wire or a damaged cable is recommended.

NOTE: The repair of a damaged wire or a damaged cable with a splice is a satisfactory alternative unless it is specified differently in the applicable repair conditions or in the applicable repair procedure.

These conditions are applicable:

- The general conditions for the repair or wire and cable; refer to Paragraph 1.B.
- All splice assemblies must have a sealed configuration
- The maximum number of splices that a wire can have is three; this maximum does not include splices that are installed during the production of the airplane
- When the repair of more than one wire in a wire harness is necessary, the minimum distance between the end of the splice on one wire and the opposite end of the splice on an adjacent wire must be 0.25 inch; refer to Figure 1
- When the number of splices and the lengths of the wires prevent the separation that is specified Figure 1, the splices can be installed with a maximum of 0.25 inch from the end of the splice on one wire to the same end of the splice on an adjacent wire; refer to Figure 2.

RECOMMENDED SEPARATION OF SPLICES
Figure 1

ALTERNATIVE SEPARATION OF SPLICES
Figure 2

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

For the general conditions that are applicable for:

- Splice assemblies and wire harness assembly, refer to Subject 20-10-11
- Splice assemblies and wire harness installation, refer to Subject 20-10-11.

F. Applicable Conditions for the Repair of a Splice Assembly

These conditions are applicable:

- The damage and repair conditions for a splice assembly are the same as the conditions for the type of wire or cable; refer to Paragraph 2.
- If it is necessary to replace a sealed splice assembly, the replacement must be a sealed splice assembly
- If it is necessary to replace an unsealed splice assembly, the replacement can be an unsealed splice assembly, but a sealed splice assembly is recommended.

2. WIRE AND CABLE DAMAGE AND REPAIR CONDITIONS

A. Unshielded Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Repair is necessary when these types of damage occur:

- Damage to the conductor; refer to Paragraph 4.A.
- Damage that goes through the primary insulation; refer to Paragraph 3.A.
- Damage that goes into the primary insulation; refer to Paragraph 3.A.
- The bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 3 and Paragraph 3.C.
- Damage that goes into or through the insulation of a splice assembly when the conductor splice does not have damage; refer to Figure 4 and Paragraph 3.F.

I. Wire or Cable With a Non-Metallic Braid

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Repair of the braid is necessary when the damage goes through the braid; refer to Paragraph 3.E.

Repair is not necessary when these types of damage occur:

- A fold in the braid at a bend
- Abrasion that makes the surface of the braid rough.

Refer to Figure 41.

SERVICEABLE FOLDS AND ABRASION

Figure 41

If there is damage to the wire or cable, refer to the wire and cable damage conditions for the applicable wire or cable configuration.

J. Aluminum Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

This paragraph is applicable for wires with an aluminum conductor. Refer to Subject 20-00-13.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Repair is necessary when these types of damage occur:

- Damage to the conductor; repair with a splice, refer to Subject 20-30-13
- Damage that goes through the primary insulation; refer to Paragraph 3.A.
- Damage that goes into the primary insulation; refer to Paragraph 3.A.
- The bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 42 and Paragraph 3.C.
- Damage to the insulation of a splice assembly when the conductor splice does not have damage; refer to Paragraph 3.F.

UNSERVICEABLE BROKEN BONDS

Figure 42

Repair is not necessary when these types of damage occur:

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough
- The bond between the overlaps of the tape of the insulation is broken for a length that is less than 50 percent of the diameter of the wire.

K. Copper Power Feeder Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

This paragraph is applicable for copper AWG 8 through AWG 4/0 wires that supply large quantities of power to equipment during normal airplane operation.

Repair is necessary when these types of damage occur:

- Damage to the conductor; repair with a splice, refer to Subject 20-30-13
- Damage that goes through the primary insulation; refer to Paragraph 3.A.
- Damage that goes into the primary insulation; refer to Paragraph 3.A.
- The bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 45 and Paragraph 3.C.
- Damage to the insulation of a splice assembly when the conductor splice does not have damage; refer to Paragraph 3.F.

UNSERVICEABLE BROKEN BONDS
Figure 45

Repair is not necessary when these types of damage occur:

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough
- The bond between the overlaps of the tape of the insulation is broken for a length that is less than 50 percent of the diameter of the wire.

Figure 47

L. Bond and Ground Jumper Assembly

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Replacement of the jumper assembly can be necessary if there are broken strands of the conductor. Refer to Subject 20-20-00 for the damage limits and service conditions.

Repair of an insulated jumper is necessary when these types of damage occur:

- Damage that goes through the insulation; refer to Paragraph 3.A.
- Damage that goes into the insulation; refer to Paragraph 3.A.

Repair is not necessary when these types of damage occur:

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough
- The bond between the overlaps of the tape of the insulation is broken for a length that is less than 50 percent of the diameter of the wire.

Refer to Figure 48.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 48

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE****M. Coax Cable**

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

The replacement of a coax cable is recommended if the damage to the shield or the dielectric is high.

Replacement of a coax cable is necessary when one of these conditions occurs:

- A coax cable that has a splice, has more damage that makes it necessary to repair the cable with a splice again
- The cable is in the Low Range Radio Altimeter Antenna System
- The cable is a tuned capture or tracking antenna cable that are connected to the Collins 51RV1, 51RV2, or 51RV4 VOR/ILS receivers.

CAUTION: COAX CABLES IN THESE SYSTEMS ARE SENSITIVE TO REPAIRS. IF THESE CABLES HAVE DAMAGE, THEY CANNOT BE REPAIRED AND MUST BE REPLACED:

- THE CABLES OF THE LOW RANGE RADIO ALTIMETER ANTENNA SYSTEM
- THE TUNED CAPTURE AND TRACKING ANTENNA CABLES THAT ARE CONNECTED TO THE COLLINS 51RV1, 51RV2, OR 51RV4 VOR/ILS RECEIVERS.

Repair is necessary when these types of damage occur:

- Damage to the shield is more than 1 inch in length; refer to Paragraph 7.B. or Paragraph 7.C. for a repair with a splice
- Damage to the shield is more than 25 percent of the circumference of the shield; refer to Paragraph 7.B. or Paragraph 7.C. for a repair with a splice
- Damage to the shield is less than 1 inch in length and less than 25 percent of the circumference of the shield; refer to Paragraph 7.A.
- Damage that goes through the jacket; refer to Paragraph 3.B.
- Damage that goes into the jacket; refer to Paragraph 3.B.

Refer to Figure 49.

CAUTION: COAX CABLES IN SOME SYSTEMS ARE SENSITIVE TO REPAIRS WITH A SPLICE. BEFORE A REPAIR WITH A SPLICE IS MADE ON A CABLE, AN ANALYSIS OF THE SYSTEM MUST BE DONE TO FIND THE APPLICABLE REPAIR CONDITIONS FOR THAT COAX CABLE IN THAT SYSTEM.

NOTE: Boeing Service Engineering can answer questions about the damage and repair conditions applicable for coax cables in a system.

UNSERVICEABLE JACKET AND SHIELD DAMAGE

Figure 49

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Repair is not necessary when these types of damage occur:

- A fold in the jacket at a bend
- A small scratch on the surface of the jacket
- Abrasion that makes the surface of the jacket rough.

Refer to Figure 50.

SERVICEABLE SCRATCHES AND ABRASION ON A COAX CABLE JACKET
Figure 50

N. Fire Resistant Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Replacement of a fire resistant wire is necessary when one of these conditions occurs:

- A wire that has a temporary repair, has more damage that makes it necessary to repair the wire again
- The wire has a temporary repair it has been a maximum of 500 flight hours subsequent to the repair
- A BMS 13-67 wire has damage that goes into the shield.

CAUTION: REPLACEMENT OF THE FIRE RESISTANT WIRE THAT HAS TEMPORARY REPAIR IS NECESSARY. THE WIRE MUST BE REPLACED AT A MAXIMUM OF 500 FLIGHT HOURS SUBSEQUENT TO THE REPAIR.

CAUTION: REPLACEMENT OF A BMS 13-67 WIRE THAT HAS DAMAGE TO THE SHIELD IS NECESSARY.

These conditions are applicable for unshielded fire resistant wire:

- If the conductor has damage, a temporary repair can be made; refer to Paragraph 9.B.
- If the damage goes through all the layers of insulation and the conductor can be seen, but the conductor does not have damage a temporary repair can be made; refer to Paragraph 9.A.
- If the bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire, a permanent repair can be made; refer to Figure 51 and Paragraph 9.A.
- If the damage goes into the outer layer of insulation but not through the outer layer of insulation, a permanent repair can be made; refer to Paragraph 9.A.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

UNSERVICEABLE BROKEN BONDS

Figure 51

These conditions are applicable for BMS 13-67 fire resistant wire and cable:

- If the damage goes into the shield, the wire or cable must be replaced
- If the damage goes through all the layers of insulation and the shield can be seen, but the shield does not have damage, a temporary repair can be made; refer to Paragraph 9.A.
- If the damage goes into the outer layer of insulation, but not through the outer layer of insulation, a temporary repair can be made; refer to Paragraph 9.A.

These conditions are applicable for other shielded fire resistant wire and cable:

- If the damage goes into the shield, the wire or cable must be replaced
- If the damage goes through all the layers of insulation and the shield can be seen, but the shield does not have damage, a temporary repair can be made; refer to Paragraph 9.A.
- If the damage goes into the outer layer of insulation, but not through the outer layer of insulation, a permanent repair can be made; refer to Paragraph 9.A.

Repair is not necessary when these type of damage occur:

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough
- The bond between the overlaps of the tape of the insulation is broken for a length that is less than 50 percent of the diameter of the wire.

Refer to Figure 52 and Figure 53.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 52

REPAIR OF ELECTRICAL WIRE AND CABLE

SERVICEABLE BROKEN BONDS
Figure 53

O. Flat Conductor Cable Assembly

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

FLAT CONDUCTOR CABLE ASSEMBLY
Figure 54

Refer to Figure 54.

Replacement of the cable assembly is necessary if these components have damage:

- The flat conductor cable
- The wafer of the connector
- The termination of the flat conductor cable
- The termination of a round conductor wire in the splice
- The BACS52H splice.

NOTE: The Boeing Spares Organization supplies the flat conductor cable assembly.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Repair is possible if these components have damage:

- A round conductor wire; refer to Paragraph 2.A.
- The termination of a round conductor wire in an MTC100-J()2(-) wafer of the connector; refer to Subject 20-73-00 to replace the round conductor wire.

P. ARINC 629 S280W502(-) Stub Cable

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Replacement is necessary when:

- Damage to the conductor of a cable that has a repair
- Damage to the shield of a cable that has a repair
- Damage to the primary insulation of a cable that has a repair.

Repair is necessary when these types of damage occur:

- Damage to the conductor; repair with a splice, refer to Subject 20-11-11
- Damage to the shield that is more than 1 inch in length or more than 25 percent of the circumference of the shield; repair with a splice, refer to Subject 20-11-11
- Damage to the shield that is less than 1 inch in length and less than 25 percent of the circumference of the shield; refer to Paragraph 6.C. for the repair of the shield
- Damage to the primary insulation; repair with a splice, refer to Subject 20-11-11
- Damage to the jacket of the cable; refer to Paragraph 3.B. for the repair of the jacket.

Repair is not necessary when these types of damage occur:

- A fold in the jacket or the primary insulation at a bend
- A small scratch on the surface of the jacket or the primary insulation
- Abrasion that makes the surface of the jacket or the primary insulation rough.

Refer to Figure 55.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 55

Q. ARINC 629 S280W651(-) Data Bus Cable Assembly

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Replacement is necessary when a cable, that has four splice assemblies on the same wire, has a damage condition that makes it necessary to repair that wire with a splice again.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Repair of an unshielded cable is necessary when these types of damage occur:

- Damage to the conductor; refer to Subject 20-11-11 for the repair with a splice
- Damage that goes through the primary insulation; refer to Subject 20-11-11 for the repair of the primary insulation of the wire
- Damage that goes into the primary insulation; refer to Subject 20-11-11 for the repair of the primary insulation of a wire
- The bond between the component wires is broken for a distance more than 0.5 inch at a location that is not at a coupler, a suppressor, or a clamp; refer to Figure 56 for the unserviceable condition and Subject 20-11-11 for the repair of the broken bond
- The bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 57 for the unserviceable condition and Subject 20-11-11 for the repair of the broken bonds.

Repair of a shielded cable is necessary when these types of damage occur:

- Damage to the conductor; refer to Subject 20-11-11 for the repair with a splice
- Damage to the primary insulation; refer to Subject 20-11-11 for the repair with a splice
- Damage to the shield that is more than 1 inch in length or more than 25 percent of the circumference of the shield; refer to Subject 20-11-11 for the repair with a splice
- Damage to the shield that is less than 1 inch in length and less than 25 percent of the circumference of the shield; refer to Paragraph 6.C. for the repair of the shield
- Damage that goes through the jacket, but the shield has no damage; refer to Paragraph 3.B. for the repair of the jacket
- Damage that goes into the jacket; refer to Paragraph 3.B. for the repair of the jacket
- The bond between the component wires is broken for a distance more than 0.5 inch at a location that is not at a coupler, a suppressor, or a clamp; refer to Figure 56 for the unserviceable condition and Subject 20-11-11 for the repair of the broken bond
- The bond between the overlaps of the tape of the jacket is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 57 for the unserviceable condition and Paragraph 3.C. for the repair of the broken bonds.

UNSERVICEABLE BROKEN BOND OF THE COMPONENT WIRES

Figure 56

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

UNSERVICEABLE BROKEN BONDS OF THE TAPE

Figure 57

Repair is not necessary when these types of damage occur:

- A fold in the jacket or the primary insulation at a bend
- A small scratch on the surface of the jacket or the primary insulation
- Abrasion that makes the surface of the jacket or the primary insulation rough.

Refer to Figure 58 and Figure 59.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 58

SERVICEABLE BROKEN BONDS

Figure 59

R. Shield Pull Through Shield Ground Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Repair is necessary when one or more of the strands of the shield conductor are damaged; refer to Figure 60 and Paragraph 8.A.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SHIELD PULL THROUGH SHIELD GROUND WIRE

Figure 60

S. Thermocouple Wire

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Repair is necessary when these types of damage occur:

- Damage to the conductor; refer to Paragraph 10.A.
- Damage that goes through the primary insulation; refer to Paragraph 3.A.
- Damage that goes into the primary insulation; refer to Paragraph 3.A.
- The bond between the overlaps of the tape of the insulation is broken for a length more than 50 percent of the diameter of the wire; refer to Figure 61 and Paragraph 3.C.
- Damage to the insulation of a splice assembly when the conductor splice does not have damage; refer to Paragraph 3.F.

UNSERVICEABLE BROKEN BONDS

Figure 61

Repair is not necessary when these types of damage occur:

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough
- The bond between the overlaps of the tape of the insulation is broken for a length that is less than 50 percent of the diameter of the wire.

Refer to Figure 62 and Figure 63.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 62

SERVICEABLE BROKEN BONDS

Figure 63

T. Engine Wire Harness Wire and Cable

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Refer to Table 3 for the location of the applicable wire and cable damage conditions.

An engine wire harness wire or cable that is repaired with a splice:

- Is a temporary repair
- Must be replaced at a maximum of 500 flight hours subsequent to the repair.

CAUTION: REPLACEMENT OF THE WIRE THAT HAS TEMPORARY REPAIR IS NECESSARY. THE WIRE MUST BE REPLACED AT A MAXIMUM OF 500 FLIGHT HOURS SUBSEQUENT TO THE REPAIR.

U. Fuel System Wiring

Fuel Systems Wiring is specified as a Critical Design Configuration Control Limitation (CDCCL).

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

For the conditions that are applicable for:

- The data in this paragraph, refer to Paragraph 1.A.
- Fuel Quantity Indicator System wiring that is in the fuel tank, refer to Paragraph 2.V.
- Fuel Quantity Indicator System wiring that is not in the fuel tank, refer to Paragraph 2.W.

V. Fuel Quantity Indicator System Wire and Cable that are Installed in a Fuel Tank

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Fuel Quantity Indicator System Wire and Cable is specified as Critical Design Configuration Limitation (CDCCL).

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

Repair is not is necessary when these types of damage occur:

Refer to Figure 64.

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION

Figure 64

Table 10 gives the damage conditions and repair procedures for the specified fuel quantity indicator system wire and cable that are installed in the fuel tank.

CAUTION: A FQIS CABLE WITH A GREEN OUTER BRAID THAT HAS A TEMPORARY REPAIR MUST BE REPLACED AT A MAXIMUM OF 4000 FLIGHT HOURS SUBSEQUENT TO THE REPAIR.

NOTE: The replacement of the wire or cable is a satisfactory alternative to the repair of the wire or cable.

W. Fuel Quantity Indicator System Wire and Cable that are not Installed in a Fuel Tank

For the conditions that are applicable to the data in this paragraph, refer to Paragraph 1.A.

Fuel Quantity Indicator System Wire and Cable is specified as Critical Design Configuration Limitation (CDCCL).

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

Repair not is necessary when these types of damage occur:

Refer to Figure 65.

- A fold in the insulation at a bend
- A small scratch on the surface of the insulation
- Abrasion that makes the surface of the insulation rough.

SERVICEABLE SCRATCHES, FOLDS, AND ABRASION
Figure 65

Table 11 gives the damage conditions and repair procedures for the specified fuel quantity indicator system wire and cable that is external to the fuel tank.

NOTE: The replacement of the wire or cable is a satisfactory alternative to the repair of the wire or cable.

3. REPAIR OF THE INSULATION OF WIRE AND CABLE

A. Repair of the Primary Insulation of a Wire

Refer to:

- Paragraph 1.B. for the applicable conditions for the repair of wire
 - Paragraph 2. for the damage and repair conditions for the wire that must have a repair.
- (1) Remove loose pieces of insulation and rough edges at the area of the damage.
Make sure that the insulation has a smooth surface.
 - (2) Clean the insulation with isopropyl alcohol. Refer to Figure 66.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure:

- To clean the damaged area of the insulation
- To clean the insulation approximately 3 inches on each side of the damage
- That the cleaned area is dry.

AREA TO CLEAN
Figure 66

(3) If the damage is a cavity in the insulation, fill in the cavity.

(a) Make a selection of a Temperature Grade D film strip from Table 6.

NOTE: A Temperature Grade D TFE tape from Table 6 is a satisfactory alternative to the film strip.

(b) Wind the necessary layers of film strip on the insulation to fill the cavity and make a smooth surface. Refer to Figure 67.

Make sure that each layer of film strip:

- Extends a minimum of 0.25 inch farther than each end of the damaged area
- Makes a 50 percent minimum circumferential overlap
- Is wound a minimum of two times on the insulation
- Is wound in the opposite direction of the layer before.

CAVITY FILLED WITH FILM STRIP
Figure 67

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

(4) Make a selection of one of these tapes from Table 6:

- Temperature Grade D TFE tape
- Temperature Grade C silicone tape.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

(5) Wind two layers of the tape on the damaged area. Refer to Figure 68.

Make sure that:

- If film strip is used to fill the cavity, each end of the tape extends a minimum of 0.75 inch farther than each end of the film strip
- Each end of the tape extends a minimum of 1 inch farther than each end of the damaged area
- Each layer of tape makes a 50 percent minimum circumferential overlap
- Each layer of tape is wound a minimum of two times on the wire
- The second layer of tape is wound in the opposite direction of the first layer.

TAPE AND WIRE HARNESS TIES ON THE INSULATION WITH DAMAGE

Figure 68

(6) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 68
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

B. Repair of the Outer Jacket of a Cable

Refer to:

- Refer to Paragraph 1.B. for the applicable conditions for the repair of cable
- Paragraph 2. for the damage and repair conditions for the cable that must have a repair.

(1) Make a selection of one of these tapes from Table 6:

- Temperature Grade D TFE tape
- Temperature Grade C silicone tape.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (2) Remove loose pieces of insulation and rough edges at the area of the damage.
Make sure that the insulation has a smooth surface.

- (3) Clean the outer jacket with isopropyl alcohol. Refer to Figure 69.

Make sure:

- To clean the damaged area of the outer jacket
- To clean the outer jacket approximately 3 inches on each side of the damage
- That the cleaned area is dry.

AREA TO CLEAN
Figure 69

- (4) Wind two layers of the tape on the damaged area. Refer to Figure 70.

Make sure that:

- Each end of the tape extends a minimum of 0.5 inch farther than each end of the damaged area
- Each layer of tape makes a 50 percent minimum circumferential overlap
- Each layer of tape is wound a minimum of two times on the cable
- The second layer of tape is wound in the opposite direction of the first layer.

TAPE AND WIRE HARNESS TIES ON THE CABLE
Figure 70

- (5) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Refer to:

- Figure 70
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

C. Repair of a Broken Bond Between Overlaps in the Primary Insulation and Outer Jacket

Refer to:

- Paragraph 1.B. for the applicable conditions for the repair of wire and cable
- Paragraph 2. for the damage and repair conditions for the wire or the cable that must have a repair.

(1) Make a selection of one of these insulation materials from Table 6:

- Temperature Grade D TFE tape
- Temperature Grade D film strip
- Temperature Grade C silicone tape.

Make sure that the insulation material is the correct Temperature Grade.

(2) Remove loose pieces of insulation and rough edges at the area of the broken bond.

Make sure that the insulation has a smooth surface.

(3) Clean the insulation with isopropyl alcohol.

Make sure:

- To clean the damaged area of the insulation
- To clean the insulation approximately 3 inches on each side of damage
- That the cleaned area is dry.

(4) Wind two layers of the insulation material on the wire.

Make sure that:

- Each end of the insulation material extends a minimum of 1 inch farther than each end of the damaged area
- Each layer makes a 50 percent minimum circumferential overlap
- Each layer is wound a minimum of two times on the wire
- The second layer of tape is wound in the opposite direction of the first layer.

(5) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the insulation material.

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 71
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

LOCATION OF WIRE HARNESS TIES

Figure 71

D. Repair of the Primary Insulation of a Wire in a Cable

Refer to Paragraph 1.B. for the applicable conditions for the repair of wire and cable.

- (1) Make a selection of a Temperature Grade D film strip from Table 6.

NOTE: A Temperature Grade D TFE tape from Table 6 is a satisfactory alternative to the film strip.

- (2) Make a selection of one of these tapes from Table 6:

- Temperature Grade D TFE tape
- Temperature Grade C silicone tape.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

- (3) Remove loose pieces of insulation and rough edges at the area of the damage.

Make sure that the insulation has a smooth surface.

- (4) Clean the jacket with isopropyl alcohol. Refer to Figure 72.

Make sure:

- To clean the damaged area of the jacket
- To clean the jacket from the damaged area to a minimum of 3 inches on each side of the damage
- That the cleaned area is dry.

AREA TO CLEAN

Figure 72

- (5) Remove the necessary length of the jacket on each side of the damage.
Make sure a sufficient length is removed to repair the wires in the cable.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CAUTION: DO NOT CUT THE PRIMARY INSULATION ON THE WIRES IN THE CABLE WHEN THE LENGTH OF THE JACKET IS REMOVED. DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

- (6) Repair the primary insulation of each wire with damage. Refer to Paragraph 3.A.
- (7) Wind the necessary layers of film strip on the cable to fill the cavity where the jacket is removed and to make a smooth surface. Refer to Figure 73.

Make sure that each layer of film strip:

- Makes an overlap of 0.25 inch minimum on each end of the outer jacket
- Makes a 50 percent minimum circumferential overlap
- Is wound a minimum of two times on the cable
- Is wound in the opposite direction of the layer before.

FILM STRIP ON THE CABLE

Figure 73

- (8) Put two layers of the tape on the damage. Refer to Figure 74.

Make sure that:

- Each end of the tape extends a minimum of 0.75 inch from each end of the film strip
- Each layer makes a 50 percent circumferential overlap
- The second layer of tape is in the opposite direction of the first layer.

TAPE AND WIRE HARNESS TIES ON THE CABLE

Figure 74

- (9) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 74
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

E. Repair of a Non-Metallic Braid

Refer to Paragraph 1.B. for the applicable conditions for the repair of wire and cable.

(1) Make a selection of one of these tapes from Table 6:

- Temperature Grade C or D TFE tape
- Temperature Grade C silicone tape
- Temperature Grade A polyester tape.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

(2) Make a selection of a coating material from Table 8.

(3) Prepare the end of the braid:

- (a) Cut the ends of the damaged area of the braid.
Make sure that the ends of the braid are smooth and straight.
- (b) Apply a layer of the varnish on the end of the braid.
- (c) Cure the varnish at room temperature.

(4) If it is necessary, do Step (3) again.

(5) Wind a layer of the tape on the damaged area of the wire or cable.

Make sure that:

- Each end of the tape extends a minimum of 0.75 inch farther than each end of the damaged area
- The tape makes a 50 percent circumferential overlap.

(6) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 75
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

TAPE AND WIRE HARNESS TIE ON THE WIRE OR CABLE

Figure 75

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

F. Repair of the Insulation of a Splice Assembly

For the damage and repair conditions that are applicable for:

- Wire and cable, refer to Paragraph 1.B.
- A splice assembly, refer to Paragraph 1.F.

- (1) Make a selection of a Temperature Grade C silicone tape from Table 6.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

- (2) Remove loose pieces of insulation and rough edges at the area of the damage.

Make sure that the insulation has a smooth surface.

- (3) Clean the insulation of the splice assembly and the insulation of the wire or cable with isopropyl alcohol.

Make sure:

- To clean all of the insulation of the splice
- To clean the insulation of the wire or cable a minimum of 1 inch farther than each end of the splice.

- (4) Let the cleaned areas dry.

- (5) Wind a minimum of two layers of tape on the splice. Refer to Figure 76.

Make sure that each layer of tape:

- Extends a minimum of 0.5 inch farther than each end of the splice
- The tape makes 50 percent circumferential overlap
- The second layer of tape is in the opposite direction of the first layer.

POSITION OF THE TAPE AND THE WIRE HARNESS TIES

Figure 76

- (6) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Refer to:

- Figure 76
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

4. REPAIR OF UNSHIELDED WIRE AND UNSHIELDED CABLE WITH A SPLICE ASSEMBLY**A. Repair of a Wire**

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire with a splice.

(1) Remove the damaged length of the wire.

(a) On one side of the damage, cut the wire.

Make sure that the end of the wire is perpendicular to the longitudinal axis of the wire.

(b) On the other side of the damage, cut the wire.

Make sure that the end of the wire is perpendicular to the longitudinal axis of the wire.

(2) Clean the insulation with isopropyl alcohol.

Make sure:

- To clean the area of the insulation from the end of each wire to a minimum of 3 inches from the end
- That the cleaned area is dry.

(3) Assemble a sealed splice.

For the splice of:

- An AWG 8 or larger high temperature wire, refer to Subject 20-30-13
- All other wires, refer to Subject 20-30-12 for the selection of a sealed splice configuration.

Make sure that the configuration is applicable for the wire.

B. Repair of a Cable

Refer to Paragraph 1.E. for the applicable conditions for the repair of cable with a splice.

(1) Remove the damaged length of the cable.

(a) On one side of the damage, cut the cable.

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

(b) On the other side of the damage, cut the cable.

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

(2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the area of the jacket from the end of each cable to a minimum of 3 inches from the end
- That the cleaned area is dry.

(3) Assemble a sealed splice.

Refer to the selection of a sealed splice configuration in Subject 20-30-12.

Make sure that the configuration is applicable for the cable.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE****5. REPAIR OF SHIELDED WIRE AND SHIELDED CABLE WITH A SPLICE ASSEMBLY****A. Repair of a Shielded Wire with a Splice Assembly**

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire with a splice.

- (1) Remove the damaged length of the shielded wire.
 - (a) On one side of the damage, cut the shielded wire.

Make sure that the end of the shielded wire is perpendicular to the longitudinal axis of the wire.
 - (b) On the other side of the damage, cut the shielded wire.

Make sure that the end of the shielded wire is perpendicular to the longitudinal axis of the wire.
- (2) Clean the jacket with isopropyl alcohol.

Make sure:

 - To clean the area from the end of each wire to a minimum of 3 inches from the end.
 - That the cleaned area is dry.
- (3) Assemble a sealed splice.

Refer to the selection of a sealed splice configuration in Subject 20-30-12.

Make sure that the configuration is applicable for the shielded wire.

B. Repair of a Shielded Wire with a Splice Assembly - Two Adjacent Shields

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire with a splice.

- (1) Remove the damaged length of the shielded wire.
 - (a) On one side of the damage, cut the shielded wire.

Make sure that the end of the shielded wire is perpendicular to the longitudinal axis of the wire.
 - (b) On the other side of the damage, cut the shielded wire.

Make sure that the end of the shielded wire is perpendicular to the longitudinal axis of the wire.
- (2) Clean the outer jacket with isopropyl alcohol.

Make sure:

 - To clean the area from the end of each wire to a minimum of 3 inches from the end.
 - That the cleaned area is dry.
- (3) Assemble a sealed splice.

Refer to the selection of a sealed splice configuration in Subject 20-30-12.

Make sure that the configuration is applicable for the shielded wire.

C. Repair of a Shielded Wire with a Splice Assembly in a Fuel Vapor Area - Two Round Conductor Shields That Are Not Adjacent

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire with a splice.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 77

Refer to Figure 77.

(1) Prepare each end of the shielded wire.

Refer to:

- Figure 78
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

SHIELDED WIRE PREPARATION

Figure 78

- (a) Remove 2.25 inches ± 0.06 inch of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the outer shield from the end of the wire.
Make sure that the distance between the end of the outer jacket and the end of the outer shield is 0.31 inch ± 0.06 inch.
- (c) Remove 1.25 inch ± 0.06 inch of the inner jacket from the end of the wire.
- (d) Remove the necessary length of the inner shield from the end of the wire.

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the distance between the end of the inner jacket and the end of the inner shield is 0.31 inch \pm 0.06 inch.

- (e) Remove 0.53 inch \pm 0.06 inch of the primary insulation from the end of the wire.
- (2) Make a selection of a shield material for the outer shield from Table 9.
- Make sure that the shield material has:
- The applicable Temperature Grade
 - The smallest diameter that can go on the folded back outer shield of the wire.
- NOTE:** For alternative shield materials, refer to Subject 20-00-11.
- (3) Cut a 5.5 inch \pm 0.1 inch length of the shield material for the outer shield.
- (4) Make a selection of a shield material for the inner shield from Table 9.
- Make sure that the shield material has:
- The applicable Temperature Grade
 - The smallest diameter that can go on the folded back inner shield of the wire.
- NOTE:** For alternative shield materials, refer to Subject 20-00-11.
- (5) Cut a 3.5 inch \pm 0.1 inch length of the shield material for the inner shield.
- (6) Make a selection of two sets of inner ferrules and outer ferrules for the outer shield. Refer to Subject 20-30-12.
- Make sure that:
- The ferrules have the applicable Temperature Grade
 - The inner ferrule is the smallest ferrule that can move freely on the outer jacket
 - The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back outer shield, and the shield material.
- (7) Put one inner ferrule on the outer jacket of each wire.
- (8) Put the shield material for the outer shield on the outer jacket of one wire.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (9) Put the 2 outer ferrules on the shield material for the outer shield.
- (10) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules for the inner shield. Refer to Subject 20-30-12.
- Make sure that:
- The inner ferrule is the smallest ferrule that can move freely on the inner jacket
 - The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back inner shield, and the shield material.
- (11) Put one inner ferrule on the inner jacket of each wire.
- (12) Put the shield material for the inner shield on the inner jacket of one wire.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (13) Put the two outer ferrules on the shield material for the inner shield.
- (14) Make a selection of an applicable butt splice assembly configuration for a wire. Refer to Subject 20-30-12.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (15) Assemble the splice of the wire. Refer to the assembly procedure for the butt splice assembly configuration.
Make sure to cut the conductor to the correct length specified in the assembly procedure for the splice.
- (16) Make a selection of the necessary ferrule crimp tools for the outer and inner shield splice. Refer to Subject 20-30-12.
- (17) Assemble the end of the inner shield splice opposite the end with the shield material. Refer to Figure 79.

CONFIGURATION OF THE INNER SHIELD SPLICE ASSEMBLY

Figure 79

- (a) Move the strands of the shield apart and make them straight.
 - (b) Align the forward end of the inner ferrule with the end of the inner jacket.
 - (c) Fold the strands of the shield back on the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
 - (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (f) Crimp the ferrules.
- (18) Do Step (17) again to assemble the other end of the inner shield splice. Refer to Figure 79.
Make sure that the shield material is pulled tight before the ferrules are crimped.
 - (19) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the inner shield splice.
 - (20) Make a selection of an insulation tape from Table 6.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

(21) Put insulation tape on the inner shield splice. Refer to Figure 79.

(a) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(b) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(22) Assemble the end of the outer shield splice opposite the end with the shield material.

(a) Move the strands of the shield apart and make them straight.

(b) Align the forward end of the inner ferrule with the end of the inner jacket.

(c) Fold the strands of the shield back on the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

(d) Align the end of the shield material with the end of the strands of the shield that are folded back.

(e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(f) Crimp the ferrules.

(23) Do Step (22) again to assemble the other end of the outer shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

(24) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the outer shield splice.

(25) Put insulation tape on the outer shield splice.

(a) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(b) Tightly wind a second layer of the tape on the splice assembly.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(26) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the tie material is the correct Temperature Grade.

D. Repair of a Shielded Wire with a Splice Assembly - Two Round Conductor Shields That Are Not Adjacent

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire with a splice.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 80

Refer to Figure 80.

(1) Prepare each end of the shielded wire.

Refer to:

- Figure 81
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SHIELDED WIRE PREPARATION
Figure 81

- (a) Remove 2.25 inches ± 0.06 inch of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the outer shield from the end of the wire.
Make sure that the distance between the end of the outer jacket and the end of the outer shield is 0.31 inch ± 0.06 inch.
- (c) Remove 1.25 inch ± 0.06 inch of the inner jacket from the end of the wire.
- (d) Remove the necessary length of the inner shield from the end of the wire.
Make sure that the distance between the end of the inner jacket and the end of the inner shield is 0.31 inch ± 0.06 inch.
- (e) Remove 0.53 inch ± 0.06 inch of the primary insulation from the end of the wire.

- (2) Make a selection of a shield material for the outer shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back outer shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (3) Cut a 5.5 inch ± 0.1 inch length of the shield material for the outer shield.
- (4) Make a selection of a shield material for the inner shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back inner shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (5) Cut a 3.5 inch ± 0.1 inch length of the shield material for the inner shield.
- (6) Make a selection of a heat shrinkable sleeve from Table 5.

Make sure that the sleeve has:

- The applicable Temperature Grade
- The smallest diameter that can move freely on the outer jacket.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

- (7) Cut a 7.5 inch minimum length of the heat shrinkable sleeve.
- (8) Put the sleeve on the outer jacket of one of the wires.
- (9) Make a selection of two sets of inner ferrules and outer ferrules for the outer shield. Refer to Subject 20-30-12.

Make sure that:

- The ferrules have the applicable Temperature Grade
- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back outer shield, and the shield material.

- (10) Put one inner ferrule on the outer jacket of each wire.
- (11) Put the shield material for the outer shield on the outer jacket of one wire.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (12) Put the 2 outer ferrules on the shield material for the outer shield.
- (13) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules for the inner shield. Refer to Subject 20-30-12.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the inner jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back inner shield, and the shield material.

- (14) Put one inner ferrule on the inner jacket of each wire.
- (15) Put the shield material for the inner shield on the inner jacket of one wire.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (16) Put the two outer ferrules on the shield material for the inner shield.
- (17) Make a selection of an applicable butt splice assembly configuration for a wire. Refer to Subject 20-30-12.
- (18) Assemble the splice of the wire. Refer to the assembly procedure for the butt splice assembly configuration.

Make sure to cut the conductor to the correct length specified in the assembly procedure for the splice.

- (19) Make a selection of the necessary ferrule crimp tools for the outer and inner shield splice. Refer to Subject 20-30-12.
- (20) Assemble the end of the inner shield splice opposite the end with the shield material. Refer to Figure 82.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE INNER SHIELD SPLICE ASSEMBLY

Figure 82

- (a) Move the strands of the shield apart and make them straight.
 - (b) Align the forward end of the inner ferrule with the end of the inner jacket.
 - (c) Fold the strands of the shield back over the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
 - (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (f) Crimp the ferrules.
- (21) Do Step (20) again to assemble the other end of the inner shield splice. Refer to Figure 82.
Make sure that the shield material is pulled tight before the ferrules are crimped.
 - (22) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the inner shield splice.
 - (23) Make a selection of an insulation tape from Table 6.
Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.
 - (24) Put insulation tape on the inner shield splice. Refer to Figure 82.
 - (a) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
 - Makes a 50 percent overlap.
 - (b) Tightly wind a second layer of the tape on the splice assembly.

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(25) Assemble the end of the outer shield splice opposite the end with the shield material.

- (a) Move the strands of the shield apart and make them straight.
- (b) Align the forward end of the inner ferrule with the end of the inner jacket.
- (c) Fold the strands of the shield back on the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

- (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(f) Crimp the ferrules.

(26) Do Step (25) again to assemble the other end of the outer shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

(27) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the outer shield splice.

(28) Put insulation tape on the outer shield splice.

(a) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(b) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(29) Align the center of the heat shrinkable sleeve with the center of the splice assembly.

(30) Shrink the sleeve into its position. Refer to Subject 20-10-14.

E. Repair of a Shielded Cable with a Splice Assembly

Refer to Paragraph 1.E. for the applicable conditions for the repair of cable with a splice.

(1) Remove the damaged length of the shielded cable.

(a) On one side of the damage, cut the shielded cable.

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

- (b) On the other side of the damage, cut the shielded cable.

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

- (2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the area of the jacket from the end of each cable to a minimum of 3 inches from the end
- That the cleaned area is dry.

- (3) Assemble a sealed splice.

Refer to the selection of a sealed splice configuration in Subject 20-30-12.

Make sure that the configuration is applicable for the shielded cable.

F. Repair of a Shielded Cable with a Splice Assembly - Two Adjacent Shields

Refer to Paragraph 1.E. for the applicable conditions for the repair of cable with a splice.

- (1) Remove the damaged length of the shielded cable.

- (a) On one side of the damage, cut the shielded cable.

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

- (b) On the other side of the damage, cut the shielded cable.

Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

- (2) Clean the outer jacket with isopropyl alcohol.

Make sure:

- To clean the area of the jacket from the end of each cable to a minimum of 3 inches from the end
- That the cleaned area is dry.

- (3) Assemble a sealed splice.

Refer to the selection of a sealed splice configuration in Subject 20-30-12.

Make sure that the configuration is applicable for the shielded cable.

G. Repair of a Shielded Cable with a Splice Assembly in a Fuel Vapor Area - Two Round Conductor Shields That Are Not Adjacent

Refer to Paragraph 1.E. for the applicable conditions for the repair of cable with a splice.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 83

Refer to Figure 83.

(1) Prepare each end of the shielded cable.

Refer to:

- Figure 84
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the outer shield is 0.31 inch \pm 0.06 inch
- The minimum distance from the end of the outer shield to the end of the inner jacket is 0.50 inch
- The distance from the end of the inner jacket to the end of the inner shield is 0.31 inch \pm 0.06 inch
- The distance from the end of the inner shield to the end of the nearest wire is 1.75 inches \pm 0.25 inch
- The distance from the end of a wire to the end of a different wire is 2.38 inches \pm 0.25 inch.

SHIELDED CABLE PREPARATION

Figure 84

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

- (2) Make a selection of a shield material for the outer shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back outer shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (3) Cut a 5.5 inch ± 0.1 inch length of the shield material for the outer shield.

- (4) Make a selection of a shield material for the inner shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back inner shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (5) Cut a 3.5 inch ± 0.1 inch length of the shield material for the inner shield.

- (6) Make a selection of two sets of inner ferrules and outer ferrules for the outer shield. Refer to Subject 20-30-12.

Make sure that:

- The ferrules have the applicable Temperature Grade
- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back outer shield, and the shield material.

- (7) Put one inner ferrule on the outer jacket of each cable.

- (8) Put the shield material for the outer shield on the outer jacket of one cable.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

- (9) Put the 2 outer ferrules on the shield material for the outer shield.

- (10) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules for the inner shield. Refer to Subject 20-30-12.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the inner jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back inner shield, and the shield material.

- (11) Put one inner ferrule on the inner jacket of each cable.

- (12) Put the shield material for the inner shield on the inner jacket of one cable.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

- (13) Put the two outer ferrules on the shield material for the inner shield.

- (14) Make a selection of an applicable butt splice assembly configuration for a wire. Refer to Subject 20-30-12.

- (15) Assemble the splices of the wires. Refer to the assembly procedure for the butt splice assembly configuration.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure to cut the conductor to the correct length specified in the assembly procedure for the splice.

- (16) Make a selection of the necessary ferrule crimp tools for the outer and inner shield splice. Refer to Subject 20-30-12.
- (17) Assemble the end of the inner shield splice opposite the end with the shield material. Refer to Figure 85.

CONFIGURATION OF THE INNER SHIELD SPLICE ASSEMBLY

Figure 85

- (a) Move the strands of the shield apart and make them straight.
 - (b) Align the forward end of the inner ferrule with the end of the inner jacket.
 - (c) Fold the strands of the shield back on the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
 - (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (f) Crimp the ferrules.
- (18) Do Step (17) again to assemble the other end of the inner shield splice. Refer to Figure 85.
Make sure that the shield material is pulled tight before the ferrules are crimped.
 - (19) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the inner shield splice.
 - (20) Make a selection of an insulation tape from Table 6.
Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.
 - (21) Put insulation tape on the inner shield splice. Refer to Figure 85.
 - (a) Tightly wind a layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

- (b) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

- (22) Assemble the end of the outer shield splice opposite the end with the shield material.

- (a) Move the strands of the shield apart and make them straight.
(b) Align the forward end of the inner ferrule with the end of the inner jacket.
(c) Fold the strands of the shield back on the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

- (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
(e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (f) Crimp the ferrules.

- (23) Do Step (22) again to assemble the other end of the outer shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (24) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the outer shield splice.

- (25) Put insulation tape on the outer shield splice.

- (a) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

- (b) Tightly wind a second layer of the tape on the splice assembly.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(26) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the tie material is the correct Temperature Grade.

H. Repair of a Shielded Cable with a Splice Assembly - Two Round Conductor Shields That Are Not Adjacent

Refer to Paragraph 1.E. for the applicable conditions for the repair of cable with a splice.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 86

Refer to Figure 86.

(1) Prepare each end of the shielded cable.

Refer to:

- Figure 87
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the outer shield is 0.31 inch \pm 0.06 inch
- The minimum distance from the end of the outer shield to the end of the inner jacket is 0.50 inch
- The distance from the end of the inner jacket to the end of the inner shield is 0.31 inch \pm 0.06 inch
- The distance from the end of the inner shield to the end of the nearest wire is 1.75 inches \pm 0.25 inch
- The distance from the end of a wire to the end of a different wire is 2.38 inches \pm 0.25 inch.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SHIELDED CABLE PREPARATION

Figure 87

- (2) Make a selection of a shield material for the outer shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back outer shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (3) Cut a 5.5 inch ±0.1 inch length of the shield material for the outer shield.

- (4) Make a selection of a shield material for the inner shield from Table 9.

Make sure that the shield material has:

- The applicable Temperature Grade
- The smallest diameter that can go on the folded back inner shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (5) Cut a 3.5 inch ±0.1 inch length of the shield material for the inner shield.

- (6) Make a selection of a heat shrinkable sleeve from Table 5.

Make sure that the sleeve has:

- The applicable Temperature Grade
- The smallest diameter that can move freely on the outer jacket.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (7) Cut the necessary length of the heat shrinkable sleeve.

Make sure that the sleeve extends one inch farther than the rear end of the outer ferrule on each side of the splice assembly.

- (8) Put the sleeve on the outer jacket of one of the cables.

- (9) Make a selection of two sets of inner ferrules and outer ferrules for the outer shield. Refer to Subject 20-30-12.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that:

- The ferrules have the applicable Temperature Grade
- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back outer shield, and the shield material.

(10) Put one inner ferrule on the outer jacket of each cable.

(11) Put the shield material for the outer shield on the outer jacket of one cable.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

(12) Put the 2 outer ferrules on the shield material for the outer shield.

(13) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules for the inner shield. Refer to Subject 20-30-12.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the inner jacket
- The outer ferrule is the smallest ferrule that can move freely on the inner ferrule, the folded back inner shield, and the shield material.

(14) Put one inner ferrule on the inner jacket of each cable.

(15) Put the shield material for the inner shield on the inner jacket of one cable.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

(16) Put the two outer ferrules on the shield material for the inner shield.

(17) Make a selection of an applicable butt splice assembly configuration for a wire. Refer to Subject 20-30-12.

(18) Assemble the splices of the wires. Refer to the assembly procedure for the butt splice assembly configuration.

Make sure to cut the conductor to the correct length specified in the assembly procedure for the splice.

(19) Make a selection of the necessary ferrule crimp tools for the outer and inner shield splice. Refer to Subject 20-30-12.

(20) Assemble the end of the inner shield splice opposite the end with the shield material. Refer to Figure 88.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE INNER SHIELD SPLICE ASSEMBLY

Figure 88

- (a) Move the strands of the shield apart and make them straight.
 - (b) Align the forward end of the inner ferrule with the end of the inner jacket.
 - (c) Fold the strands of the shield back on the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
 - (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (f) Crimp the ferrules.
- (21) Do Step (20) again to assemble the other end of the inner shield splice. Refer to Figure 88.
Make sure that the shield material is pulled tight before the ferrules are crimped.
 - (22) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the inner shield splice.
 - (23) Make a selection of an insulation tape from Table 6.
Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.
 - (24) Put insulation tape on the inner shield splice. Refer to Figure 88.
 - (a) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
 - Makes a 50 percent overlap.
 - (b) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(25) Assemble the end of the outer shield splice opposite the end with the shield material.

- (a) Move the strands of the shield apart and make them straight.
- (b) Align the forward end of the inner ferrule with the end of the inner jacket.
- (c) Fold the strands of the shield back over the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

- (d) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (e) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(f) Crimp the ferrules.

(26) Do Step (25) again to assemble the other end of the outer shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

(27) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the outer shield splice.

(28) Put insulation tape on the outer shield splice.

(a) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(b) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(29) Align the center of the heat shrinkable sleeve with the center of the splice assembly.

(30) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

6. REPAIR OF THE SHIELD OF A SHIELDED WIRE AND A SHIELDED CABLE

A. Selection of a Sealed Shield Splice Configuration

Refer to:

- Paragraph 2. for the damage and repair conditions of the applicable shielded wire or shielded cable
- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice.

**Table 13
SEALED SHIELD SPLICE CONFIGURATIONS**

C. Shield Repair - Tape and Ties

Refer to Paragraph 1.B. for the applicable conditions for the repair of wire and cable.

(1) Make a selection of one of these tapes from Table 6:

- Temperature Grade C or D TFE Tape
- Temperature Grade A polyester tape.

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

(2) Clean the jacket with isopropyl alcohol. Refer to Figure 89.

Make sure:

- To clean the damaged area of the jacket
- To clean the jacket approximately 3 inches on each side of the damage
- That the cleaned area is dry.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

AREA TO CLEAN

Figure 89

- (3) Put the strands of the damaged shield:
- Flat against the primary insulation
 - Even and symmetrical around the circumference of the area with damage.

Refer to Figure 90.

POSITION OF THE SHIELD FOR REPAIR

Figure 90

- (4) Put a minimum of two layers of the tape on the damaged area. Refer to Figure 91.
- Make sure that:
- Each end of the tape extends a minimum of 0.5 inch farther than each end of the damaged area
 - The tape makes 50 percent circumferential overlap
 - The second layer of tape is in the opposite direction of the first layer.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

TAPE AND WIRE HARNESS TIES ON THE SHIELDED WIRE OR SHIELDED CABLE

Figure 91

- (5) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from each end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 91
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

D. Shield Repair - Solder Shield Splice Sleeve

**Table 16
SOLDER SHIELD SPLICE SLEEVE**

Jacket O.D. (inch)		Part Number	Supplier
Maximum	Minimum		
0.11	0.06	D-155-0350	Raychem

D-155-0450	2.18	±0.04

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Table 17 (continued)

Solder Shield Splice Sleeve	Jacket Removal Length L (inch)	
	Target	Tolerance
D-155-0475	3.16	± 0.04
D-155-0550	2.18	± 0.04
D-155-0575	3.16	± 0.04
D-155-0675	3.16	± 0.04
D-155-0975	3.16	± 0.04

Refer to Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice.

- (1) Make a selection of a solder shield splice sleeve from Table 16.

Make sure that the O.D of the wire or cable is:

- Near but not more than the maximum jacket O.D for the sleeve
- More than the minimum jacket O.D. for the sleeve.

- (2) Remove the necessary length of the outer jacket. Refer to Figure 92.

JACKET REMOVAL
Figure 92

- (a) Find the length of the jacket to remove from Table 17.
- (b) Carefully cut the jacket around the circumference of the wire or the cable on each side of the damaged area of the shield.

Make sure that:

- The distance between the two ends of the jacket is equal to the jacket removal length
- The damaged area is in the center of the two ends of the jacket.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (3) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the outer jacket approximately 3 inches from each end of the jacket
- That the cleaned area is dry.

- (4) Put the strands of the damaged shield:

- Flat against the primary insulation
- Even and symmetrical around the circumference of the area with damage.

- (5) Put the sleeve on the wire or cable.

- (6) Push the sleeve on the area where the jacket is removed. Refer to Figure 93.

Make sure that each end of the jacket is between the seal ring and the solder shield material in the sleeve.

POSITION OF THE SOLDER SHIELD SPLICE SLEEVE

Figure 93

- (7) Shrink one end of the shield splice sleeve. Refer to Subject 20-10-14.

- (a) Apply heat at the center of the sleeve until the solder melts and the sleeve begins to shrink.
- (b) Continue to apply heat from the center of the sleeve to one end of the sleeve until the solder melts and flows.

- (8) Do Step (7) again for the other end of the sleeve.

E. Shield Repair - Solder Sleeves, Shield Material, Tape, and a Sleeve without Shield Folded Back

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 94 for the configuration of the splice assembly.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 94

- (1) Remove the necessary length of the outer jacket. Refer to Figure 95.

JACKET REMOVAL

Figure 95

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the area from each end of the jacket to a minimum of 3 inches to the rear
- That the cleaned area is dry.

- (3) Make a selection of a Temperature Grade B shield material from Table 9.

Make sure that the shield material has the smallest diameter that can be put on the shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (4) Put the strands of the damaged shield:

- Flat against the primary insulation
- Even and symmetrical around the circumference of the area with damage.

- (5) Cut a length of the shield material that is equal to the length of the jacket that is removed from the wire or the cable. Refer to Figure 96.

Make sure that each end of the shield material is a maximum of 0.1 inch from the nearest end of the jacket.

POSITION OF THE SHIELD MATERIAL

Figure 96

- (6) Put the shield material on the wire or cable. Refer to Figure 96.

- (7) Make a selection of two solder sleeves from Table 14.

Refer to Figure 96 for the applicable dimensions of the shield splice assembly.

- (8) Assemble one end of the shield splice.

- (a) Put the solder sleeve on the wire or cable. Refer to Figure 97.

Make sure that:

- The end of the shield material is a maximum of 0.1 inch from the end of the jacket
- The inner edge of the rear seal ring is aligned with the end of the jacket
- The seal ring does not make an overlap with the shield.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

POSITION OF THE SOLDER SLEEVE

Figure 97

- (b) Shrink the solder sleeve into position.
Make sure that:
 - The solder sleeve stays in the correct position
 - A minimum of 75 percent of the indicator ring on top of the solder ring is melted.
- (9) Do Step (8) again to assemble the other end of the shield splice.
Make sure the shield material is pulled tight before the end of the splice is assembled.
- (10) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 5.
Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.
NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (11) Cut the necessary length of the heat shrinkable sleeve.
Make sure that the length is a minimum of 1 inch farther than the rear end of the solder sleeve on each end of the splice assembly.
- (12) Make a selection of a Temperature Grade B or higher TFE insulation tape from Table 6.
- (13) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at the other end of the splice
 - Makes a 50 percent overlap.
- (14) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (15) Put the sleeve on the shield splice assembly.
Make sure that each end of the sleeve is a minimum of 0.25 inch farther than the end of the tape on each end of the splice assembly.
- (16) Shrink the sleeve into position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

F. Shield Repair - Solder Sleeves, Shield Material, Tape, and Ties without Shield Folded Back

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 98 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 98

- (1) Remove the necessary length of the outer jacket. Refer to Figure 99.

JACKET REMOVAL
Figure 99

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the outer jacket approximately 3 inches from each end of the jacket
- That the cleaned area is dry.

- (3) Make a selection of a Temperature Grade B shield material from Table 9.

Make sure that the shield material has the smallest diameter that can be put on the shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (4) Put the strands of the damaged shield:

- Flat against the primary insulation
- Even and symmetrical around the circumference of the area with damage.

- (5) Cut a length of the shield material that is equal to the length of the jacket that is removed from the wire or the cable. Refer to Figure 100.

Make sure that each end of the shield material is a maximum of 0.1 inch from the nearest end of the jacket.

POSITION OF THE SHIELD MATERIAL

Figure 100

- (6) Put the shield material on the wire or cable. Refer to Figure 100.

- (7) Make a selection of two solder sleeves from Table 14.

Refer to Figure 100 for the applicable dimensions of the shield splice assembly.

- (8) Assemble one end of the shield splice.

- (a) Put the solder sleeve on the wire or cable. Refer to Figure 101.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that:

- The end of the shield material is a maximum of 0.1 inch from the end of the jacket
- The inner edge of the rear seal ring is aligned with the end of the jacket
- The seal ring does not make an overlap with the shield.

POSITION OF THE SOLDER SLEEVE ON THE SHIELD MATERIAL

Figure 101

(b) Shrink the solder sleeve into position.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

(9) Do Step (8) again to assemble the other end of the shield splice.

Make sure the shield material is pulled tight before the end of the splice is assembled.

(10) Make a selection of a Temperature Grade B or higher TFE insulation tape from Table 6.

(11) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at the other end of the splice
- Makes a 50 percent overlap.

(12) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(13) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

G. Shield Repair - Solder Sleeves, Shield Material, Tape, and a Sleeve with Shield Folded Back

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 102 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 102

- (1) Remove the necessary length of the outer jacket. Refer to Figure 103.

JACKET REMOVAL
Figure 103

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the jacket approximately 3 inches from each end of the jacket
- That the cleaned area is dry.

- (3) Prepare the shield. Refer to Figure 104.

SHIELD PREPARATION

Figure 104

- (a) Carefully cut around the circumference of the shield on each side of the damaged area.

Make sure that the distance from the end of the jacket to the end of the shield is 0.25 inch ± 0.06 inch.

- (b) Remove the unwanted shield with the damage.

- (4) Fold the shield back against the jacket on the rear end of the splice assembly.

- (5) Make a selection of a Temperature Grade B shield material from Table 9.

Make sure that the shield material has the smallest diameter that can be put on the folded back shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (6) Cut the necessary length of the shield material.

Make sure that the length of the shield material is a minimum of 0.5 inch more than the length of the jacket that is removed from the wire or the cable.

- (7) Put the shield material on the wire or cable. Refer to Figure 105.

Make sure that the rear end of the shield material is aligned with the end of the folded back shield.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

POSITION OF THE SHIELD MATERIAL
Figure 105

- (8) Make a selection of two solder sleeves from Table 14.
Refer to Figure 105 for the applicable dimensions of the shield splice assembly.
- (9) Assemble one end of the shield splice.
 - (a) Put the solder sleeve on the wire or cable. Refer to Figure 106.

Make sure that:

- The inner edge of the rear seal ring is aligned with the end of the shield and the shield material
- The seal ring does not make an overlap with the shield and the shield material.

POSITION OF THE SOLDER SLEEVE ON THE SHIELD MATERIAL
Figure 106

- (b) Shrink the solder sleeve into position.
 - Make sure that:
 - The solder sleeve stays in the correct position
 - A minimum of 75 percent of the indicator ring on top of the solder ring is melted.
- (10) Fold the shield back against the jacket on the forward end of the splice assembly.
- (11) If it is necessary, cut the shield material.
Make sure that the shield material is aligned with the end of the folded back shield.
- (12) Do Step (9) again to assemble the other end of the shield splice.
Make sure the shield material is pulled tight before the end of the splice is assembled.
- (13) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 5.
Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (14) Cut the necessary length of the heat shrinkable sleeve.
Make sure that the length is a minimum of 1 inch farther than the rear end of the solder sleeve on each end of the splice assembly.
- (15) Make a selection of a Temperature Grade B or higher TFE insulation tape from Table 6.
- (16) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at the other end of the splice
 - Makes a 50 percent overlap.
- (17) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (18) Put the sleeve on the shield splice assembly.
Make sure that each end of the sleeve is a minimum of 0.25 inch farther than the tape on each end of the splice assembly.
- (19) Shrink the sleeve into position. Refer to Subject 20-10-14.

H. Shield Repair - Solder Sleeves, Shield Material, Tape, and Ties with Shield Folded Back

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 107 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 107

- (1) Remove the necessary length of the outer jacket. Refer to Figure 108.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

JACKET REMOVAL

Figure 108

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Clean the jacket with isopropyl alcohol.

Make sure:

- To clean the jacket approximately 3 inches from each end of the jacket
- That the cleaned area is dry.

- (3) Prepare the shield. Refer to Figure 109.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SHIELD PREPARATION

Figure 109

- (a) Carefully cut around the circumference of the shield on each side of the damaged area. Make sure that the distance from the end of the jacket to the end of the shield is 0.25 inch \pm 0.06 inch.
- (b) Remove the unwanted shield with the damage.
- (4) Fold the shield back against the jacket on the rear end of the splice assembly.
- (5) Make a selection of a Temperature Grade B shield material from Table 9. Make sure that the shield material has the smallest diameter that can be put on the folded back shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (6) Cut the necessary length of the shield material. Make sure that the length of the shield material is a minimum of 0.5 inch more than the length of the jacket that is removed from the wire or the cable.
- (7) Put the shield material on the wire or cable. Refer to Figure 110. Make sure that the rear end of the shield material is aligned with the end of the folded back shield.

POSITION OF THE SHIELD MATERIAL

Figure 110

- (8) Make a selection of two solder sleeves from Table 14. Refer to Figure 110 for the applicable dimensions of the shield splice assembly.
- (9) Assemble one end of the shield splice.
 - (a) Put the solder sleeve on the wire or cable. Refer to Figure 111.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that:

- The inner edge of the rear seal ring is aligned with the end of the shield and the shield material
- The seal ring does not make an overlap with the shield and the shield material.

POSITION OF THE SOLDER SLEEVE ON THE SHIELD MATERIAL

Figure 111

(b) Shrink the solder sleeve into position.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

(10) Fold the shield back against the jacket on the forward end of the splice assembly.

(11) If it is necessary, cut the shield material.

Make sure that the shield material is aligned with the end of the folded back shield.

(12) Do Step (9) again to assemble the other end of the shield splice.

Make sure the shield material is pulled tight before the end of the splice is assembled.

(13) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 5.

Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

(14) Cut the necessary length of the heat shrinkable sleeve.

Make sure that the length is a minimum of 1 inch farther than the rear end of the solder sleeve on each end of the splice assembly.

(15) Make a selection of a Temperature Grade B or higher TFE insulation tape from Table 6.

(16) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at the other end of the splice
- Makes a 50 percent overlap.

(17) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(18) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

I. Shield Repair - Mechanical Ferrules, Shield Material, Tape, and a Sleeve

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 112 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 112

(1) Remove the necessary length of the outer jacket. Refer to Figure 113.

JACKET REMOVAL

Figure 113

(a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Prepare the shield. Refer to Figure 114.

SHIELD PREPARATION

Figure 114

- (a) Carefully cut around the circumference of the shield on each side of the damaged area. Make sure that the distance from the end of the jacket to the end of the shield is a minimum of 0.31 inch.

- (b) Remove the unwanted shield with the damage.

- (3) Make a selection of two sets of inner and outer mechanical ferrules. Refer to Subject 20-30-12.

Make sure that:

- The ferrules are the correct Temperature Grade
- The inner ferrule has the smallest diameter that can move freely on the jacket
- The outer ferrule has the smallest diameter that can be put on the inner ferrule and shield.

- (4) Make a selection of a ferrule crimp tool. Refer to Subject 20-30-12.

- (5) Put one inner ferrule on the jacket of the wire or cable, to the rear of the area to repair.

- (6) Move the strands of the rear shield apart and make them straight.

- (7) Align the forward end of the inner ferrule with the end of the jacket.

- (8) Fold the strands of the rear shield back on the inner ferrule.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

- (9) Make a selection of a shield material from Table 9.

Make sure that the shield material has:

- The correct Temperature Grade
- The smallest diameter that can be put on the folded back shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (10) Cut the necessary length of the shield material.

Make sure that the length of the shield material is a minimum of 0.62 inch more than the length of the jacket that is removed from the wire or the cable.

- (11) Put the shield material on the wire or cable.
(12) Put the two outer ferrules on the shield material.
(13) Align the end of the shield material with the end of the shield that is folded back.
(14) Align the rear end of one of the outer ferrules with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (15) Crimp the ferrules.
(16) Put the other inner ferrule on the jacket of the wire or cable forward of the area to repair.
(17) Move the strands of the forward shield apart and make them straight.
(18) Align the forward end of the inner ferrule with the end of the jacket.
(19) Fold the strands of the forward shield back over the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

- (20) Put the end of the shield material on the folded back shield.
(21) Align the rear end of the other outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The shield material is pulled tight
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (22) Crimp the ferrules.
(23) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
(24) Make a selection of a heat shrinkable sleeve from Table 5.

Make sure that the sleeve has:

- The correct Temperature Grade
- The smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

(25) Cut the necessary length of the sleeve.

Make sure that the length is a minimum of 1 inch farther than the rear end of the ferrules on each end of the splice assembly.

(26) Make a selection of a TFE insulation tape from Table 6.

Make sure that the insulation tape is the correct Temperature Grade.

(27) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(28) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(29) Put the sleeve on the shield splice assembly.

Make sure that each end of the sleeve is a minimum of 0.25 inch farther than the tape on each end of the splice assembly.

(30) Shrink the sleeve into its position. Refer to Subject 20-10-14.

J. Shield Repair - Mechanical Ferrules, Shield Material, Tape, and Ties

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 115 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 115

(1) Remove the necessary length of the outer jacket. Refer to Figure 116.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

JACKET REMOVAL

Figure 116

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.4 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Prepare the shield. Refer to Figure 117.

SHIELD PREPARATION

Figure 117

- (a) Carefully cut around the circumference of the shield on each side of the damaged area.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the distance from the end of the jacket to the end of the shield is a minimum of 0.31 inch.

- (b) Remove the unwanted shield with the damage.
- (3) Make a selection of two sets of inner and outer mechanical ferrules. Refer to Subject 20-30-12.
Make sure that:
- The ferrules are the correct Temperature Grade
 - The inner ferrule has the smallest diameter that can move freely on the jacket
 - The outer ferrule has the smallest diameter that can be put on the inner ferrule and shield.
- (4) Make a selection of a ferrule crimp tool. Refer to Subject 20-30-12.
- (5) Put one inner ferrule on the jacket of the wire or cable, to the rear of the area to repair.
- (6) Move the strands of the rear shield apart and make them straight.
- (7) Align the forward end of the inner ferrule with the end of the jacket.
- (8) Fold the strands of the rear shield back on the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
- (9) Make a selection of a shield material from Table 9.
Make sure that the shield material has:
- The correct Temperature Grade
 - The smallest diameter that can be put on the folded back shield.
- NOTE: For alternative shield materials, refer to Subject 20-00-11.
- (10) Cut the necessary length of the shield material.
Make sure that the length of the shield material is a minimum of 0.62 inch more than the length of the jacket that is removed from the wire or the cable.
- (11) Put the shield material on the wire or cable.
- (12) Put the two outer ferrules on the shield material.
- (13) Align the end of the shield material with the end of the shield that is folded back.
- (14) Align the rear end of one of the outer ferrules with the rear end of the inner ferrule.
Make sure that:
- The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (15) Crimp the ferrules.
- (16) Put the other inner ferrule on the jacket of the wire or cable forward of the area to repair.
- (17) Move the strands of the forward shield apart and make them straight.
- (18) Align the forward end of the inner ferrule with the end of the jacket.
- (19) Fold the strands of the forward shield back over the inner ferrule.
Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
- (20) Put the end of the shield material on the folded back shield.
- (21) Align the rear end of the other outer ferrule with the rear end of the inner ferrule.

20-10-13

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that:

- The outer ferrule goes around the shield material
- The shield material is pulled tight
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(22) Crimp the ferrules.

(23) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

(24) Make a selection of a TFE insulation tape from Table 6.

Make sure that the insulation tape is the correct Temperature Grade.

(25) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(26) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(27) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the lacing tape is the correct Temperature Grade.

K. Shield Repair - Shield-Kons, Shield Material, Tape, and a Sleeve

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 118 for the configuration of the splice assembly.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 118

- (1) Remove the necessary length of the outer jacket. Refer to Figure 119.

JACKET REMOVAL

Figure 119

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.6 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.6 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Prepare the shield. Refer to Figure 120.

SHIELD PREPARATION
Figure 120

- (a) Carefully cut around the circumference of the shield on each side of the damaged area. Make sure that the distance from the end of the jacket to the end of the shield is a minimum of 0.5 inch.
- (b) Remove the unwanted shield with the damage.
- (3) Fold the end of each shield against the outer jacket.
- (4) Make a selection of a shield material from Table 9.

Make sure that the shield material has:

- The correct Temperature Grade
- The smallest diameter that can be put on the folded back shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (5) Cut the necessary length of the shield material. Make sure that the minimum length is the distance between the two ends of the folded back shields.
- (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (7) Put the shield material on the wire or cable.
- (8) Align one end of the shield material with the end of the folded back shield. Refer to Figure 121.

POSITION OF THE SHIELD MATERIAL
Figure 121

- (9) Measure the outer diameter of the shield assembly. Refer to Figure 122.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 122

- (10) Make a selection of two Shield-Kons that have the correct dimensions. Refer to Subject 20-30-12. Make sure that the Shield-Kons are the correct Temperature Grade.
- (11) Assemble the splice of the shield.
 - (a) Make a selection of a Shield-Kon crimp tool. Refer to Subject 20-30-12.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 121.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.
 - (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 123.

SHIELD SPLICE ASSEMBLY
Figure 123

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (12) Make a selection of a heat shrinkable sleeve from Table 5.

Make sure that the sleeve has:

- The correct Temperature Grade
- The smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (13) Cut the necessary length of the sleeve.

Make sure that the length is a minimum of 1 inch farther than the rear end of the Shield-Kon on each end of the splice assembly.

- (14) Make a selection of a TFE insulation tape from Table 6.

Make sure that the insulation tape is the correct Temperature Grade.

- (15) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
- Makes a 50 percent overlap.

- (16) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

- (17) Put the sleeve on the shield splice assembly.

Make sure that each end of the sleeve is a minimum of 0.25 inch farther than the tape on each end of the splice assembly.

- (18) Shrink the sleeve into its position. Refer to Subject 20-10-14.

L. Shield Repair - Shield-Kons, Shield Material, Tape, and Ties

Refer to:

- Paragraph 1.E. for the applicable conditions for the repair of wire and cable with a splice
- Figure 124 for the configuration of the splice assembly.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 124

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (1) Remove the necessary length of the outer jacket. Refer to Figure 125.

JACKET REMOVAL
Figure 125

- (a) On one side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.6 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (b) On the other side of the damaged area, carefully cut the jacket around the circumference of the wire or the cable a minimum of 0.6 inch from the end of the damage, away from the damaged area.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (c) Cut the jacket lightly along the length of the jacket to be removed.

CAUTION: DO NOT CUT ALL THE WAY THROUGH THE JACKET. DAMAGE CAN OCCUR TO THE SHIELD OR WIRE.

- (d) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or the cable can be bent at the lines where the jacket was cut.

CAUTION: DO NOT BEND THE WIRE OR THE CABLE MORE THAN 3 TIMES THE DIAMETER. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

- (2) Prepare the shield. Refer to Figure 126.

SHIELD PREPARATION
Figure 126

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (a) Carefully cut around the circumference of the shield on each side of the damaged area.
Make sure that the distance from the end of the jacket to the end of the shield is a minimum of 0.5 inch.
- (b) Remove the unwanted shield with the damage.
- (3) Fold the end of each shield against the outer jacket.
- (4) Make a selection of a shield material from Table 9.
Make sure that the shield material has:
 - The correct Temperature Grade
 - The smallest diameter that can be put on the folded back shield.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (5) Cut the necessary length of the shield material.
Make sure that the minimum length is the distance between the two ends of the folded back shields.
- (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (7) Put the shield material on the wire or cable.
- (8) Align one end of the shield material with the end of the folded back shield. Refer to Figure 127.

POSITION OF THE SHIELD MATERIAL
Figure 127

- (9) Measure the outer diameter of the shield assembly. Refer to Figure 128.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 128

- (10) Make a selection of two Shield-Kons that have the correct dimensions. Refer to Subject 20-30-12.
Make sure that the Shield-Kons are the correct Temperature Grade.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

- (11) Assemble the splice of the shield.
- Make a selection of a Shield-Kon crimp tool. Refer to Subject 20-30-12.
 - Remove the temporary layer of tape around the end of each shield.
 - Align one end of the shield material with the end of the shield. Refer to Figure 127.
 - Put one of the Shield-Kons into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - Put the crimp tool and the Shield-Kon on the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - Crimp the Shield-Kon.
 - Put the other Shield-Kon into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - Make the shield material smooth and tight.
 - Put the crimp tool and the Shield-Kon on the other end of the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - Crimp the Shield-Kon.
 - Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 129.

SHIELD SPLICE ASSEMBLY
Figure 129

- (12) Make a selection of a TFE insulation tape from Table 6.
Make sure that the insulation tape is the correct Temperature Grade.
- (13) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (14) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF ELECTRICAL WIRE AND CABLE**

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

- (15) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the lacing tape is the correct Temperature Grade.

7. REPAIR OF COAX CABLE**A. Repair of the Shield of a Coax Cable**

For the conditions that are applicable for the repair of coax cable, refer to Paragraph 2.M.

- (1) Make a selection of one of these tapes from Table 6:
- Temperature Grade C or D TFE Tape
 - Temperature Grade A polyester tape

Make sure that the tape has a temperature grade that is applicable for the location at the wire installation.

- (2) Remove loose pieces of insulation and rough edges at the area of the damage.
Make sure that the insulation has a smooth surface.
- (3) Clean the jacket with isopropyl alcohol. Refer to Figure 130.

Make sure:

- To clean the damaged area of the jacket
- To clean the jacket approximately 3 inches on each side of the damage.

AREA TO CLEAN
Figure 130

- (4) Let the cleaned area dry.
- (5) Put the strands of the damaged shield:
- Flat against the primary insulation
 - Even and symmetrical around the circumference of the area with damage.

Refer to Figure 131.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

POSITION OF THE SHIELD FOR REPAIR
Figure 131

(6) Put a minimum of two layers of the tape on the damaged area. Refer to Figure 132.

Make sure that:

- Each end of the tape extends a minimum of 0.5 inch farther than each end of the damaged area
- The tape makes 50 percent circumferential overlap
- The second layer of tape is in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE AND THE WIRE HARNESS TIES
Figure 132

(7) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.25 inch from the end of the tape.

Make sure that the lacing tape is the correct Temperature Grade.

Refer to:

- Figure 132
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

B. Repair of a Coax Cable with a Splice

For the conditions that are applicable for the repair of coax cable, refer to Paragraph 2.M.

NOTE: If the coax cable does not have the sufficient length to make a jack connector and a plug connector, a repair can be made with a splice and a new length of coax cable. Refer to Paragraph 7.C.

(1) Make a selection of a jack connector and a straight plug connector that are specified for the coax cable. Refer to Subject 20-51-00.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (2) Remove the length of the damaged coax cable.
- (3) Assemble the splice. Refer to Figure 133.

COAX CABLE SPLICE
Figure 133

- (a) Assemble the jack connector on the end of one length of the cable. Refer to the Subject that is applicable for the assembly of the jack.
- (b) Assemble the plug connector on the end of the other length of the cable. Refer to the Subject that is applicable for the assembly of the jack.
- (4) Engage the jack connector and the plug connector for the splice.

C. Repair of a Coax Cable with a Splice and a New Length of Coax Cable

For the conditions that are applicable for the repair of coax cable, refer to Paragraph 2.M.

- (1) Find the part number or the specification of the coax cable. Refer to the WDM and Subject 20-00-13.
- (2) Make a selection of a jack connector and a straight plug connector that are specified for the coax cable. Refer to Subject 20-51-00.
- (3) Make a selection of the end of the coax cable assembly to remove. Refer to Figure 134.

REMOVAL OF ONE END OF THE COAX CABLE ASSEMBLY
Figure 134

- (4) Cut the coax cable at the rear edge of the area of damage. Refer to Figure 134.
- (5) Cut a new length of the same type of coax cable that is as long as the length of coax cable that is removed.
- (6) Assemble the splice. Refer to Figure 135.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

SPLICE OF THE NEW LENGTH OF COAX CABLE

Figure 135

- (a) Assemble the jack or the plug connector on the end of the remaining length of coax cable. Refer to the Subject that is applicable for the connector.
 - (b) Assemble the other connector on one end of the new length of coax cable. Refer to the Subject that is applicable for the connector.
- (7) Assemble a new coax connector on the other end of the new length of coax cable. Refer to the Subject that is applicable for the connector.

Make sure that:

- The new connector has the same part number as the initial coax connector; refer to Figure 134 and Figure 135
- The new length of coax cable is equal to the length of coax cable that is removed.

- (8) Engage the jack connector and the plug connector for the splice.

8. REPAIR OF SHIELD GROUND WIRE

A. Repair of a Shield Pull Through Shield Ground Wire

This paragraph gives the procedure to repair a damaged shield pull through shield ground wire with a shield extension and a shield ground wire.

**Table 18
NECESSARY LENGTH OF THE SHIELD EXTENSION**

Shield Ground Wire Assembly Configuration	Necessary Length of the Shield Extension
Mechanical Ferrule, Shield Folded Back	Distance from the end of the jacket to the mark plus 0.35 inch
Mechanical Ferrule, Shield Not Folded Back	Distance from the end of the jacket to the mark
Shield-Kon, Shield Folded Back	Distance from the end of the jacket to the mark plus 0.35 inch
Shield Pull Through	Distance from the end of the jacket to the mark plus the length of the shield ground wire
Solder Sleeve, Shield Folded Back	Distance from the end of the jacket to the mark plus 0.35 inch
Solder Sleeve, Shield Not Folded Back	Distance from the end of the jacket to the mark

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

CABLE PREPARATION

Figure 136

Refer to Figure 136.

- (1) If it is necessary remove the contact assemblies from the connector.
Refer to the Subject that is applicable for the connector.
- (2) Cut the jacket around the circumference of the wire or the cable, 2 inches to 3 inches from the rear end of the shield ground wire assembly.
- (3) Carefully cut the jacket and the insulation sleeve or tape lightly along the length of the cable.
Make sure cut the jacket and the sleeve or the tape from the location the jacket is cut circumferentially to the end of the sleeve or the tape.

CAUTION: DO NOT CUT THE SHIELD. DAMAGE TO THE SHIELD OR THE WIRES CAN OCCUR.

- (4) Remove the unwanted jacket and the unwanted insulation sleeve or tape from the wires.
- (5) Make a mark on a wire where the wires are pulled through the shield.
- (6) At the end of the jacket, carefully cut the shield around the circumference of the wire or the cable.

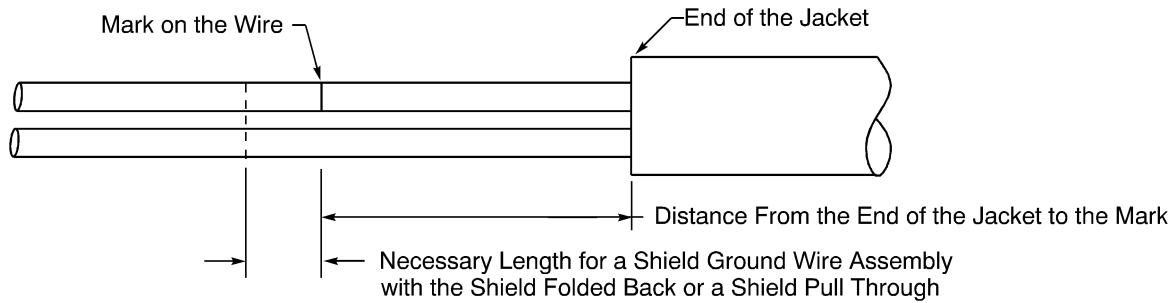

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRES OF THE CABLE. DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (7) Remove the unwanted length of the shield.
- (8) Make a selection of a shield ground wire assembly configuration. Refer to Subject 20-10-15.
- (9) Assemble a shield extension. Refer to Subject 20-10-15.

Make sure that the length of the shield extension is correct for the shield ground wire assembly configuration. Refer to Table 18 and Figure 137.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

NECESSARY LENGTH OF THE SHIELD EXTENSION

Figure 137

- (10) Assemble a shield ground wire at the end of the shield extension. Refer to Subject 20-10-15.
- (11) Assemble a terminal lug on the end of the shield ground wire. Refer to Subject 20-30-11.

9. REPAIR OF A FIRE RESISTANT WIRE

A. Repair of the Insulation of a Fire Resistant Wire

For the damage and repair conditions that are applicable for the repair of fire resistant wire, refer to Paragraph 2.N.

CAUTION: IF THE REPAIR IS A TEMPORARY REPAIR, THE WIRE MUST BE REPLACED AT A MAXIMUM OF 500 FLIGHT HOURS SUBSEQUENT TO THE REPAIR.

CAUTION: THIS PROCEDURE IS APPLICABLE ONLY FOR THE FIRE RESISTANT WIRES IN TABLE 19. IF THIS PROCEDURE IS USED TO REPAIR OTHER FIRE RESISTANT WIRES, THE REPAIR CAN GIVE AN UNSATISFACTORY PERFORMANCE.

**Table 19
FIRE RESISTANT WIRES**

Part Number or Specification	Supplier
24-00033	Champlain
24-00034	Champlain
BMS 13-55	QPL

BMS 13-8	QPL
M25038/1-()-()	QPL

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

INSULATION REPAIR

Figure 138

Refer to Figure 138.

- (1) Make a selection of one of these insulation materials from Table 6:
 - Temperature Grade D film strip
 - Temperature Grade D TFE tape.
- (2) Make a selection of a glass supported TFE tape from Table 7.
- (3) Remove loose pieces of insulation and rough edges at the area of the damage.
Make sure that the insulation has a smooth surface.
- (4) Wind a layer of TFE tape or film strip on the wire.
Make sure that:
 - The end of the tape is a minimum of 0.4 inch farther than the end of the damaged area
 - The tape or film strip makes a 50 percent overlap
- (5) Wind a second layer of TFE tape or film strip on the wire.
Make sure that:
 - The layer of tape is wound in the opposite direction of the first layer of tape
 - The end of the tape is aligned with the end of the first layer of tape
 - The tape or film strip makes a 50 percent overlap.
- (6) Wind a layer of glass supported TFE tape on the wire.
Make sure that:
 - The end of the tape is a minimum of 0.4 inch farther than the end of the first layers of tape
 - The tape makes a 50 percent overlap
- (7) Wind a second layer of glass supported TFE tape on the wire.
Make sure that:
 - The layer of tape is wound in the opposite direction of the first layer of tape
 - The end of the tape is aligned with the end of the first layer of tape
 - The tape makes a 50 percent overlap.
- (8) Wind a third layer of glass supported TFE tape on the wire.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that:

- The layer of tape is wound in the opposite direction of the last layer of tape
 - The end of the tape is a minimum of 0.25 inch farther than the end of the first two layers of glass supported tape
 - The tape makes a 50 percent overlap
- (9) Assemble a lacing tape wire harness tie on each end of the repair approximately 0.35 inch from the end of the sleeve.

Refer to Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie in a high vibration area.

Make sure that:

- The Temperature Grade of the lacing tape is Temperature Grade D
- The tie is on the end of the first two layers of glass supported tape.

B. Repair of Unshielded Fire Resistant Wire with a Splice

For the damage and repair conditions that are applicable for the repair of fire resistant wire, refer to Paragraph 2.N.

CAUTION: THE REPAIR OF FIRE RESISTANT WIRE WITH A SPLICE IS A TEMPORARY REPAIR ONLY. THE WIRE:

- CAN BE REPAIRED ONCE WITH A MAXIMUM OF TWO SPLICES FOR EACH WIRE SEGMENT
- MUST BE REPLACED AT A MAXIMUM OF 500 FLIGHT HOURS SUBSEQUENT TO THE REPAIR.

CAUTION: THIS PROCEDURE IS APPLICABLE ONLY FOR THE FIRE RESISTANT WIRES IN TABLE 20. IF THIS PROCEDURE IS USED TO REPAIR OTHER FIRE RESISTANT WIRES, THE REPAIR CAN GIVE AN UNSATISFACTORY PERFORMANCE.

**Table 20
FIRE RESISTANT WIRES**

Wire Size (AWG)	Splice	Crimp Tool	
		Part Number	Supplier
18	BACT12C20	46673	AMP
16	BACT12C15	46988	AMP

**CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 139**

Refer to Figure 139.

- (1) Make a selection these Temperature Grade D heat shrinkable sleeves from Table 5:
 - A 3.00 inch \pm 0.25 inch length of 1/4 inch diameter sleeve
 - A 4.00 inch \pm 0.25 inch length of 5/16 inch diameter sleeve.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade D TFE tape from Table 6.
- (3) Make a selection of a glass supported TFE tape from Table 7.
- (4) Make a selection of a splice from Table 21.
- (5) Make a selection of a crimp tool Table 22.
- (6) Put the lengths of the heat shrinkable sleeve on the end of the wire in this sequence:
 - The 5/16 inch diameter sleeve
 - The 1/4 inch diameter sleeve.
- (7) Remove the necessary length of the insulation from the end of each wire. Refer to Table 23.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

**Table 23
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Removal Length (inch)		
	Minimum	Target	Maximum
18	0.22	0.25	0.28
16	0.22	0.25	0.28

- (8) Assemble one end of the splice:
 - (a) Put the end of a wire into the crimp barrel of the splice.
Make sure that all of the strands of the conductor are in the crimp barrel of the splice.
 - (b) Crimp the splice.
- (9) Do Step (8) again for the other wire in the other end of the splice.
- (10) Wind a layer of TFE tape on the wire.
Make sure that:
 - The end of the tape is a minimum of 0.4 inch farther than the end of the damaged area
 - The tape makes a 50 percent overlap
- (11) Wind a second layer of TFE tape on the wire.
Make sure that:
 - The layer of tape is wound in the opposite direction of the first layer of tape
 - The end of the tape is aligned with the end of the first layer of tape
 - The tape makes a 50 percent overlap.
- (12) Wind a layer of glass supported TFE tape on the wire.
Make sure that:
 - The end of the tape is a minimum of 0.4 inch farther than the end of the first layers of tape
 - The tape makes a 50 percent overlap
- (13) Wind a second layer of glass supported TFE tape on the wire.
Make sure that:
 - The layer of tape is wound in the opposite direction of the first layer of glass supported TFE tape
 - The end of the tape is aligned with the end of the first layer of tape
 - The tape makes a 50 percent overlap.
- (14) Align the center of the 1/4 inch diameter heat shrinkable sleeve with the center of the splice.
- (15) Assemble a lacing tape wire harness tie on each end of the sleeve approximately 0.25 inch from the end of the sleeve. Refer to Subject 20-10-11.
Refer to Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie in a high vibration area.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.
- (16) Align the center of the 5/16 inch diameter heat shrinkable sleeve with the center of the splice.
- (17) Assemble a lacing tape wire harness tie on each end of the sleeve approximately 0.25 inch from the end of the sleeve.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Refer to Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie in a high vibration area.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

10. REPAIR OF A THERMOCOUPLE WIRE WITH A SPLICE

A. Repair of Alumel and Chromel Thermocouple Wires with a Splice

**Table 24
ALUMEL AND CHROMEL SPLICE PART NUMBERS**

Wire Material	Splice		
	Part Number	Color	Supplier
Alumel	1-322325-0	Green	AMP
Chromel	1-322325-1	Grey	AMP

**Table 25
SPLICE CRIMP TOOLS**

Basic Unit	Setting	Supplier
46673	3	AMP

- (1) Make a selection of a splice from Table 24.
Make sure to use:
 - The alumel splice with alumel wire
 - The chromel splice with chromel wire.
- (2) Make a selection of a crimp tool from Table 25.
- (3) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 5.
Make sure that the heat shrinkable sleeve has the smallest diameter that can be installed on the splice assembly.
NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (4) Cut a 2.50 inch \pm 0.25 inch length of the heat shrinkable sleeve.
- (5) Make a selection of one of these two insulation materials from Table 6:
 - Temperature Grade D TFE tape
 - Temperature Grade D film strip.
- (6) Make a selection of a protective tape from Table 6.
- (7) Remove the damaged length of the wire.
 - (a) On one side of the damage, cut the wire.
Make sure that the end of the wire is perpendicular to the longitudinal axis of the wire.
 - (b) On the other side of the damage, cut the wire.
Make sure that the end of the wire is perpendicular to the longitudinal axis of the wire.
- (8) Clean the insulation with isopropyl alcohol.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure:

- To clean the area of the insulation from the end of each wire to a minimum of 3 inches from the end
- That the cleaned area is dry.

- (9) Put the heat shrinkable sleeve on the wire.
- (10) Remove 0.25 inch \pm 0.06 inch of the insulation from the end of the wire.
- (11) Put the wire into the splice until it stops.
- (12) Crimp the splice. Refer to Figure 140.

ALUMEL AND CHROMEL SPLICE ASSEMBLY
Figure 140

- (13) Put two layers of the insulation tape or the insulation film strip on the splice assembly. Refer to Figure 141.

Make sure that:

- Each end of each layer extends a minimum of 0.38 inch farther than each end of the splice
- The tape makes a 50 percent overlap
- The second layer is wound in the opposite direction of the first layer.

INSULATION OF THE SPLICE
Figure 141

- (14) Put two layers of the protective tape on the splice assembly.

Make sure that:

- Each end of each layer extends a minimum of 1 inch farther than each end of the splice
- The tape makes a 50 percent overlap
- The second layer is wound in the opposite direction of the first layer.

Refer to Figure 141.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

(15) Assemble a lacing tape wire harness tie:

- At each end of the tape
- In the middle of the tape.

Refer to:

- Figure 141
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

(16) Align the center of the heat shrinkable sleeve with the center of the splice.

Refer to Figure 141.

(17) Assemble a lacing tape wire harness tie:

- At each end of the sleeve
- In the middle of the sleeve.

Refer to:

- Figure 141
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

11. REPAIR OF FUEL QUANTITY INDICATOR SYSTEM CABLE

A. Repair of the Jacket of Hi Z Cables External to the Fuel Tank

**Table 26
NECESSARY MATERIALS**

Material	Part Number	Supplier
Naphtha, aliphatic	TT-N-95	Any Source
Sealant	E.C. 776SR	3M Company
	Nycote Type 7-11	Nycote Laboratories
	Nycote Type 88	Nycote Laboratories

- (1) Make a selection of a sealant from Table 26.
- (2) Remove loose pieces of insulation and rough edges at the area of the damage.
Make sure that the insulation has a smooth surface.
- (3) Clean the damaged area of cable with aliphatic naphtha.
- (4) Apply one layer of primer.
- (5) Cure the primer at room temperature.
- (6) Apply a layer of sealant.

B. Repair of Hi Z Cables External to the Fuel Tank with a Splice

This paragraph gives the procedure that can be used to:

- Repair an isolated, damaged point on a cable
- Replace a section of a damaged cable.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

**Table 27
SPLICE KIT PART NUMBERS**

Part Number	Supplier
D-150-0194	Raychem

**Table 28
RAYCHEM D-150-0194 SPLICE KIT COMPONENTS**

Description	Part Number	Supplier
Solder Shield Splice, Inner Shield	D-155-0450	Raychem
Solder Shield Splice, Outer Shield	D-155-0575	Raychem
Splice, Miniseal (2 pieces)	D-436-37	Raychem

**Table 29
NECESSARY TOOLS**

Tool	Description	Supplier
AD-1377	Splice Crimp Tool	Raychem
CV-5300	Minigun with MG-1 Reflector	Raychem

- (1) Remove the damaged length of cable.
- (2) Prepare each end of the remaining cable. Refer to Figure 142.

**HI Z CABLE TRIM DIMENSIONS
Figure 142**

- (a) Remove 1.6 inches of the outer jacket from the end of the cable.
- (b) Remove the necessary length of the outer shield.
Make sure that the end of the shield is 0.5 inch from the end of the jacket.
- (c) Fold the shield back over the jacket.
- (d) Remove 1.1 inches of the inner jacket from the end of the cable.
- (e) Push the inner shield toward the outer jacket to open the strands of the inner shield.
- (f) Pull the inner shield back to its initial position.
- (g) Remove the length of the inner shield so that the end of the shield is 0.4 inch from the end of the inner jacket.

20-10-13

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (h) Remove 0.25 inch of the primary jacket from the end of the cable.
- (3) Assemble the miniseal splice. Refer to Figure 143 and Table 27.

NOTE: To make the steps of this procedure more clear, one end of the cable is Cable A and the other end is Cable B.

POSITION OF THE SOLDER SHIELD SPLICES ON CABLE A
Figure 143

- (a) Put an outer shield solder splice and an inner shield solder splice on Cable A. Make sure to put the small end of the splice on the cable first.
- (b) Make a selection of a crimp tool from Table 29.
- (c) Put the crimp barrel component of the miniseal splice on the primary wire.
- (d) Crimp the component on the wire.
- (e) Put the sleeve component of the miniseal splice on the cable so that it extends farther than the crimp barrel.
- (f) Put the primary wire of Cable B into the crimp barrel component of the miniseal splice.
- (g) Crimp the component on the wire.
- (h) Make a selection of a hot air gun from Table 29 or an equivalent source of heat. Make sure that the hot air gun:
 - Has a reflector
 - Is ready for operation; refer to Paragraph 12.B.

WARNING: THE OPERATION OF A HOT AIR GUN CAN CAUSE AN EXPLOSION. REFER TO THE SAFETY PRACTICES IN SUBJECT 20-00-10 FOR THE NECESSARY PRECAUTIONS TO PREVENT:

- DAMAGE TO THE EQUIPMENT
- INJURY TO THE PERSON.

- (i) Move the sleeve component of the miniseal splice. Make sure that the center of the sleeve is aligned with the center of the crimp barrel.
- (j) Apply heat to the miniseal splice until the inserts melt and the solder flows.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE ADJACENT WIRES. DAMAGE TO THE WIRES CAN OCCUR.

- (4) Push the inner shield solder splice so that the center of the splice is aligned with the center of the miniseal splice.
- (5) Shrink the inner shield solder splice:

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

- (a) Apply heat to the center of the splice until the solder melts and the sleeve shrinks.
- (b) Move the heat to one end slowly so that the solder melts and the sleeve shrinks.

NOTE: Before the end of the splice is reached, approximately 1/4 inch, shrink the end of the sleeve to make a seal.

- (c) Start at the edge of the center of the splice that is not melted and slowly move the heat to the other end so that the solder melts and the sleeve shrinks.

NOTE: Before the end of the splice is reached, approximately 1/4 inch, shrink the end of the sleeve to make a seal.

- (6) Fold the outer shield wire back into position over the end of the inner splice.
- (7) Put the outer solder shield splice over the inner shield splice and end of the outer shield.
- (8) Do Step (5) to shrink the outer shield solder splice.

12. HOT AIR GUNS

A. Part Numbers and Description

**Table 30
HOT AIR GUN PART NUMBERS**

Part Number	Description	Power Supply	Supplier
AA-400	Super Heater Mark II Hot Air Gun	115 VAC, 60 Hz	Raychem
HT-900	Hot Air Gun	115 VAC, 50 Hz to 400 Hz	Raychem

**RAYCHEM MODEL AA-400 HOT AIR GUN
Figure 144**

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

RAYCHEM MODEL HT-900 HOT AIR GUN

Figure 145

B. Operation of the Hot Air Gun

WARNING: DO NOT OPERATE THE HOT AIR GUN ON OR NEAR THE AIRPLANE WHEN THERE ARE FLAMMABLE:

- LIQUIDS
- VAPORS
- GASES.

WARNING: A HOT WORK PERMIT MUST BE RECEIVED FROM THE FIRE DEPARTMENT BEFORE THE HOT AIR GUNS ARE USED ON OR NEAR THE AIRPLANE.

- (1) Make a selection of a hot air gun from Table 30.

WARNING: THE RAYCHEM AA-400 HOT AIR GUN MUST NOT BE USED ON OR NEAR THE AIRPLANE.

NOTE: To do work on or near the airplane, the Raychem HT-900 hot air gun must be used.

- (2) To operate the Raychem AA-400 hot air gun:
- (a) Turn the air pressure control knob fully to the counterclockwise position. Refer to Figure 144.

NOTE: The red plastic ring below the knob must be raised to unlock the knob.

- (b) Attach a source of compressed air to the fitting on the control unit.

20-10-13

707, 727-787

STANDARD WIRING PRACTICES MANUAL

REPAIR OF ELECTRICAL WIRE AND CABLE

Make sure that the source of the compressed air:

- Is clean
- Is dry
- Is free of oil
- Can supply a minimum of 4 CFM at 60 psi.

(3) To operate the Raychem HT-900 hot air gun:

- (a) Turn the air pressure control knob fully to the counterclockwise position. Refer to Figure 145.
- (b) Attach a source of compressed air or compressed nitrogen to the fitting on the control unit.

Make sure that the source of the compressed air or compressed nitrogen:

- Is clean
- Is dry
- Is free of oil
- Can supply a minimum of 4 CFM at 80 psi to 200 psi.

(4) Connect the power cord to the power supply.

2.	<u>INSTALLATION OF HEAT SHRINKABLE SLEEVES</u>	1
	A. General Conditions for the Installation	1
	B. Installation of Heat Shrinkable Sleeves	1
3.	<u>INSTALLATION OF COLD SHRINK SLEEVES</u>	2
	A. Cold Shrinkable Sleeves	2

20-10-14 CONTENTS

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF SHRINKABLE SLEEVES****1. PART NUMBERS AND DESCRIPTION****A. Shrinkable Sleeve Part Numbers**

Refer to the shrinkable sleeves shown in Subject 20-00-11.

2. INSTALLATION OF HEAT SHRINKABLE SLEEVES

WARNING: THE OPERATION OF A HOT AIR GUN OR A HEAT GUN CAN CAUSE AN EXPLOSION. REFER TO THE SAFETY PRACTICES IN Subject 20-00-10 FOR THE NECESSARY PRECAUTIONS TO AVOID:

- DAMAGE TO THE EQUIPMENT
- INJURY TO THE PERSON.

A. General Conditions for the Installation

Make sure that the sleeve can be:

- Moved easily over the component
- Held in position permanently after the heat is applied.

After the heat is applied, the sleeve must make 3/16 inch to 1/2 inch overlap with the insulation of the wire or cable on these assemblies:

- A contact
- A shield termination
- A splice
- A terminal
- A wire bundle breakout.

B. Installation of Heat Shrinkable Sleeves

- (1) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (2) Cut the sleeve so that the length of the sleeve is the sufficient length.

NOTE: The sufficient length is the necessary length plus a maximum 10 percent of the necessary length because of the longitudinal shrinkage of the sleeve.

- (3) To prevent heat damage, put a split Teflon sleeve or fish paper on the wire at each end of the heat shrinkable sleeve so that:
 - The end of the protection touches the end of the sleeve
 - The protection extends a minimum 1 inch from the end of the sleeve.
- (4) To prevent heat damage to all of the adjacent wires with shields, put the protection on those wires.
- (5) Heat the hot gun for 15 seconds minimum.
- (6) Shrink the sleeve in position:
 - (a) Hold the gun 3 inches minimum from the sleeve
 - (b) Point the gun at the center of the sleeve for 5 to 10 seconds.

CAUTION: DO NOT APPLY THE HEAT FOR MORE THAN 20 SECONDS AT ANY ONE TIME.

- (7) If the sleeve does not fully shrink:
 - (a) Wait for of 5 minutes minimum so that the cable becomes cool.
 - (b) Do Step (6) again.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF SHRINKABLE SLEEVES

3. INSTALLATION OF COLD SHRINK SLEEVES

A. Cold Shrinkable Sleeves

Cold shrinkable sleeves are used in:

- The assembly of copalum splices; refer to Subject 20-30-13
 - The assembly of copalum terminals; refer to Subject 20-30-14.
- (1) Make a selection of a cold shrinkable sleeve from Subject 20-00-11.
 - (2) Put the sleeve on the wire.
 - (3) Hold the sleeve in position with one hand.
 - (4) Pull the core off in a counterclockwise direction with the other hand.
The sleeve shrinks over the wire as the core is removed.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

This Subject gives the procedures to assemble:

- A shield ground wire
- A shield dead end
- A shield extension.

1. APPLICABLE CONDITIONS FOR SHIELD TERMINATION

A. General Data

For the conditions that are applicable for:

- Shield terminations and wire harness assembly, refer to Subject 20-10-11
- Shield terminations and wire harness installation, refer to Subject 20-10-11.

B. Airworthiness Limitations

These types of wiring configurations are specified as Critical Design Configuration Control Limitations (CDCCL):

- Fuel System Wiring that has Airworthiness Limitations
- Wiring that is installed adjacent to the fuel tank. Refer to Subject 20-10-11.

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

To find more data about CDCCL wiring, refer to Table 1 for the document that is applicable for the airplane model.

Table 1
BOEING DOCUMENTS FOR AIRWORTHINESS LIMITATIONS

Boeing Document	Airplane Model
D6-7552-AWL	707
D6-8766-AWL	727
D6-38278-CMR	737-100,-200,-200C,-300,-500

	747-400 and later 747 models
	757
	767
	777

C. Selection of a Shield Ground Wire Configuration

For the shield termination of special shielded wires and shielded cables, refer to Paragraph 3.

For the applicable conditions related to:

- The maximum length of a shield ground wire, refer to Paragraph 1.D.
- The maximum length of wire without a shield, refer to Paragraph 1.E.
- The configuration of shield ground wires on adjacent wires, refer to Paragraph 1.F.
- Shield ground wires with the same ground connection, refer to Paragraph 1.G.

D. Maximum Length of a Shield Ground Wire

**Table 3
SHIELD GROUND WIRE MAXIMUM LENGTH**

Ground Connection	Maximum Length (inch)	Special Conditions
Contact, ARINC Connector Ground Block	3	-
Contact, Connector Insert	2	-
Terminal Lug to Connector Strain Relief Backshell	2	-
Terminal Lug to Structure	6	-
Data Bus	18	757 Data Bus Cables (5000 series wire numbers)

E. Maximum Length of Wire without a Shield

The connection of the shield and the shield ground wire must be as close as possible to the point of the termination of the wire.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Refer to Table 4 and Figure 1 for the maximum length of wire without a shield.

NOTE: The point of the shield termination is the end of the continuous metal around the primary insulation of the conductor.

LENGTH OF THE WIRE WITHOUT A SHIELD
Figure 1

Table 4
LENGTH OF THE WIRE WITHOUT A SHIELD

Type of Wire Termination	Point of Wire Termination	Length L (inch)	
		Minimum	Maximum
Connector with Integral Grommet and Strain Relief	Rear of Strain Relief	-	1.5
Connector with Integral Grommet and no Strain Relief	Connector Grommet or Potting	-	1.5
Connector with Removable Grommet and Strain Relief	Rear of the Strain Relief	-	1.5
Connector with Removable Grommet and no Strain Relief	Rear of the Connector Shell	-	4
Splice	Rear of the Conductor Splice	0.5	1.5
Terminal Lug	Rear of the Crimp Barrel	0.5	0.75
Terminal Module	Surface of the Module	1.5	2.0

F. Configuration of Shield Ground Wires on Adjacent Wires

Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

For shield ground wire assemblies on adjacent wires, these conditions are applicable:

- The shield ground wire assemblies must not be put in adjacent locations
- A shield extension can be assembled when the number of shield ground wires makes it necessary to put a shield ground wire assembly at a location where the length of wire without a shield is greater than the maximum length for the type of wire termination; refer to Table 4

If a shield extension is necessary, these conditions are applicable:

- The shield ground wire assembly must not be put farther than 6 inches from the point of the wire termination
- The end of the shield extension, that is opposite of the end with the shield ground wire, must be a dead end
- The shield dead ends must not be put in adjacent locations
- If the point of wire termination is the potting of a connector, the shield dead end must not extend into the area where sealant must be applied.

If the necessary distance for all of the shield ground wire assemblies on the wire harness is greater than 6 inches, these conditions are applicable:

- The shield ground wire assemblies can be put in adjacent locations
- The number of adjacent shield ground wire assemblies must be kept to a minimum.

POSITION OF SHIELD GROUND WIRE ASSEMBLIES ON ADJACENT WIRES

Figure 2

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

G. Shield Ground Wires with the Same Ground Connection

For two or more shield ground wires that have the same connection to ground, these conditions are applicable:

- The number of shield ground wires can be decreased to one shield ground wire with a splice; refer to Subject 20-30-12
- The one shield ground wire must be an AWG 20 wire; refer to Table 5.

If the connection of the shield ground wire to ground is a ground stud, these conditions are applicable:

- The shield ground wires must be attached to the ground stud with a terminal lug
- The maximum number of shield ground wires for one terminal lug is 6.

For 5 or more shield ground wires of a wire harness that can have the same connection to ground, these conditions are applicable:

- A closed loop configuration of shield ground wires can be made; refer to Figure 3
- As an alternative, the shield ground wires between adjacent shield ground wire assemblies can be connected to each other with a closed end splice; refer to Subject 20-30-12.
- If a closed end splice is used to connect the shield ground wires of shield ground wire assemblies, the splice assembly must be attached to the wire harness with a wire harness tie.

CLOSED LOOP CONFIGURATION OF SHIELD GROUND WIRES
Figure 3

2. SELECTION OF SHIELD GROUND WIRE ASSEMBLY COMPONENTS

A. Selection of a Shield Ground Wire

Table 5
SHIELD GROUND WIRES

Area of the Airplane	Temperature Grade	Wire		
		Specification	Size (AWG)	Color
Pressurized	-	BMS 13-16 Type 1	20	Black
		BMS 13-16 Type 1	20	White with Black Stripe

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Table 5 (continued)

Area of the Airplane	Temperature Grade	Wire		
		Specification	Size (AWG)	Color
Unpressurized	A	BMS 13-16 Type 1	18	Black
		BMS 13-16 Type 1	18	White with Black Stripe
	B	BMS 13-16 Type 1	18	Black
		BMS 13-16 Type 1	18	White with Black Stripe
	C	BMS 13-16 Type 1	18	Black
		BMS 13-16 Type 1	18	White with Black Stripe
D	BMS 13-31 Type 1	18	Gray	

- (1) If the type, the color, and the size of the old shield ground wire are known, use a shield ground wire that is the same as the old wire.
- (2) If the type, the color, and the size of the old shield ground wire are not known, make a selection of a wire from Table 5.

NOTE: AWG 22 wire can be used for a shield ground wire for assemblies that have wire wrap wire inside:

- A junction box
- An electronic module
- A Survivability or a Vulnerability box.

B. Selection of Mechanical Ferrules

BACS13S FERRULE PART NUMBER STRUCTURE

Figure 4

**Table 6
TEMPERATURE GRADE OF FERRULES**

Maximum Temperature Grade	Ferrule
B	BACS13S()
D	BACS13S()NP

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Table 7
APPROVED SUPPLIERS OF BOEING STANDARD MECHANICAL FERRULES

Boeing Standard	Supplier
BACS13S()	Thomas & Betts
BACS13S()NP	Thomas & Betts

NOTE: The mechanical ferrules specified in Table 8 are Temperature Grade B.

NOTE: For the part numbers of the mechanical ferrules that are Temperature Grade D, NP is added to the end of the part number specified in Table 8. Refer to Figure 4 and Table 6.

NOTE: Temperature Grade D mechanical ferrules do not have color codes. If NP is added to the end of the part number, the color codes that are specified in Table 6 are not applicable. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

B. Shield Termination for Raychem 44A7620 Thermocouple Cables

The paragraph gives the procedure to assemble these shield terminations for the Raychem 44A7620-22 and 44A7260-20 shielded cables:

- A shield dead end
- A shield ground wire with mechanical ferrules.

NOTE: A satisfactory alternative for the shield ground wire termination is the assembly of a shield ground wire with a solder sleeve. Refer to Paragraph 8. or Paragraph 9.

**Table 20
MECHANICAL FERRULE PART NUMBERS**

Cable	Shield Termination	Ferrule		
		Type	Boeing Standard	Color
44A7620-22	Shield Dead End	Inner	BACS13S-124B	Tin
		Outer	BACS13S-175C	Blue
	Shield Ground Wire	Inner	BACS13S-124B	Tin
		Outer	BACS13S-199C	Tin
44A7620-20	Shield Dead End	Inner	BACS13S-128B	Tin
		Outer	BACS13S-175C	Blue
	Shield Ground Wire	Inner	BACS13S-128B	Tin
		Outer	BACS13S-199C	Tin

- (1) Make a selection of an inner ferrule from Table 20.
- (2) Make a selection of an outer ferrule from Table 20.
Make sure that outer ferrule is applicable for the type of shield termination.
- (3) Make a selection of a ferrule crimp tool from Table 23.
- (4) Make a selection of a heat shrinkable sleeve from Table 18.
NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (5) Prepare the cable. Refer to Paragraph 4.
- (6) Remove the necessary length of shield from the end of the cable to make the distance from the end of the jacket to the end of the shield equal to 0.62 inch ±0.06 inch.
- (7) If the shield termination is a shield ground wire:
 - (a) Make a selection of a shield ground wire from Table 5.
Make sure that the length of the shield ground wire is the minimum length that is necessary to attach the wire to the specified ground.
 - (b) Remove 0.3 inch ±0.1 inch of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.
- (8) Put the inner ferrule on the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the inner ferrule is:

- Between the shield and the wires of the cable
- Against the end of the cable jacket.

(9) Put the outer ferrule on the cable.

Make sure that:

- The shield is between the inner ferrule and the outer ferrule
- The center of the outer ferrule is aligned with the center of the inner ferrule
- The forward end of the inner ferrule does not extend more than 0.06 inch farther than the forward end of the outer ferrule.

(10) If the shield termination is a shield ground wire, put the bare conductor of the shield ground wire between the outer ferrule and the shield.

Make sure that the length of the bare conductor of the shield ground wire:

- Extends the full length of the outer ferrule
- Extends a small amount farther than the rear end of the outer ferrule.

(11) Crimp the outer ferrule.

(12) Remove the unwanted length of the shield that extends farther than the forward edge of the outer ferrule.

NOTE: The outer surface of the inner ferrule can be used to cut against.

(13) Put the necessary length of heat shrinkable sleeve on the cable.

Make sure that the distance:

- From the end of the sleeve to the end of the ferrule where the shield ground wire makes an exit from the assembly is 0.5 inch minimum
- From the other end of the sleeve to the other end of the ferrule is 0.25 inch minimum.

(14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Shield Termination for 10-60875 FQIS Cables and Component Wires

The paragraph gives the procedure to assemble these shield terminations for the Boeing 10-60875 FQIS shielded cables and component wires:

- A shield dead end
- A shield ground wire with mechanical ferrules.

**Table 21
MECHANICAL FERRULE PART NUMBERS**

Cable	Shield Termination	Ferrule		
		Type	Boeing Standard	Color
10-60875-5	Shield Dead End	Inner	BACS13S-219B	Green
		Outer	BACS13S-281C	Blue
	Shield Ground Wire	Inner	BACS13S-219B	Green
		Outer	BACS13S-297C	Tin

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Table 21 (continued)

Cable	Shield Termination	Ferrule		
		Type	Boeing Standard	Color
10-60875-9	Shield Dead End	Inner	BACS13S-219B	Green
		Outer	BACS13S-281C	Blue
	Shield Ground Wire	Inner	BACS13S-219B	Green
		Outer	BACS13S-297C	Tin

- (1) Make a selection of an inner ferrule from Table 21.
- (2) Make a selection of an outer ferrule from Table 21.
Make sure that the outer ferrule is applicable for the type of shield termination.
- (3) Make a selection of a ferrule crimp tool from Table 23.
- (4) Prepare the cable. Refer to Paragraph 4.
- (5) Remove the necessary length of shield from the end of the cable to make the distance from the end of the jacket to the end of the shield equal to 0.62 inch \pm 0.06 inch.
- (6) If the shield termination is a shield ground wire:
 - (a) Make a selection of a shield ground wire from Table 5.
Make sure that the length of the shield ground wire is the minimum length that is necessary to attach the wire to the specified ground.
 - (b) Remove 0.3 inch \pm 0.1 inch of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.
- (7) Put the inner ferrule on the cable.
Make sure that the inner ferrule is:
 - Between the shield and the wires of the cable
 - Against the end of the cable jacket.
- (8) Put the outer ferrule on the cable.
Make sure that:
 - The shield is between the inner ferrule and the outer ferrule
 - The center of the outer ferrule is aligned with the center of the inner ferrule
 - The forward end of the inner ferrule does not extend more than 0.06 inch farther than the forward end of the outer ferrule.
- (9) If the shield termination is a shield ground wire, put the bare conductor of the shield ground wire between the outer ferrule and the shield.
Make sure that the length of the bare conductor of the shield ground wire:
 - Extends the full length of the outer ferrule
 - Extends a small amount farther than the rear end of the outer ferrule.
- (10) Crimp the outer ferrule.
- (11) Remove the unwanted length of the shield that extends farther than the forward edge of the outer ferrule.

NOTE: The outer surface of the inner ferrule can be used to cut against.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

(12) Assemble the shield termination of the 10-60875-4 component wire. Refer to Paragraph 3.E.

D. Shield Termination for Component Wires of Unshielded 10-60875 FQIS Cables

The paragraph gives the procedure to assemble these shield terminations for a shielded component wire of a Boeing 10-60875 FQIS unshielded cable:

- A shield dead end
- A shield ground wire with mechanical ferrules.

- (1) Prepare the cable. Refer to Paragraph 4.
- (2) Assemble the shield termination of the 10-60875-4 component wire. Refer to Paragraph 3.E.

E. Shield Termination for 10-60875 FQIS Wires

The paragraph gives the procedure to assemble these shield terminations for the Boeing 10-60875 FQIS shielded wires:

- A shield dead end
- A shield ground wire with mechanical ferrules.

**Table 22
MECHANICAL FERRULE PART NUMBERS**

Cable	Shield Termination	Ferrule		
		Type	Boeing Standard	Color
10-60875-4	Shield Dead End	Inner	BACS13S-080B	Blue
		Outer	BACS13S-128C	Blue
	Shield Ground Wire	Inner	BACS13S-080B	Blue
		Outer	BACS13S-156C	Yellow
10-60875-8	Shield Dead End	Inner	BACS13S-080B	Blue
		Outer	BACS13S-128C	Blue
	Shield Ground Wire	Inner	BACS13S-080B	Blue
		Outer	BACS13S-156C	Yellow

- (1) Make a selection of an inner ferrule from Table 22.
- (2) Make a selection of an outer ferrule from Table 22.
Make sure that the outer ferrule is applicable for the type of shield termination.
- (3) Make a selection of a ferrule crimp tool from Table 23.
- (4) Prepare the wire. Refer to Paragraph 4.
- (5) Remove the necessary length of shield from the wire to make the distance from the end of the jacket to the end of the shield equal to 0.62 inch ±0.06 inch.
- (6) If the shield termination is a shield ground wire:
 - (a) Make a selection of a shield ground wire from Table 5.
Make sure that the length of the shield ground wire is the minimum length that is necessary to attach the wire to the specified ground.
 - (b) Remove 0.3 inch ±0.1 inch of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.

20-10-15

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (7) Put the inner ferrule on the wire.

Make sure that the inner ferrule is:

- Between the shield and the primary insulation of the wire
- Against the end of the jacket of the wire.

- (8) Put the outer ferrule on the wire.

Make sure that:

- The shield is between the inner ferrule and the outer ferrule
- The center of the outer ferrule is aligned with the center of the inner ferrule
- The forward end of the inner ferrule does not extend more than 0.06 inch farther than the forward end of the outer ferrule.

- (9) If the shield termination is a shield ground wire, put the bare conductor of the shield ground wire between the outer ferrule and the shield.

Make sure that the length of the bare conductor of the shield ground wire:

- Extends the full length of the outer ferrule
- Extends a small amount farther than the rear end of the outer ferrule.

- (10) Crimp the outer ferrule.

- (11) Remove the unwanted length of the shield that extends farther than the forward edge of the outer ferrule.

NOTE: The outer surface of the inner ferrule can be used to cut against.

4. WIRE AND CABLE PREPARATION**A. Jacket Removal from the End of a Wire or Cable**

- (1) Make a selection of a wire or cable jacket removal tool. Refer to Subject 20-00-15.

NOTE: One of these tools is a satisfactory alternative:

- A sharp knife
- A thermal tool for insulation removal
- The Reon Manufacturing R-720 cable jacket removal tool for BMS13-51 cable.

- (2) Make a selection of the location on the jacket of the wire or cable to make the shield termination. Refer to Paragraph 1. for the conditions that are applicable for shield termination.

- (3) Carefully cut the jacket around the circumference of the wire or cable at that location.

CAUTION: DO NOT CUT ALL OF THE WAY THROUGH THE JACKET. DAMAGE TO THE SHIELD OR THE COMPONENT WIRES CAN OCCUR.

- (4) If it is necessary, carefully cut the jacket longitudinally the location to the end of the wire or cable.

CAUTION: DO NOT CUT ALL OF THE WAY THROUGH THE JACKET. DAMAGE TO THE SHIELD OR THE COMPONENT WIRE CAN OCCUR.

- (5) Pull the jacket apart at the lines where it is cut.

NOTE: If it is necessary, the wire or cable can be bent to make the removal easier.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: DO NOT BEND THE WIRE OR CABLE MORE THAN THE POINT WHERE THE RADIUS OF THE BEND IS LESS THAN 3 TIMES THE DIAMETER OF THE WIRE OR CABLE. DAMAGE TO THE WIRE OR CABLE CAN OCCUR.

- (6) Examine the jacket, the shield, and primary insulation of the component wires for damage. For the conditions that are applicable after the removal of a jacket from the end of a wire or cable, refer to Subject 20-00-15.

5. ASSEMBLY OF A SHIELD GROUND WIRE WITH A SHIELD PULL THROUGH

A. Shield Pull Through with Sleeve Strain Relief

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (1) Make a selection of a heat shrinkable sleeve from Table 18.
 - NOTE:** For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (2) Put an approximate 0.7 inch length of heat shrinkable sleeve on the wire or cable.
- (3) Prepare the wire or cable. Refer to Figure 11 and Paragraph 4.A.

JACKET REMOVAL
Figure 11

- (4) If the wire or cable has adjacent shields, remove the outer shield.
 - CAUTION:** DAMAGE TO THE REMAINING INNER SHIELD MUST BE PREVENTED. DAMAGE TO THE CONDUCTORS OF THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.
 - (a) Move the strands of the outer shield apart.
 - (b) Carefully cut the strands of the shield at the end of the jacket.
 - Make sure that the end of the outer shield is aligned with the end of the jacket.
- (5) Push the shield rearward to expand it at the end of the jacket. Refer to Figure 12.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

EXPANDED SHIELD

Figure 12

- (6) Make a hole in the shield with a nylon awl or an equivalent tool. Refer to Figure 13. Make sure that the center of the hole is approximately 0.5 inch from the end of the cable jacket.

LOCATION OF THE HOLE IN THE SHIELD

Figure 13

- (7) Carefully bend the wire or cable until the component wires can be seen in the hole. Refer to Figure 14.

POSITION OF THE HOLE ON THE BEND OF THE CABLE

Figure 14

- (8) Carefully pull a wire through the hole in the shield with the nylon awl. Refer to Figure 15.

POSITION OF THE WIRE THROUGH THE HOLE IN THE SHIELD

Figure 15

- (9) Pull the wire out of the hole. Refer to Figure 16.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE WIRE OUT OF THE SHIELD
Figure 16

- (10) Do Step (8) and Step (9) again for each wire in the cable.
- (11) Pull the end of the shield tight to make a flat and symmetrical conductor.
- (12) Remove the necessary length from the end of the shield conductor to make the distance from the end of the conductor to the end of the jacket equal to 1.7 inches to 2.0 inches. Refer to Figure 17.

LENGTH OF THE SHIELD CONDUCTOR
Figure 17

- (13) Fold the shield conductor back on the jacket of the wire or cable. Make sure that the free end of the conductor is pointed away from the end of the cable.
- (14) Align the center of the sleeve with the end of the shield. Refer to Figure 18. Make sure that:
 - The rear end of the sleeve makes an overlap with the end of the jacket
 - The free end of the shield conductor is pointed in the correct direction out of the sleeve.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 18

- (15) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Shield Pull Through with Tape Strain Relief

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (1) Make a selection of tape from Table 18.
- (2) Prepare the wire or cable. Refer to Figure 19 and Paragraph 4.A.

JACKET REMOVAL
Figure 19

- (3) If the wire or cable has adjacent shields, remove the outer shield.

CAUTION: DAMAGE TO THE REMAINING INNER SHIELD MUST BE PREVENTED. DAMAGE TO THE CONDUCTORS OF THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (a) Move the strands of the outer shield apart.
- (b) Carefully cut the strands of the shield at the end of the jacket.

Make sure that the end of the outer shield is aligned with the end of the jacket.

- (4) Push the shield rearward to expand it at the end of the jacket. Refer to Figure 20.

EXPANDED SHIELD
Figure 20

- (5) Make a hole in the shield with a nylon awl or an equivalent tool. Refer to Figure 21.

Make sure that the center of the hole is approximately 0.5 inch from the end of the cable jacket.

LOCATION OF THE HOLE IN THE SHIELD
Figure 21

- (6) Carefully bend the wire or cable until the component wires can be seen in the hole. Refer to Figure 22.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE HOLE ON THE BEND OF THE CABLE

- (8) Pull the wire out of the hole. Refer to Figure 24.

POSITION OF THE WIRE OUT OF THE SHIELD

Figure 24

- (9) Do Step (7) and Step (8) again for each wire in the cable.
 (10) Pull the end of the shield tight to make a flat and symmetrical conductor.
 (11) Remove the necessary length from the shield conductor to make the distance from the end of the conductor to the end of the jacket equal to 1.7 inches to 2.0 inches. Refer to Figure 25.

LENGTH OF THE SHIELD CONDUCTOR

Figure 25

- (12) Fold the shield conductor back on the jacket of the wire or cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the free end of the conductor is pointed away from the end of the cable.

- (13) Put two layers of tape on the shield conductor, the jacket, and the wires of the cable. Refer to Figure 26.

Make sure that:

- Each layer has a 0.25 inch overlap
- The rear end of each each layer extends a minimum of 0.3 inch farther than the rear end of the shield
- The forward end of each each layer extends a minimum of 0.3 inch farther than the forward end of the shield
- The second layer is wound in the opposite direction of the first layer
- The free end of the shield conductor is pointed in the correct direction out of the layers of tape.

Figure 29

B. Shield Ground Wire - Shield Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Make a selection of a tape from Table 18.
Make sure the tape has the correct Temperature Grade.
- (4) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

NOTE: If two shield ground wires are specified, a satisfactory alternative to the minimum length is two times the minimum length from which the insulation can be removed at the center. Refer to Figure 28.

- (5) Measure the O.D. of the wire or cable.
- (6) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the wire or cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (7) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (8) Put the inner ferrule on the wire or cable.

Make sure that the ferrule is the smallest ferrule that can be moved freely on the jacket of the wire or cable.

- (9) Remove the necessary length of the shield:

- (a) Use a sharp knife to score around the outer jacket at two positions. Make the distance between the scores 0.25 - 0.38 inches. Refer to Figure 30.

CAUTION: DO NOT CUT FULLY THROUGH THE CABLE JACKET. CUTTING THROUGH THE CABLE JACKET CAN DAMAGE THE SHIELD AND THE INTERNAL CONDUCTORS AND CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

DIMENSION BETWEEN THE SCORES IN THE OUTER JACKET

Figure 30

- (b) Tear or pull the outer jacket at the first score line until the first piece of outer jacket is not attached. Refer to Figure 31.

NOTE: The cable can be bent to help remove the first piece of the outer jacket.

CAUTION: DO NOT BEND THE CABLE TO A RADIUS THAT IS LESS THAN 3 TIMES THE CABLE DIAMETER. DAMAGE TO THE CABLE CAN OCCUR.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

REMOVAL OF THE FIRST PIECE OF OUTER JACKET

Figure 31

- (c) Remove the first piece of the outer jacket. Refer to Figure 31.
- (d) Push the shield back to make a ring against the second piece of the outer jacket. Refer to Figure 32.

SHIELD PUSH BACK AND TRIM

Figure 32

- (e) Cut the shield with scissors or cutters. Refer to Figure 32.

CAUTION: DO NOT CUT THE SHIELD WITH A KNIFE AGAINST THE CABLE. DAMAGE TO THE INNER CONDUCTORS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (f) Tear or pull the outer jacket at the second score line until the second piece of outer jacket is not attached. Refer to Figure 33.

NOTE: The cable can be bent to help remove the second piece of the outer jacket.

CAUTION: DO NOT BEND THE CABLE TO A RADIUS THAT IS LESS THAN 3 TIMES THE CABLE DIAMETER. DAMAGE TO THE CABLE CAN OCCUR.

REMOVAL OF THE SECOND PIECE OF OUTER JACKET

Figure 33

- (10) If the cable has adjacent shields, remove the outer shield. Refer to Figure 34.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

REMOVAL OF THE OUTER SHIELD

Figure 34

- (a) Move the strands of the outer shield apart and make them straight.
- (b) Cut the strands of the outer shield at the end of the jacket.

CAUTION: THE STRANDS OF THE OUTER SHIELD MUST BE CUT CAREFULLY. DAMAGE TO THE INNER SHIELD OR THE WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (11) Move the strands of the remaining shield apart and make them straight.
- (12) Push the inner ferrule forward until the forward end of the ferrule is aligned with the end of the jacket. Refer to Figure 35.

POSITION OF THE INNER FERRULE

Figure 35

- (13) Fold the strands of the shield back on the inner ferrule. Refer to Figure 36.
Make sure that the strands of the shield are smooth and symmetrical around the circumference of the inner ferrule.

STRANDS OF THE SHIELD FOLDED BACK

Figure 36

- (14) Remove the necessary length of insulation from one end of each shield ground wire. Refer to Subject 20-00-15.

Make sure that the conductor of each shield ground wire has the sufficient length to extend the full length of the outer ferrule.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (15) Put the conductor of each shield ground wire on the shield and the inner ferrule.
Make sure that each shield ground wire is pointed in the correct direction.

CAUTION: MORE THAN THREE SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY. MORE THAN THREE SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

For the configuration of:

- One shield ground wire, refer to Figure 27
- Two shield ground wires, refer to Figure 28
- Three shield ground wires, refer to Figure 29.

- (16) Put the outer ferrule on the inner ferrule.

Refer to:

- Figure 37 for a shield ground wire that is pointed forward
- Figure 38 for a shield ground wire that is pointed rearward.

Make sure that:

- The outer ferrule is the smallest that can be crimped on the inner ferrule and the shield ground wires
- The rear end of the inner ferrule does not extend farther than 0.06 inch from the rear end of the outer ferrule
- The end of each shield ground wire extends farther than the end of the outer ferrule
- For a shield ground wire that is pointed forward, the end of each shield ground wire does not extend farther than the rear end of the inner ferrule
- For a shield ground wire that is pointed rearward, the end of each shield ground wire does not extend farther than the forward end of the shield.

Figure 38

- (17) Make a selection of a ferrule crimp tool from Table 23.
- (18) Crimp the outer ferrule.
- (19) Remove the unwanted length of the shield that extends farther than the rear end of the outer ferrule. Refer to Figure 39.

NOTE: The outer surface of the inner ferrule can be used to cut against.

REMOVAL OF THE UNWANTED LENGTH OF SHIELD
Figure 39

- (20) Put two layers of tape on the shield ground wire assembly.

Refer to:

- Figure 40 for a shield ground wire that is pointed forward
- Figure 41 for a shield ground wire that is pointed rearward.

Make sure that:

- Each layer has a 50 percent overlap
- The rear end of each layer extends 0.5 inch to 0.75 inch from the rear end of the outer ferrule
- The forward end of each layer extends 0.5 inch to 0.75 inch from the forward end of the outer ferrule
- The second layer is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE - SHIELD GROUND WIRE POINTED REARWARD

Figure 41

- (21) Assemble a wire harness tie on each end of the shield ground wire assembly approximately 0.25 inch from the end of the layers of tape.

Refer to:

- Figure 40 for a shield ground wire that is pointed forward
- Figure 41 for a shield ground wire that is pointed rearward
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

C. Shield Ground Wire - Outer Shield Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has an outer shield with round conductors and an adjacent inner shield with flat conductors.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Make a selection of a tape from Table 18.
Make sure the tape has the correct Temperature Grade.
- (4) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

NOTE: If two shield ground wires are specified, a satisfactory alternative to the minimum length is two times the minimum length from which the insulation can be removed at the center. Refer to Figure 28.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (5) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

NOTE: If two shield ground wires are specified, a satisfactory alternative to the minimum length is two times the minimum length from which the insulation can be removed at the center. Refer to Figure 28.

- (6) Measure the O.D. of the wire or cable.
- (7) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the wire or cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (8) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (9) Put the inner ferrule on the wire or cable.

Make sure that the ferrule is the smallest ferrule that can be moved freely on the jacket of the wire or cable.

- (10) Remove the necessary length of the shield or adjacent shields to make the distance from the end of the shield to the end of the jacket equal to 0.62 inch \pm 0.06 inch. Refer to Figure 42.

LENGTH OF THE SHIELD
Figure 42

- (11) Move the stands of the outer shield apart and make them straight.
- (12) Push the inner ferrule forward until the forward end of the ferrule is aligned with the end of the jacket. Refer to Figure 43.

POSITION OF THE INNER FERRULE
Figure 43

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (13) Fold the strands of the outer shield back on the inner ferrule. Refer to Figure 44.

Make sure that the strands of the shield are smooth and symmetrical around the circumference of the inner ferrule.

**STRANDS OF THE SHIELD FOLDED BACK****Figure 44**

- (14) Remove the necessary length of insulation from one end of each shield ground wire. Refer to Subject 20-00-15.

Make sure that the conductor of each shield ground wire has the sufficient length to extend the full length of the outer ferrule.

- (15) Put the conductor of each shield ground wire on the shield and the inner ferrule.

Make sure that each shield ground wire is pointed in the correct direction.

CAUTION: MORE THAN THREE SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY. MORE THAN THREE SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

For the configuration of:

- One shield ground wire, refer to Figure 27
- Two shield ground wires, refer to Figure 28
- Three shield ground wires, refer to Figure 29.

- (16) Put the outer ferrule on the inner ferrule.

Refer to:

- Figure 45 for a shield ground wire that is pointed forward
- Figure 46 for a shield ground wire that is pointed rearward.

Make sure that:

- The outer ferrule is the smallest that can be crimped on the inner ferrule and the shield ground wires
- The rear end of the inner ferrule does not extend farther than 0.06 inch from the rear end of the outer ferrule
- The end of each shield ground wire extends farther than the end of the outer ferrule
- For a shield ground wire that is pointed forward, the end of each shield ground wire does not extend farther than the rear end of the inner ferrule
- For a shield ground wire that is pointed rearward, the end of each shield ground wire does not extend farther than the end of the forward end of the shield.

- Figure 50 for a shield ground wire that is pointed rearward
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

D. Shield Ground Wire - Shield Not Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

For the procedure to assemble a shield ground wire that is not at the end of a cable, refer to Paragraph 6.E.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

NOTE: If two shield ground wires are specified, a satisfactory alternative to the minimum length is two times the minimum length from which the insulation can be removed at the center. Refer to Figure 28.

- (4) Measure the O.D. of the shield.
- (5) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the shield of the cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (6) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (7) Make a selection of a ferrule crimp tool from Table 23.
- (8) Put the outer ferrule on the cable.
- (9) Put the inner ferrule on the cable. Refer to Figure 51.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The inner ferrule is the smallest ferrule that can be moved freely on the primary insulation of the wire
- The inner ferrule is between the shield and the primary insulation
- The rear end of the inner ferrule is tight against the end of the cable jacket.

CAUTION: THE INNER FERRULE MUST BE LARGE ENOUGH TO PREVENT DAMAGE TO THE PRIMARY INSULATION OF THE WIRE. DAMAGE TO THE PRIMARY INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

POSITION OF THE INNER FERRULE
Figure 51

- (10) Remove the necessary length of insulation from one end of each shield ground wire. Refer to Subject 20-00-15.

NOTE: Removal of the necessary length of the insulation from the center of the shield ground wire is an acceptable alternative if the length of the ground wire is two times the minimum length. Refer to Step (3).

- (11) Put the conductor of each shield ground wire between the jacket and the outer ferrule.

Make sure that:

- The free end of the shield ground wire is pointed in the correct direction
- The length of bare conductor extends the full length of the outer ferrule
- The bare conductor extends a small amount farther than the rear end of the outer ferrule.

CAUTION: MORE THAN THREE SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY ON A CABLE WITH ONE SHIELD. MORE THAN THREE SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: MORE THAN TWO SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY ON A CABLE WITH ADJACENT SHIELDS. MORE THAN TWO SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

For the configuration of:

- One shield ground wire, refer to Figure 27
- Two shield ground wires, refer to Figure 28
- Three shield ground wires, refer to Figure 29.

- (12) Push the outer ferrule and the shield ground wires forward until the center of the outer ferrule is aligned with the center of the inner ferrule. Refer to Figure 52.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the forward end of the inner ferrule does not extend farther than 0.06 inch from the forward end of the outer ferrule.

POSITION OF THE OUTER FERRULE ON THE INNER FERRULE

Figure 52

- (13) Crimp the outer ferrule.
- (14) Remove the unwanted length of the shield that extends farther than the forward edge of the outer ferrule. Refer to Figure 53.

NOTE: The outer surface of the inner ferrule can be used to cut against.

REMOVAL OF THE UNWANTED LENGTH OF SHIELD

Figure 53

- (15) Make a selection of a heat shrinkable sleeve from Table 18.
Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

NOTE: As an alternative, a layer of tape can be put on the shield ground wire assembly. Refer to Table 18.

- (16) If the shield ground wire is pointed away from the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the wire or cable. Refer to Figure 54.
Make sure that the distance:
 - From the rear end of the ferrule to the rear end of the sleeve is 0.25 inch minimum
 - From the forward end of the ferrule to the forward end of the sleeve is 0.5 inch minimum.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE HEAT SHRINKABLE SLEEVE

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (17) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the wire or cable. Refer to Figure 55. Make sure that the distance:
 - From the rear end of the ferrule to the rear end of the sleeve is 0.25 inch minimum
 - From the forward end of the ferrule to the forward end of the sleeve is 0.5 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 55

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

E. Shield Ground Wire - Not at the End of a Wire or Cable

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Remove the necessary length of insulation from one end of each shield ground wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (5) Measure the O.D. of the shield.
- (6) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the shield of the cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (7) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (8) Make a selection of a ferrule crimp tool from Table 23.
- (9) Put the outer ferrule on the cable.
- (10) Push the shield in the direction of the end of the jacket to make the shield loose.
- (11) Put the inner ferrule on the cable. Refer to Figure 56.

Make sure that:

- The inner ferrule is the smallest ferrule that can be moved freely on the primary insulation of the wire
- The inner ferrule is between the shield and the primary insulation
- The rear end of the inner ferrule is tight against the end of the cable jacket.

NOTE: A rigid tube that has the same diameter and thickness as the ferrule can be used to push the ferrule into the correct position.

CAUTION: THE INNER FERRULE MUST BE LARGE ENOUGH TO PREVENT DAMAGE TO THE PRIMARY INSULATION OF THE WIRE. DAMAGE TO THE PRIMARY INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

POSITION OF THE INNER FERRULE
Figure 56

- (12) Put the conductor of each shield ground wire between the shield and the outer ferrule.

Make sure that:

- The free end of the shield ground wire is pointed in the correct direction
- The length of bare conductor extends the full length of the outer ferrule
- The bare conductor extends a small amount farther than the rear end of the outer ferrule.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

CAUTION: MORE THAN THREE SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY ON A CABLE WITH ONE SHIELD. MORE THAN THREE SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: MORE THAN TWO SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY ON A CABLE WITH ADJACENT SHIELDS. MORE THAN TWO SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (13) Push the outer ferrule and the shield ground wires forward until the center of the outer ferrule is aligned with the center of the inner ferrule.
Make sure that the forward end of the inner ferrule does not extend farther than 0.06 inch from the forward end of the outer ferrule.
- (14) Crimp the outer ferrule.
- (15) Pull the end of the loose shield forward to the end of the cable.
- (16) Assemble a shield dead end at the end of the wire or cable.
Refer to Figure 57 and Paragraph 12.A.

SHIELD DEAD END
Figure 57

- (17) Make a selection of a heat shrinkable sleeve from Table 18.
Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.
- NOTE:** For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (18) If the shield ground wire is pointed away from the end of the wire or cable:
- (a) Put the necessary length of heat shrinkable sleeve on the wire or cable. Refer to Figure 58.
Make sure that the distance:
- From the rear end of the ferrule to the rear end of the sleeve is 0.5 inch minimum
 - From the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum.

POSITION OF THE FIRST HEAT SHRINKABLE SLEEVE

Figure 58

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (19) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the forward end of the shield ground wire assembly. Refer to Figure 59.

Make sure that:

- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum
- The rear end of the sleeve is aligned with the forward end of the ferrule.

POSITION OF THE SECOND HEAT SHRINKABLE SLEEVE

Figure 59

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) Put the necessary length of heat shrinkable sleeve on the ferrule and the shield ground wire. Refer to Figure 59.
 - Make sure that the distance:
 - From the rear end of the ferrule to the rear end of the sleeve is 0.5 inch minimum
 - From the forward end of the ferrule to the forward end of the sleeve is 0.5 inch minimum.
- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.

F. Shield Ground Wires - Shields Not Folded Back

This paragraph gives the procedure to assemble the shield ground wires of a cable that has two shields that are not adjacent.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

SHIELD GROUND WIRE OF THE OUTER SHIELD

Figure 60

SHIELD GROUND WIRE OF THE INNER SHIELD

Figure 61

- (1) Prepare the cable for the shield ground wire of the outer shield. Refer to Figure 62.

OUTER JACKET AND OUTER SHIELD REMOVAL

Figure 62

- (a) Remove 2.60 inches ± 0.02 inch of the outer jacket from the end of the cable. Refer to Paragraph 4.A.
- (b) Remove the necessary length of the outer shield to make the distance from the end of the shield to the end of the outer jacket equal to 0.35 inch ± 0.03 inch.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Measure the O.D. of the shield.
- (5) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the shield of the cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (6) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (7) Make a selection of a ferrule crimp tool from Table 23.
- (8) Put the outer ferrule on the cable.
- (9) Put the inner ferrule on the cable. Refer to Figure 62.

Make sure that:

- The inner ferrule is the smallest ferrule that can be moved freely on the inner jacket of the cable
- The inner ferrule is between the outer shield and the inner jacket
- The rear end of the inner ferrule is tight against the end of the outer jacket.

CAUTION: THE INNER FERRULE MUST BE LARGE ENOUGH TO PREVENT DAMAGE TO THE INNER JACKET OF THE CABLE. DAMAGE TO THE INNER JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (10) Remove the necessary length of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.
- (11) Put the conductor of the shield ground wire between the jacket and the outer ferrule.

Make sure that:

- The free end of the shield ground wire is pointed forward to the end of the cable
- The length of bare conductor extends the full length of the outer ferrule
- The bare conductor extends a small amount farther than the rear end of the outer ferrule.

- (12) Push the outer ferrule and the shield ground wire forward until the center of the outer ferrule is aligned with the center of the inner ferrule.

Make sure that the forward end of the inner ferrule does not extend farther than 0.06 inch from the forward end of the outer ferrule.

- (13) Crimp the outer ferrule.
- (14) Remove the unwanted length of the shield that extends farther than the forward edge of the outer ferrule.

NOTE: The outer surface of the inner ferrule can be used to cut against.

- (15) Make a selection of a heat shrinkable sleeve from Table 18.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

NOTE: As an alternative, a layer of tape can be put on the shield ground wire assembly. Refer to Table 18.

- (16) Put the necessary length of heat shrinkable sleeve on the wire or cable.

Make sure that the distance:

- From the rear end of the ferrule to the rear end of the sleeve is 0.25 inch minimum
- From the forward end of the ferrule to the forward end of the sleeve is 0.5 inch minimum.

Refer to:

- Figure 60 for the shield ground wire of the outer shield
- Figure 61 for the shield ground wire of the inner shield.

- (17) Shrink the sleeve into its position. Refer to Subject 20-10-14.

- (18) Prepare the cable for the shield ground wire of the inner shield. Refer to Figure 63.

INNER JACKET AND INNER SHIELD REMOVAL

Figure 63

- (a) Remove 1.85 inches ± 0.02 inch of the inner jacket from the end of the cable. Refer to Paragraph 4.A.
 - (b) Remove the necessary length of the inner shield to make the distance from the end of the shield to the end of the jacket equal to 0.35 inch ± 0.03 inch.
- (19) Do Step (2) through Step (8) for the shield ground wire of the inner shield.
 - (20) Put the inner ferrule on the cable. Refer to Figure 63.

Make sure that:

- The inner ferrule is the smallest ferrule that can be moved freely on the primary insulation of the wire
- The inner ferrule is between the shield and the primary insulation
- The rear end of the inner ferrule is tight against the end of the inner jacket.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: THE INNER FERRULE MUST BE LARGE ENOUGH TO PREVENT DAMAGE TO THE PRIMARY INSULATION OF THE WIRE. DAMAGE TO THE PRIMARY INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

(21) Do Step (10) through Step (17) for the shield ground wire of the inner shield.

7. ASSEMBLY OF A SHIELD GROUND WIRE - RSK SHIELD-KON

A. Shield Ground Wire Assembly

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Remove the necessary length of the shield from the end of the wire or cable to make the length of the shield equal to 0.35 inch \pm 0.10 inch. Refer to Figure 64.

LENGTH OF THE SHIELD

Figure 64

- (5) Fold the shield back on the jacket of the wire or cable. Refer to Figure 65.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.

SHIELD FOLDED BACK

Figure 65

20-10-15

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (6) Make a selection of an RSK Shield-Kon from Table 9.
Refer to Figure 65 for the applicable dimensions of the shield ground wire assembly.
- (7) Make a selection of crimp tool from Table 24.
- (8) Remove 0.3 inch \pm 0.1 inch of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.
- (9) Put the Shield-Kon in the jaws of the upper and lower dies of the crimp tool. Refer to Figure 66.

Make sure that:

- The shield ground wire clip is pointed up
- The center of the Shield-Kon is aligned with the center of the die.

POSITION OF THE SHIELD-KON IN THE CRIMP TOOL

Figure 66

- (10) Put the conductor of the shield ground wire in the shield ground wire clip of the Shield-Kon. Refer to Figure 67.

Make sure that:

- The shield ground wire is pointed in the correct direction
- The conductor of the shield ground wire is in the correct position in the shield ground clip.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE SHIELD GROUND WIRE AND THE WIRE OR CABLE
Figure 67

- (11) Put the wire or cable in the bottom of the Shield-Kon. Refer to Figure 67.
 Make sure that the rear end of the Shield-Kon is aligned with the rear end of the shield.
- (12) Crimp the Shield-Kon.
- (13) Install the insulation of the shield ground wire assembly.
 For insulation with:
 - A heat shrinkable sleeve, refer to Paragraph 7.B.
 - A tape, refer to Paragraph 7.C.

B. Insulation with Heat Shrinkable Sleeve

- (1) Make a selection of a heat shrinkable sleeve from Table 18.
 Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.
NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (2) If the shield ground wire is pointed away from the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the wire or cable. Refer to Figure 68.
 Make sure that:
 - The distance from the forward end of the Shield-Kon to the forward end of the heat shrinkable sleeve is 0.25 inch minimum
 - The distance from the rear end of the Shield-Kon to the rear end of the heat shrinkable sleeve is 0.5 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 68

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
 - (3) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the wire or cable. Refer to Figure 69.
- Make sure that:
- The distance from the forward end of the Shield-Kon to the forward end of the heat shrinkable sleeve is 0.5 inch minimum
 - The distance from the rear end of the Shield-Kon to the rear end of the heat shrinkable sleeve is 0.25 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 69

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Insulation with Tape

- (1) Make a selection of a tape from Table 18.
- (2) Put two layers of tape on the shield ground wire assembly. Refer to Figure 70.

Make sure that:

- Each layer has a 0.25 inch overlap
- The rear end of each each layer extends a minimum of 0.3 inch farther than the rear end of the Shield-Kon
- The forward end of each each layer extends a minimum of 0.3 inch farther than the forward end of the Shield-Kon
- The second layer is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE
Figure 70

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

8. ASSEMBLY OF A SHIELD GROUND WIRE - SOLDER SLEEVE WITHOUT AN INTEGRAL WIRE

This paragraph gives the procedures to assemble a shield ground wire with a solder sleeve that does not have an integral wire.

For the assembly of a shield ground wire with a solder sleeve that has:

- An insulated integral wire, refer to Paragraph 9.
- An uninsulated integral wire, refer to Paragraph 10.

A. Shield Ground Wire Configurations

Figure 76

B. Shield Ground Wire - Shield Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

For the procedure to assemble a shield ground wire:

- With a shield that is not folded back, refer to Paragraph 8.C.
- That is not at the end of a wire or cable, refer to Paragraph 8.D.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 77.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELD

Figure 77

- (5) Fold the shield back on the jacket of the wire or cable.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.
- (6) Remove 0.25 inch \pm 0.06 inch of insulation from one end of each shield ground wire.
- (7) Make a selection of a solder sleeve from Table 10.
Refer to Figure 78 for the applicable dimensions of the shield ground wire assembly.

DIMENSIONS FOR SOLDER SLEEVE SELECTION

Figure 78

- (8) Put the conductor of each shield ground wire against the shield of the wire or cable.
For the position of:
 - One shield ground wire, refer to Figure 71 and Figure 72
 - Two shield ground wires, refer to Figure 73 and Figure 74
 - Three shield ground wires, refer to Figure 75 and Figure 76.

CAUTION: THE STRANDS OF THE SHIELD GROUND WIRE MUST NOT GO INTO THE SHIELD OF THE CABLE. A SHORT CIRCUIT BETWEEN THE CONDUCTOR OF THE WIRE AND THE SHIELD CAN OCCUR.

- (9) Put the solder sleeve on the wire or cable. Refer to Figure 5 and Figure 79.
Make sure that:
 - The large end of the solder sleeve is put on the wire or cable first
 - The end of the insulation of the shield ground wire is aligned with the end of the shield
 - The inner edge of the rear seal ring is aligned with the rear end of the shield.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE SOLDER SLEEVE AND THE SHIELD GROUND WIRE

Figure 79

- (10) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve and the shield ground wire stay in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

C. Shield Ground Wire - Shield Not Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

For the procedure to assemble a shield ground wire:

- With a shield that is folded back, refer to Paragraph 8.B.
- That is not at the end of a wire or cable, refer to Paragraph 8.D.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 80.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELD

Figure 80

(5) Remove 0.25 inch \pm 0.06 inch of insulation from one end of each shield ground wire.

(6) Make a selection of a solder sleeve from Table 10.

Refer to Figure 81 for the applicable dimensions of the shield ground wire assembly.

O.D. of the Shield Ground Wire Assembly

DIMENSIONS FOR SOLDER SLEEVE SELECTION

Figure 82

- (9) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve and the shield ground wire stay in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

D. Shield Ground Wire - Not at the End of a Wire or Cable

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
 - A shield with flat conductors
 - An outer shield with round conductors and an adjacent inner shield with round conductors
 - An outer shield with round conductors and an adjacent inner shield with flat conductors.
- (1) Remove 0.25 inch \pm 0.06 inch of the jacket from the wire or cable at the location of the shield termination.
Refer to Paragraph 4.A. for the applicable jacket removal tool.
 - (2) Make a selection of a shield ground wire from Table 5.
 - (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.
For the maximum length of the shield ground wire, refer to Paragraph 1.D.
 - (4) Remove 0.25 inch \pm 0.06 inch of insulation from the one end of each shield ground wire.
 - (5) Make a selection of a solder sleeve from Table 10.

Refer to Figure 83 for the applicable dimensions of the shield ground wire assembly.

DIMENSIONS FOR SOLDER SLEEVE SELECTION

(8) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve and the shield ground wire stay in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

9. ASSEMBLY OF A SHIELD GROUND WIRE - SOLDER SLEEVE WITH AN INSULATED INTEGRAL WIRE

This paragraph gives the procedures to assemble a shield ground wire with solder sleeve that has an insulated integral wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

For the assembly of a shield ground wire with a solder sleeve that:

- Does not have an integral wire, refer to Paragraph 8.
- Has an uninsulated integral wire, refer to Paragraph 10.

A. Shield Ground Wire Configurations

POSITION OF ONE SHIELD GROUND WIRE
Figure 85

B. Shield Ground Wire - Shield Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

For the procedure to assemble a shield ground wire:

- With a shield that is not folded back, refer to Paragraph 9.C.
- That is not at the end of a wire or cable, refer to Paragraph 9.D.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 86.

LENGTH OF THE SHIELD
Figure 86

- (3) Fold the shield back on the jacket of the wire or cable.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.
- (4) Make a selection of a solder sleeve from Table 13.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Refer to Figure 87 for the applicable dimensions of the shield ground wire assembly.

Figure 87

- (5) Put the solder sleeve on the wire or cable. Refer to Figure 7 and Figure 88.

Make sure that:

- The large end of the solder sleeve is put on the wire or cable first
- The inner edge of the rear seal ring is aligned with the rear end of the shield.

POSITION OF THE SOLDER SLEEVE AND THE SHIELD GROUND WIRE
Figure 88

- (6) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (7) Remove the necessary length from the end of the shield ground wire.

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

C. Shield Ground Wire - Shield Not Folded Back

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

For the procedure to assemble a shield ground wire:

- With a shield that is folded back, refer to Paragraph 9.B.
- That is not at the end of a wire or cable, refer to Paragraph 9.D.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 89.

LENGTH OF THE SHIELD
Figure 89

- (3) Make a selection of a solder sleeve from Table 13.
Refer to Figure 90 for the applicable dimensions of the shield ground wire assembly.

DIMENSIONS FOR SOLDER SLEEVE SELECTION

- The large end of the solder sleeve is put on the wire or cable first
- The inner edge of the rear seal ring is aligned with the end of the jacket.

POSITION OF THE SOLDER SLEEVE AND THE SHIELD GROUND WIRE

Figure 91

- (5) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (6) Remove the necessary length from the end of the shield ground wire.

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

D. Shield Ground Wire - Not at the End of a Wire or Cable

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Remove 0.25 inch \pm 0.06 inch of the jacket from the wire or cable at the location of the shield termination.

Refer to Paragraph 4.A. for the applicable jacket removal tool.

- (2) Make a selection of a solder sleeve from Table 13.

Refer to Figure 92 for the applicable dimensions of the shield ground wire assembly.

STANDARD WIRING PRACTICES MANUAL

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The large end of the solder sleeve is put on the wire or cable first
- The inner edge of the rear seal ring is aligned with the end of the jacket.

POSITION OF THE SOLDER SLEEVE AND THE SHIELD GROUND WIRE
Figure 100

- (5) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (6) Remove the necessary length from the end of the shield ground wire.

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

D. Shield Ground Wire - Not at the End of a Wire or Cable

This paragraph gives the procedure to assemble a shield ground wire on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Remove 0.25 inch \pm 0.06 inch of the jacket from the wire or cable at the location of the shield termination.

Refer to Paragraph 4.A. for the applicable jacket removal tool.

- (2) Make a selection of a solder sleeve from Table 15.

Refer to Figure 101 for the applicable dimensions of the shield ground wire assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

DIMENSIONS FOR SOLDER SLEEVE SELECTION
Figure 101

(3) Put the solder sleeve on the wire or cable. Refer to Figure 9 and Figure 102.

Make sure that:

- The large end of the solder sleeve is put on the wire or cable first
- The inner edge of the rear seal ring is aligned with the end of the jacket.

POSITION OF THE SOLDER SLEEVE AND THE SHIELD GROUND WIRE
Figure 102

(4) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

(5) Remove the necessary length from the end of the shield ground wire.

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

11. ASSEMBLY OF A SHIELD GROUND WIRE AND A SHIELD EXTENSION

A. Shield Ground Wire and a Shield Extension - Mechanical Ferrules

This paragraph gives the procedure to assemble a shield ground wire and a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

CAUTION: MORE THAN TWO SHIELD GROUND WIRES MUST NOT BE INSTALLED IN ONE SHIELD GROUND WIRE ASSEMBLY. MORE THAN TWO SHIELD GROUND WIRES CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

- (4) Measure the O.D. of the wire or cable.
- (5) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the wire or cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (6) Make a selection of an outer ferrule that is specified for the inner ferrule from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (7) Put the inner ferrule on the wire or cable.
- (8) Put the inner ferrule on the wire or cable.

Make sure that the ferrule is the smallest ferrule that can be moved freely on the jacket of the wire or cable.

- (9) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the jacket equal to 0.62 inch \pm 0.06 inch. Refer to Figure 103.

LENGTH OF THE SHIELD
Figure 103

- (10) Push the inner ferrule forward until the forward edge of the ferrule is aligned with the end of the jacket. Refer to Figure 104.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES****POSITION OF THE INNER FERRULE****Figure 104**

- (11) Move the stands of the shield apart and make them straight.
- (12) Fold the strands of the shield back on the inner ferrule. Refer to Figure 105.
Make sure that the strands of the shield are even and symmetrical around the circumference of the wire or cable.

**SHIELD FOLDED BACK****Figure 105**

- (13) Remove the necessary length of insulation from one end of each shield ground wire. Refer to Subject 20-00-15.
- (14) Make a selection of a shield material from Table 17.
Make sure that the shield has the smallest diameter that can be put on the inner ferrule and the strands of the shield.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (15) Cut the necessary length of the shield material.
Make sure that the length of the shield material is sufficient:
 - To align one end with the rear end of the shield that is folded back
 - To assemble a shield dead end on the other end in the correct position; refer to Paragraph 1.F.
- (16) Put the shield material on the wire or cable. Refer to Figure 106.
Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE SHIELD MATERIAL

Figure 106

(17) Put the conductor of each shield ground wire on the shield material and the inner ferrule.

Make sure that:

- Each shield ground wire is pointed in the correct direction
- The conductor of each shield ground wire extends the full length of the ferrules.

(18) Put the outer ferrule on the inner ferrule. Refer to Figure 107.

Make sure that:

- The outer ferrule is the smallest that can be crimped on the inner ferrule and the shield ground wires
- The rear end of the inner ferrule does not extend farther than 0.06 inch from the rear end of the outer ferrule
- The shield ground wires extend farther than the end of the outer ferrule
- The shield ground wires do not extend farther than the end of the inner ferrule.

POSITION OF THE OUTER FERRULE

Figure 107

(19) Make a selection of a ferrule crimp tool from Table 23.

(20) Crimp the outer ferrule.

(21) Remove the unwanted length of the shield that extends farther than the rear edge of the outer ferrule. Refer to Figure 108.

NOTE: The outer surface of the inner ferrule can be used to cut against.

REMOVAL OF THE UNWANTED LENGTH OF SHIELD

Figure 108

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (22) Assemble a shield dead end on the opposite end of the shield material. Refer to Paragraph 12.A.
- (23) Make a selection of a heat shrinkable sleeve from Table 18.

Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (24) If the shield ground wire is pointed away from the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the ferrule, the shield ground wire, the extension, and the dead end. Refer to Figure 109.

Make sure that:

- The distance from the rear end of the ferrule to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 109

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (25) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the extension and the dead end. Refer to Figure 110.

Make sure that:

- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum
- The rear end of the sleeve is aligned with the forward end of the ferrule.

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 110

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) Put the necessary length of heat shrinkable sleeve on the ferrule and the shield ground wire. Refer to Figure 110.

Make sure that:

- The distance from the rear end of the ferrule to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the ferrule to the forward end of the sleeve is 0.5 inch minimum.

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Shield Ground Wire and a Shield Extension - RSK Shield-Kon

This paragraph gives the procedure to assemble a shield ground wire and a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Make a selection of a shield ground wire from Table 5.
- (3) Cut the minimum length of the shield ground wire that is necessary to attach the wire to the specified ground.

For the maximum length of the shield ground wire, refer to Paragraph 1.D.

- (4) Remove the necessary length of the shield from the end of the wire or cable to make the length of the shield equal to 0.35 inch \pm 0.10 inch. Refer to Figure 111.

LENGTH OF THE SHIELD
Figure 111

- (5) Fold the shield back on the jacket of the wire or cable.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.
- (6) Remove 0.3 inch \pm 0.1 inch of insulation from one end of the shield ground wire. Refer to Subject 20-00-15.
- (7) Make a selection of a shield material from Table 17.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

Make sure that the shield material has the smallest diameter that can be put on the shield and the jacket of the wire or cable.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (8) Cut the necessary length of the shield material.

Make sure that the length of the shield material is sufficient:

- To align one end with the rear end of the shield that is folded back
- To assemble a shield dead end on the other end in the correct position; refer to Paragraph 1.F.

- (9) Put the shield material on the wire or cable. Refer to Figure 112.

Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

**POSITION OF THE SHIELD MATERIAL****Figure 112**

- (10) Make a selection of an RSK Shield-Kon from Table 9.

Refer to Figure 112 for the applicable dimensions of the shield ground wire assembly.

- (11) Make a selection of an RSK Shield-Kon crimp tool from Table 24.

- (12) Put the Shield-Kon in the jaws of the upper and lower dies of the crimp tool. Refer to Figure 113.

Make sure that:

- The shield ground wire clip is pointed up
- The center of the Shield-Kon is aligned with the center of the die.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE SHIELD-KON IN THE CRIMP TOOL
Figure 113

- (13) Put the conductor of the shield ground wire in the shield ground clip of the Shield-Kon. Refer to Figure 114.

Make sure that:

- The shield ground wire is pointed in the correct direction
- The conductor of the shield ground wire is in the correct position in the shield ground clip.

POSITION OF THE SHIELD GROUND WIRE, THE WIRE OR CABLE, AND THE SHIELD MATERIAL
Figure 114

- (14) Put the wire or cable and the shield material in the bottom of the Shield-Kon. Refer to Figure 114. Make sure that the rear end of the Shield-Kon is aligned with the rear end of the shield material.
- (15) Crimp the Shield-Kon.
- (16) Assemble a shield dead end on the opposite end of the shield material. Refer to Figure 115 and Paragraph 12.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

SHIELD EXTENSION AND SHIELD DEAD END

Figure 115

- (17) Make a selection of a heat shrinkable sleeve from Table 18.

Make sure that the sleeve has the smallest diameter that can be moved freely on the shield ground wire assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (18) If the shield ground wire is pointed away from the end of the wire or cable:

- (a) Put the necessary length of heat shrinkable sleeve on the Shield-Kon, the shield ground wire, the extension, and the dead end. Refer to Figure 116.

Make sure that:

- The distance from the rear end of the Shield-Kon to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 116

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (19) If the shield ground wire is pointed forward to the end of the wire or cable:
- (a) Put the necessary length of heat shrinkable sleeve on the extension and the dead end. Refer to Figure 117.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum
- The rear end of the sleeve is aligned with the forward end of the Shield-Kon.

POSITION OF THE HEAT SHRINKABLE SLEEVES

Figure 117

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) Put the necessary length of heat shrinkable sleeve on the Shield-Kon and the shield ground wire. Refer to Figure 117.

Make sure that:

- The distance from the rear end of the Shield-Kon to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the Shield-Kon to the forward end of the sleeve is 0.5 inch minimum.

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Shield Ground Wire and a Shield Extension - Solder Sleeve, Shield Folded Back

This paragraph gives the procedure to assemble a shield ground wire and a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch ±0.06 inch. Refer to Figure 118.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELD
Figure 118

- (3) Fold the shield back on the jacket of the wire or cable.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.
- (4) Make a selection of a shield material from Table 17.
Make sure that the shield material has:
 - The correct Temperature Grade
 - The smallest diameter that can be put on the shield and the jacket of the wire or cable.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (5) Cut the necessary length of shield material.
Make sure that the length of the shield material is sufficient:
 - To align one end with the rear end of the shield that is folded back
 - To assemble a shield dead end on the other end in the correct position; refer to Paragraph 1.F.
- (6) Put the shield material on the wire or cable. Refer to Figure 119.
Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

POSITION OF THE SHIELD MATERIAL
Figure 119

- (7) Make a selection of a solder sleeve from Table 13.
Refer to Figure 119 for the applicable dimensions of the shield ground wire assembly.
- (8) Put the solder sleeve on the wire or cable. Refer to Figure 120.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The shield ground wire is pointed in the correct direction
- The inner edge of the rear seal ring is aligned with the rear end of the shield material.

POSITION OF THE SOLDER SLEEVE

Figure 120

- (9) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (10) Assemble a shield dead end on the opposite end of the shield material. Refer to Figure 121 and Paragraph 12.A.

SHIELD EXTENSION AND SHIELD DEAD END

Figure 121

- (11) Make a selection of a heat shrinkable sleeve from Table 18.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (12) If the shield ground wire is pointed away from the end of the wire or cable:
- (a) Put the necessary length of heat shrinkable sleeve on the solder sleeve, the shield ground wire, the extension, and the dead end. Refer to Figure 122.

Make sure that:

- The distance from the rear end of the solder sleeve to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum.

- (13) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the extension and the dead end. Refer to Figure 123.

Make sure that:

- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum
- The rear end of the heat shrinkable sleeve is aligned with the forward end of the solder sleeve.

POSITION OF THE HEAT SHRINKABLE SLEEVES

Figure 123

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) Put the necessary length of heat shrinkable sleeve on the solder sleeve and the shield ground wire. Refer to Figure 123.

Make sure that:

- The distance from the rear end of the solder sleeve to the rear end of the heat shrinkable sleeve is 0.5 inch minimum
- The distance from the forward end of the solder sleeve to the forward end of the heat shrinkable sleeve is 0.5 inch minimum.

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (14) Remove the necessary length from the end of the shield ground wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

D. Shield Ground Wire and a Shield Extension - Solder Sleeve, Shield Not Folded Back

This paragraph gives the procedure to assemble a shield ground wire and a shield extension on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 124.

LENGTH OF THE SHIELD
Figure 124

- (3) Make a selection of a shield material from Table 17.

Make sure that the shield material has:

- The correct Temperature Grade
- The smallest diameter that can be put on the shield of the wire or cable.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (4) Cut the necessary length of shield material.

Make sure that the length of the shield material is sufficient:

- To align one end with the rear end of the shield
- To assemble a shield dead end on the other end in the correct position; refer to Paragraph 1.F.

- (5) Put the shield material on the wire or cable. Refer to Figure 125.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the rear end of the shield material is aligned with the rear end of the shield.

POSITION OF THE SHIELD MATERIAL
Figure 125

- (6) Make a selection of a solder sleeve from Table 13.
Refer to Figure 125 for the applicable dimensions of the shield ground wire assembly.

- (7) Put the solder sleeve on the wire or cable. Refer to Figure 126.

Make sure that:

- The shield ground wire is pointed in the correct direction
- The inner edge of the rear seal ring is aligned with the end of the jacket.

POSITION OF THE SOLDER SLEEVE
Figure 126

- (8) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (9) Assemble a shield dead end on the opposite end of the shield material. Refer to Paragraph 12.A.
- (10) Install a shield dead end on the opposite end of the shield extension, refer to Paragraph 12.A.
- (11) Make a selection of a heat shrinkable sleeve from Table 18.
- (12) If the shield ground wire is pointed away from the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the solder sleeve, the shield ground wire, the extension, and the dead end. Refer to Figure 127.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The distance from the rear end of the solder sleeve to the rear end of the sleeve is 0.5 inch minimum
- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 127

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (13) If the shield ground wire is pointed forward to the end of the wire or cable:
 - (a) Put the necessary length of heat shrinkable sleeve on the extension and the dead end. Refer to Figure 128.

Make sure that:

- The distance from the forward end of the dead end to the forward end of the sleeve is 0.25 inch minimum
- The rear end of the heat shrinkable sleeve is aligned with the forward end of the solder sleeve.

POSITION OF THE HEAT SHRINKABLE SLEEVES

Figure 128

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) Put the necessary length of heat shrinkable sleeve on the solder sleeve and the shield ground wire. Refer to Figure 128.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The distance from the rear end of the solder sleeve to the rear end of the heat shrinkable sleeve is 0.5 inch minimum
- The distance from the forward end of the solder sleeve to the forward end of the heat shrinkable sleeve is 0.5 inch minimum.

(d) Shrink the sleeve into its position. Refer to Subject 20-10-14.

(14) Remove the necessary length from the end of the shield ground wire.

Make sure that:

- The length of the shield ground wire is sufficient to attach the wire to the specified ground
- The length of the shield ground wire is not more than the maximum length; refer to Paragraph 1.D.

12. ASSEMBLY OF A SHIELD DEAD END

A. Shield Dead End - Shield Folded Back

This paragraph gives the procedure to assemble a shield dead on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE SHIELD DEAD END.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

(1) If the wire or cable does not have a jacket, fold the shield back at the specified point of the shield termination.

Make sure that the length of the shield that is folded back is between 0.25 inch and 0.38 inch.

(2) If the wire or cable has a jacket, prepare the shield. Refer to Figure 129.

LENGTH OF THE SHIELD
Figure 129

- (a) Prepare the wire or cable. Refer to Paragraph 4.A.
- (b) Push the end of the shield in the direction of the end of the jacket to expand the shield at the end of the jacket.
- (c) Cut the shield with scissors or wire cutters where the circumference is largest to make the length of the shield equal to 0.25 inch to 0.38 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

CAUTION: DO NOT A USE KNIFE TO CUT AGAINST THE PRIMARY INSULATION. DAMAGE TO THE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE OR CABLE.

(d) Fold the shield back on the jacket.

Make sure that the length of the shield is between 0.25 inch and 0.38 inch.

NOTE: As an alternative, the strands of the shield can be moved apart and folded back symmetrically against the jacket.

(3) Make a selection of an insulation material from Table 18.

Make sure that the material has the correct Temperature Grade.

(4) If the insulation material is a heat shrinkable sleeve:

(a) Put a length of the sleeve that is 0.5 inch longer than the length of the shield on the wire or cable.

(b) Align the center of the sleeve and the center of the shield.

(c) Shrink the sleeve into its position. Refer to Subject 20-10-14.

(5) If the insulation material is tape, put two layers of tape on the wire or cable. Refer to Figure 130.

Make sure that:

- Each layer of tape makes a 0.25 inch overlap
- The end of each layer is 0.25 inch minimum farther than the forward end of the shield
- The end of each layer is 0.5 inch minimum farther than the rear end of the shield
- The second layer is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE

Figure 130

B. Shield Dead End - Shield Not Folded Back

This paragraph gives the procedure to assemble a shield dead end on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

(1) Prepare the wire or cable. Refer to Paragraph 4.A.

(2) Remove the necessary length of shield to make the distance from the end of the shield to the end of the jacket equal to 0.25 inch to 0.38 inch. Refer to Figure 131.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELD
Figure 131

- (3) Make a selection of an insulation material from Table 18.
Make sure that the material has the correct Temperature Grade.
- (4) If the insulation material is a heat shrinkable sleeve:
 - (a) Put a length of the sleeve that is 0.5 inch longer than the length of the shield on the wire or cable.
 - (b) Align the center of the sleeve and the center of the shield.
 - (c) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) If the insulation material is tape, put two layers of tape on the wire or cable. Refer to Figure 132.
Make sure that:
 - Each layer of tape makes a 0.25 inch overlap
 - The end of each layer is 0.25 inch minimum farther than the forward end of the shield
 - The end of each layer is 0.5 inch minimum farther than the rear end of the shield
 - The second layer is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE
Figure 132

C. Shield Dead End - Shields Not Adjacent

This paragraph gives the procedure to assemble a shield dead on a wire or cable that has an outer jacket, an outer shield, an inner jacket, and an inner shield.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELDS

Figure 133

Refer to Figure 133.

- (1) Remove the necessary length of outer jacket from the end of the wire or cable. Refer to Paragraph 4.A.
- (2) Push the end of the outer shield in the direction of the end of the jacket to expand the shield at the end of the jacket.
- (3) Cut the outer shield with scissors or wire cutters to make the length of the shield between 0.25 inch and 0.38 inch.

CAUTION: DO NOT A USE KNIFE TO CUT AGAINST THE INNER JACKET. DAMAGE TO THE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE OR CABLE.

- (4) Remove the necessary length of the inner jacket to make the length from the end of the jacket to the end of the outer shield equal to 0.75 inch. Refer to Paragraph 4.A.
- (5) Push the end of the inner shield in the direction of the end of the inner jacket to expand the shield at the end of the jacket.
- (6) With a pair of scissors or wire cutters, cut the shield where the circumference is largest to make the length of the shield equal to 0.25 inch to 0.38 inch.

CAUTION: DO NOT A USE KNIFE TO CUT AGAINST THE PRIMARY INSULATION. DAMAGE TO THE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE OR CABLE.

- (7) Fold the shield back on the jacket.
Make sure that the length of the shield is between 0.25 inch and 0.38 inch.

NOTE: As an alternative, the strands of the shield can be moved apart and folded back symmetrically against the jacket.

- (8) Make a selection of an insulation material from Table 18.
Make sure that the material has the correct Temperature Grade.
- (9) If the insulation material is a heat shrinkable sleeve:
 - (a) Put a length of the sleeve that is 0.5 inch longer than the distance from the forward end of the inner shield to the rear end of the outer shield.
 - (b) Align the center of the sleeve and the center point between the two shields.
 - (c) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (10) If the insulation material is tape, put two layers of tape on the wire or cable. Refer to Figure 134.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- Each layer of tape makes a 0.25 inch overlap
- The end of each layer is 0.25 inch minimum farther than the forward end of the inner shield
- The end of each layer is 0.5 inch minimum farther than the rear end of the outer shield
- The second layer is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE
Figure 134

13. ASSEMBLY OF A SHIELD EXTENSION

A. Shield Extension - Mechanical Ferrules

This paragraph gives the procedure to assemble a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Measure the O.D. of the wire or cable.
- (3) Make a selection of an inner ferrule from Table 8.

NOTE: The applicable ferrule has an I.D. that is a small amount larger than the O.D. of the wire or cable. Refer to Figure 4.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (4) Make a selection of an outer ferrule that is specified for the inner ferrule and 2 or 3 shield ground wires from Table 8.

NOTE: In Table 8, more than one outer ferrule can be specified for one inner ferrule. It is possible that shields of different wires and cables have different thicknesses. This can make it necessary to use a smaller or a larger outer ferrule.

Make sure that the ferrule has the correct Temperature Grade; refer to Figure 4 and Table 6.

- (5) Put the inner ferrule on the wire or cable.

Make sure that the ferrule is the smallest ferrule that can be moved freely on the jacket of the wire or cable.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (6) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to 0.62 inch \pm 0.06. Refer to Figure 135.

LENGTH OF THE SHIELD

Figure 135

- (7) Push the inner ferrule forward until the forward edge of the ferrule is aligned with the end of the jacket. Refer to Figure 136.

POSITION OF THE INNER FERRULE

Figure 136

- (8) Move the stands of the shield apart and make them straight.
- (9) Fold the strands of the shield back on the inner ferrule. Refer to Figure 137.

Make sure that the strands of the shield are even and symmetrical around the circumference of the wire or cable.

SHIELD FOLDED BACK

Figure 137

- (10) Make a selection of shield material from Table 17.
Make sure that the shield material has the smallest diameter that can be put on the inner ferrule and the strands of the shield.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (11) Cut the necessary length of shield material.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the length of the shield material is sufficient:

- To align one end with the rear end of the shield that is folded back
- To assemble a shield dead end or a shield ground wire on the other end in the correct position; refer to Paragraph 1.F.

(12) Put the shield material on the cable. Refer to Figure 138.

Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

POSITION OF THE SHIELD MATERIAL
Figure 138

(13) Put the outer ferrule on the inner ferrule. Refer to Figure 139.

Make sure that:

- The outer ferrule is the smallest that can be crimped on the inner ferrule and the shield material
- The rear end of the inner ferrule does not extend farther than 0.06 inch from the rear end of the outer ferrule.

POSITION OF THE OUTER FERRULE
Figure 139

(14) Make a selection of a ferrule crimp tool from Table 23.

(15) Crimp the outer ferrule.

(16) Remove the unwanted length of the shield that extends farther than the rear edge of the outer ferrule. Refer to Figure 140.

NOTE: The outer surface of the inner ferrule can be used to cut against.

REMOVAL OF THE UNWANTED LENGTH OF SHIELD
Figure 140

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (17) Make a selection of a heat shrinkable sleeve from Table 18.

Make sure that the sleeve has the smallest diameter that can be moved freely on the outer ferrule and the extension.

- (18) Put the necessary length of heat shrinkable sleeve on the shield extension assembly. Refer to Figure 141.

Make sure that the length of the sleeve is sufficient to put:

- The rear end of the sleeve 0.5 inch minimum to the rear of the rear end of the outer ferrule
- The forward end of the sleeve at the location where the rear end of the shield dead end or the shield ground wire assembly must be put.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 141

- (19) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Shield Extension - RSK Shield-Kon

This paragraph gives the procedure to assemble a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of the shield from the end of the wire or cable to make the length of the shield equal to 0.35 inch \pm 0.10 inch. Refer to Figure 142.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

LENGTH OF THE SHIELD

Figure 142

- (3) Fold the shield back on the jacket of the wire or cable.
Make sure that the shield is even and symmetrical around the circumference of the wire or cable.
- (4) Make a selection of a shield material from Table 17.
Make sure that the shield material has:
 - The correct Temperature Grade
 - The smallest diameter that can be put on the shield and the jacket of the wire or cable.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (5) Cut the necessary length of shield material.
Make sure that the length of the shield material is sufficient:
 - To align one end with the rear end of the shield that is folded back
 - To assemble a shield dead end or a shield ground wire on the other end in the correct position; refer to Paragraph 1.F.
- (6) Put the shield material on the cable. Refer to Figure 143.
Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

POSITION OF THE SHIELD MATERIAL

Figure 143

- (7) Make a selection of an RSK Shield-Kon from Table 9.
Refer to Figure 143 for the applicable dimensions of the shield extension assembly.
- (8) Make a selection of an RSK Shield-Kon crimp tool from Table 24.
- (9) Put the Shield-Kon into the jaws of the upper and lower dies of the crimp tool. Refer to Figure 144.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that:

- The shield ground wire clip is pointed up
- The center of the Shield-Kon is aligned with the center of the die.

POSITION OF THE SHIELD-KON IN THE CRIMP TOOL

Figure 144

- (10) Put the wire or cable and the shield material in the bottom of the Shield-Kon. Refer to Figure 145. Make sure that the rear end of the Shield-Kon is aligned with the rear end of the shield material.

POSITION OF THE WIRE OR CABLE AND THE SHIELD MATERIAL

Figure 145

- (11) Crimp the Shield-Kon.
- (12) Make a selection of a heat shrinkable sleeve from Table 18. Make sure that the sleeve has:
- The correct Temperature Grade
 - The smallest diameter that can be moved freely on the Shield-Kon and the extension.
- (13) Put the necessary length of heat shrinkable sleeve on the shield extension assembly. Refer to Figure 146.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the length of the sleeve is sufficient to put:

- The rear end of the sleeve 0.5 inch minimum to the rear of the rear end of the Shield-Kon
- The forward end of the sleeve at the location where the rear end of the shield dead end or the shield ground wire assembly must be put.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 146

(14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Shield Extension - Solder Sleeve, Shield Folded Back

This paragraph gives the procedure to assemble a shield extension on a wire or cable that has:

- A shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors.

CAUTION: A SHIELD EXTENSION ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

CAUTION: THIS PROCEDURE CAUSES DAMAGE TO A SHIELD THAT HAS FLAT CONDUCTORS. DAMAGE TO THE FLAT CONDUCTORS OF A SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.
- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 147.

LENGTH OF THE SHIELD
Figure 147

- (3) Fold the shield back on the jacket of the wire or cable.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

Make sure that the shield is even and symmetrical around the circumference of the wire or cable.

- (4) Make a selection of a shield material from Table 17.

Make sure that the shield material has:

- The correct Temperature Grade
- The smallest diameter that can be put on the shield and the jacket of the wire or cable.

NOTE: A length of shield from a larger size of the same type of wire or cable is a satisfactory alternative.

NOTE: For other alternative shield materials, refer to Subject 20-00-11.

- (5) Cut the necessary length of shield material.

Make sure that the length of the shield material is sufficient:

- To align one end with the rear end of the shield that is folded back
- To assemble a shield dead end or a shield ground wire on the other end in the correct position; refer to Paragraph 1.F.

- (6) Put the shield material on the wire or cable. Refer to Figure 148.

Make sure that the rear end of the shield material is aligned with the rear end of the shield that is folded back.

POSITION OF THE SHIELD MATERIAL
Figure 148

- (7) Make a selection of a solder sleeve from Table 10.

Refer to Figure 148 for the applicable dimensions of the shield extension assembly.

- (8) Put the solder sleeve on the wire or cable. Refer to Figure 149.

Make sure that the inner edge of the rear seal ring is aligned with the rear end of the shield material.

POSITION OF THE SOLDER SLEEVE
Figure 149

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SHIELD GROUND WIRES**

- (9) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (10) Make a selection of a heat shrinkable sleeve from Table 18.

Make sure that the sleeve has:

- The correct Temperature Grade
- The smallest diameter that can be moved freely on the solder sleeve and the extension.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (11) Put the necessary length of heat shrinkable sleeve on the shield extension assembly. Refer to Figure 150.

Make sure that the length of the sleeve is sufficient to put:

- The rear end of the sleeve 0.5 inch minimum to the rear of the rear end of the solder sleeve
- The forward end of the sleeve at the location where the rear end of the shield dead end or the shield ground wire assembly must be put.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 150

- (12) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Shield Extension - Solder Sleeve, Shield Not Folded Back

This paragraph gives the procedure to assemble a shield extension on a wire or cable that has:

- A shield with round conductors
- A shield with flat conductors
- An outer shield with round conductors and an adjacent inner shield with round conductors
- An outer shield with round conductors and an adjacent inner shield with flat conductors.

CAUTION: A SHIELD EXTENSION ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A WIRE OR A CABLE THAT HAS A SHIELD WITH NICKEL PLATED CONDUCTORS. THE SOLDER SLEEVE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTION OF THE SHIELD TO GROUND.

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Prepare the wire or cable. Refer to Paragraph 4.A.

20-10-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

- (2) Remove the necessary length of shield from the wire or cable to make the length of the shield equal to 0.25 inch \pm 0.06 inch. Refer to Figure 151.

LENGTH OF THE SHIELD

Figure 151

- (3) Make a selection of a shield material from Table 17.

Make sure that the shield material has:

- The correct Temperature Grade
- The smallest diameter that can be put on the shield of the wire or cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (4) Cut the necessary length of shield material.

Make sure that the length of the shield material is sufficient:

- To align one end with the rear end of the shield
- To assemble a shield dead end or a shield ground wire on the other end in the correct position; refer to Paragraph 1.F.

- (5) Put the shield material on the wire or cable. Refer to Figure 152.

Make sure that the rear end of the shield material is aligned with the rear end of the shield.

POSITION OF THE SHIELD MATERIAL

Figure 152

- (6) Make a selection of a solder sleeve from Table 10.

Refer to Figure 152 for the applicable dimensions of the shield extension assembly.

- (7) Put the solder sleeve on the wire or cable. Refer to Figure 153.

Make sure that the inner edge of the rear seal ring is aligned with the end of the jacket.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SHIELD GROUND WIRES

POSITION OF THE SOLDER SLEEVE
Figure 153

- (8) Shrink the solder sleeve into its position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of 75 percent of the indicator ring on top of the solder ring is melted.

- (9) Make a selection of a heat shrinkable sleeve from Table 18.

Make sure that the sleeve has:

- The correct Temperature Grade
- The smallest diameter that can be moved freely on the solder sleeve and the extension.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (10) Put the necessary length of heat shrinkable sleeve on the shield extension assembly. Refer to Figure 154.

Make sure that the length of the sleeve is sufficient to put:

- The rear end of the sleeve 0.5 inch minimum to the rear of the rear end of the solder sleeve
- The forward end of the sleeve at the location where the rear end of the shield dead end or the shield ground wire assembly must be put.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 154

- (11) Shrink the sleeve into its position. Refer to Subject 20-10-14.

2. ASSEMBLY OF MOLDED TEE FITTINGS

A. Convoluted Tube Installation

- (1) Make a selection of a convoluted Teflon tube from Table 3.
- (2) Make a selection of a masking tape from Table 5.
- (3) Put the tube on the wire in 3 locations. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS

POSITION OF THE CONVOLUTED TUBES
Figure 1

- (4) Wind two layers of the tape around each tube as a mark for the position of the molded tee. Refer to Figure 2.

Make sure that:

- The inner edge of the tape is 0.75 inch \pm 0.13 inch from the end of the tube that is near the tee
- The edge of the tape is parallel to the edge of the tube.

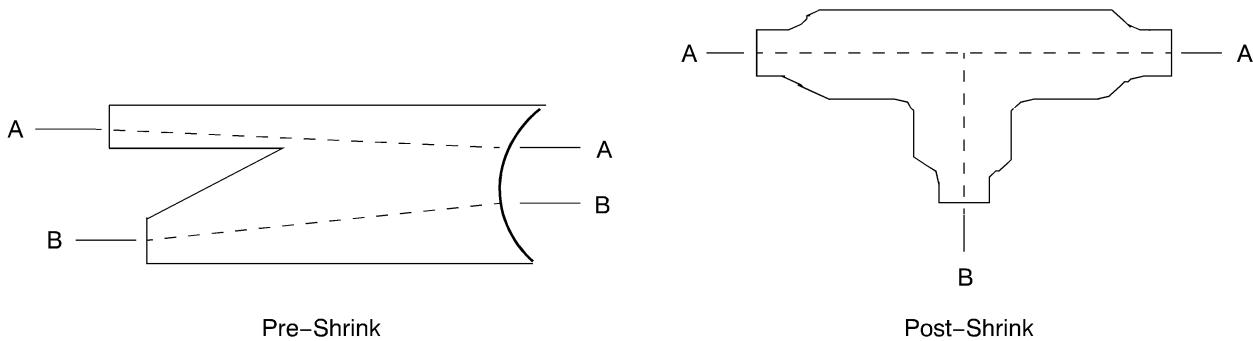

POSITION OF THE TAPE ON THE TUBE
Figure 2

B. Molded Tee Installation

- (1) Make a selection of a 500 degree F hot air gun without a reflector. Refer to Subject 20-10-14.
- (2) Put the wire harness or cable through the molded tee.

Refer to Figure 3 and Figure 4.

CONFIGURATION OF THE MOLDED TEE
Figure 3

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS

POSITION OF THE TEE ON THE TUBES
Figure 4

- (3) Push each tube into the molded tee until the inner edge of the tape is at the edge of the each tee.
- (4) Shrink the center of the molded tee.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE MOLDED TEE. DAMAGE TO THE MOLDED TEE CAN OCCUR.

- (5) Shrink each end of a tee until the tee is tight against the tube. Refer to Figure 5.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE MOLDED TEE. DAMAGE TO THE MOLDED TEE CAN OCCUR.

Make sure that after the tee is in its shrunk state, the contour of the tubes can be seen.

FINAL CONFIGURATION OF THE MOLDED TEE
Figure 5

- (6) Remove all of the tape.

3. ASSEMBLY OF A STRAIGHT HEAT SHRINKABLE BOOT

A. Boot Installation

- (1) For a wire harness that contains a wire or a cable with Teflon insulation, make a selection of a 750 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (2) For a wire harness that contains a wire or a cable with insulation that is not Teflon, make a selection of a 500 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (3) Prepare the surfaces of the connector and the boot to make a bond with an adhesive. Refer to Figure 6 and Paragraph 3.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS

BOND SURFACES ON CONNECTORS

Figure 6

- (4) Put the boot on the cable or the wire harness.
- (5) Assemble the connector. Refer to the applicable Subject for the connector.
- (6) Apply the adhesive:
 - (a) Make a selection of an adhesive from Table 5.
 - (b) Make a selection of a solvent from Table 5.
 - (c) Apply the adhesive on the bond surface of these components:
 - The boot
 - The connector
 - The cable or harness jacket.

Make sure that the adhesive extends 0.13 inch farther than the bond surface.

- (7) Move the boot into its position on the threads of the connector. Refer to Figure 7.

Make sure that:

- The coupling nut can be turned freely
- The distance between the forward end of the boot and the rear end of the coupling nut is 0.13 inch maximum.

INSTALLATION OF A BOOT THAT IS BONDED TO THE CONNECTOR

Figure 7

- (8) Shrink the boot.

Make sure that:

- The intake air vent on the hot air gun is open
- The hot air gun is at the full operation temperature
- A heat shield is used to give the insulation of the wire or cable protection from damage
- Heat is applied for no longer than 40 seconds at one time
- The distance between the forward end of the boot and the rear end of the coupling nut is 0.13 inch maximum.

NOTE: If all of the wires in the harness or cable have Teflon insulation, the heat can be applied for a maximum of 3 minutes.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS**

- (9) If unwanted adhesive is on the boot or the connector, remove the unwanted adhesive immediately with a clean wiper and solvent.
- (10) If it is necessary to apply heat again, let the boot cool for 5 minutes before the heat is applied again.
- (11) Seal the boot with potting compound if:
 - The potting compound is specified
 - The initial installation had potting compound.

Refer to Paragraph 3.C.

B. Bond Surface Preparation

For the conditions that are applicable for this procedure, refer to Paragraph 3.A.

- (1) Make a selection of an aliphatic naphtha from Table 5.
- (2) Prepare the surfaces of the boot that must make a bond with the adhesive.
 - (a) Wind a piece of emery cloth around an applicable rod or tool.
 - (b) Make the bond surfaces rough.
 - (c) Shake the loose particles out of the boot.
 - (d) Clean the bond surfaces with a clean wiper and naphtha.
 - (e) Dry the boot with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE BOOT. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (3) Clean the other surfaces that must make a bond with the adhesive.
 - (a) Clean the bond surfaces of the connector with a clean wiper and naphtha. Refer to Figure 6.
 - (b) Dry the connector with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE CONNECTOR. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (c) Clean the bond surface of each wire or cable with a clean wiper and naphtha.

Make sure to clean the insulation of each wire or cable approximately 1 inch farther than the bond surface.
- (d) Dry the insulation with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE INSULATION. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

C. Seal of the Boot with Potting Compound

For the conditions that are applicable for this procedure, refer to Paragraph 3.A.

- (1) Make a selection of a potting compound from Table 7.
- (2) If the potting compound is a silicone compound, make a selection of a catalyst from Table 5.

Refer to the manufacturer's instructions to mix the compound with the catalyst.

- (3) Fill the boot with potting compound.

Make sure that air is not caught in the boot.

NOTE: To make a continuous flow of the potting compound, a constant pressure is recommended.

- (4) Lightly tap the boot on a solid surface or shake the boot to release air that is caught in the boot.

20-10-16

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS**

(5) Let the potting compound cure for the specified time. Refer to Table 7.

4. ASSEMBLY OF A 90 DEGREE HEAT SHRINKABLE BOOT**A. Boot Installation**

- (1) Make a selection of an adhesive from Table 5.
- (2) For a wire harness that contains a wire or a cable with Teflon insulation, make a selection of a 750 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (3) For a wire harness that contains a wire or a cable with insulation that is not Teflon, make a selection of a 500 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (4) Prepare the boot. Refer to Paragraph 4.B.
- (5) Prepare the bond surface. Refer to Paragraph 4.C.
- (6) Put the boot on the cable or the wire harness.
- (7) Assemble the connector components. Refer to the applicable Subject for the connector.
- (8) Put the cable or wire harness in an approximate 90 degree position. Refer to Figure 9.
- (9) Apply the adhesive on the bond surface of these components:
 - The boot
 - The connector
 - The cable or harness jacket.

Make sure that the adhesive extends 0.13 inch farther than the bond surface.

- (10) Move the boot into its position on the threads of the connector. Refer to Figure 8.

Make sure that:

- The coupling nut can be turned freely
- The boot assembly is in the correct clock position on the connector.

INSTALLATION OF A 90 DEGREE BOOT
Figure 8

- (11) Shrink the boot.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS

Make sure that:

- The intake air vent on the hot air gun is open
- The hot air gun is at the full operation temperature
- A heat shield is used to give the insulation of the wire or cable protection from damage
- Heat is applied for no longer than 40 seconds at one time.

NOTE: If all of the wires in the harness or cable have Teflon insulation, the heat can be applied for a maximum of 3 minutes.

- (12) Remove the unwanted adhesive immediately with a clean wiper and solvent.
- (13) If it is necessary to apply heat again, let the boot cool for 5 minutes before the heat is applied again.
- (14) Seal the boot with potting compound if:
 - The potting compound is specified
 - The initial installation had potting compound.

Refer to Paragraph 4.D.

B. Boot Preparation

For the conditions that are applicable to this procedure, refer to Paragraph 4.A.

PREPARATION OF A 90 DEGREE BOOT
Figure 9

Refer to Figure 9.

- (1) Put a 1/4 to 5/16 inch diameter rod approximately 0.5 inch into the square cut end of the boot. Refer to Figure 9.
- (2) Shrink the boot on the rod.
- (3) Let the boot cool.
- (4) Remove the rod from the boot.

C. Bond Surface Preparation

For the conditions that are applicable for this procedure, refer to Paragraph 4.A.

- (1) Make a selection of an aliphatic naphtha from Table 5.
- (2) Prepare the surfaces of the boot that must make a bond with the adhesive.
 - (a) Wind a piece of emery cloth around an applicable rod or tool.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MOLDED TEE FITTINGS AND HEAT SHRINKABLE BOOTS**

- (b) Make the bond surfaces rough.
- (c) Shake the loose particles out of the boot.
- (d) Clean the bond surfaces with a clean wiper and naphtha.
- (e) Dry the boot with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE BOOT. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (3) Clean the other surfaces that must make a bond with the adhesive.
 - (a) Clean the bond surfaces of the connector with a clean wiper and naphtha. Refer to Figure 6.
 - (b) Dry the connector with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE CONNECTOR. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (c) Clean the bond surface of each wire or cable with a clean wiper and naphtha.
Make sure to clean the insulation of each wire or cable approximately 1 inch farther than the bond surface.
- (d) Dry the insulation with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE INSULATION. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

D. Seal of the Boot with Potting Compound

For the conditions that are applicable for this procedure, refer to Paragraph 4.A.

- (1) Make a selection of a potting compound from Table 7.
- (2) If the potting compound is a silicone compound, make a selection of a catalyst from Table 5.
Refer to the manufacturer's instructions to mix the compound with the catalyst.

- (3) Fill the boot assembly with potting compound.
Make sure that air is not caught in the boot.

NOTE: To make a continuous flow of the potting compound, a constant pressure is recommended.

- (4) Lightly tap the boot on a solid surface or shake the boot to release air that is caught in the boot.
- (5) Let the potting compound cure for the specified time. Refer to Table 7.

INSTALLATION OF ZIPPERTUBING

1. PART NUMBERS AND DESCRIPTION

A. Zippertubing Part Numbers

**Table 1
ZIPPERTUBING PART NUMBERS**

Part Number	I.D. (inch)	Supplier
ZTZ-1125-SH3FEP5-P250	1.125	Zippertubing Company
ZTZ-1380-SH3FEP5-P250	1.380	Zippertubing Company
ZTZ-1500-SH3FEP5-P250	1.500	Zippertubing Company

**ZTZ-() ZIPPERTUBING PART NUMBER STRUCTURE
Figure 1**

B. Description

Zippertubing:

- Is installed on specified wire bundles in the leading edge of the wing for protection lightning
- Is supplied in bulk quantities
- Can be cut to the correct fit for the installation.

The material has these technical features:

- A 5 mil teflon layer laminated to a 3 mil aluminum foil layer
- A Z-Trac zipper closure is included in the teflon tubing
- An integral full length ground shield is included in the foil.

2. INSTALLATION OF ZIPPERTUBING

A. Assembly of the Shield Ground Terminals

- (1) Cut the Zippertubing so that the length is 12 inches more than the necessary length. The greater length permits the assembly of the shield ground terminals at each end.
- (2) Loosen 6 inches ± 1/4 inch of the stitches of the shield at both ends. Refer to Figure 2.

Make sure that:

- The shield is not damaged
- The threads of the stitches have the sufficient length so that they can be tightly attached after the tube has been cut.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ZIPPERTUBING

PREPARATION OF THE ZIPPERTUBING

Figure 2

- (3) Move the shield out of the way.
- (4) Cut the Zippertubing up to 1/8 inch from the last remaining stitch of the shield.
- (5) Attach the threads of the stitches to each other tightly and permanently.
- (6) Remove the unwanted length of the threads.
- (7) Make a selection of a BACT12AC-() terminal with a size 14-16 wire barrel. Refer to Subject 20-30-11.
- (8) Assemble a terminal on both ends of the shield:
 - (a) On the last 1/2 inch at the end of the shield, move the strands of the shield apart.
 - (b) Lightly twist the strands together.
 - (c) Put the end of the shield in the crimp barrel of the terminal.
 - (d) Crimp the terminal.

B. Zippertubing Installation

- (1) Put the Zippertubing in the position so that:
 - The aluminum foil side is down
 - The shield ground terminal is to the left.
- (2) Cut a 1/4 inch to 3/8 inch width of the front edge the necessary length so that the front edge and the shield make an approximate 45 degree angle.

Refer to Figure 3.

PREPARATION OF THE ZIPPERTUBING FOR INSTALLATION

Figure 3

20-10-17

707, 727-787

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ZIPPERTUBING

- (3) Pull the slider down approximately one inch.
- (4) Turn the Zippertubing over.
- (5) Put the Zippertubing into a trough form.
- (6) Put the cable into the trough.
- (7) Put the remaining Zippertubing around the cable so that:
 - The ends of the Zippertubing make an overlap
 - The end with the shield is under the end with the slider.
- (8) Put the 45 degree angle edge, that is adjacent to the shield, into the slider.
- (9) Make the Zippertubing straight and symmetrical along the Z-Trac.
- (10) Pull the slider to the other edge of the Zippertubing.

NOTE: To close the Zippertubing smoothly, make sure to keep each Z-Trac low and parallel.

INSTALLATION OF SLEEVES ON WIRING

<u>Paragraph</u>	<u>Page</u>
1. GENERAL DATA	1
A. General Conditions	1
B. Configuration of Sleeves on Wire Bundles	1
C. Fiberglass Sleeves	2

20-10-18 CONTENTS

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF SLEEVES ON WIRING

This Subject gives the general conditions for the installation of sleeves for the protection and support of electrical wiring.

1. GENERAL DATA

A. General Conditions

Only Skydrol resistant materials are used on wire bundles in specified Skydrol areas.

B. Configuration of Sleeves on Wire Bundles

Figure 1 shows a wire bundle that has many breakouts and is a usual configuration of the sleeves when the wires are attached to circuit breakers.

Figure 2 shows an alternative configuration.

NOTE: It is:

- Not necessary to install a sleeve on the breakout wire since the wire is controlled when it is attached to the circuit breaker
- Necessary to assemble a wire bundle tie only at the location of the breakout when the breakout wire is 6 inches or less in length.

SLEEVES ON A WIRE BUNDLE WITH CONTROLLED BREAKOUTS
Figure 1

ALTERNATIVE CONFIGURATION OF SLEEVES ON WIRE BUNDLE BREAKOUTS
Figure 2

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF SLEEVES ON WIRING

When it is necessary to install a TFE 2XTW or a TFE 2XSW sleeve on a wire bundle and the diameter of an available TFE sleeve is not sufficient, these conditions are applicable:

- The wires of the wire bundle can be divided into groups
- The size of the groups can be the size of the available sleeves
- The necessary number of wire harness ties can be assembled to make a single wire bundle.

Refer to Figure 3.

ALTERNATIVE CONFIGURATION OF TFE SLEEVES

Figure 3

When a sleeve is installed on the wire or wire bundle at a connector, these conditions are applicable:

- If the connector has a cable clamp, put the end of the sleeve under the clamp
- If the connector does not have a cable clamp, assemble a wire bundle tie on the sleeve a minimum of 1.0 inch from the connector.

C. Fiberglass Sleeves

The ends of all fiberglass sleeves must have a coating of Nycote 88 varnish or an equivalent varnish so that the strands of the fiberglass are held together.

NOTE: Blue dye can be added to the varnish so that the varnish can be seen.

When a fiberglass sleeve is installed on a group of wires and at least one shield ground wire is not terminated in a connector, the conditions for the installation of the sleeve are different for:

- A connector with a backshell
- A connector without a backshell.

For the connectors with backshells, the end of the sleeve:

- Is not under the cable clamp of the connector
- Is as close as possible to the cable clamp of the connector
- Does not extend past the shield ground wire breakout
- Has a wire bundle tie.

For the connectors without backshells, the end of the sleeve:

- Is approximately two inches from the connector
- Does not extend past the shield ground wire breakout
- Has a wire bundle tie.

A. Functional Separation	16

20-10-19 CONTENTS

STANDARD WIRING PRACTICES MANUAL**WIRE SEPARATION**

This Subject gives:

- The general conditions for wire separation
- The special conditions for wire separation in the specified models.

1. GENERAL CONDITIONS FOR THE SEPARATION OF CIRCUITS**A. General Data**

The airplane wiring is designed and installed:

- To prevent the propagation of the effects of electrical faults to other independent power sources
- To prevent possibility that the failure of a component in a redundant system can disable another related, redundant system
- To avoid electromagnetic interference (EMI) between electromagnetic compatibility (EMC) circuits that are not compatible.

B. Necessary Conditions of Separation for Wire Harness Design

These are the applicable types of separation:

- Separation between independent power sources (Functional Separation)
- Separation between redundant system circuits (Functional Separation)
- Separation between EMC circuits that are not compatible (Electromagnetic Separation).

To obey these conditions:

- Electrical circuits, for which separation is necessary, are put in different wire harness assemblies
- If the circuits cannot be put in different wire harnesses, separation is done within the same wire harness with sleeves and shielded wire except in the case where the EMC circuits are not compatible.

C. Functional Separation Group

The primary conditions for the functional separation of circuits are:

- Separation between the independent power sources for a single system
- Separation between the redundant system circuits.

NOTE: In relation to functional separation, the airplane engine systems are redundant for each engine.

D. EMC Separation Group

These are the 3 basic separation codes:

- Code 1 for circuits contain the noisy, interference wiring; usually power lines
- Code 2 for all the wiring that satisfies the conditions of EMC
- Code 3 for the sensitive, susceptible circuits; such as audio or analog.

E. EMC Separation Group Code 1 - Source of Interference Circuits

These are system wires that carry power current or other EMI offensive circuits. Examples of these are:

- Both AC and DC generator and power feeders
- Other 400 Hz power wires that go beyond 12000V-ft or 400A-ft of potential coupling
- Automatically switching DC circuits that switch 5 amps or more
- Both AC and DC inductive load turnoff transients that are not suppressed.

20-10-19

STANDARD WIRING PRACTICES MANUAL**WIRE SEPARATION****F. EMC Separation Group Code 2 - Passive Circuits**

These are systems wires which are expected to tolerate and not degrade the electromagnetic environment in the airplane. Examples of these are:

- AC signal or control circuits that are not susceptible to common mode coupling of 100 mV RMS or less
- 400 Hz power wires do not go beyond 12000V-ft or 400A-ft when they are located with their own Category 2 system harness.

G. EMC Separation Group Code 3 - Sensitive or Susceptible Circuits

These are system wires that cannot satisfy the limits of Category 2 susceptibility.

H. Sub-Functional Separation Category

Some more separation may be necessary within a functional separation code because of special system functional conditions. Decisions for sub-functional conditions are made in relation to:

- The airplane model
- The system.

NOTE: When a sub-functional separation is given, that separation must be kept.

2. WIRE HARNESS IDENTIFICATION FOR FUNCTIONAL SEPARATION**A. Functional/EMC/Sub-Functional Separation Code**

The separation code has these properties:

- A separation code is assigned to each wire harness
- When the sub-functional separation is not necessary for 737, 747, 757, and 767 airplane models, the third digit is removed; only 2 digits are necessary
- When the sub-functional separation is not necessary for 777 airplane model, the fourth digit is removed; only 3 digits are necessary
- An N code identifies a wire that does not have any separation conditions and can have the same routing as a wire harness from any other functional separation group.

B. Color Codes of the Separation Groups

NOTE: Refer to the specified model for the color codes that are used for each functional separation code.

A color code system is used so that:

- The separation group of a wire harness can be identified
- The installation and inspection of a wire harness on the airplane is easier.

For the 737, 747, 757, and 767 airplane models, all wire harnesses have color codes except these types:

- A coax cable that is installed as a single cable and does not have any wire harness ties
- Wire harnesses in which all wires are covered with sleeves (white tie material)
- Wire harnesses which that contain only shielded wires (white tie material)
- Shelf harnesses (white tie material)
- Wire harnesses that are identified as neutral (N).

For the 777 airplane model, all wires harnesses have have color codes except these types:

- A coax cable that is installed as a single cable and does not have any wire harness ties
- Shelf harnesses (white tie material)
- Wire harnesses that are identified as neutral (N).

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

3. WIRE HARNESS FUNCTIONAL SEPARATION

A. Separation by a Distance

Refer to Table 1 to find the minimum distance for the specified separation code of each model.

NOTE: In the areas where a turbine burst occurs, a larger physical separation is necessary between the specified engine functions.

NOTE: More protection or a larger physical separation, or both are given in the areas where damage, that is caused by a mechanical failure, can occur to the primary and the redundant wiring. Some types of mechanical failures are:

- The rupture of a pneumatic duct
- A tire tread that is thrown.

These standby system power wires must be isolated from all other wiring through separation by distance:

- Battery to hot battery bus
- Hot battery bus to battery bus and static inverter
- Static inverter to standby AC bus.

CAUTION: THE STANDBY SYSTEM POWER WIRES MUST NOT HAVE THE SAME ROUTING AS ANY OTHER WIRING. DAMAGE, THAT IS CAUSED BY THE FAILURE OF THE OTHER WIRING, CAN OCCUR TO THE STANDBY SYSTEM POWER WIRES.

20-10-19

STANDARD WIRING PRACTICES MANUAL**WIRE SEPARATION****B. Separation by an Insulation Material**

Insulation sleeves or insulation tubes are used to give the specified separation for the wire harness when these conditions occur:

- The 1/4 inch distance of separation in the pressurized area is not possible
- The 1/4 inch distance of separation in the area that is not pressurized for all airplane models except the 747 and the 777 is not possible
- The 1/2 inch distance of separation in the area that is not pressurized for the 747 and the 777 airplane models is not possible.

To give the specified separation in the areas that are:

- Pressurized, Varglas non-fray, Type HO or Type HP insulation sleeves are used
- Not pressurized, TFE Teflon sleeves or TFE tubes with a wall thickness of 9.0 mils or larger are used.

NOTE: The separation by an insulation material is not necessary where a BACC18AD type of fusible link, single-phase circuit breaker is used to protect the circuit in the wiring that is:

- In the flight deck
- In the E/E compartment
- In between the flight deck and the E/E compartment.

C. Separation by a Fusible Link Circuit Breaker

NOTE: Separation by a fusible link circuit breaker is not sufficient when a wire harness is in a location where it is open to:

- A turbine burst
- The failure of a pneumatic duct
- A tire tread that is thrown
- Other types of physical damage.

If wires with different functional separation codes come directly from a circuit breaker source and are protected with a fusible link circuit breaker:

- The separation by an insulation material is not necessary
- The wires can have the same routing.

A wire, that has the same routing as another wire, must have a insulation sleeve or insulation tube if all of these conditions occur:

- The wires have different functional separation codes
- The wire is not protected with a fusible link circuit breaker
- The other wire is protected with a fusible link circuit breaker.

4. WIRE HARNESS EMC SEPARATION**A. Separation Between EMC Groups**

An analysis of the EMC codes is made for the routing of each specified wire harness.

As a general rule, the EMC wire harnesses with:

- Code 1 and Code 3 do not have the same routing
- Code 2 can have the same routing as a wire harness Code 1 or Code 3 after sufficient analysis.

20-10-19

STANDARD WIRING PRACTICES MANUAL**WIRE SEPARATION****5. MODIFICATION OF AIRPLANE WIRING**

This paragraph gives the procedures to keep the correct separation of wire harnesses when a modification is made to the wiring of an airplane.

A. A Change in the Routing of a Wire Harness

- (1) Refer to the specified conditions for the airplane model.
- (2) If the conditions for separation by distance in Paragraph 3.A. cannot be obeyed, put a sleeve on either:
 - The full harness, if it is necessary
 - Only at the point where the wire harnesses touch, if it is sufficient.

Refer to Paragraph 3.B.

B. A Wire That Is Added to a Wire Harness

- (1) Find the separation group of the wire harness from the applicable chart in the Wiring Diagram Manual Chapter 91.
- (2) Find the separation group of the new wire from its function and its EMC condition.
- (3) If it is necessary, make a selection of either of these types of separation:
 - (a) Use a shielded wire.
 - (b) Put a sleeve on the wire. Refer to Paragraph 3.B.

NOTE: It is not necessary to put a sleeve on each individual wire, if the wires are in the same separation group.

- (4) Put the wires of the redundant circuits through the different connectors.
- (5) Assemble the wire harness ties again with the same color of tie material.

Make sure that the wire harness with the new wire does not touch another wire harness that has a color code that does not agree with the color code of the new harness.

C. A New Wire Harness

- (1) Find the separation group of the new harness from its function and its EMC condition.

NOTE: A wire harness can have only one functional separation group code.

- (2) Examine every circuit or wire in the new harness.

For circuits that do not agree with the selection of the separation group for the harness, make sure that these conditions for separation are obeyed:

- The separation by distance; refer to Paragraph 3.A.
- The separation by insulation material; refer to Paragraph 3.B.
- The separation with shielded wire.

CAUTION: AN INSULATION SLEEVE DOES NOT GIVE THE SUFFICIENT SEPARATION FOR THE CIRCUITS OF THE EMC GROUPS THAT ARE NOT COMPATIBLE.

- (3) Put the wires of the redundant circuits through the different connectors.
- (4) Examine the physical location of the installation of a new harness in relation to the wire harnesses that are installed on the airplane.
 - (a) Assemble the wire harness ties of the new harness with the correct color of tie material for the identification of the separation group of the wire harness. Refer to Subject 20-10-11.

20-10-19

707, 727-787

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

- (b) Obey the specified conditions for separation. Refer to Paragraph 3.
- (5) Add this data to the applicable charts in the Wiring Diagram Manual Chapter 91:
 - The new harness number
 - The separation group
 - The routing.

6. MODEL 737-300, MODEL 737-400, AND MODEL 737-500

A. Functional Separation of the Fail-Passive Autoland System

NOTE: The 737 Wiring Diagram Manual 91-06-() Subjects give the functional separation codes.

These are the conditions for the autoland system:

- All circuits are given a separation code
- A color code system is used in airplane wiring, shelve wiring, and panel wiring; refer to Table 2.

The codes A, B, E, and F identify the necessary separation between:

- Independent power sources
- Redundant system circuits.

The code N identifies circuits for which separation is not necessary.

**Table 2
COLOR CODES FOR 737 SEPARATION**

Autoland Channel Code	Circuit	Tie Material Color
A	System A power, logic, excitation; sensor instrument	Red
B	System B power, logic, excitation; sensor instrument	Yellow
E	Cross channel wires; buffer protected	Blue
F	Common cruise wires	Orange
N	Other systems; identification of wires is not necessary	White

7. MODEL 737-600, MODEL 737-700, MODEL 737-800, MODEL 737-900, AND MODEL 737-900ER

A. Wire Harness Separation

Refer to Table 3 for the Power Source Separation Codes for the 737-600, 737-700, 737-800, 737-900 and 737-900ER.

20-10-19

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

**Table 3
COLOR CODES FOR 737-600, 737-700, 737-800, 737-900, AND 737-900ER SEPARATION**

Power Source Separation Code	Circuit	Tie Material Color
L	Left Generator feeders and controls. Circuits which are powered from the left power system, and do not meet the requirements for Category N shall be assigned a power separation code of L.	White
R	Right generator feeders and controls. Circuits which are powered from the right power system, and do not meet the requirements for Category N shall be assigned a power separation code of R.	White
S	Circuits which are dependent upon power from the battery, hot battery, and AC or DC standby busses, and do not meet the requirements for Category N shall be assigned a power separation code of S.	White
A	Circuits which are associated with APU power feeders and controls, and do not meet the requirements of Category N shall be assigned a power separation code of A.	White
N	Neutral circuits.	White

NOTE: Category "N" neutral circuits are one of these types of circuits:

- a. Circuits protected by the following primary distribution circuit breaker size or smaller and are not associated with Standby and APU power sources and controls.
 - DC-2.5 Amp
 - 1-Phase AC-5.0 Amp
 - 3-Phase AC-3.0 Amp.
- b. Circuits that are current limited by circuit impedance or transformer action to values equal to or less than those in (a) above.
- c. Circuits that are energized only on the ground.

NOTE: Neutral circuits are exempt from separation requirements and can be routed with any power source if the redundant system separation and EMC requirements are obeyed.

8. MODEL 747-100, MODEL 747-200, AND MODEL 747-300

When the Fail-Operational Autoland System is installed, the separation of the wire harnesses by auto pilot channel is necessary.

A. Functional Separation for the Fail-Operational Autoland System

NOTE: The 747 Wiring Diagram Manual 91-00-() Subjects give the functional separation codes.

When separation by distance is used, a minimum of 1/4 inch of separation is necessary.

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

When the necessary distance of separation of different wire harnesses between the wire harness clamps cannot be kept, any of these alternatives are satisfactory:

- More wire harness clamps must be installed
- More insulation material must be installed
- Another type of physical separation must be used.

When insulation sleeves are used for separation:

- Varglas Type HO or Type HP sleeves are used in the other areas
- TFE sleeves are used in areas where resistance to high abrasion is necessary.

B. Identification of Wire Harnesses

The wire harnesses of the Fail-Operational Autoland System are identified by color codes:

- So that the correct separation of channels is kept after rework or modification
- With colored lacing tape or colored plastic ties
- That are given in Table 4.

NOTE: Color identification if the channel is not applicable to:

- Coax cables
- Shelf and panel integration wire harnesses.

**Table 4
COLOR CODES FOR 747 SEPARATION**

Autopilot Channel Code	Tie Material Color
A	Red
B	Yellow
C	Green
D	Orange
E	Blue
F	Brown
G	Black

C. Wire Harnesses Identified by Color Codes

A wire harness:

- Can be either fully color coded or not fully color coded; refer to Figure 1
- That has a Fail-Operational Autoland System circuit in every of the branch of the harness are fully color coded
- That has one of more branches that do not have a Fail-Operational Autoland System circuit is not fully color coded.

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

**COLOR CODED WIRE HARNESS
Figure 1**

Wire harnesses that do not have any Fail-Operational Autoland System circuits can be called Associated Fail-Operational Autoland System wire harnesses when both of these conditions occur:

- They have routing that is near a Fail-Operational Autoland System wire harness
- They have a different generator power source than the Fail-Operational Autoland System wire harness.

To make sure that the different power sources are correctly isolated, the Associated wire harnesses are color coded for the part that has the routing that is near Fail-Operational Autoland System wire harness.

Refer to the Generator Power 1 in Figure 2.

**COLOR CODED ASSOCIATED WIRE HARNESS
Figure 2**

It is necessary to keep the specified separation as close as possible to the termination when two or more Fail-Operational Autoland System wire harnesses:

- Have different channel assignments
- Have wires that are spliced together or are electrically common.

Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

This configuration:

- Is functionally correct
- Keeps the specified separation of channels
- Occurs where the stabilizer trim control circuits of both the Captain and the First Officer are in parallel.

ELECTRICALLY COMMON TERMINATION
Figure 3

9. MODEL 747-400

A. Functional Separation

NOTE: The 747-400 Wiring Diagram Manual 91-06-() and 91-07-() Subjects give the functional separation codes.

These conditions are applicable:

- All circuits are given a separation code; refer to Table 5
- The necessary separation between independent power sources and redundant system circuits is identified by Codes 1, 2, 3, and 4
- The necessary separation between EMC circuits that are not compatible is identified by Codes 1, 2, and 3
- Circuits for which separation is not necessary are identified by Code N.

Table 5
COLOR CODES FOR 747-400 FUNCTIONAL SEPARATION

Functional Separation Code	Circuit	Tie Material Color
1	All electrical and avionic circuits that are powered from bus Number 1 and do not have N or S standby codes	Green
2	All electrical and avionic circuits powered from bus Number 2 that do not have N or S standby codes	Yellow
3	All electrical and avionic circuits powered from Number 3 that do not have N or S standby codes	Red

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

Table 5 (continued)

Functional Separation Code	Circuit	Tie Material Color
4	All electrical and avionic circuits powered from Number 4 that do not have N or S standby codes	Brown
N	Power circuits and other circuits in which current is kept to a limit; refer to Table 6	White
S	Any circuit that is supplied power from the battery; DC Standby, Hot Battery, or AC Standby	Blue

Table 6

CODE N, NON-REDUNDANT CIRCUITS OR NON-REDUNDANT POWER CIRCUITS IN 747-400 FUNCTIONAL SEPARATION

Circuit or Component	Note
DC 2.5 amperes or smaller circuit breaker, BACC18Z type	Does not apply to battery bus, DC Standby Bus, and Hot Battery Bus unless the load is not critical and is not necessary during Standby Power Only operation
1 Phase AC 5.0 amperes or smaller circuit breaker, BACC18Z type	Does not apply to AC Standby
3 Phase AC 3.0 amperes or smaller circuit breaker, BACC18AC type	-
Current is kept to a limit by circuit impedance or transformer action	Current is less than or equal to DC 2.5 amperes, 1 Phase AC 5.0 amperes, or 3 Phase AC 3.0 amperes
Power is supplied from the ground handling bus and are not energized during flight	-
Ground seeking circuits that use Master Dim and Test Power	Neutral on the ground side of lamps

10. MODEL 757

A. Functional Separation

NOTE: The 757 Wiring Diagram Manual 91-05-() Subjects give the functional separation codes.

These conditions are applicable:

- All circuits are given a separation code; refer to Table 7
- The necessary separation between independent power sources is identified by Codes A, C, H, L, R, and S
- The necessary separation between redundant system circuits is identified by Codes C, H, L, and R
- The necessary separation between EMC circuits that are not compatible is identified by Codes 1, 2, or 3
- Circuits for which separation is not necessary are identified by Code N.

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

**Table 7
COLOR CODES FOR 757 FUNCTIONAL SEPARATION**

Functional Separation Code	Circuit	Tie Material Color
A	Circuits that are related to the APU Electrical Power and the APU Control and can cause shutdown of the auxiliary generator power	Orange
C	Circuits that are related to the power that is supplied by the center bus powered circuits; redundant system circuits are included	Yellow
H	Circuits that are related to the Extended Range Operations (EROPS); the Hydraulic Motor Driven AC and DC Generator Systems, electrical power feeders, control and protection	Purple
L	Circuits that are related to the power that is supplied by the left power system and do not have N codes; redundant system circuits are included	Red
N	Power circuits and other circuits in which current is kept to a limit; refer to Table 8	White
R	Circuits that are related to the power supplied by the right power system and do not have N codes; redundant system circuits are included	Green
S	Any circuit that is supplied power from the battery; DC Standby, Hot Battery, or AC Standby	Blue

NOTE: For Code C circuits, power is supplied to the center buses:

- From the left power system during normal operations
- From the standby power system during a Category III Autoland; in this mode, can have the same routing as Code S circuits.

**Table 8
CODE N, NON-REDUNDANT CIRCUITS OR NON-REDUNDANT POWER CIRCUITS IN 757 FUNCTIONAL SEPARATION**

Circuit or Component	Note
DC 2.5 amperes or smaller circuit breaker, BACC18Z type	Does not apply to battery bus, DC Standby Bus, and Hot Battery Bus unless the load is not critical and is not necessary during Standby Power Only operation
1 Phase AC 5.0 amperes or smaller circuit breaker, BACC18Z type	Does not apply to AC Standby
3 Phase AC 3.0 amperes or smaller circuit breaker, BACC18AC type	-
Current is kept to a limit by circuit impedance or transformer action	Current is less than or equal to DC 2.5 amperes, 1 Phase AC 5.0 amperes, or 3 Phase AC 3.0 amperes
Power is supplied from the ground handling bus and are not energized during flight	-
Ground seeking circuits that use Master Dim and Test Power	Neutral on the ground side of lamps

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

B. Engine Wire Harness Separation

Installation of the wire harnesses that have engine control and indication circuits must be kept as they are supplied:

- To make sure that separation of redundant engine systems is correct
- To keep engine to engine separation.

11. MODEL 767

A. Functional Separation

NOTE: The 767 Wiring Diagram Manual 91-06-() Subjects give the functional separation codes.

These conditions are applicable:

- All circuits are given a separation code; refer to Table 9
- The necessary separation between independent power sources is identified by Codes A, C, H, L, R, and S
- The necessary separation between redundant system circuits is identified by Codes C, H, L, and R
- The necessary separation between EMC circuits that are not compatible is identified by Codes 1, 2, or 3
- Circuits for which separation is not necessary are identified by Code N.

**Table 9
COLOR CODES FOR 767 FUNCTIONAL SEPARATION**

Functional Separation Code	Circuit	Tie Material Color
A	Circuits that are related to the APU Electrical Power and the APU Control and can cause shutdown of the auxiliary generator power	Orange
C	Circuits that are related to the power that is supplied by the center bus powered circuits; redundant system circuits are included	Yellow
H	Circuits that are related to the Extended Range Operations (EROPS); the Hydraulic Motor Driven AC and DC Generator Systems, electrical power feeders, control and protection	Purple
L	Circuits that are related to the power that is supplied by the left power system and do not have N codes; redundant system circuits are included	Red
N	Power circuits and other circuits in which current is kept to a limit; refer to Table 10	White
R	Circuits that are related to the power supplied by the right power system and do not have N codes; redundant system circuits are included	Green
S	Any circuit that is supplied power from the battery; DC Standby, Hot Battery, or AC Standby	Blue

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

NOTE: For Code C circuits, power is supplied to the center buses:

- From the left power system during normal operations
- From the standby power system during a Category III Autoland; in this mode, can have the same routing as Code S circuits.

**Table 10
CODE N, NON-REDUNDANT CIRCUITS OR NON-REDUNDANT POWER CIRCUITS IN 767 FUNCTIONAL SEPARATION**

Circuit or Component	Note
DC 2.5 amperes or smaller circuit breaker, BACC18Z type	Does not apply to battery bus, DC Standby Bus, and Hot Battery Bus unless the load is not critical and is not necessary during Standby Power Only operation
1 Phase AC 5.0 amperes or smaller circuit breaker, BACC18Z type	Does not apply to AC Standby
3 Phase AC 3.0 amperes or smaller circuit breaker, BACC18AC type	-
Current is kept to a limit by circuit impedance or transformer action	Current is less than or equal to DC 2.5 amperes, 1 Phase AC 5.0 amperes, or 3 Phase AC 3.0 amperes
Power is supplied from the ground handling bus and are not energized during flight	-
Ground seeking circuits that use Master Dim and Test Power	Neutral on the ground side of lamps

12. MODEL 777

A. Functional Separation

NOTE: The 777 Wiring Diagram Manual 91-05-() Subjects give the functional separation codes.

These conditions are applicable:

- All circuits are given a separation code; refer to Table 11
- Wire harnesses that have different functional separation codes have the same routing only if the Wiring Diagram Manual shows the same routing
- If wire harnesses that have different functional separation codes have the same routing, the harnesses are held together with white lacing tape or natural color plastic ties.

It is not necessary to identify these wire harnesses with a color code:

- Wire harnesses installed in the location of the engine
- Wire harnesses installed in the struts
- Wire harnesses installed in the shelves and panels
- Coax cables.

NOTE: Coax cables and wire harnesses that contain coax cables for which a color code is not necessary must be held together or installed with white lacing tape.

STANDARD WIRING PRACTICES MANUAL

WIRE SEPARATION

NOTE: Wire harnesses and cables for which a color code is not necessary can be held together or installed with either of these tie materials:

- White lacing tape
- Natural color plastic ties.

**Table 11
COLOR CODES FOR 777 FUNCTIONAL SEPARATION**

Functional Separation Code	Circuit	Tie Material Color
AK	Auxiliary Power Unit	Orange
BK	Back-up Power; Variable Speed Constant Frequency	Magenta
CP	Center Primary; Flight Control DC Permanent Magnet Generator	Blue

2. REMOVAL OF THE PRESSURE BULKHEAD SEAL**A. Seal Removal**

CAUTION: DO NOT CAUSE DAMAGE TO:

- THE STRUCTURE
- THE WIRE HARNESS, IF THE WIRE HARNESS MUST BE USED AGAIN.

(1) Make a selection of a scraper made of wood or plastic.

CAUTION: DO NOT USE A SCRAPER THAT IS MADE OF A MATERIAL THAT IS HARDER THAN 2024-T3 ALUMINUM. A HARDER MATERIAL CAN CAUSE DAMAGE TO THE STRUCTURE.

(2) Make a selection of a solvent from Table 16.

(3) Remove the sealant on and around the installation hardware of the seal fitting.

(4) Remove the installation hardware.

(5) Remove the seal fitting from the structure:

- Carefully put the scraper between the seal fitting and the structure.
- Move the two halves of the seal apart.

(6) If the fitting must be replaced, discard the seal fitting.

(7) If the wire harness must be installed again:

- Carefully remove the sealant from each wire or cable.
- Clean the wire or cable with solvent.

(8) Remove the sealant from each side of the structure with the scraper.

CAUTION: DO NOT USE A SCRAPER THAT IS MADE OF A MATERIAL THAT IS HARDER THAN 2024-T3 ALUMINUM. A HARDER MATERIAL CAN CAUSE DAMAGE TO THE STRUCTURE.

(9) Clean each side of the structure with solvent.

(10) Remove the remaining solvent with a clean, dry cloth.

20-10-20

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS****3. INSTALLATION OF A NEW WIRE OR CABLE IN THE PRESSURE BULKHEAD SEAL****A. Seal Preparation**

This paragraph gives the procedure to make a groove or a hole through the sealant for a new wire or cable.

CAUTION: A HOLE SHOULD BE MADE THROUGH A SEAL, ONLY IF IT IS NECESSARY. THIS PROCEDURE HAS A HIGH RISK OF DAMAGE TO THE WIRE.

- (1) Examine the wire harness on each side of the pressure bulkhead seal.
- (2) Remove the seal from the bulkhead but do not remove the sealant around the wires. Refer to Paragraph 2.
- (3) Make a groove in the seal.

NOTE: As an alternative, a hole can be made through the sealant. Refer to Step (4).

- (a) If a spacer is installed in the seal, find the section that has the smallest number of wires.
- (b) Find an area near the edge of the seal that has no wires.
- (c) Cut a groove in the edge of the sealant. Refer to Figure 8.

Make sure that the groove has a sufficient depth for the wire.

PREPARATION OF THE GROOVE
Figure 8

- (4) If the alternative procedure to make a hole is necessary, make a hole with a circular tool:
 - (a) Find a location to make a hole in the sealant where damage to the wires or the cables cannot occur.
 - (b) Make a selection of one of these tools:
 - A drill
 - A small hollow tube that removes a core of the sealant
 - A 0.125 inch diameter stainless steel rod that has a point.
 - (c) Carefully push the tool through the sealant.

NOTE: The hole is easier to make if the tool is lubricated while it goes through the sealant.

20-10-20

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS**

WARNING: IF THE TOOL IS NOT CAREFULLY CONTROLLED AS IT GOES THROUGH, IT CAN CAUSE INJURY TO A PERSON ON THE OTHER SIDE OF THE SEALANT.

CAUTION: IF THE TOOL IS NOT CAREFULLY CONTROLLED AS IT GOES THROUGH, IT CAN CAUSE DAMAGE TO A WIRE OR A CABLE IN THE SEALANT.

- (5) Examine the wires that are installed in the pressure seal.
Make sure that the wires do not have damage.

B. Wire Installation

- (1) Make a selection of a sealant from Table 16.
Refer to Table 17 for the cure time of each sealant.
- (2) If the sealant is a polythioether type sealant make a selection of an adhesion promoter from Table 16.
- (3) Make a selection of a solvent from Table 16.
- (4) With a clean wipe and solvent, clean these surfaces:
- The groove in the seal
 - The end of the seal on the pressurized side of structure.

CAUTION: A SURFACE THAT SEALANT MAKES A BOND WITH MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

- (5) If the sealant is a polythioether type sealant:
- (a) Apply the adhesion promoter to:
- The groove or the hole in the seal
 - The end of the seal on the pressurized side of structure.
- (b) Let the adhesion promoter dry for a minimum of 30 minutes before the polythioether sealant is applied.
- (6) Carefully put the end of the wire through the groove or the hole in the sealant from the pressurized side of the structure. Refer to Figure 9.

**POSITION OF THE NEW WIRE IN THE GROOVE****Figure 9****20-10-20**

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS**

- (7) Pull the wire through the seal until the wire is approximately 4 inches from the final position.
- (8) Put a layer of sealant around the new wire or the new cable. Refer to Figure 10.

Make sure that the new sealant on the wire can make an overlap with the old sealant when the wire is in the final position.

**SEAL OF THE NEW WIRE****Figure 10**

- (9) Put the seal assembly back in the structure.
- (10) Pull the wire into the final position.
Make sure that the layer of new sealant on the wire makes an overlap with the old sealant.
- (11) On the pressurized side of the seal, put a layer of sealant around:
- The new wire or the new cable
 - All of the wires that go through the seal.

Refer to Figure 11.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

SEAL OF WIRES
Figure 11

(12) Let the sealant cure for the specified time. Refer to Table 17.

4. ASSEMBLY OF A PRESSURE BULKHEAD SEAL

A. Wire Preparation

- (1) Make a selection of a wire harness seal from Table 1.
- (2) Make a selection of a solvent from Table 16.
- (3) Put the wires, the cables, or the wire harness through the cutout.
- (4) Install the wires, or the cables, or the wire harness.

Make sure that the wire harness has 2 inches of slack on the pressurized side of the cutout so that the assembly of the seal is easier.

- (5) Clean all of the surfaces where the sealant must be applied.
- (6) Remove the remaining solvent with a clean, dry cloth.

B. Spacer Installation

To fill the area between the wires, cables, or wire harness with sealant, it is necessary to install one of these types of spacers:

- A coil spacer
- A star spacer.

- (1) To install a coil spacer:
 - (a) Make a selection of a coil spacer from Table 11. Refer to Figure 4.
 - (b) Put a coil spacer on each wire and each multiconductor cable. Refer to Figure 12.

Make sure that the spacer is in the center of the cutout.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

COIL SPACERS IN THE CENTER OF THE SEAL

Figure 12

(2) To install a star spacer:

(a) Make a selection of a star spacer from Table 14.

Refer to:

- Figure 7
- Figure 6
- Figure 5.

(b) Put the star spacer between the wires, the cables, or the wire harness. Refer to Figure 13.

Make sure that the spacer is in the center of the cutout.

STAR SPACER IN THE CENTER OF THE CUTOUT

Figure 13

(3) Remove all wire harness ties that are 3 inches or less from the cutout to make sure that the sealant can fill the area around the wires or the group of wires in the harness.

C. Assembly of a Seal for a Single Cutout

(1) Make a selection of the necessary components for the seal installation from Table 7.

(2) Make a selection of a solvent from Table 16.

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS**

(3) To assemble a BACS45A seal:

(a) Make a selection of a sealant from Table 16.

Refer to Table 17 for the cure time of each sealant.

(b) With a clean wipe and solvent, clean the surfaces that the sealant must make a bond with.

CAUTION: A SURFACE THAT SEALANT MAKES A BOND WITH MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

(c) Fill each half of the seal groove with sealant. Refer to Figure 14.

SEAL GROOVE OF THE BACS45A() SEAL

Figure 14

(d) Put the halves of the seal around the wires on the pressurized side of the cutout so that:

- The seal groove is turned to the cutout
- The center of the seal is aligned with the center of the spacers.

(e) Attach the seal to the pressurized side of the structure. Refer to Figure 15.

ASSEMBLY OF THE BACS45A() SEAL

Figure 15

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS**

(4) To assemble a BACS45B seal:

- (a) Make a selection of a seal ring from Table 4.
- (b) Make a selection of a snap ring from Table 7.
- (c) With a clean wipe and solvent, clean the surfaces that the sealant must touch.

CAUTION: A SURFACE THAT SEALANT MAKES A BOND WITH MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

(d) Fill each half of the seal groove with the sealant. Refer to Figure 16.

SEAL GROOVE OF THE BACS45B() SEAL

Figure 16

- (e) Put the halves of the seal around the wires on the pressurized side of the cutout so that:
 - The seal groove is turned to the cutout
 - The center of the seal is aligned with the center of the spacers.
- (f) Put the necessary number of seal rings between the snap ring groove and the structure to make a tight fit when the snap ring is installed. Refer to Figure 17.

Make sure that the maximum distance the seal can move in the longitudinal direction is 0.10 inch.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

ASSEMBLY OF THE BACS45B() SEAL

Figure 17

(g) Put the snap ring in the snap ring groove. Refer to Figure 16.

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS****ASSEMBLY OF THE BACS45A SEAL AND SEAL PLATE****Figure 18**

Refer to:

- Figure 18
 - Table 19 for the correct cover plate, filler, and screw.
- (1) Put the seal plate on the unpressurized side of the structure.
 - (2) Put the wires or wire harness in the correct positions.
 - (3) Align the correct filler in the structure hole from the pressurized side.
 - (4) Install the center screw.
 - (5) Install the cover plates over all the holes in the seal plate that are not used.
 - (6) Install a seal around each harness in the remaining holes.

Refer to Paragraph 4.C.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

ASSEMBLY OF THE SEAL PLATES

Figure 19

Refer to:

- Figure 19
 - Table 20 for the correct cover plate, filler, and screw.
- (1) Put the seal plate on the unpressurized side of the structure.
 - (2) Put the wires or wire harness in the correct positions.
 - (3) Align the correct filler in the structure hole from the pressurized side.
 - (4) Put the seal plate in position over the filler on the pressurized side of the structure hole.
 - (5) Align the screw holes.

20-10-20

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF PRESSURE BULKHEAD SEALS**

- (6) Install the center screw.
- (7) Install the cover plates over all the holes in the seal plate that are not used.
- (8) Install a seal around each harness in the remaining holes.

Refer to Paragraph 4.C.

5. INSTALLATION OF THE PRESSURE BULKHEAD SEAL**A. Assembly of the Sealant Mold**

The sealant mold made with:

- Plastic tape is recommended
 - Paper tape is the satisfactory alternative.
- (1) To make a sealant mold with plastic tape:
 - (a) Make a selection of a plastic tape from Table 16.
 - (b) Wind several layers of the tape around the seal assembly on each side of the structure. Refer to Figure 20.

**PLASTIC TAPE SEALANT MOLD****Figure 20**

- (2) To make a sealant mold with paper tape:
 - (a) Make a selection of a tape from Table 16.
 - (b) On the pressurized side, put an 8 inch length of string on the seal assembly so that it is parallel to the wires or wire harness.

The string is used to remove the tape after the sealant has cured.
 - (c) Put three equal and symmetrical layers of 1-1/2 inch wide tape around the end of the assembly. Refer to Figure 21.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

INITIAL STEP OF THE PAPER TAPE SEALANT MOLD
Figure 21

- (d) Make a symmetrical form with the tape against the end of the seal that is adjacent to the wires or wire harness.
- (e) Wind three layers of 3/4 inch masking tape around the end of the paper tape. Refer to Figure 22.

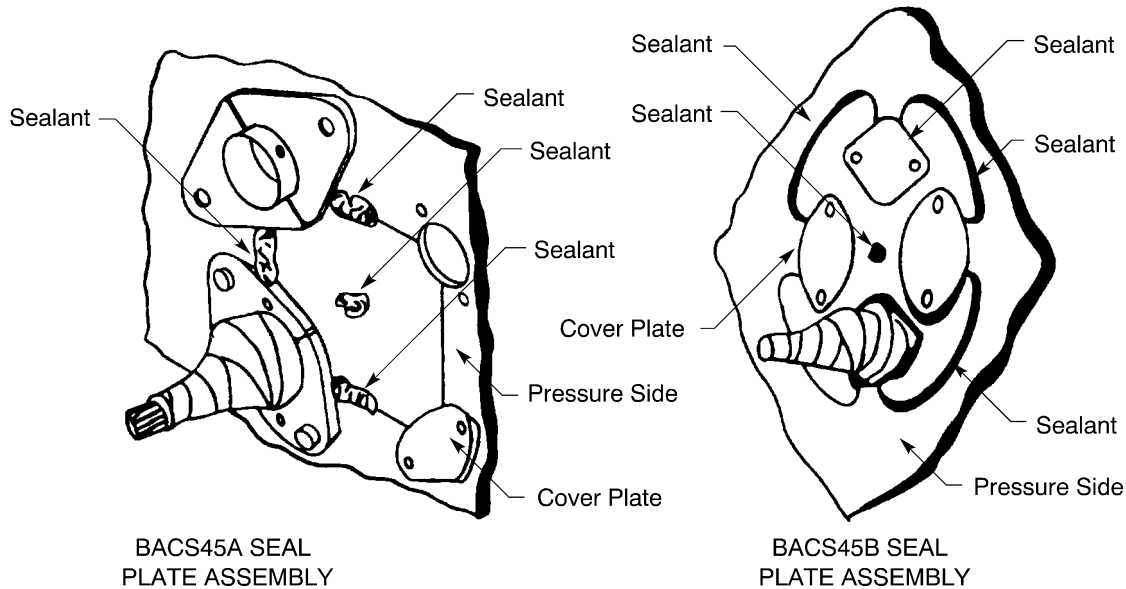

PAPER TAPE SEALANT MOLD
Figure 22

- (f) Do Step (a) through Step (e) again for the seal that is on the unpressurized side of the structure.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

B. Installation of the Sealant

LOCATION OF THE SEALANT ON THE FILLER AND THE SEAL PLATE
Figure 23

- (1) Make a selection of a fillet sealant from Table 16.
Refer to Table 17 for the cure time of each sealant.
- (2) Make a selection of a sealant from Table 16.
- (3) With a clean wipe and solvent, clean the surfaces that the sealant must make a bond with.

CAUTION: A SURFACE THAT SEALANT MAKES A BOND WITH MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

- (4) Put a layer of the sealant on:
 - The joints of the filler
 - The center screw
 - The edges of the BACS45B seal plate.

Refer to Figure 23.

- (5) Make a hole in the sealant mold over all of the injection hole of the seal.

NOTE: As an alternative, a hole can be made at the end of the mold that is adjacent to the wires or wire harness.

- (6) Put the sealant into each injection hole with a sealant gun at 80 psi to 100 psi pressure.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF PRESSURE BULKHEAD SEALS

Make sure:

- That the sealant comes out from around the wires at the edges of the mold
 - To complete the injection of the sealant in the specified time for the sealant
 - That the sealant is continuous and has no voids, holes, bubbles, cracks, unwanted objects, used sealant, or metal particles.
- (7) Let the sealant cure for the specified time. Refer to Table 17.
- (8) Remove all of the sealant molds.
- (9) Put a layer of the fillet sealant:
- On the heads of the screws
 - Around the outer edges of the seal flange.

B. Assembly of the Power Feeder Cable Terminals	2

20-10-21 CONTENTS

STANDARD WIRING PRACTICES MANUAL

POWER FEEDER WIRE HARNESS RACEWAY SEAL

This Subject gives the procedures to remove and install the raceway seal for the power feeder wire harness.

1. REMOVAL OF THE RACEWAY SEAL

A. Preparation for Removal

- (1) Remove the fanning strip from the power feeder cables near the power feeder terminals.
- (2) Remove the terminals from the ends of the power feeder cables.

B. Raceway Seal Removal

POWER FEEDER CABLE RACEWAY SEAL
Figure 1

Refer to Figure 1.

- (1) Remove these components from the seal assembly:
 - The bolt
 - The nut
 - The washer.
- (2) Pull the power feeder cables through the seal housing.
- (3) Remove the cover plates and the seal from the power feeder cables.

2. ASSEMBLY OF THE RACEWAY SEAL

A. Raceway Seal Assembly

- (1) Put the power feeder cables through the cover plates and the seal.

STANDARD WIRING PRACTICES MANUAL

POWER FEEDER WIRE HARNESS RACEWAY SEAL

Make sure the cables are in the correct position. Refer to Figure 1.

- (2) Find the seal and the cover plates inside the seal housing.
- (3) Put the bolt through:
 - The seal housing
 - The cover plates
 - The seal.

NOTE: The bolt can be installed from either side.

- (4) Put the washer and the nut on the bolt.
- (5) Torque the nut to whichever occurs first:
 - 75 inch-pounds to 90 inch-pounds
 - The is against the end of the threads.

CAUTION: MAKE SURE THAT THE COVER PLATES DO NOT CATCH ON THE SEAL HOUSING.

- (6) Examine the assembly.

Make sure that:

- The seal comes out of the cover plate at the wire penetration holes
- The cover plate is not caught on the edge of the seal housing
- The cover plate does not extend outside the seal housing.

B. Assembly of the Power Feeder Cable Terminals

- (1) Assemble a terminal on the ends of the power feeder cables.
Refer to Subject 20-30-11.
- (2) Put the fanning strip on the wire harness next to the terminal lugs. Refer to Table 1.

Table 1
POWER FEEDER TERMINAL LUGS

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

1. GENERAL DATA

A. Seal Fitting Part Numbers

SHELL SIZE 24 AND 36 SEAL FITTING COMPONENTS

Figure 1

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

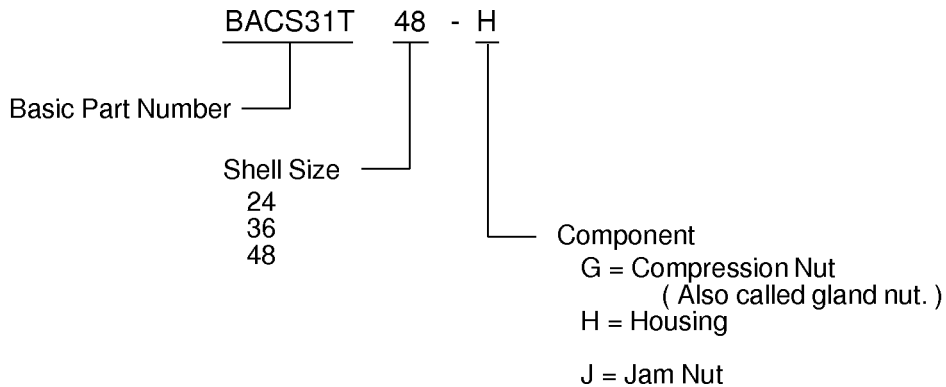

SHELL SIZE 48 SEAL FITTING COMPONENTS

Figure 2

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

PART NUMBER STRUCTURE FOR THE HOUSING COMPONENTS OF THE SEAL FITTING
Figure 3

Table 1
Seal Fitting Housing Component Part Numbers

Shell Size	Part	Part Number
24	Housing	BACS31T24H
	Jam Nut	BACS31T24J
	Compression Nut	BACS31T24G
36	Housing	BACS31T36H
	Jam Nut	BACS31T36J
	Compression Nut	BACS31T36G
48	Housing	BACS31T48H
	Jam Nut	BACS31T48J
	Compression Nut	BACS31T48G

NOTE: For the seal fitting assembly, one Housing, one Jam Nut, and one Compression Nut are necessary.

PART NUMBER STRUCTURE FOR THE INTERNAL COMPONENTS OF THE SEAL FITTING
Figure 4

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Table 2
Seal Fitting Internal Component Part Numbers

Shell Size	Part	Part Number
24	Grommet	BACS31U24S()
	Internal Seal	BACS31U24G()
	Bushing	BACS31U24B()
36	Grommet	BACS31U36S()
	Internal Seal	BACS31U36G()
	Bushing	BACS31U36B()
48	Grommet	BACS31U48S()
	Internal Seal	BACS31U48G()
	Bushing	BACS31U48B()

Refer to Paragraph 1.B. for the Seal Designator for the Grommet.

NOTE: If a Grommet is not used, one Internal Seal, and one Bushing are necessary.

NOTE: If a Grommet is used, one Internal Seal, one Bushing, and one Grommet are necessary.

INTERNAL SEALS
Figure 5

Type A Grommets are used with shell size 24 and 36 seal fittings. Type B Grommets are used with shell size 48 seal fittings. Refer to Figure F6.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

TYPE A AND TYPE B GROMMETS
Figure 6

NOTE: The Bushing and the Internal Seal must have the same Designator. Refer to Figure 7 .

Make sure that the Designator on the replacement Bushing and the Designator on the replacement Internal Seal is the same as the Designator on the Bushing and on the Internal Seal of the original configuration.

LOCATION OF THE DESIGNATOR ON THE INTERNAL SEAL AND ON THE BUSHING
Figure 7

Table 3
Seal Plug Part Numbers

Seal Plug Part Number	Grommet Hole Letter Designator	Grommet Hole Diameter Range (inch)
BACS31UP1	A	0.250 to 0.315
BACS31UP2	B	0.375 to 0.440
BACS31UP3	C	0.500 to 0.560
BACS31UP4	D	0.625 to 0.690
BACS31UP5	E	0.750 to 0.815
BACS31UP6	F	0.950 to 1.015

NOTE: Only the grommet holes of the diameter ranges that are given in Table 3 can have a seal plug.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

NOTE: Figure 8 through Figure 35 show the diameter limits for sealed wire harnesses, single wires, or single cables that go through the wire cavity holes in the grommet.

NOTE: Each grommet arrangement has an alignment mark. Refer to Figure 8 .

NOTE: Grommet holes have a Letter Designator that defines the wire harness diameter range for that hole. Refer to Table 3.

NOTE: Only the grommet holes of the diameter ranges that are given in Table 3 can have a seal plug.

2. REMOVAL AND DISASSEMBLY OF THE SEAL FITTING

A. Removal of the Seal Fitting from the Structure

Table 5
Necessary Tools

Tool	Description	Shell Size	Size (inches)	Part Number
Wrench	Crowfoot, Jam Nut	24	2.0	AN850832B
				ST2580-343A-17
		36	2-5/8	AN850842B
				ST2580-343A-15
		48	3-1/2	057-0919-05
Wrench	Socket, Jam nut, Unpressurized Side	48	3-1/2	057-0898-05

- (1) Make a selection of a crowfoot jam nut wrench from Table 5. On the unpressurized side of the structure, turn the jam nut in the counterclockwise direction to loosen it from the seal fitting.
- (2) Push on the two halves of the jam nut to separate the two halves of the jam nut. Refer to Figure 36.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

REMOVAL OF THE JAM NUT AND SEPARATION OF THE JAM NUT HALVES

Figure 36

- (3) On the pressurized side of the structure, pull the seal fitting and the wire harness from the penetration hole.

CAUTION: Do not cause damage to the insulation of the wires.

B. Disassembly of Shell Size 24 and 36 Seal Fittings

**Table 6
Necessary Tools**

Tool	Description	Shell Size	Size (inch)	Part Number
Wrench	Allen	24	7/64	-
		36	7/64	-
Wrench	Crow Foot, Compression Nut	24	1-1/2	AN850824B ST2580-343A-20
		36	1-5/8	AN850826B ST2580-343A-18
Holding Tool	-	24	2	ST2580-343A-23
		36	2-5/8	ST2580-343A-21

- (1) Make a selection of an allen wrench from table 6.
- (2) Disengage the screws that hold the two housing halves together. Refer to Figure 37.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

LOCATION OF DISENGAGED SCREWS

Figure 37

- (3) Separate the two halves of the housing.
- (4) Make a selection of a crowfoot compression nut wrench from Table 6.
- (5) Pull the wire harness, the internal seal, the bushing, and the compression nut from the housing. Refer to Figure 38.

REMOVAL OF WIRE HARNESS, INTERNAL SEAL, BUSHING, AND COMPRESSION NUT

Figure 38

- (6) If the seal fitting has a grommet:
 - (a) Remove the grommet from the internal seal.
 - (b) Remove the wires from the grommet.
- (7) If the seal fitting does not have a grommet, remove the wire harness from the internal seal.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

C. Disassembly of the Shell Size 48 Seal Fitting

**Table 7
Necessary Tools**

Seal Fitting Shell Size	Tool	Description	Size (inch)	Part Number
48	Wrench	Allen	9/64	-
		Crow Foot, Compression Nut	3-1/2	ST2580-343A-19
	Holding Tool	-	3-1/2	ST2580-343A-22

- (1) Make a selection of crow foot compression nut wrench from Table 7.
- (2) Remove the compression nut from the seal fitting. Refer to Figure 39.

**SHELL SIZE 48 SEAL FITTING REMOVED FROM THE STRUCTURE
Figure 39**

- (3) Make a selection of allen wrench from Table 6.
- (4) Disengage the screws that hold the two housing halves together. Refer to Figure 39.
- (5) Separate the two halves of the housing.
- (6) Pull the wire harness, the internal seal and grommet, and the bushing from the housing.
- (7) If the seal fitting does not have a grommet, remove the wire harness from the internal seal.
- (8) If the seal fitting has a grommet:
 - (a) Remove the grommet from the internal seal.
 - (b) Remove the wires from the grommet.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

D. Removal of the Sealant Tape from the Harness

**Table 8
Necessary Materials**

Material	Description	Part Number	Supplier
Solvent	Isopropyl Alcohol	TT-I-735	An available source
	Naptha, Aliphatic	TT-N-95 Type I	An available source

**Table 9
Necessary Tools**

Description	Notes	Supplier
Gloves	Powder Free	An available source
Scissors	-	An available source
Wiper	-	An available source

NOTE: Use gloves to touch or move the adhesive sealant tape. Refer to Table 9.

- (1) Make a selection of:
 - A solvent from Table 8
 - A pair of Scissors from Table 9
 - A wiper from Table 9.

- (2) Cut the outer wrap of tape with the scissors.

NOTE: To make the operation easier, the tape can be lifted as it is cut.

CAUTION: DO NOT CAUSE DAMAGE TO THE INSULATION OF THE WIRES. DAMAGE TO THE INSULATION OF THE WIRE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (3) Use a sealant stick to move the tape apart
- (4) Remove the tape from the harness.
- (5) Put the solvent on the wiper.
- (6) Use the wiper to remove the adhesive sealant from the wire harness.

NOTE: It is not necessary to remove all of the sealant if the sealant does not touch something before the wire harness is taped again.

3. PREPARATION OF A WIRE HARNESS SEAL FITTING

A. Preparation of a Wire Harness for Installation in a Grommet

**Table 10
Necessary Materials**

Material	Description	Part Number	Supplier
Adhesive Sealant Tape	0.50 inch wide, Black	5313	3M
Flag Marker Tape	-	BACT19ET-5	Boeing

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Table 10 (continued)

Material	Description	Part Number	Supplier
Silicone Tape	0.57 inch wide, Black	67N	Federal Mogul

**Table 11
Necessary Tools**

Tool	Description	Part Number
Marker	Temporary	-
Wrench, Compression Strap	-	057-0750-00
Wrench, Torque	50 inch-pound	-
Ruler	-	-

DIAMETER D OF THE FINISHED WIRE HARNESS AFTER THE INSTALLATION OF THE SEALANT TAPE
Figure 40

**Table 12
Wire Harness Diameters**

Specified Diameter (inch)	Assembly Diameter D (inch) Refer to Figure 40 .	
	Minimum	Maximum
0.250	0.19	0.250
0.375	0.32	0.375
0.500	0.44	0.500
0.625	0.57	0.625
0.750	0.69	0.750
0.950	0.89	0.950

- (1) Find the Controlled Diameter Area on the wire harness:
 - (a) Put one seal fitting housing half in the penetration hole in the structure.
Make sure that the flange gasket is against the structure on the pressurized area side.
 - (b) Put the wire harness in the housing.
 - (c) Make a selection of a Marker from Table 11.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

- (d) Make a temporary mark on the wire harness approximately in the center of the Controlled Diameter Area.

Refer to:

- Figure 41 for shell size 24 and shell size 36 seal fittings
- Figure 42 for shell size 48 seal fittings.

POSITION OF THE TEMPORARY MARK ON THE HARNESS FOR THE SHELL SIZE 24 AND 36 SEAL FITTINGS
Figure 41

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE TEMPORARY MARK ON THE HARNESS FOR THE SHELL SIZE 48 SEAL FITTING
Figure 42

- (e) Do Step (b) through Step (d) again for each wire harness that must be installed in the seal fitting.
- (2) Make a selection of a Flag Marker Tape from Table 10 .
- (3) For each wire harness that will be installed in the seal fitting, put a length of Flag Marker Tape on the harness 6.0 inches ± 0.1 inch from the temporary mark in the direction of the pressurized area. Refer to Figure 43.

POSITION OF THE FLAG MARKER
Figure 43

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

- (4) Make a selection of an Adhesive Sealant Tape from Table 10.
- (5) Cut two lengths of the Adhesive Sealant Tape.
Make sure that the lengths of the sealant tape are not longer than 4.4 inches. Refer to Figure 44 .
- (6) Move all or some of the wires of the wire harness to make one layer of wires not more than 4 inches wide. Refer to Figure 44 .

CONFIGURATION OF THE WIRES ON THE FIRST LENGTH OF SEALANT TAPE

Figure 44

- (7) Put the layer of the wires on the sealant tapes and push each wire into the sealant. Refer to Figure 44.

Make sure that the position of the temporary mark on the wires is located at half the distance between the lengths of the sealant tape.

Where the wires touch the sealant , make sure that :

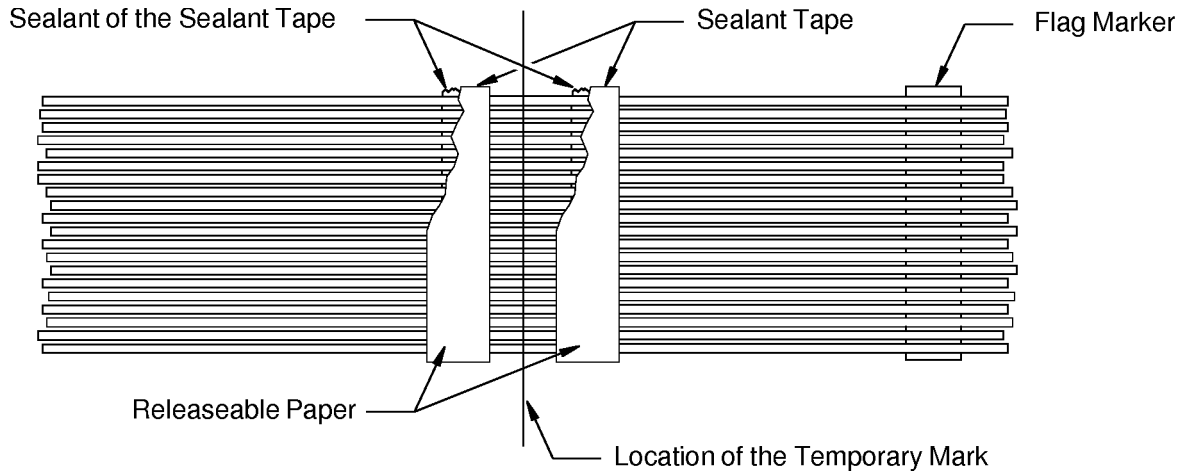

- The width of the layer of wires is 4 inches maximum
- The wires are all adjacent to each other
- One of the wires is not on another wire
- The end of the length of sealant tape extends approximately 0.1 inch to 0.2 inch beyond the wires.

- (8) Put an additional length of the sealant tape on the wires above each layer of sealant tape. Refer to Figure 45 .

Make sure that the sealant on these lengths of sealant tape touches the wires.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

THE SECOND LENGTH OF SEALANT TAPE ON THE LAYER OF WIRES
Figure 45

- (9) Remove the releasable paper from these additional layers of sealant tape.
- (10) If more layers of wires are necessary, do Step (6) through Step (9) again for each additional layer of wires. Refer to Figure 46 .

Make sure that no lengths of the releasable paper are between the layers of the wires and the sealant.

CONFIGURATION OF THE LAYERS OF THE SEALANT TAPE AND THE LAYERS OF THE WIRES
Figure 46

- (11) Wind the layers of sealant and wire on itself, and at the same time, remove the remaining length of releasable paper from the first layer of sealant tape. Refer to Figure 46 and Figure 47.
- Make sure that the wire harness now has a circular shape.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

CONFIGURATION OF THE WIRE HARNESS AFTER IT IS WOUND
Figure 47

- (12) Make a selection of silicone tape from Table 10 .
- (13) Wrap a minimum of one layer of the silicone tape on the harness at approximately a 60 degree angle from the unpressurized side to the pressurized side. Refer to Figure 48 .

Make sure that the wrap starts at 4.4 inches \pm 0.2 inch from the temporary mark.

POSITION OF THE OUTER LAYER OF TAPE ON THE WIRE HARNESS
Figure 48

- (14) Continue to apply the necessary layers of silicone tape until the wire harness diameter is sufficiently increased.

For the length of the wrap, refer to Figure 49.

For the outer diameter of the wrap, refer to:

- Paragraph 1.B. for the grommet cavity diameter
- Table 12 and Figure 40 for the applicable harness assembly diameter.

Make sure that while the silicone tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched
- The sealant is not pushed out
- The tension is smooth and even.

STANDARD WIRING PRACTICES MANUAL**DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS****LOCATION OF THE CONTROLLED DIAMETER AREA OF THE WIRE HARNESS****Figure 49**

- (15) Make a selection of a compression strap wrench from Table 11.
- (16) Make a selection of a torque tool from Table 11.
- (17) Align one edge of the strap with the approximate center of the taped area.

Refer to:

- Figure 50
- Figure 51
- Figure 52.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE HARNESS IN THE COMPRESSION STRAP WRENCH

Figure 50

POSITION OF THE COMPRESSION STRAP WRENCH ON THE HARNESS

Figure 51

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

STRAP OF THE COMPRESSION STRAP WRENCH AROUND THE WIRE HARNESS
Figure 52

- (18) Put the torque tool on the end of the compression strap wrench. Refer to Figure 53 .

POSITION OF THE TORQUE TOOL ON THE COMPRESSION STRAP WRENCH
Figure 53

- (19) Apply from 16 inch-pounds to 29 inch-pounds of torque to compress the harness in the strap wrench tool.
Refer to Figure 53 and Figure 54.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

CAUTION: DO NOT TIGHTEN THE MECHANISM TOO MUCH.

CAUTION: DO NOT TIGHTEN THE MECHANISM FARTHER THAN THE RED REFERENCE MARK ON THE TOOL. IF THE MECHANISM IS TIGHTENED FARTHER THAN THE RED REFERENCE MARK, THE TORQUE INDICATION WILL NOT BE ACCURATE.

A COMPRESSED AREA OF THE HARNESS

Figure 54

(20) Put the strap on the other side of the center of the tape area.

(21) Do Step (17) through Step (19) again.

Make sure that

- This side of the tape area is compressed to the same diameter as in Step (19)
- The sealant does come out from between the tape wraps.

(22) Measure the compressed diameter of the harness.

(23) If the measured diameter is specified:

(a) Get the assembly diameter.

Refer to :

- Table 12
- Figure 40 .

(b) If the compressed diameter of the tape area is less than the minimum, add more layers of tape.

Make sure that, while the tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched
- The sealant is not pushed out
- The tape tension is smooth and even.

Make sure that the harness diameter is the same throughout the controlled diameter area.

Refer to:

- Figure and 49
- Figure 55

(24) If the diameter is not specified or not within an assembly diameter range, add layers of tape to meet the first larger assembly diameter.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Make sure that, while the tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched
- The sealant is not pushed out
- The tape tension is smooth and even.

Refer to:

- Table 12
- Figure 40

Make sure the harness diameter is the same throughout the controlled diameter area.

Refer to:

- Figure and 49
- Figure 55 .

CONFIGURATION OF THE COMPRESSED, WRAPPED WIRE HARNESS
Figure 55

(25) Do Step (5) through Step (24) again for each wire harness that will be installed in the seal fitting grommet.

B. Preparation of One Wire or One Cable for Installation in a Grommet Hole

NOTE: This procedure applies to a single wire or cable that will go through the seal fitting in a grommet hole where this wire or cable is the only wire or cable in that hole.

Table 13
Necessary Materials

Material	Description	Part Number	Supplier
Flag Marker Tape	-	BACT19ET-5	Boeing
Silicone Tape	0.57 inch wide, Black	67N	Federal Mogul

POSITION OF THE TEMPORARY MARK ON THE HARNESS FOR THE SHELL SIZE 48 SEAL FITTING
Figure 58

- (e) Do Step (b) through Step (d) again for each wire harness that must be installed in the seal fitting.
- (2) Make a selection of a Flag Marker Tape from Table 13 .
- (3) Put a length of Flag Marker Tape on each wire or cable 6.0 inches \pm 0.1 inch from the temporary mark in the direction of the pressurized area. Refer to Figure 59.

POSITION OF THE FLAG MARKER
Figure 59

STANDARD WIRING PRACTICES MANUAL**DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS**

- (4) Make a selection of silicone tape from Table 13 .
- (5) Wrap the silicone tape on the harness at approximately a 60 degree angle from the unpressurized side to the pressurized side. Refer to Figure 60 .

Make sure that the wrap starts at 4.4 inches \pm 0.2 inch from the temporary mark.

**POSITION OF THE OUTER LAYER OF TAPE ON THE WIRE HARNESS****Figure 60**

- (6) If the diameter is specified, apply the necessary layers of silicone tape until the outer diameter is within the assembly diameter range shown in Table 15.

Make sure that while the silicone tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched.
- The tension is smooth and even.
- The harness diameter is the same throughout the controlled diameter area.

For the length of the wrap, refer to:

- Figure and 61
- Figure 62 .

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

LOCATION OF THE CONTROLLED DIAMETER AREA OF THE WIRE OR CABLE
Figure 61

- (7) If the diameter is not specified or not within an assembly diameter range, add layers of tape to meet the first larger assembly diameter.

Make sure that, while the tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched
- The tape tension is smooth and even
- The harness diameter is the same throughout the controlled diameter area.

For the outer diameter of the wrap, refer to:

- Paragraph 1.B. for the grommet cavity diameter
- Table 15 for the applicable harness assembly diameter range.
- Figure 56 .

For the length of the wrap, refer to:

- Figure and 61
- Figure 62 .

CONFIGURATION OF THE COMPRESSED, WRAPPED WIRE HARNESS
Figure 62

STANDARD WIRING PRACTICES MANUAL**DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS**

- (8) Do Step (1) through Step (7) again for each wire or cable that will go through the seal fitting in a grommet hole and be the only wire or cable in that hole.

C. Preparation of a Wire Harness for Installation in Sealant

Table 16
NECESSARY MATERIALS

Material	Description	Part Number	Supplier
Adhesive Sealant Tape	0.50 inch wide, Black	5313	3M
Silicone Tape	0.57 inch wide, Black	67N	Federal Mogul

Table 17
NECESSARY TOOLS

Tool	Description	Part Number
Marker	Temporary	-
Wrench, Compression Strap	-	057-0750-00
Wrench, Torque	50 inch-pound	-

- (1) Find the Sealant Tape Area on the wire harness for the new sealant tape:
- (a) Put one seal fitting housing half in the penetration hole in the structure.
Make sure that the flange gasket is against the structure on the pressurized area side.
 - (b) Put the wire harness in the housing.
 - (c) Make a selection of a Marker from Table 17.
 - (d) Make an End Mark on the wire harness 0.25 inch to 0.38 inch from each end of the housing.
Refer to Figure 63.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE TEMPORARY MARK ON THE HARNESS FOR THE SHELL SIZE 24 AND 36 SEAL FITTINGS
Figure 63

- (e) Do Step (b) through Step (d) again for each wire harness that must be installed in the seal fitting.
- (2) Make a third temporary mark on the wire harness at a location half the distance between the two End Marks. Refer to Figure 64.

POSITION OF THE TEMPORARY MARKS ON THE HARNESS
Figure 64

- (3) Make a selection of an Adhesive Sealant Tape from Table 16.
- (4) Cut two lengths of the Adhesive Sealant Tape.
 Make sure that the lengths of the sealant tape are not longer than 4.4 inches.
- (5) Move all or some of the wires of the wire harness to make one layer of wires not more than 4 inches wide.
- (6) Put each of the wires of the layer of wires on the sealant of the sealant tapes and push each wire into the sealant. Refer to Figure 65.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Make sure that the position of the center mark on the wires is located at half the distance between the lengths of the sealant tape.

Where the wires touch the sealant, make sure that :

- The width of the layer of wires is 4 inches maximum
- The wires are all adjacent to each other
- One of the wires is not on another wire
- The end of the length of sealant tape extends approximately 0.1 inch to 0.2 inch beyond the wires.

CONFIGURATION OF THE WIRES ON THE FIRST LENGTH OF SEALANT TAPE
Figure 65

- (7) Put an additional length of the sealant tape on the wires above each layer of sealant tape. Refer to Figure 66 .

Make sure that the sealant on these lengths of sealant tape touches the wires.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

THE SECOND LENGTH OF SEALANT TAPE ON THE LAYER OF WIRES
Figure 66

- (8) Remove the releasable paper from these additional layers of sealant tape.
- (9) If more layers of wires are necessary, do Step (6) through Step (8) again for each additional layer of wires. Refer to Figure 67.

Make sure that no lengths of the releasable paper are between the layers of the wires and the sealant.

CONFIGURATION OF THE LAYERS OF THE SEALANT TAPE AND THE LAYERS OF THE WIRES
Figure 67

- (10) Wind the layers of sealant and wire on itself, and at the same time, remove the remaining length of releasable paper from the first layer of sealant tape. Refer to Figure 67 and Figure 68.

Make sure that the wire harness bundles now has a circular shape.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

CONFIGURATION OF THE WIRE HARNESS AFTER IT IS WOUND
Figure 68

- (11) Make a selection of silicone tape from Table 16 .
- (12) Wrap a minimum of one layer of the silicone tape on the harness at approximately a 60 degree angle from the unpressurized side to the pressurized side. Refer to Figure 69 and Figure and 70.

Make sure that:

- The wrap starts at an End Mark
- The wrap ends at the other End Mark.

Make sure that while the silicone tape is put on:

- Each tape wrap makes a 40 percent to 50 percent overlap
- The tape is stretched
- The sealant is not pushed out
- The tension is smooth and even.

POSITION OF THE OUTER LAYER OF TAPE ON THE WIRE HARNESS
Figure 69

STANDARD WIRING PRACTICES MANUAL**DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS****LOCATION OF THE SEALANT TAPE AREA OF THE WIRE HARNESS****Figure 70**

- (13) Make a selection of a compression strap wrench from Table 17.
- (14) Make a selection of a torque tool from Table 17.
- (15) Align one edge of the strap with the approximate center of the taped area.

Refer to:

- Figure 71
- Figure 72
- Figure 73.

**POSITION OF THE HARNESS IN THE COMPRESSION STRAP WRENCH****Figure 71****20-10-22**

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE COMPRESSION STRAP WRENCH ON THE HARNESS
Figure 72

STRAP OF THE COMPRESSION STRAP WRENCH AROUND THE WIRE HARNESS
Figure 73

- (16) Put the torque tool on the end of the compression strap wrench. Refer to Figure 74.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE TORQUE TOOL ON THE COMPRESSION STRAP WRENCH
Figure 74

- (17) Apply from 16 inch-pounds to 29 inch-pounds of torque to compress the harness in the strap wrench tool.

Refer to Figure 74 and Figure 75.

CAUTION: DO NOT TIGHTEN THE MECHANISM TOO MUCH.

CAUTION: DO NOT TIGHTEN THE MECHANISM FARTHER THAN THE RED REFERENCE MARK ON THE TOOL. IF THE MECHANISM IS TIGHTENED FARTHER THAN THE RED REFERENCE MARK, THE TORQUE INDICATION WILL NOT BE ACCURATE.

A COMPRESSED AREA OF THE HARNESS
Figure 75

- (18) Put the strap on the other side of the center of the tape area.
- (19) Do Step (15) through Step (17) again.

Make sure that the sealant does come out from between the tape wraps.

4. ASSEMBLY OF THE SEAL FITTING

A. Shell Size 24 and 36 Grommet and Internal Seal Assembly

- (1) On the side of the grommet, pull a slot in the grommet to an open position, and at the same time, from the side of the grommet, push a large gage wire or a sealed wire harness into the correct hole in the grommet. Refer to Figure 76 and Figure 77.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Make sure that:

- The end of the grommet that has the cavity identification points to the pressurized side of the panel
- The wire harness diameter has a close fit in the grommet opening
- The wire harness diameter does not force the slot to remain open
- The wire harness diameter does not have a loose fit
- The wire or wire harness is in the correct grommet hole
- For a sealed wire harness, the distance from the flag marker to the edge of the grommet is 5.5 inches \pm 0.1 inch.

POSITION OF A WIRE HARNESS IN THE GROMMET

Figure 76

NOTE: If the wire harness does not have a good fit, it is possible that the wire harness is not in the correct hole or that more layers of tape are necessary. Refer to Paragraph 3.A. for the procedure to wrap and seal a wire harness.

NOTE: One large gage wire, one large diameter cable, or one sealed wire harness can be installed in each grommet hole.

- (2) Repeat Step (1) for each wire or cable that will go through the seal fitting.
- (3) If a hole in the grommet is not used, push a seal plug into each unused hole until it stops. Refer to Figure 77.

Make sure that:

- The end of the seal plug that has the cavity identification points to the pressurized side of the panel
- The seal plugs are in the end of the grommet that points to the pressurized side of the panel
- The end of the seal plug is flush with the end of the grommet.

NOTE: If the grommet cavity has a two digit designator. The second digit is the seal plug designator. For example, if the cavity designator is 2C, the seal plug that has designator C fits that cavity.

NOTE: If the grommet cavity does not have a seal plug designator, a seal plug is not available for that cavity.

20-10-22

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

INSTALLATION OF THE SEAL PLUGS

Figure 77

- (4) At the slot in the internal seal, pull the internal seal to an open position, and at the same time, put the internal seal on all of the wires and cables that go through the grommet. Refer to Figure 78. Make sure that the skirt of the internal seal points to the pressurized side of the panel.

ALIGNMENT OF THE INTERNAL SEAL AND THE GROMMET

Figure 78

- (5) Push the internal seal on the grommet. Refer to Figure 79.

Make sure that:

- The edges of the grommet and the edges of the internal seal are approximately aligned
- The controlled diameter area of the wire harnesses and the middle of the grommet are aligned.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

ALIGNMENT OF THE BUSHING AND THE INTERNAL SEAL
Figure 79

- (6) At the slot in the bushing, pull the bushing to an open position, and at the same time, put the bushing on all of the wires and cables that go through the grommet. Refer to Figure 80. Make sure that the thin edge of the bushing points toward the skirt of the internal seal.

ALIGNMENT OF THE BUSHING AND THE INTERNAL SEAL
Figure 80

Compression Nut Torque Values**

Shell Size	Torque (foot-pounds)
24	15
36	18

- (1) Put the assembled internal seal, bushing and wire into one of the two housing halves. Refer to Figure 81 and Figure 82.

Make sure that:

- The controlled diameter area of the wire harness and the center of the internal seal area aligned
- The skirt of the internal seal points to the pressurized side of the panel
- The thin edge of the bushing is adjacent to the skirt of the internal seal
- The end of the internal seal with the largest diameter fits tightly against the gasket in the housing.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

ASSEMBLY OF A HOUSING HALF, THE WIRE HARNESS, THE INTERNAL SEAL, AND THE BUSHING
Figure 81

- (2) Put other housing half on the assembly. Refer to Figure 82 .

CONFIGURATION OF THE TWO HALVES OF THE HOUSING
Figure 82

- (3) Make a selection of an allen wrench from Table 18.
- (4) Engage the four housing screws in one housing half with the nuts in the other housing half. Refer to Figure 83.

NOTE: The nuts are not removable.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

LOCATION OF THE HOUSING SCREWS
Figure 83

- (5) Tighten the housing screws to 12 inch-pounds \pm 2 inch-pounds.
 - (6) Put the two halves of the compression nut together on the wire harness on the pressurized side of the assembly. Refer to Figure 84 .
- Make sure that the end of the compression nut that has the hex nut is pointed to the pressurized side of the harness.

POSITION OF THE COMPRESSION NUT
Figure 84

- (7) Engage the outer threads of the compression nut with the inner threads of the housing.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

- (8) From Table 18, make a selection of :
- A holding tool
 - A torque tool
 - A compression nut crowfoot wrench.
- (9) Hold the assembly by the housing flats and, at the same time, torque the compression nut.
Refer to Table 20 for the torque value.

Make sure that the holding tool:

- Fully spans the width of flats
- Does not squeeze the part
- Has a tight fit
- Does not scratch or dent the housing.

POSITION OF THE HOLDING TOOL ON THE ASSEMBLY

Figure 85

- (10) Examine the assembly. Refer to Figure 86.
Make sure that the tape on the wire harness extends a minimum of 0.375 inch farther than the edge of the seal fitting shell on each side.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

CONFIGURATION OF THE SEAL FITTING AND THE TAPE

Figure 86

- (11) If the tape does not extend a minimum of 0.375 inch farther than the edges of the seal fitting:
 - (a) Make a selection of a silicone tape from Table 19.
 - (b) Wrap two layers of the specified silicone tape around the wire harness with tension on the tape.
Make sure that:
 - The layers of tape have a 50 percent overlap
 - The tape wraps extend more than 0.375 inch beyond each end of the seal fitting.
- (12) Assemble a lacing tape wire harness tie on the wire harness and the wire harness tie tab on the compression nut. Refer to Figure 87 and Subject 20-10-11.
Make sure that the wire harness tie does not put strain on the wires or on the wire harness.

NOTE: If it is necessary, layers of tape can be used to increase the diameter of the wire harness where the wire harness tie is installed to prevent strain on the wire harness.

POSITION OF THE COMPRESSION NUT

Figure 87

C. Shell Size 48 Grommet and Internal Seal Assembly

- (1) Pull a slot in the grommet to an open position and push a large gage wire or a sealed wire harness into the hole in the grommet. Refer to Figure 88.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

Make sure that:

- The edge of the grommet stays aligned with the temporary mark on the sealed length of the wire harness
- The wire harness diameter is a close fit to the grommet cavity
- The wire harness diameter does not force the slot to remain open
- The wire harness diameter does not have a loose fit in the grommet cavity.

NOTE: If the wire harness does not have a good fit, it is possible that the wire harness is not in the correct hole or that more layers of tape are necessary. Refer to Paragraph 3.A. for the procedure to seal and wrap a wire harness.

NOTE: One large gage wire, one large diameter cable, or one sealed wire harness can be installed in each grommet hole.

POSITION OF A WIRE HARNESS IN THE GROMMET

Figure 88

- (2) Do Step (1) again for each wire harness or cable that must go through the seal fitting.
- (3) Push a seal plug in each unused hole until it stops. Refer to Figure 89

Make sure that:

- The end of the seal plug that has the identification mark points to the pressurized side of the panel
- The seal plugs are in the end of the grommet that points to the pressurized side of the panel
- The end of the seal plug is flush with the end of the grommet.

NOTE: If the grommet cavity has a two digit designator. The second digit is the seal plug designator. For example, if the cavity identification is 2C, the seal plug that has designator C fits that cavity.

NOTE: If the grommet cavity does not have a seal plug designator, a seal plug is not available for that cavity.

**Table 22
Necessary Materials**

Material	Description	Part Number	Supplier
Silicone Tape	0.57 inch wide, Black	67N	Federal Mogul

(1) Put the assembled internal seal, bushing and wire into one of the two housing halves. Refer to Figure 93.

Make sure that:

- If there is a grommet, the grommet is in the internal seal
- The controlled diameter area of the wire harness and the center of the internal seal are aligned
- The skirt of the internal seal points to the pressurized side of the panel
- The thin edge of the bushing is adjacent to the skirt of the internal seal.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

ASSEMBLY OF A HOUSING HALF, THE WIRE HARNESS, THE INTERNAL SEAL, AND THE BUSHING
Figure 93

- (2) Put the other housing half on the assembly. Refer to Figure 94.
 Make sure that the center of the tape wrapped area of the wire harness and the center of the internal seal are aligned.

CONFIGURATION OF THE TWO HALVES OF THE HOUSING
Figure 94

- (3) Make selection of an allen wrench from Table 21.
- (4) Engage the two housing screws in one housing half and the captivated nuts in the other housing half. Refer to Figure 95.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

LOCATION OF THE HOUSING SCREWS

Figure 95

- (5) Tighten the housing screws to 16 inch-pounds \pm 2 inch-pounds.
- (6) Put the two halves of the compression nut together on the wire harness on the pressurized side of the assembly. Refer to Figure 96.

POSITION OF THE COMPRESSION NUT ON THE WIRE HARNESS

Figure 96

- (7) Engage the inner threads of the compression nut and the outer threads of the housing.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

- (8) From Table 21 , make a selection of:
- A holding tool
 - A torque tool
 - A compression nut crowfoot wrench.
- (9) Hold the assembly by the housing flats, and at the same time, torque the compression nut to 22 foot-pounds \pm 1 foot-pound.

Refer to Figure 96.

Make sure that the holding tool:

- Fully spans the width of the flats
 - Does not squeeze the part
 - Has a tight fit
 - Does not scratch or dent the housing.
- (10) Examine the assembly. Refer to Figure 97.
- Make sure that the tape on the wire harness extends a minimum of 0.375 inch farther than the edge of the seal fitting shell on each side.

CONFIGURATION OF THE SEAL FITTING AND THE TAPE

Figure 97

- (11) If the tape does not extend a minimum of 0.375 inch farther than the edge of the shell:
- (a) Make a selection of a silicone tape from Table 22.
 - (b) Wrap two layers of the tape around the wire harness with tension

Make sure that:

- The layers of the tape have a 50 percent overlap
- The tape wraps extend more than 0.375 inch farther than each end of the seal fitting.

- (1) Put the sealed wires or wire harnesses into one of the two housing halves. Refer to Figure 103.

**POSITION OF THE WIRE HARNESSES IN THE HOUSING HALF
Figure 103**

- (2) Put the other housing half on the assembly. Refer to Figure 104.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE TWO HALVES OF THE HOUSING
Figure 104

- (3) Make a selection of an allen wrench from Table 25.
- (4) Engage the four screws in one housing half with nuts in the other housing half. Refer to Figure 105.

NOTE: These nuts cannot be removed from the housing half.

LOCATION OF THE HOUSING SCREWS
Figure 105

- (5) Tighten the housing screws to 12 inch-pounds \pm 2 inch-pounds.
- (6) Put the two halves of the compression nut together on the wire harness on the pressurized side of the seal fitting. Refer to Figure 106.

Make sure that the end of the compression nut that has the hex nut points to the pressurized side.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

POSITION OF THE COMPRESSION NUT ON THE WIRE HARNESS
Figure 106

- (7) Engage the outer threads of the compression nut and the inner threads of the housing.
- (8) Tighten the compression nut with the fingers until it stops.
- (9) Install the seal fitting in the panel. Refer to Paragraph 4.E..
- (10) Examine the wire harness in the seal fitting.
 Make sure that the tape on the wire harness extends an equal distance from each side of the seal fitting.
- (11) If the tape does not extend an equal distance from each end of the seal fitting:
 - (a) Make a selection of silicone tape from Table 26.
 - (b) Wrap more layers of tape on the wire harness at each end of the seal fitting.
 Make sure that the tape extends an equal distance from each end of the seal fitting.
- (12) Assemble a lacing tape wire harness tie around the wire harness and the tie tab on the compression nut. Refer to Subject 20-10-11.
 Make sure that the wire harness tie does not put strain on the wires or on the wire harnesses.
NOTE: If it is necessary, layers of tape can be installed to increase the diameter of the wire harness at the location of the wire harness tie to prevent strain on the wire harnesses.
- (13) Fill the seal fitting with sealant. Refer to Paragraph 4.I..

- (7) Engage the inner threads of the compression nut and the outer threads of the housing.
- (8) Tighten the compression nut with the fingers until it stops.
- (9) Install the seal fitting in the panel. Refer to Paragraph 4.E..
Make sure that the tape on the wire harness extends an equal distance on each side of the seal fitting.
- (10) If the tape does not extend an equal distance from each end of the seal fitting:
 - (a) Make a selection of a silicone tape from Table 28.
 - (b) Add more layers of tape on the wire harness at each end of the seal fitting until the tape extends an equal distance from each end.
- (11) Fill the seal fitting with sealant. Refer to Paragraph 4.I..

I. Injection of Sealant

NOTE: This process is used when the original installation included sealant.

**Table 29
Necessary Tools**

Tool	Note	Part Number	Supplier
Sealant Injection Tool	-	-	An available source
Wiper	-	BMS15-5 Class A	QPL
		BMS15-5 Class B	QPL
Gloves	Powder Free	-	An available source

**Table 30
Necessary Materials**

Material	Description	Part Number or Specification	Supplier
Sealant	Any Grade	BMS 5-37	QPL
Solvent	Isopropyl Alcohol	TT-I-735	An available source
	Naptha, Aliphatic	TT-N-95, Type I	An available source
Plastic Tape	2.0 inches wide	P-29	Permacel

NOTE: Use gloves to touch or apply sealant. Refer to Table 29.

- (1) Make a selection of these materials from Table 30:
 - Sealant
 - A plastic tape.
- (2) Make a selection of a sealant injection tool from Table 29.
- (3) Wrap plastic tape on the wire harnesses near the seal fitting.
- (4) Make a hole in the tape on each wire harness on the unpressurized side of the seal fitting. Refer to Figure 111.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

PREPARATION FOR POTTING

Figure 111

- (5) Wrap plastic tape around each wire harness on the pressurized side of the seal fitting.
- (6) Make a hole in the base of the tape on each wire harness with the injection tool. Refer to Figure 112.

STANDARD WIRING PRACTICES MANUAL

DISASSEMBLY, ASSEMBLY, AND INSTALLATION OF BACS31T SEAL FITTINGS

APPLICATION OF THE TAPE AND THE POTTING COMPOUND

Figure 112

- (7) Apply the sealant on all sides of each wire or wire harness from the pressurized side of the seal fitting.
- (8) Apply the sealant to completely cover the each wire harness and the outer surface and edges of the seal fitting.
Make sure that each of the wire harnesses is separated from each other from the seal fitting to the clamp nearest to the seal fitting.
- (9) If too much sealant is applied:
 - (a) Make a selection of a solvent from Table 30.
 - (b) Make a selection of wiper from Table 29.
 - (c) Remove the unwanted sealant from the assembly.
 - (d) Remove the remaining solvent with a clean wiper.

B. Repair of a Convolute Tube	2
2. <u>REPAIR OF A FLEXIBLE CONDUIT WITH A METAL OVERBRAID SHIELD</u>	3
A. General Conditions	3
B. Repair of a Metal Overbraid Shield	4

20-10-91 CONTENTS

STANDARD WIRING PRACTICES MANUAL**REPAIR OF FLEXIBLE ELECTRICAL CONDUITS**

This Subject gives the procedures to repair these configurations of flexible conduits that are not made with metal:

- A convoluted tube
- A convoluted tube with a metal overbraid shield.

1. REPAIR OF A FLEXIBLE CONDUIT**A. General Conditions**

A conduit assembly must be replaced when:

- A wire in the convoluted tube has damage
- The convoluted tube has a crack
- The convoluted tube has damage that is equal to or larger than 1 inch in length; refer to Figure 1
- The convoluted tube has damage that is equal to or larger than 15 percent of the circumference of the tube; refer to Figure 2
- The inner PTFE or ETFE surface of the convoluted tube is not smooth and continuous
- The inner PTFE or ETFE surface of the convoluted tube has a blockage or a sharp edge.

A convoluted tube with abrasive damage can be repaired if:

- The tube has damage that is smaller than 1 inch in length; refer to Figure 1
- The tube has damage that is smaller than 15 percent of the circumference of the tube; refer to Figure 2.

**LONGITUDINAL DAMAGE LIMITS OF A FLEXIBLE CONDUIT****Figure 1****20-10-91**

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FLEXIBLE ELECTRICAL CONDUITS

CIRCUMFERENTIAL DAMAGE LIMITS OF A FLEXIBLE CONDUIT
Figure 2

B. Repair of a Convoluted Tube

- (1) Make an inspection of the wires in the convoluted tube.
- (2) If a wire has damage to the insulation, the shield, or the conductor:
 - (a) Remove the wire harness from the conduit assembly.
 - (b) Replace or repair the wire. Refer to Subject 20-10-13 for the applicable conditions.

CAUTION: A SPLICE ON A WIRE IN A CONDUIT IS NOT PERMITTED.

- (c) Replace the conduit assembly.
- (3) If the wires do not have damage, and the damage to the convoluted tube is not greater than the limits specified in Paragraph 1.A., repair the convoluted tube.
 - (a) Make a selection of a Teflon silicone adhesive tape. Refer to Subject 20-00-11.
 Make sure that the tape has the applicable Temperature Grade and Class for the location of the repair.
 - (b) If applicable, remove sharp or rough edges from the damaged area.
 - (c) Clean the area with isopropyl alcohol. Refer to Subject 20-00-11.
 - (d) Put a minimum of 2 layers of tape on the damaged area. Refer to Figure 3.

LOCATION OF THE LAYERS OF TAPE
Figure 3

20-10-91

STANDARD WIRING PRACTICES MANUAL**REPAIR OF FLEXIBLE ELECTRICAL CONDUITS**

Make sure that:

- The end of each layer of tape makes a 1 inch minimum overlap with each end of the damaged area
 - The tape makes 50 percent overlap on each layer
 - The second layer of tape is in the opposite direction of the first layer.
- (e) Assemble a wire harness tie on the tape at each end of the repair area. Refer to:
- Figure 4
 - Subject 20-10-11 for the procedure to assemble a wire harness tie.

POSITION OF THE WIRE HARNESS TIES

Figure 4

- (4) If the damage to the convoluted tube is greater than the limits specified in Paragraph 1.A., replace the damaged convoluted tube with a new convoluted tube. Refer to Subject 20-00-11.

2. REPAIR OF A FLEXIBLE CONDUIT WITH A METAL OVERBRAID SHIELD

A. General Conditions

A conduit assembly must be replaced when:

- A wire in the convoluted tube has damage
- The convoluted tube has damage
- The inner PTFE or ETFE surface of the convoluted tube is not smooth and continuous
- The inner PTFE or ETFE surface of the convoluted tube has a blockage or a sharp edge
- The overbraid shield has damage that is equal to or larger than 1 inch in length; refer to Figure 5
- The overbraid shield has damage that is equal to or larger than 25 percent of the circumference of the conduit; refer to Figure 6
- The electrical bond between the two end fittings has a resistance that is greater than 10 milliohms.

A conduit assembly with abrasive damage of the metal overbraid shield can be repaired if:

- The shield has damage that is smaller than 1 inch in length; refer to Figure 5
- The shield has damage that is smaller than 25 percent of the circumference of the shield; refer to Figure 6
- The electrical bond between the two end fittings has a resistance that is less than or equal to 10 milliohms.

LONGITUDINAL DAMAGE LIMITS OF A FLEXIBLE CONDUIT WITH A METAL OVERBRAID SHIELD

Figure 5

CIRCUMFERENTIAL DAMAGE LIMITS OF A FLEXIBLE CONDUIT WITH A METAL OVERBRAID SHIELD

Figure 6

B. Repair of a Metal Overbraid Shield

- (1) Make an inspection of the wires in the convoluted tube.
- (2) If a wire has damage to the insulation, the shield, or the conductor:
 - (a) Remove the wire harness from the conduit assembly.
 - (b) Replace or repair the wire. Refer to Subject 20-10-13 for the applicable conditions.
 - (c) Replace the conduit assembly.
- (3) If the convoluted tube has damage:
 - (a) Remove the wire harness from the conduit assembly.
 - (b) Replace the conduit assembly.
- (4) If the wires or the convoluted tube do not have damage, repair the overbraid shield.

Make sure that the damage of the shield is not greater than the limits that are specified in Paragraph 2.A.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FLEXIBLE ELECTRICAL CONDUITS

- (a) Make a selection of a Teflon silicone adhesive tape. Refer to Subject 20-00-11.
Make sure that the tape has the applicable Temperature Grade and Class for the location of the repair.
- (b) If applicable, remove broken strands and rough edges of the shield from the damaged area.
- (c) Clean the area with isopropyl alcohol.
- (d) Put a minimum of 2 layers of tape on the damaged area. Refer to Figure 3.
Make sure that:
 - The end of each layer of tape makes a 1 inch minimum overlap with each end of the damaged area
 - The tape makes 50 percent overlap on each layer
 - The second layer of tape is in the opposite direction of the first layer.
- (e) Assemble a wire harness tie on the tape at each end of the repair area. Refer to:
 - Figure 4
 - Subject 20-10-11 for the procedure to assemble a wire harness tie.

3. DATA BUS DISASSEMBLY

A. Removal of a Data Bus Cable for the S227W001-1, -2, -4, and -6 Two Piece Couplers

**Table 7
NECESSARY TOOLS**

Tool	Description
Screwdriver	Flat Head

- (1) Loosen each loop cable clamp on the panel. Refer to Figure 1.
- (2) If the data bus cable has a receptacle at one end, remove the receptacle from the panel.
- (3) Remove the terminator from the terminator clamps.
- (4) Make a selection of a screwdriver from Table 7.
- (5) Turn the quarter turn fasteners on the coupler cover approximately 1/4 turn counter clockwise with the screwdriver. Refer to Figure 2 and Figure 3.
Make sure that you push on the screwdriver while you turn it.
- (6) Remove the coupler cover from the coupler base.
- (7) Carefully pull the data bus cable out of each wire guide of each coupler base.

B. Removal of a data bus cable for the S227W001-8 One Piece Coupler

- (1) Loosen each loop cable clamp on the panel. Refer to Figure 1.
- (2) If the data bus cable has a receptacle at one end, remove the receptacle from the panel.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (3) Remove the terminator from the terminator clamps.
- (4) Push the spring latch out of the notch to open the coupler lid. Refer to Figure 5.

Table 8
NECESSARY TOOLS

Tool	Description
Screwdriver	Flat Head
	Phillips Head

- (1) If necessary, remove the data bus coupler from the wire guide of the coupler base:
 - (a) Make a selection of a flathead screwdriver from Table 8.
 - (b) Turn the quarter turn fastener on the coupler cover approximately turn counter clockwise with the screwdriver. Refer to Figure 2 and Figure 3.
 Make sure that you push on the screwdriver while you turn it.
 - (c) Remove the coupler cover from the coupler base.
 - (d) Carefully pull the data bus cable from the wire guide of the coupler base.
- (2) Make a selection of a phillips head screwdriver from Table 8.
- (3) Disengage the threads of the four captive mounting screws with the screwdriver. Refer to Figure 2 and Figure 3.
- (4) Carefully pull the coupler base from the panel.

STANDARD WIRING PRACTICES MANUAL

- (1) Make a selection of a screwdriver from Table 9.
- (2) Disengage the threads of the two mounting screws with the screwdriver. Refer to Figure 6.

**S227W001-8 ONE PIECE COUPLER
Figure 6**

- (3) Carefully pull the coupler base from the panel.

4. DATA BUS ASSEMBLY

A. Separation of the Data Bus Wires

**Table 10
NECESSARY TOOLS**

Tool	Part Number
Wire Separator	WST8139

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

DANIELS WST8139 WIRE SEPARATOR TOOL

Figure 7

- (1) Make a selection of a wire separator tool from Table 10.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (2) Put one wire in the lower jaw and the other wire in the upper jaw of the tool. Refer to Figure 7.
- (3) Pull the trigger until it is against the handle to move the wires apart.
- (4) Remove the wires from the tool.

B. Coupler Installation Configurations

**Table 11
NECESSARY TOOLS**

Tool	Description
Screwdriver	Flat blade
Torque	Phillips head screwdriver

- (1) Make a selection of a solvent. Refer to Subject 20-00-11.
- (2) Clean these surfaces with the solvent:
 - The bottom surface of the coupler base
 - The area of the panel where the coupler is installed.
- (3) Remove the coupler cover from the coupler base. Refer to Figure 12 and Figure 13.

Figure 13

- (4) Align the ends of the captive screws with the four screw holes in the panel.
- (5) Make a selection of a screwdriver from Table 11.
- (6) Tighten the screws with the screwdriver.
- (7) Make a selection of a torque tool from Table 11.
- (8) Torque the screws 17.0 inch-pounds \pm 3.0 inch-pounds.
- (9) Measure the electrical bond resistance between the coupler base and the panel. Refer to Subject 20-20-00.
- (10) If the electrical resistance between the coupler base and the panel is greater than 5 milliohms, do Step (2) through Step (9) again.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

D. Installation of the S227W001-8 One Piece Coupler

**Table 12
NECESSARY TOOLS**

Tool	Description
Screwdriver	Phillips head
Torque	Phillips head screwdriver

- (1) Make a selection of a solvent. Refer to Subject 20-00-11.
- (2) Clean these surfaces with the solvent:
 - The bottom surface of the coupler
 - The area of the panel where the coupler is installed.
- (3) Align the ends of the two mounting screws with the two screw holes in the panel.
- (4) Make a selection of a screwdriver from Table 12.
- (5) Tighten the screws with the screwdriver.
- (6) Make a selection of a torque tool from Table 12.
- (7) Torque the screws 17.0 inch-pounds \pm 3.0 inch-pounds.
- (8) Measure the electrical bond resistance between the coupler and the panel. Refer to Subject 20-20-00.
- (9) If the electrical resistance between the coupler and the panel is greater than 5 milliohms, do Step (2) thru Step (8) again.

E. Installation of the Data Bus Cable in the Couplers

For the position of the wires in the adjacent couplers, refer to:

- Figure 8 for no empty coupler positions between the couplers
 - Figure 9 for one empty coupler position between the couplers
 - Figure 10 for two empty coupler positions between the couplers
 - Figure 11 for three empty coupler positions between the couplers.
- (1) If it is specified, install the necessary:
 - Foil tape on the data bus cable; refer to Paragraph 4.H.
 - Ferrite suppressor on the data bus cable; refer to Paragraph 4.I.
 - (2) Make a selection of a BACC10DK loop clamp from Table 1.
 - (3) Install the necessary number of BACC10DK clamps for the cable and the terminators on the panel.
 - (4) Put the terminator that is nearest to the top of the panel in two BACC10DK clamps.

NOTE: Do not tighten the clamps on the terminators.
 - (5) Put the data bus cable through all of the loop clamps along the specified route of the cable.
 - (6) Put the cable above the center of the wire guide of the coupler base that is the nearest to the terminator at the top of the panel.
 - (7) Make an estimate of the location to make a separation between the blue and yellow wires where the wires go in the grooves of the coupler base.
 - (8) Make a separation between the blue and yellow wires. Refer to Paragraph 4.A.

STANDARD WIRING PRACTICES MANUAL**ARINC 629 WIRING**

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (9) Install the wires in the coupler base. Refer to Figure 8.
Make sure that the insulation of the wire does not have damage.
- (a) Push the blue wire into the top groove of the coupler.
 - (b) Push the yellow wire into the bottom groove of the coupler.
- (10) If the panel has no empty coupler positions between the last coupler and the subsequent coupler. Refer to Figure 8.
- (a) Put the cable above the center of the wire guide of the subsequent coupler base.
 - (b) Make an estimate of the location to make a separation between the blue and yellow wires where the wires go in grooves of the coupler base.
 - (c) Make a separation between the blue and yellow wires. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (d) Push the yellow wire into the top groove of the coupler.
 - (e) Push the blue wire into the bottom groove of the coupler.
 - (f) Install the coupler cover. Refer to Paragraph 4.F.
- (11) If the panel has one empty coupler position between the last coupler and the subsequent coupler, install the wires in the next coupler. Refer to Figure 9.
- (a) Put the cable above the center of the wire guide of the subsequent coupler base.
 - (b) Make an estimate of the location to make a separation between the blue and yellow wires where the wires go in the grooves of the coupler base.
 - (c) Make a separation between the blue and yellow wires. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (d) Push the blue wire into the top groove of the coupler.
 - (e) Push the yellow wire into the bottom groove of the coupler.
 - (f) Install the coupler cover. Refer to Paragraph 4.F.
- (12) If the panel has two empty coupler positions between the last coupler and the subsequent coupler, install the wire in the next coupler. Refer to Figure 10.
- (a) Put the cable above the center of the wire guide of the subsequent coupler base.
 - (b) Make an estimate of the location to make a separation between the blue and yellow wires where the wires go in the grooves of the coupler base.
 - (c) Make a separation between the blue and yellow wires. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (d) Push the yellow wire into the top groove of the coupler.
- (e) Push the blue wire into the bottom groove of the coupler.
- (f) Install the coupler cover.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Refer to:

- Paragraph 4.F. for the S227W001-1, -2, -4, and -6 Two Piece Couplers
- Paragraph 4.G. for the S227W001-8 One Piece Couplers

- (13) If the panel has three empty coupler positions between the last coupler and the subsequent coupler, install the wires in the next coupler. Refer to Figure 11.
- (a) Put the cable above the center of the wire guide of the subsequent coupler base.
 - (b) Make an estimate of the location to make a separation between the blue and yellow wires where the wires go in the grooves of the coupler base.
 - (c) Make a separation between the blue and yellow wires. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN TABLE 10. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (d) Push the blue wire into the top groove of the coupler.
- (e) Push the yellow wire into the bottom groove of the coupler.
- (f) Install the coupler cover.

Refer to:

- Paragraph 4.F. for the two piece coupler
- Paragraph 4.G. for the one piece coupler.

- (14) Do Step (10) thru Step (13) again for the remaining length of data bus cable.
- (15) If the data bus cable has a separation between the blue and yellow wires at the location of an empty coupler position, install the necessary layer of tape and wire harness ties at each location.

Refer to:

- Figure 9 for one empty coupler position where the cable has one separation
- Figure 10 for two empty coupler positions where the cable has two separations
- Figure 11 for three empty coupler positions where the cable has three separations.

- (a) Make a selection of a silicone tape from Table 2.
- (b) Put the wires together.
- (c) Put a layer of tape on 2 inches \pm 0.5 inch of the cable.

Make sure that:

- The center of the layer of tape is aligned with the center of the coupler position
 - The tape makes a 50 percent circumferential overlap.
- (d) Assemble a lacing tape wire harness tie on each end of the layer of tape. Refer to Subject 20-10-11.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

- (16) Tighten the cable clamps.
- (17) Tighten the terminator clamps.

20-11-11

F. Installation of the Coupler Cover for the S227W001-1, -2, -4, and -6, Two Piece Couplers

**Table 13
NECESSARY TOOLS**

Tool	Description
Screwdriver	Flat head
Microhmmeter	Bonding meter

CAUTION: DO NOT TRY TO PUT THE COUPLER COVER FROM ONE SUPPLIER ON THE COUPLER BASE FROM A DIFFERENT SUPPLIER. THE COVER AND THE BASE DO NOT HAVE THE CORRECT FIT.

- (1) Make a selection of a microhmmeter from Table 13.
- (2) Examine the coupler bases and the coupler covers for:
 - Damage to the insulation between the E-Core and the wire grooves
 - Separation of the insulation from the E-Core
 - An E-Core that has a crack
 - A piece of the E-Core that is missing.

CAUTION: DO NOT USE A COUPLER BASE OR A COUPLER COVER THAT HAS DAMAGE. A COUPLER THAT HAS DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (3) Remove contamination from the coupler covers and the E-Core assemblies of all the coupler bases with a suction hose that has a soft nozzle.

CAUTION: DO NOT USE A SUCTION HOSE THAT HAS A METAL NOZZLE. A METAL NOZZLE CAN CAUSE DAMAGE TO THE E-CORE ASSEMBLY.

NOTE: A coupler cover must be installed on a coupler base a maximum of 5 minutes after the E-Core assembly has been cleaned.

- (4) Hold the wires in position. Refer to Figure 14.

**POSITION OF THE WIRES IN THE COUPLER BASE
Figure 14**

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (5) For the S277W001-1 Coupler, align the latch of the coupler cover with the slot of the coupler base. Refer to Figure 15.

ALIGNMENT OF THE COUPLER COVER AND THE COUPLER BASE FOR THE S277W001-1 COUPLER
Figure 15

- (6) For the S277W001-2, -4, and -6 Couplers, align the latch tabs of the coupler cover with the latch slots of the coupler base. Refer to Figure 16.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

ALIGNMENT OF THE COUPLER COVER AND THE COUPLER BASE FOR THE S227W001-2, -4, AND -6 COUPLERS
Figure 16

- (7) Carefully push the end of the cover that is opposite the latch down until it is engaged with the base.
- (8) Make a selection of a screwdriver from Table 13.
- (9) Install the coupler cover on the coupler base.

CAUTION: DO NOT USE THE SPRING-LOADED CENTER-PUNCH PROBE ON THE COUPLER COVER. THE PROBE CAN CAUSE DAMAGE TO THE COUPLER COVER.

- (a) Align the screwdriver slot in the quarter turn fastener with the coupler length. Refer to Figure 12 and Figure 13.
 Make sure that the fastener is aligned with the fastener retainer.
- (b) Turn the quarter turn fastener clockwise until it is locked.
- (c) Make sure that you push on the screwdriver while you turn it.
- (10) Measure the resistance between the panel and each coupler cover with a microhmmeter. Refer to Subject 20-20-00.
 Make sure that the resistance between the panel and each coupler cover is 1.5 milliohms or less.
- (11) If the resistance between the panel and each coupler cover is more than 1.5 milliohms:
 - (a) Remove the coupler cover.
 - (b) Clean the ground contacts. Refer to Figure 14.
 - (c) Do Step (3) through Step (10) again.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

G. Installation of the coupler cover for the S227W001-8 One Piece Coupler

Table 14
NECESSARY TOOLS

Tool	Description
Screwdriver	Flat head
Microhmmeter	Bonding meter

- (1) Make a selection of a microhmmeter from Table 13.
- (2) Examine the coupler for:
 - Damage to the insulation between the E-Core and the wire grooves
 - Separation of the insulation from the E-Core
 - An E-Core that has a crack
 - A piece of the E-Core that is missing.

CAUTION: DO NOT USE A COUPLER THAT HAS DAMAGE. A COUPLER THAT HAS DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (3) Remove contamination from the coupler E-Core assemblies of all the couplers with a suction hose that has a soft nozzle.

CAUTION: DO NOT USE A SUCTION HOSE THAT HAS A METAL NOZZLE. A METAL NOZZLE CAN CAUSE DAMAGE TO THE E-CORE ASSEMBLY.

NOTE: A coupler lid must be closed on a one piece coupler a maximum of 5 minutes after the E-Core assembly has been cleaned.

- (4) Hold the wires in position. Refer to Figure 17.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

S227W001-8 ONE PIECE COUPLERS WITH DATA CABLE
Figure 17

- (5) Carefully push the coupler lid down until it is engaged with the base.
- (6) Push the spring latch up until it engages the notch. Refer to Figure 18.

S227W001-8 COUPLER SPRING LATCH ATTACHMENT
Figure 18

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

H. Installation of Foil Tape on a Data Bus Cable

- (1) Make a selection of the foil tape from Table 2.
- (2) Install the foil tape on each specified location of the data bus cable. Refer to Figure 19.

NOTE: If a length of the data bus cable has a bend radius of less than 0.5 inch, a maximum length of 1.5 inches of cable in the bend area can be without foil tape.

POSITION OF THE FOIL TAPE ON THE DATA BUS CABLE

Figure 19

- (a) Put one full layer of the foil tape around the cable at the end of the cable clamp that is the nearest to the receptacle.
- (b) Continue to put the layer of the tape along the specified length of the cable. Make sure that the tape makes a 25 percent to 75 percent overlap.
- (c) Put one full layer of the foil tape around the end point.
- (d) Cut the foil tape at the end point.
- (e) Assemble a lacing tape wire harness tie at each end of the foil tape. Refer to Subject 20-10-11. Make sure that:
 - The color of the lacing tape is yellow
 - The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP IS NOT PERMITTED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

- (3) If the foil tape breaks when the wire harness tie is tightened:
 - (a) Remove the wire harness tie.
 - (b) Put one more full layer of the foil tape on the broken area.
 - (c) Assemble the wire harness tie again.

I. Installation of a Ferrite Suppressor on the Data Bus Cable

CAUTION: IF THE FERRITE SUPPRESSOR IS INSTALLED ON A WIRE THAT DOES NOT HAVE A LAYER OF POLYESTER TAPE FOR PROTECTION, THE WIRE GUIDES CAN CAUSE DAMAGE TO THE INSULATION OF THE WIRE.

- (1) Make a selection of a ferrite suppressor clamp from Table 1.
- (2) Make a selection of a polyester tape from Table 2.
- (3) If it is necessary to install the ferrite suppressor at an empty coupler position:
 - (a) Remove the wire harness ties.
 - (b) Remove the layer of silicone tape.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (4) Install a layer of the polyester tape on the data bus cable at the location of the ferrite suppressor. Refer to Figure 20.

Make sure that the layer of tape makes:

- A 20 percent to 80 percent overlap
- A 5 percent maximum overlap at the each end of the tape.

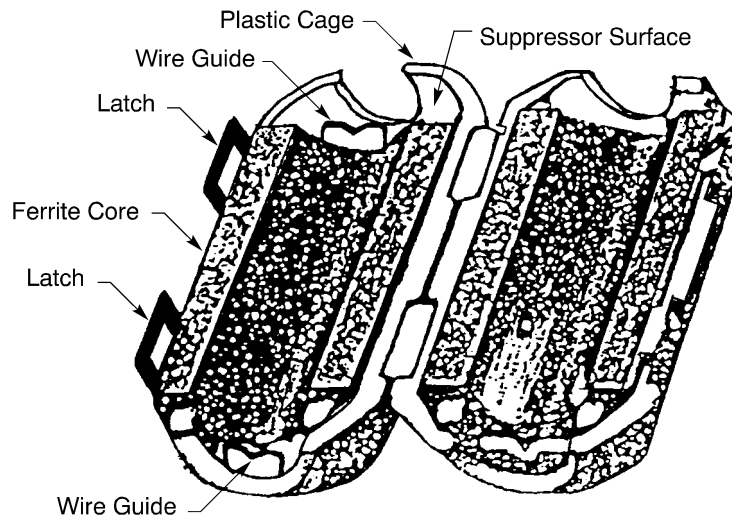

POSITION OF THE POLYESTER TAPE ON THE CABLE

Figure 20

- (5) Carefully open the ferrite suppressor. Refer to Figure 21.

CAUTION: MAKE SURE TO PREVENT DAMAGE TO THE FERRITE SUPPRESSOR AS IT IS OPENED. DAMAGE TO THE FERRITE CORE CAN CAUSE UNSATISFACTORY PERFORMANCE.

S280W752-1 FERRITE SUPPRESSOR

Figure 21

- (6) Remove dust or contamination from the ferrite core and the suppressor surfaces with a suction hose that has a soft nozzle.

CAUTION: DUST OR CONTAMINATION ON THE SURFACES OF THE CORE AND THE SUPPRESSOR CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (7) Put the suppressor on the cable.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Make sure that:

- The center of the taped area on the cable is approximately aligned with the longitudinal center of the core
 - The wire guides are against the area of the cable that has a layer of polyester tape.
- (8) Carefully push the two halves of the suppressor together until the latches are fully engaged in the latch retainers.

Make sure that the latches and the latch retainers are correctly engaged.

NOTE: The ferrite suppressor does not hold the data bus cable tightly.

- (9) Install a clamp on each ferrite suppressor. Refer to Figure 22.

POSITION OF THE FERRITE SUPPRESSOR IN THE CLAMP

Figure 22

- (a) Put the clamp on the suppressor.

Make sure that each end of the clamp is 0.25 inch \pm 0.15 inch from the end of the tape on the cable.

- (b) Tighten the clamp installation screw.

5. DATA BUS CONNECTOR ASSEMBLY

Refer to Paragraph 2.A. for the Data Bus components.

A. Shielded Cable Preparation

The paragraph gives the procedure to assemble a shield cable with a backshell.

- (1) Put these components on the cable:

- The strain relief backshell; refer to Table 1
- A 1.13 inch length of 13/16 inch diameter heat shrinkable sleeve.

Refer to Figure 23.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

POSITION OF THE BACKSHELL AND HEAT SHRINKABLE SLEEVE ON THE CABLE

Figure 23

- (2) Carefully remove approximately 2.25 inches of the outer jacket from the end of the cable. Refer to Subject 20-00-15.

Refer to Figure 24.

CABLE JACKET REMOVAL LENGTH

Figure 24

- (3) Fold the shield back. Refer to Figure 25.

POSITION OF THE SHIELD FOLDED BACK

Figure 25

- (4) Remove approximately 0.25 inch of insulation from the end of each wire.

Refer to:

- Subject 20-00-15 for the insulation removal processes.
- Figure 26.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

INSULATION REMOVAL
Figure 26

B. Unshielded Cable Preparation

Table 15
NECESSARY MATERIALS

Material	Part Number or Specification	Size	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem
	MIL-LT	-	Raychem

- (1) Make a selection of a strain relief clamp from Table 1.
- (2) Put the strain relief clamp on the unshielded cable. Refer to Figure 27.

POSITION OF THE STRAIN RELIEF CLAMP ON THE CABLE
Figure 27

- (3) Make a selection of a 1.0 inch length of 1/4 inch diameter shrinkable sleeve from Table 15.
- (4) Put the heat shrinkable sleeve on the cable to make the distance from the forward end of the sleeve to the end of the cable approximately 0.63 inch. Refer to Figure 28.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 28

- (5) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (6) Make a selection of a 1.5 inch length of 3/8 inch diameter heat shrinkable sleeve from Table 15.
- (7) Put the sleeve on the cable. Refer to Figure 29.

TEMPORARY POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 29

- (8) Move the end of the wires apart approximately 0.63 inch. Refer to Figure 30.

INSULATION REMOVAL LENGTH
Figure 30

- (9) Remove approximately 0.25 inch of insulation from the end of each wire.
Refer to:
 - Subject 20-00-15 for the wire insulation removal process
 - Figure 30 for the insulation removal.

C. Connector Assembly

Table 16
NECESSARY MATERIALS

Material	Part Number or Specification	Size	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem
	MIL-LT	-	Raychem

- (1) Assemble the contacts. Refer to Subject 20-61-11.
- (2) If the cable has a shield:
 - (a) Make a selection of a 1.5 inch length of 1/4 inch diameter heat shrinkable sleeve from Table 16.
 - (b) Put the heat shrinkable sleeve on the cable.
 - (c) Push the sleeve rearward until the end of the rear end of the sleeve is against the end of the forward end of the shield. Refer to Figure 31.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

POSITION OF THE SLEEVE ON THE CABLE

Figure 31

(3) Install the contacts in the connector. Refer to Subject 20-61-11.

Make sure that:

- The yellow wire is installed in contact cavity 1
- The blue wire is installed in contact cavity 2
- Each contact cavity that does not have a contact has a seal rod or seal plug.

(4) If the cable has a shield, shrink the 1.5 inch sleeve into its position.

Refer to:

- Figure 32
- Subject 20-10-14 to shrink the sleeve in its position.

POSITION OF THE SLEEVE ON THE CABLE

Figure 32

D. Backshell Assembly

**Table 17
NECESSARY TOOLS**

Tool	Description	Part Number
Microhmmeter	Meter	-
Strap Wrench	3/8 inch drive	TG-70
Torque Tool	-	76-101

- (1) Make a selection of a torque tool or a strap wrench from Table 17.
- (2) Engage the threads of the backshell and the connector.
- (3) Torque the backshell 60 inch-pounds minimum.
- (4) Attach the shield to the backshell with a shield termination band. Refer to Subject 20-25-14.
- (5) Measure the electrical resistance from the band to the shield with a microhmmeter. Refer to Subject 20-20-00.

Make sure that the electrical resistance is less than 1.5 milliohms.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (6) Push the black heat shrinkable sleeve forward until the forward edge of the sleeve is on the shield terminator band.
- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Install the saddle clamp bars.

Make sure that the surface of each bar is against the surface of each strain relief arm.

E. Strain Relief Clamp Assembly

**Table 18
NECESSARY TOOLS**

Tool	Part Number
Strap Wrench, 3/8 inch drive	TG-70
Torque Tool	76-101

- (1) Make a selection of a torque tool or a strap wrench from Table 18.
- (2) Push the 1.5 inch sleeve until the forward edge of the sleeve is as near the rear of the connector as possible. Refer to Figure 33.

**POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 33**

- (3) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (4) Engage the threads of the strain relief clamp and the connector.
- (5) Torque the clamp 60 inch-pounds minimum. Refer to Figure 34.

**POSITION OF THE STRAIN RELIEF CLAMP AGAINST THE CONNECTOR
Figure 34**

- (6) Install the saddle clamp.

STANDARD WIRING PRACTICES MANUAL**ARINC 629 WIRING****6. STUB CABLE ASSEMBLY AND DISASSEMBLY****A. Connector Disassembly**

- (1) For a connector with a S280W603 backshell assembly that has a protective sleeve on the assembly:
 - (a) Make a cut in the sleeve along the longitudinal axis of the sleeve.
 - (b) Remove the sleeve.
 - (c) Remove the wire harness tie.
 - (d) Unwind the silicon tape.
 - (e) Discard the tape.
 - (f) Hold the free end of the buckle on the shield terminator band with a pair of needle nose pliers.
 - (g) Pull the free end of the buckle in a direction that is up and away from the band until the end of the band is free from the buckle. Refer to Figure 35.

BUCKLE RELEASE OF THE SHIELD TERMINATOR BAND
Figure 35

- (h) Remove the metal band from the assembly.
 - (i) Discard the shield terminator band.
 - (j) Unwind the shield tape.
- (2) Remove the saddle bars from the cable clamp.
 - (3) Disengage the threads of the connector and the backshell.
 - (4) Push the backshell rearward from the connector.
 - (5) Remove the contacts from the connector. Refer to Subject 20-61-11.

B. Twinax Contact Removal

Refer to Subject 20-71-14.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

C. Preparation of the S280W502-() Cable with a Shield Ground Wire Pointed Rearward

**CABLE PREPARATION
Figure 36**

**Table 19
NECESSARY MATERIALS**

Material	Part Number or Description	Color	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem
	Grade B, Class 1	Blue	Refer to Subject 20-00-11.
	MIL-LT	-	Raychem

APPROVED SUPPLERS OF BOEING STANDARD MECHANICAL FERRULES**

Ferrule	Supplier
BACS13S()	Thomas & Betts

- (1) Make a selection of a 4.00 inch ±0.25 inch length of shrinkable sleeve from Table 19.
- (2) Put the sleeve on the cable.
- (3) Make a mark on the cable 5.00 inches ±0.13 inch from the end of the cable. Refer to Figure 36.
- (4) Make a mark on the cable 3.87 inches ±0.13 inch from the end of the cable.
- (5) Remove the cable insulation between the two marks.
Make sure that the length of shield window is 1.13 inch ±0.13 inch.
- (6) Remove a 1.50 inches ±0.15 inch length of insulation from the end of cable.
- (7) Remove the necessary length of shield to make the distance from the end of the cable insulation to the end of the shield equal to 0.25 inch ±0.06 inch.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (8) Make a selection of one of these shield ground wire configurations:
 - A shield ground wire with a solder sleeve
 - A shield ground wire with mechanical ferrules.
- (9) If the configuration is a shield ground wire with mechanical ferrules, make a selection of the mechanical ferrules from Table 20.
- (10) Assemble the shield ground wire. Refer to Subject 20-10-15.
 For the assembly of a shield ground wire with a mechanical ferrule, make sure to use the specified mechanical ferrules in Table 20.

D. Preparation of the S280W502-() Cable with a Shield Ground Wire Pointed Forward

CABLE PREPARATION
Figure 37

Table 22
NECESSARY MATERIALS

Material	Part Number or Description	Color	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem

Ferrule	Supplier
BACS13S()	Thomas & Betts

- (1) Make a selection of a 4.00 inch \pm 0.25 inch length heat shrinkable sleeve from Table 22.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (2) Put the heat shrinkable sleeve on the cable.
- (3) Make a mark on the cable 5.00 inches \pm 0.13 inch from the end of the cable. Refer to Figure 37.
- (4) Make a mark on the cable 3.87 inches \pm 0.13 inch from the end of the cable.
- (5) Remove the cable insulation between the two marks.
Make sure that the length of shield window is 1.13 inch \pm 0.13 inches.
- (6) Remove a 2.0 inch \pm 0.15 inch length of insulation from the end of the wire.
- (7) Remove the necessary length of shield to make the distance from the end of the cable insulation to the end of the shield equal to 0.25 inch \pm 0.06 inch.
- (8) Make a selection of one of these shield ground wire configurations:
 - A shield ground wire with a solder sleeve
 - A shield ground wire with mechanical ferrules.
- (9) If the configuration is a shield ground wire with mechanical ferrules, make a selection of the mechanical ferrules from Table 23.
- (10) Assemble the shield ground wire. Refer to Subject 20-10-15.
For the assembly of a shield ground wire with a mechanical ferrule, make sure to use the specified mechanical ferrules in Table 23.

E. Connector Assembly with a S280W603() Backshell

**Table 25
NECESSARY MATERIALS**

Material	Part Number or Specification	Size	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem
	MIL-DTL-23053/16	-	QPL
Protective Tape	Scotch 70	-	3M
Shield Tape	Scotch No. 24	-	3M

- (1) Make a selection of a 4.00 \pm 0.25 inch length of heat shrinkable sleeve from Table 25.
- (2) Put the sleeve on the cable.
- (3) Assemble the contacts. Refer to Subject 20-61-11.
- (4) Installation the contacts. Refer to Subject 20-61-11.
- (5) For the connection of the backshell with the connector refer to Subject 20-61-11.
- (6) Put each shield ground wire through the slot in the backshell.

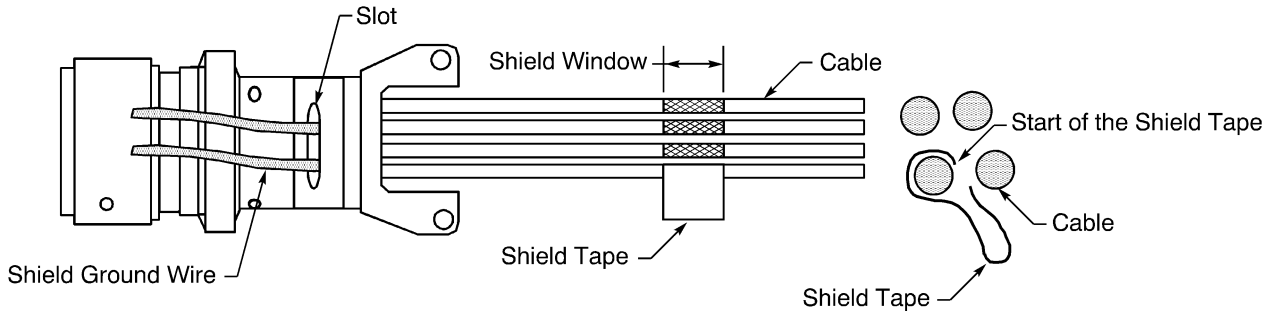

Make sure that:

- The ground wires are equal around the backshell
- The end of the ground wire is pointed to the front of the connector
- Each ground wire has no unwanted length.

Refer to Figure 38.

STANDARD WIRING PRACTICES MANUAL

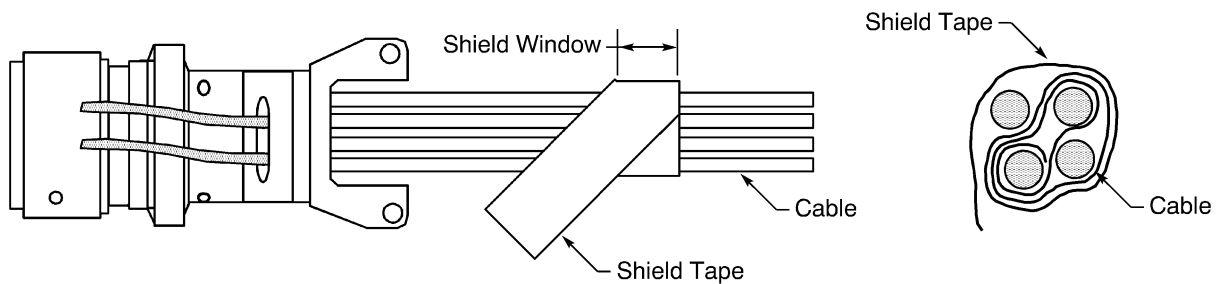

ARINC 629 WIRING

POSITION OF THE SHIELD TAPE ON THE WIRE

Figure 38

- (7) Put the end of the shield tape on the shield window of one wire. Refer to Figure 38.
Make sure that the center of the shield tape is aligned with the center of the shield window.
- (8) Wind a layer of the shield tape on the shield window of one wire. Refer to Figure 38.
- (9) Continue to wind the shield tape on each shield window on each wire.
Make sure that the surface of the shield tape is against each shield in the shield window.

POSITION OF THE SHIELD TAPE ON EACH SHIELD WINDOW

Figure 39

- (10) Wind one full layer of shield tape on all of the cables at the location of the shield windows.
- (11) Continue to wind the shield tape forward on the cables until the tape is against the rear end of the backshell. Refer to Figure 40.
Make sure that the shield tape makes a 50 percent overlap.

POSITION OF THE SHIELD TAPE AGAINST THE BACKSHELL

Figure 40

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (12) Continue to wind the shield tape across one ear of the backshell. Refer to Figure 40.
- (13) Continue to wind the shield tape across the other ear of the backshell. Refer to Figure 41.

POSITION OF THE SHIELD TAPE ON THE EARS OF THE BACKSHELL
Figure 41

- (14) Continue to wind the shield tape on the rear end of the shield termination band platform. Refer to Figure 42.

Make sure that:

- The forward edge of the shield tape is aligned with the rear edge of the slot of the backshell
- The shield termination platform has one full layer of shield tape.

POSITION OF THE SHIELD TAPE ON THE SHIELD TERMINATION BACKSHELL PLATFORM
Figure 42

- (15) Fold each shield ground wire back on the layer of shield tape. Refer to Figure 43.

POSITION OF THE SHIELD GROUND WIRES
Figure 43

STANDARD WIRING PRACTICES MANUAL**ARINC 629 WIRING**

- (16) Continue to wind the shield tape on the shield ground wires on the shield termination backshell platform.

Make sure that the shield ground wires have one full layer shield tape.

- (17) Continue to wind the shield tape forward on the backshell. Refer to Figure 44.

Make sure that:

- The backshell slot has one or two layers of the shield tape
- The shield tape does not make an interference with the drain holes of the backshell
- The shield tape holds each ground wire in its position.

POSITION OF THE SHIELD TAPE ON THE SHIELD GROUND WIRES

Figure 44

- (18) Continue to wind the shield tape rearward around the cables. Refer to Figure 45.

POSITION OF THE SHIELD TAPE ON THE CABLES

Figure 45

- (19) Continue to wind the shield tape rearward to the location of the shield windows.

- (20) Put one more layer of the shield tape on the cables at the location of the shield windows. Refer to Figure 46.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

LAYER OF SHIELD TAPE ON THE SHIELD WINDOW
Figure 46

- (21) Cut the shield tape.
- (22) Make a selection of a protective tape. Refer to Table 25.
- (23) Put two layers of protective tape on the shield tape. Refer to Figure 47.

Make sure that:

- The first layer of starts 0.5 inch from the forward end of the location of the shield windows
- The first layer stops at the rear end of the location of the shield windows
- The second layer starts at the forward end of the location of the shield windows
- The second layer stops 0.5 inches from the rear end of the shield tape.

POSITION OF THE LAYERS OF PROTECTIVE TAPE
Figure 47

- (24) Assemble a lacing tape wire harness tie at the center of the protective tape.
- Refer to:
- Figure 47
 - Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

- (25) Install a shield terminator band on the shield termination platform of the backshell. Refer to Subject 20-25-14.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (26) Cut each shield ground wire to make the distance from the end of the shield ground wire to the rear edge of the shield terminator band 0.10 inch to 0.25 inches. Refer to Figure 47.
- (27) Push the heat shrinkable sleeve forward until it stops. Refer to Figure 48.
- (28) Align the holes of the saddle clamp with the installation holes in the ears of the backshell.
Make sure that the end of the heat shrinkable sleeve extends a minimum of 0.6 inch from the forward edge of the saddle clamp.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE HARNESS
Figure 48

- (29) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (30) Install the saddle clamp.

F. Connector Assembly with a S280W605() Backshell

Refer to Subject 20-25-13.

G. Twinax Contact Assembly

Refer to Subject 20-71-14.

H. Twinax Contact Insertion

Refer to Subject 20-71-14.

I. Connection of the Plug and the Receptacle

- (1) Engage the threads of the plug and the receptacle.
- (2) Tighten the plug and receptacle hand tight plus 1/8 turn.

7. REPAIR OF ARINC 629 S280W502-() STUB CABLES

A. Necessary Parts and Materials

D. Splice Assembly with RSK Shield-Kons and a Cold Shrink Sleeve - S280W502-1 Stub Cables

Refer to Paragraph 7.C. for:

- The conditions that are applicable for this procedure
- More splice configurations.

(1) Make a selection of these materials from Table 26:

- A sealant
- An adhesive tape
- A silicone tape
- A shield material
- A cold shrink sleeve
- A cold shrink sleeve kit.

NOTE: An equivalent shield material is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) Make a selection of two butt splices from Table 27.
- (3) Make a selection of two RSK Shield-Kons from Table 29.
- (4) Make a selection of a butt splice crimp tool from Table 31.
- (5) Make a selection of a crimp tool for RSK Shield-Kons from Table 33.
- (6) Cut the cable at each end of the area with damage.
- (7) Put the length of cold shrink sleeve on one end of the cable.
- (8) Put the necessary length of shield material on the end of the cable with the cold shrink sleeve.
Make sure that the length of the shield material is a minimum of 5.25 inches.
- (9) Prepare the ends of the cable.
 - (a) Carefully remove approximately 2.95 inches of the outer jacket from the end of cable A.

Refer to:

- Figure 50
- Subject 20-00-15 for insulation removal procedures.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

CABLE JACKET REMOVAL LENGTH
Figure 50

- (b) Carefully remove approximately 1.75 inches of the outer jacket from the end of cable B.
Refer to:
- Figure 50
 - Subject 20-00-15 for insulation removal procedures.
- (c) Fold back the shield on the cable jacket. Refer to Figure 51.

CABLE SHIELDS FOLDED BACK
Figure 51

- (d) Remove the necessary length of shield that makes the distance from the end of the jacket to the end of the shield equal to 0.5 inch. Refer to Figure 51.
- (e) Wind a length of adhesive tape on the end of each shield to temporarily hold the shields in position.
- (f) Make the wires straight.
- (g) Remove approximately 0.50 inch of insulation from the end of each wire.

- Refer to:
- Figure 52
 - Subject 20-00-15 for insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 52

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (h) Fold the conductor back on itself.
- (10) Put the wire in the splice.
Make sure that the color of the wire in each end of the splice is the same.
- (11) Crimp the splice. Refer to Figure 53.

ASSEMBLY OF THE BUTT SPLICE
Figure 53

- (12) Wind two layers of 1 inch length of silicone tape on one butt splice.
Make sure that:
- The distance from one end of the layers of tape to the other end of the layers of tape is 1 inch
 - The center of the layers of tape is aligned with the center of the splice
 - The outer diameter of the layers of tape is equal to approximately 0.184 inch.

NOTE: If the tape is 0.012 inch thick, three layers of tape are necessary.

- (13) Do again Step (12) for the other butt splice.
- (14) Remove the necessary length of the rubber fillers from the cold shrink splice kit to make the length of the filler equal to 1.15 inch.

NOTE: The length of cold shrink sleeve in the cold shrink sleeve kit is not needed and can be discarded.

- (15) Put a filler on each butt splice. Refer to Figure 54.
Make sure that the center of the filler is aligned with the center of the butt splice.

POSITION OF THE RUBBER FILLERS
Figure 54

- (16) Push the shield material on the splice assembly. Refer to Figure 55.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Make sure that:

- The shield material goes on the full splice area
- The ends of the shield material are approximately aligned with ends of the folded back shields
- The center of the shield material is approximately aligned with the center of the butt splices.

POSITION OF THE SHIELD MATERIAL
Figure 55

(17) Assemble the splice of the shield. Refer to Figure 56.

ASSEMBLY OF THE SHIELD SPLICE
Figure 56

- (a) Remove the temporary layer of tape around the end of each shield.
- (b) Put one of the Shield-Kons into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (c) Put the crimp tool and the Shield-Kon on the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (d) Crimp the Shield-Kon.
- (e) Put the other Shield-Kon into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (f) Make the shield material smooth and tight.
- (g) Put the crimp tool and the Shield-Kon on the other end of the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (h) Crimp the Shield-Kon.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (i) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice.
- (18) Push the cold shrink sleeve on the splice assembly until one end of the cold shrink is approximately 0.25 inch from the end of shield material.
- (19) Remove the necessary length of cold shrink sleeve to make the distance from each end of the sleeve to the ends of the shield material equal to 0.25 inch.
- (20) Seal each end of the sleeve with sealant. Refer to Figure 57.

SEAL OF THE SLEEVE
Figure 57

E. Splice Assembly with a Solder Shield Splice Kit - S280W502-1 Stub Cables

Refer to Paragraph 7.C. for:

- The conditions that are applicable for this procedure
- More splice configurations.

Table 36
CABLE PREPARATION DIMENSIONS

Cable	Conductor	Trim Dimension (inch)		
		Dimension	Target	Tolerance
A	C1	D1	0.28	± 0.02

		D3	2.20	

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

ASSEMBLY CONFIGURATION OF THE SOLDER SHIELD SPLICE

Figure 58

Refer to Figure 69.

- (1) Make a selection of solder shield splice kit from Table 30.
- (2) Find the butt splice part number. Refer to Table 28.
- (3) Make a selection of a crimp tool from Table 28.
- (4) Make a selection of a hot air gun from Table 34.
- (5) Put the solder shield splice sleeve on each of the cables on one side of the splice assembly.
- (6) Remove these specified lengths from the end of the cable or the wire:
 - The outer jacket
 - The shield
 - The primary insulation
 - The conductor.

Refer to Table 36 and Figure 59.

CABLE PREPARATION

Figure 59

- (7) Assemble the splice of each wire.
 - (a) Put the seal sleeve on the wire or wires.
Make sure that the large end of the sleeve is pointed to the end of the cable.
 - (b) Put the necessary conductors in one end of the butt splice.
Make sure that the end of each conductor is against the wire stop at the center of the splice.
 - (c) Crimp the splice.
 - (d) Put the necessary conductors in the other end of the splice.
Make sure that the end of each conductor is against the notch at the center of the splice.
 - (e) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (f) Align the center of the seal sleeve with the center of the butt splice.
- (g) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Align the center of the shield splice sleeve with the middle of the distance between the ends of the outer jackets of the cable on both sides of the splice assembly.
- (9) Shrink one end of the shield splice sleeve:
 - (a) Apply heat at the center of the sleeve until the solder melts and the sleeve begins to shrink.
 - (b) Continue to apply heat from the center of the sleeve to one end of the sleeve until the solder ring melts and flows.
- (10) Do Step (9) again for the other end of the sleeve.

F. Splice Assembly with RSK Shield-Kons and a Cold Shrink Sleeve - S280W502-4 Stub Cables

Refer to Paragraph 7.C. for:

- The conditions that are applicable for this procedure
- More splice configurations.

**Table 37
CABLE PREPARATION DIMENSIONS**

Cable	Component Wire	
	Color	Necessary Length (inch)
A	Red	3.90
	Blue	3.25
	Red with Black Stripe	2.65
	Blue with Black Stripe	2.00
B	Red	2.00
	Blue	2.65
	Red with Black Stripe	3.25
	Blue with Black Stripe	3.90

- (1) Make a selection of these materials from Table 26:
 - A sealant
 - An adhesive tape
 - A silicone tape
 - A shield material
 - A cold shrink sleeve
 - A cold shrink sleeve kit.

NOTE: An equivalent shield material is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) Make a selection of four butt splices from Table 27.
- (3) Make a selection of two RSK Shield-Kons from Table 29.
- (4) Make a selection of a butt splice crimp tool from Table 31.
- (5) Make a selection of a crimp tool for RSK Shield-Kons from Table 33.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (6) Cut the cable at each end of the area with damage.
- (7) Put the length of cold shrink sleeve on one end of the cable.
- (8) Put the necessary length of shield material on the end of the cable with the cold shrink sleeve. Make sure that the length of the shield material is a minimum of 7.25 inches.
- (9) Prepare the ends of the cable.
 - (a) Carefully remove approximately 3.90 inches of the outer jacket from the end of cable A.

Refer to:

- Figure 60
- Subject 20-00-15 for insulation removal procedures.

CABLE JACKET REMOVAL LENGTH

Figure 60

- (b) Carefully remove approximately 3.90 inches of the outer jacket from the end of cable B.
- Refer to:
- Figure 60
 - Subject 20-00-15 for insulation removal procedures.
- (c) Fold back the shield on the cable jacket. Refer to Figure 61.

CABLE SHIELDS FOLDED BACK

Figure 61

- (d) Remove the necessary length of shield that makes the distance from the end of the jacket to the end of the shield equal to 0.5 inch. Refer to Figure 61.
- (e) Wind a length of adhesive tape on the end of each shield to temporarily hold the shields in position.
- (f) Make the wires straight.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (g) Remove the necessary length of wire from the end of each component wire on cable A. Refer to Table 37 and Figure 62.

CABLE PREPARATION
Figure 62

- (h) Remove the necessary length of wire from the end of each component wire on cable B. Refer to Table 37 and Figure 62.
- (i) Remove approximately 0.50 inch of insulation from the end of each wire.

Refer to:

- Figure 63
- Subject 20-00-15 for insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 63

- (j) Fold the conductor back on itself.
- (10) Put the wire in the splice.
Make sure that the color of the wire in each end of the splice is the same.
- (11) Crimp the splice. Refer to Figure 64.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

ASSEMBLY OF THE BUTT SPLICE
Figure 64

- (12) Wind two layers of 1 inch length of silicone tape on one butt splice.

Make sure that:

- The distance from one end of the layers of tape to the other end of the layers of tape is 1 inch
- The center of the layers of tape is aligned with the center of the splice
- The outer diameter of the layers of tape is equal to approximately 0.25 inch.

NOTE: If the tape is 0.012 inch thick, three layers of tape are necessary.

- (13) Do again Step (12) for the other butt splices.

- (14) Remove the necessary length of the rubber fillers from the cold shrink splice kit to make the length of the filler equal to 1.15 inch.

NOTE: The length of cold shrink sleeve in the cold shrink sleeve kit is not needed and can be discarded.

- (15) Put a filler on each butt splice. Refer to Figure 65.

Make sure that the center of the filler is aligned with the center of the butt splice.

POSITION OF THE RUBBER FILLERS
Figure 65

- (16) Push the shield material on the splice assembly. Refer to Figure 67.

Make sure that:

- The shield material goes on the full splice area
- The ends of the shield material are approximately aligned with ends of the folded back shields
- The center of the shield material is approximately aligned with the center of the butt splices.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

POSITION OF THE SHIELD MATERIAL
Figure 66

(17) Assemble the splice of the shield. Refer to Figure 67.

ASSEMBLY OF THE SHIELD SPLICE
Figure 67

- (a) Remove the temporary layer of tape around the end of each shield.
 - (b) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (c) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (d) Crimp the Shield-Kon.
 - (e) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (f) Make the shield material smooth and tight.
 - (g) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (h) Crimp the Shield-Kon.
 - (i) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice.
- (18) Push the cold shrink sleeve on the splice assembly until one end of the cold shrink is approximately 0.25 inch from the end of shield material.
- (19) Remove the necessary length of cold shrink sleeve to make the distance from each end of the sleeve to the ends of the shield material equal to 0.25 inch.
- (20) Seal each end of the sleeve with sealant. Refer to Figure 68.

ASSEMBLY CONFIGURATION OF THE SOLDER SHIELD SPLICE
Figure 69

Refer to Figure 69.

- (1) Make a selection of solder shield splice kit from Table 30.
- (2) Find the butt splice part number. Refer to Table 28.
- (3) Make a selection of a crimp tool from Table 32.
- (4) Make a selection of a hot air gun from Table 34.
- (5) Put the solder shield splice sleeve on each of the cables on one side of the splice assembly.
- (6) Remove these specified lengths from the end of the cable or the wire:
 - The outer jacket
 - The shield
 - The primary insulation
 - The conductor.

Refer to Table 38 and Figure 70.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

CABLE PREPARATION
Figure 70

- (7) Assemble the splice of each wire.
 - (a) Put the seal sleeve on the wire or wires.
Make sure that the large end of the sleeve is pointed to the end of the cable.
 - (b) Put the necessary conductors in one end of the butt splice.
Make sure that the end of each conductor is against the wire stop at the center of the splice.
 - (c) Crimp the splice.
 - (d) Put the necessary conductors in the other end of the splice.
Make sure that the end of each conductor is against the notch at the center of the splice.
 - (e) Crimp the splice.
 - (f) Align the center of the seal sleeve with the center of the butt splice.
 - (g) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Align the center of the shield splice sleeve with the middle of the distance between the ends of the outer jackets of the cable on both sides of the splice assembly.
- (9) Shrink one end of the shield splice sleeve:
 - (a) Apply heat at the center of the sleeve until the solder melts and the sleeve begins to shrink.
 - (b) Continue to apply heat from the center of the sleeve to one end of the sleeve until the solder ring melts and flows.
- (10) Do Step (9) again for the other end of the sleeve.

STANDARD WIRING PRACTICES MANUAL**ARINC 629 WIRING****C. Repair of a Broken Bond Between the Component Wires**

Table 43
NECESSARY MATERIALS

Material	Description	Part Number	Supplier
Tape	Polyester, Acrylic adhesive	850	3M

- (1) Make a selection of a tape from Table 43.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) At the location of the broken bond, wind two layers of tape around the two component wires. Make sure to keep the initial configuration of the twists in the wires.

D. Repair of a Broken Bond Between Overlaps in the Primary Insulation of a Wire

Refer to Subject 20-10-13 for:

- The conditions that are applicable for this procedure
- The general conditions that are applicable for the repair of a wire or a cable.

- (1) Make a selection of one of these insulation materials from Table 40:

- Temperature Grade D TFE tape
- Temperature Grade D film strip
- Temperature Grade C silicone tape.

Make sure that the insulation material has a Temperature Grade that is applicable for the wire.

- (2) Remove the rough edges of the insulation.
(3) Clean the insulation with isopropyl alcohol.

Make sure to:

- Clean the damaged area of the insulation
- Clean the insulation approximately 3 inches on each side of damage.

- (4) Let the clean areas dry.
(5) Wind two layers of the insulation material on the cable.

Make sure that:

- The two wires are together
- Each end of the insulation material extends a minimum of 1 inch farther than each end of the damaged area
- Each layer has a minimum 50 percent overlap of the tape
- Each layer is wound a minimum of two times on the cable
- The second layer is wound in the opposite direction of the first layer.

- (6) Assemble a lacing tape wire harness tie on each end of the insulation material approximately 0.25 inch from the end of the insulation material.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Refer to:

- Figure 73
- Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

POSITION OF THE WIRE HARNESS TIES ON THE LAYERS OF INSULATION MATERIAL
Figure 73

E. Repair of the Primary Insulation of a Wire in an Unshielded Cable

Refer to Subject 20-10-13 for:

- The conditions that are applicable for this procedure
 - The general conditions that are applicable for the repair of a wire or a cable.
- (1) Make a separation between the blue and yellow wires that has a maximum length of 1.5 inches from each end of the damaged area. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN Paragraph 4.A. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

SEPARATION OF THE WIRES
Figure 74

- (2) Clean the insulation of each wire with isopropyl alcohol. Refer to Figure 75.

Make sure to:

- Clean the damaged area of the insulation
- Clean the insulation of each wire approximately 3 inches on each side of the damage.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

CLEAN AREAS OF THE WIRES
Figure 75

- (3) Let the clean areas dry.
- (4) If the damage is a cavity in the insulation, fill in the cavity.
 - (a) Make a selection of a Temperature Grade D film strip from Table 40.

NOTE: A Temperature Grade D TFE tape from Table 40 is a satisfactory alternative to the film strip.
 - (b) Wind the necessary layers of film strip on the wire with damage to fill the cavity and make a smooth surface. Refer to Figure 76.

Make sure that each layer of film strip:

- Extends a minimum of 0.25 inch farther than each end of the damaged area
- Has a 50 percent minimum overlap of the tape
- Is wound a minimum of two times on the insulation
- Is wound in the opposite direction of the layer before.

CAVITY FILLED WITH FILM STRIP
Figure 76

- (5) Make a selection of one of these tapes from Table 40:
 - Temperature Grade D TFE tape
 - Temperature Grade C silicone tape.

Make sure that the tape has a Temperature Grade that is applicable for the cable.

- (6) Wind two layers of the tape on the damaged area of the wire. Refer to Figure 77.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Make sure that:

- If a cavity is filled with film strip, each end of the tape extends a minimum of 0.75 inch farther than the end of the film strip
- If a cavity is not filled with film strip, each end of the tape extends a minimum of 1 inch farther than end of the damaged area
- Each layer has a 50 percent minimum overlap of the tape
- Each layer of tape is wound a minimum of two times on the wire
- The second layer of tape is wound in the opposite direction of the first layer.

POSITION OF THE LAYERS OF TAPE
Figure 77

- (7) Put the two wires together.
- (8) Tightly wind a layer of tape around the two wires.

Make sure that the layer of tape:

- Extends 0.5 inch minimum farther than each end of the layers of tape on the wire or wires with damage
 - Makes a 50 percent overlap.
- (9) Assemble a lacing tape wire harness tie approximately 0.25 inch from each end of the tape.

Refer to:

- Figure 78
- Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

POSITION OF THE WIRE HARNESS TIE ON THE LAYER OF TAPE
Figure 78

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

F. Splice Assembly on One Wire of an Unshielded Cable

Refer to Subject 20-10-13 for:

- The conditions that are applicable for this procedure
- The general conditions that are applicable for the repair of a wire or a cable
- The general conditions that are applicable for the repair of a wire or a cable with a splice.

(1) Make a selection of these splice assembly components from Table 39:

- One butt splice
- One splice seal sleeve
- One 0.55 inch \pm 0.05 inch length of inner sleeve
- One 2.0 inch \pm 0.1 inch length of Kynar outer sleeve.

Refer to Figure 71.

- (2) Make a selection of a crimp tool from Table 41.
- (3) Make a selection of a standard temperature hot air gun from Table 42.
- (4) Prepare the cable. Refer to Figure 79.

SEPARATION OF THE WIRES
Figure 79

- (a) Remove the damaged area from the wire.
- (b) Make a separation between Wire A1 and Wire B that has a maximum length of 2.35 inches \pm 0.10 inch from the end of Wire A1. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN Paragraph 4.A. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (c) Make a separation between Wire A2 and Wire B that has a maximum length of 0.8 inch \pm 0.1 inch from the end of Wire A2. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN Paragraph 4.A. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (d) Remove a 0.25 inch \pm 0.03 inch of insulation from each end of Wire A. Refer to Subject 20-00-15.
- (e) Clean the insulation of each wire with isopropyl alcohol. Refer to Figure 80.

Make sure to:

- Clean the insulation of Wire A1 and Wire A2 approximately 3 inches from the end of each wire
- Clean the length of Wire B that is parallel to the clean lengths of Wire A.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

CLEAN AREAS OF THE WIRES
Figure 80

- (f) Let the clean areas dry.
- (g) Put the inner sleeve on Wire A2.
- (h) Put the seal splice sleeve on Wire A1.
- (i) Put the Kynar outer sleeve on Wire A1.
- (5) Assemble one end of the butt splice:
 - (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the conductor of one of the wires in the crimp barrel of one end of the splice.
Make sure that:
 - The end of the conductor can be seen in the inspection hole of the splice
 - The end of the conductor does not make an overlap with the wire stop in the splice
 - The insulation of the wire is not in the crimp barrel
 - The end of the wire insulation is a maximum of 0.13 inch from the end of the splice.
 - (d) Crimp the splice.
- (6) Do Step (5) again for the other end of the splice.
- (7) Align the center of the inner sleeve with the center of the butt splice.
- (8) Shrink the inner sleeve into its position. Refer to Subject 20-10-14.
- (9) Align the center of the splice seal sleeve with the center of the inner sleeve. Refer to Figure 81.

POSITION OF THE SPLICE SEAL SLEEVE
Figure 81

- (10) Shrink the splice seal sleeve into its position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.
- (11) Align the center of the Kynar outer sleeve with the center of the splice seal sleeve. Refer to Figure 82.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

POSITION OF THE KYNAR OUTER SLEEVE

Figure 82

- (12) Shrink the Kynar outer sleeve into its position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.

- (13) Make a selection of one of these tapes from Table 40:

- Temperature Grade D TFE tape
- Temperature Grade C silicone tape

Make sure that the tape has a Temperature Grade that is applicable for the cable.

- (14) Put the two wires together.
- (15) Tightly wind a layer of tape on the two wires.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch farther than the end of the outer sleeve on the Wire A2 side of the splice assembly
- Stops a minimum of 0.5 inch farther than the end of the outer sleeve on the Wire A1 side of the splice assembly
- Has a 50 percent overlap of tape.

- (16) Assemble a wire harness tie approximately 0.25 inch from the end of the tape on the Wire A1 side of the splice assembly.

Refer to:

- Figure 83
- Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

POSITION OF THE WIRE HARNESS TIE ON LAYER OF TAPE

Figure 83

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

G. Splice Assembly on Each Wire of an Unshielded Cable

Refer to Subject 20-10-13 for:

- The conditions that are applicable for this procedure
- The general conditions that are applicable for the repair of a wire or a cable
- The general conditions that are applicable for the repair of a wire or a cable with a splice.

- (1) Make a selection of these splice assembly components from Table 39:
 - Two butt splices
 - Two 0.55 inch \pm 0.05 inch lengths of heat shrinkable inner sleeves
 - Two splice seal sleeves
 - One 2.0 inch \pm 0.1 inch length of Kynar outer sleeve.

Refer to Figure 71.

- (2) Make a selection of a crimp tool from Table 41.
- (3) Make a selection of a standard temperature hot air gun from Table 42.
- (4) Prepare the cable. Refer to Figure 84.

SEPARATION OF THE WIRES
Figure 84

- (a) Remove the damaged area from each wire.
- (b) Make a separation between the Wire A1 and Wire B1 that has a maximum length of 1.35 inches \pm 0.10 inch from the end of Wire A1. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN Paragraph 4.A. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

- (c) Make a separation between the Wire A2 and Wire B2 that has a maximum length of 0.8 inch \pm 0.1 inch from the end of Wire A2. Refer to Paragraph 4.A.

CAUTION: ONLY USE A TOOL THAT IS SPECIFIED IN Paragraph 4.A. OTHER TOOLS CAN CAUSE DAMAGE TO THE WIRES.

Make sure that the distance from the end of each wire to the location where the wires are against each other is 0.8 inch \pm 0.1 inch

- (d) Remove a 0.25 inch \pm 0.03 inch of insulation from each end of Wire A and Wire B. Refer to Subject 20-00-15.
- (e) Clean the insulation of each wire with isopropyl alcohol. Refer to Figure 85.
Make sure to the length of insulation approximately 3 inches from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

CLEAN AREAS OF THE WIRES

Figure 85

- (f) Let the clean areas dry.
 - (g) Put an inner sleeve on the end of:
 - Wire A2
 - Wire B2.
 - (h) Put a splice seal sleeve on the end of:
 - Wire A1
 - Wire B1.
 - (i) Put Wire A2 and Wire B2 together.
 - (j) Put the Kynar outer sleeve on wires.
Make sure that Wire A2 and Wire B2 are together.
- (5) Assemble the butt splice on Wire A:
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the conductor of one end of the wire in the crimp barrel of one end of the splice.
Make sure that:
 - The end of the conductor can be seen in the inspection hole of the splice
 - The end of the conductor does not make an overlap with the wire stop in the splice
 - The insulation of the wire is not in the crimp barrel
 - The end of the wire insulation is a maximum of 0.13 inch from the end of the splice.
 - (d) Crimp the splice.
 - (e) Do Step (a) through Step (d) for the other end of the splice.
Make sure that the wire has the same color of insulation as the wire in the opposite end of the splice.
- (6) Do Step (5) again for Wire B.
- (7) On one of the wires, align the center of the inner sleeve with the center of the splice.
- (8) Shrink the inner sleeve into its position. Refer to Subject 20-10-14.
- (9) Do Step (7) and Step (8) again for the other wire.
- (10) On Wire A, align the center of the splice seal sleeve with the center of the inner sleeve. Refer to Figure 86.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

POSITION OF THE SPLICE SEAL SLEEVES ON THE WIRES

Figure 86

- (11) Shrink the splice seal sleeve into position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.
- (12) Do Step (10) and Step (11) again for Wire B.
- (13) Align the center of the Kynar outer sleeve with the centers of the splice seal sleeves. Refer to Figure 87.

POSITION OF THE KYNAR OUTER SLEEVE ON THE CABLE

Figure 87

- (14) Shrink the Kynar outer sleeve into position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.

H. Splice Assembly on Each Wire of a Shielded Cable

Refer to Subject 20-10-13 for:

- The conditions that are applicable for this procedure
- The general conditions that are applicable for the repair of a wire or a cable
- The general conditions that are applicable for the repair of a wire or a cable with a splice.

- (1) Make a selection of these splice assembly components from Table 39:
 - Two butt splices
 - Two 0.55 inch \pm 0.05 inch lengths of inner sleeve
 - Two splice seal sleeves
 - One 3.0 inch \pm 0.1 inch length of Kynar outer sleeve
 - Two seal sleeves
 - One solder shield splice sleeve
 - One 6.0 inch \pm 0.1 inch length of protection sleeve.

Refer to Figure 72.

- (2) Make a selection of a crimp tool from Table 41.
- (3) Make a selection of a standard temperature hot air gun from Table 42.
- (4) Prepare each end of the cable:

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (a) Remove the damaged area from the cable.
- (b) Put these components on one end of the cable:
 - The protection sleeve
 - One seal sleeve with the large end pointed to the end of the cable.
- (c) Put these components on the other end of the cable:
 - One seal sleeve with the large end pointed to the end of the cable
 - The solder shield splice sleeve
 - The Kynar outer sleeve.
- (d) Remove approximately 1.5 inches of the outer jacket from each end of the cable. Refer to Figure 88 and Subject 20-00-15.

CABLE JACKET REMOVAL
Figure 88

- (e) Clean the jacket of each cable with isopropyl alcohol.
Make sure clean the length of jacket approximately 3 inches from the end of the jacket.
- (f) Let the clean areas dry.
- (g) Fold each shield back. Refer to Figure 89.

POSITION OF THE SHIELDS FOLDED BACK
Figure 89

- (h) Put a temporary layer of tape around the end of each shield to prevent movement of the shields.
- (i) Move the wires apart on each end of the cable.
- (j) Remove approximately 0.6 inch of the white TFE insulation from each wire. Refer to Figure 90 and Subject 20-00-15.

CAUTION: DO NOT CUT THE PRIMARY INSULATION OF THE WIRES. DAMAGE TO THE BLUE INSULATION OR THE YELLOW INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE CABLE.

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

TFE INSULATION REMOVAL

Figure 90

- (k) Remove a 0.25 inch \pm 0.03 inch of insulation from the end of each wire. Refer to Figure 91.

PRIMARY INSULATION REMOVAL

Figure 91

- (5) Put one splice seal sleeve on each wire of one of the cables.
- (6) Put one inner sleeve on each wire of the other cable.
- (7) Assemble the splice of the wires with the blue insulation. Refer to Figure 92.

POSITION OF THE BUTT SPLICE

Figure 92

- (a) Put the splice in the crimp tool.
- (b) Hold the splice in position with light pressure.
- (c) Put the conductor of one of the wires into the crimp barrel of splice.

Make sure that:

- The end of the conductor can be seen in the inspection hole of the splice
- The end of the conductor does not make an overlap with the wire stop in the splice
- The insulation of the wire is not in the crimp barrel
- The end of the wire insulation is a maximum of 0.13 inch from the end of the splice.

- (d) Crimp the splice.
- (e) Do Step (a) through Step (d) again for the other end of the splice.

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

Make sure that the wire has the same color of insulation as the wire in the opposite end of the splice.

- (8) Do Step (7) again for the wires with the yellow insulation.
- (9) Install the inner sleeve on the splice of the wires with the blue insulation:
 - (a) Align the center of the inner sleeve with the center of the butt splice.
 - (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (10) Do Step (9) again for the wires with the yellow insulation.
- (11) Align the center of the splice seal sleeve with the center of the inner sleeve on the wire with blue insulation. Refer to Figure 93.

POSITION OF THE SPLICE SEAL SLEEVE

Figure 93

- (12) Shrink the splice seal sleeve into position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.
- (13) Do Step (11) and Step (12) again for the wires with the yellow insulation.
- (14) Align the center of the Kynar outer sleeve with the center of the splice seal sleeves.
- (15) Align one end of the Kynar outer sleeve with the nearest folded edge of the shield.
- (16) If it is necessary, remove the necessary length from the other end of the Kynar outer sleeve it align the end of the sleeve with the other folded edge of the shield.
- (17) Shrink the Kynar outer sleeve into position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.
- (18) Remove the temporary tape from the end of the shield on each side of the splice assembly.
- (19) Fold each length of shield forward on the Kynar sleeve.
- (20) Align the center of the solder shield splice sleeve with the center of the Kynar outer sleeve. Refer to Figure 94.

POSITION OF THE SOLDER SHIELD SPLICE SLEEVE

Figure 94

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (21) Shrink one end of the solder shield splice sleeve:
 - (a) Apply heat at the center of the sleeve until the solder melts and the sleeve starts to shrink.
 - (b) Continue to apply heat from the center of the sleeve to one end of the sleeve until the solder melts and flows.
- (22) Do Step (21) again for the other end of the sleeve.
- (23) Install the seal sleeve on one end of the splice assembly. Refer to Figure 95.

POSITION OF THE SEAL SLEEVE
Figure 95

- (a) Push the sleeve to the center of the splice until the forward edge of the sleeve makes an overlap with the end of the shield splice sleeve.
- (b) Shrink sleeve into its position.
- (24) Do Step (23) again for the other end of the splice assembly.
- (25) Align the center of the protection sleeve with the center of the solder shield splice sleeve. Refer to Figure 96.

POSITION OF THE PROTECTION SLEEVE
Figure 96

- (26) Shrink the protection sleeve into its position:
 - (a) Apply heat from the center of the sleeve to one end of the sleeve.
 - (b) Apply heat from the center of the sleeve to the other end of the sleeve.

9. REPAIR OF THE STUB CABLE ASSEMBLY

A. Replacement of the Protective Sleeve on a S280W603() Backshell Assembly

Table 44
NECESSARY MATERIALS

Material	Part Number or Specification	Size	Supplier
Heat Shrinkable Sleeve	DR-25	-	Raychem
	MIL-DTL-23053/16	-	QPL

20-11-11

STANDARD WIRING PRACTICES MANUAL

ARINC 629 WIRING

- (1) Remove the heat shrinkable sleeve from the cable assembly.
- (2) Remove the saddle clamp from the connector.
- (3) If it is necessary to replace the heat shrinkable sleeve, make a selection of a 4.00 inch \pm 0.25 inch length of sleeve from Table 44.

Make sure that the sleeve has sufficient diameter that it can make a 0.5 inch overlap with its self when it is cut longitudinally. Refer to Figure 97.

LOCATION OF THE WIRE HARNESS TIES ON THE SLEEVE
Figure 97

- (4) Cut the sleeve along the longitudinal axis of the sleeve.
- (5) Put the sleeve on the shield tape.
 Make sure that the sleeve makes a tight fit on the cable assembly.
- (6) Assemble three lacing tape wire harness ties on the sleeve. Refer to Subject 20-10-11.

Put one wire harness tie at:

- Each end of the sleeve
- The center of the sleeve.

Make sure that:

- The color of the lacing tape is yellow
- The lacing tape has a Temperature Grade and a Class that are applicable for the cable.

CAUTION: A PLASTIC TIE STRAP MUST NOT BE USED. DAMAGE TO THE INSULATION OF THE DATA BUS CABLE CAN OCCUR.

- (7) Assemble the saddle clamp.

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

This Subject gives the procedures to disassemble, disconnect, assemble, and install Boeing S280W701-() fiber optic cable assemblies.

1. PART NUMBERS AND DESCRIPTION

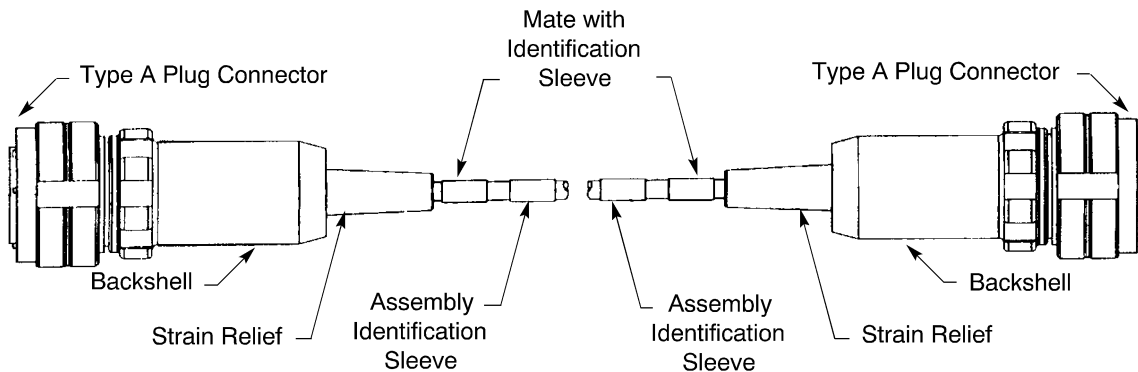

A. Fiber Optic Cable Assembly Part Numbers

The configurations of the S280W701-() fiber optic cable assembly are:

- The trunk cable; refer to Table 1 and Figure 1
- The stub cable; refer to Table 2 and Figure 2
- The gatelink cable; refer to Table 3 and Figure 3
- The gatelink inline cable; refer to Table 3 and Figure 4.

**Table 1
3-CHANNEL TRUNK CABLE ASSEMBLY PART NUMBERS**

Boeing Specification	Length (inch)		Connectors	
	Minimum	Maximum	First End	Second End
S280W701-101	202.0	214.0	S280W701-602	S280W701-601
S280W701-102	434.0	446.0	S280W701-601	S280W701-602
S280W701-114	480.0	492.0	S280W701-601	S280W701-602
