B. Fiber Optic Connector Part Numbers

The S280W701-() fiber optic cable assemblies have these types of connectors:

- Type A; refer to Figure 5
- Type B; refer to Figure 6
- Type C; refer to Figure 7.

Table 5
FIBER OPTIC CONNECTOR PART NUMBERS

Boeing Specification	Connector Type	Number of Channels	Polarization
S280W701-601	Type A Plug	3	N

Table 7
DUST CAPS PART NUMBERS

Connector	Shell Size	Part Number	Supplier
Plug, Threaded	17	204-9520-000	ITT Cannon
	19	204-9520-001	ITT Cannon
Receptacle, Threaded	17	204-9519-000	ITT Cannon
	19	204-9519-001	ITT Cannon

NOTE: A MIL-C-38999 Series III style dust cap is an acceptable alternative to a 024-95() dust cap. These dust caps do not have threads.

A Type A connector has these technical qualities:

- A threaded coupling mechanism
- A butt type connector with ceramic terminuses
- The transmission of a light beam from the end of one optical fiber into the end of another optical fiber.

20-12-11

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

TYPE A RECEPTACLE AND PLUG CONNECTORS
Figure 5

A Type B connector has these technical qualities:

- A threaded coupling mechanism
- An expanded beam connector that has a miniature lens behind a protective window
- The transmission of a light beam by the miniature lens from an optical fiber through the protective windows to the opposite miniature lens into the opposite optical fiber.

TYPE B RECEPTACLE AND PLUG CONNECTORS
Figure 6

20-12-11

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

A Type C connector has these technical qualities:

- A push-pull coupling mechanism
- An expanded beam connector that contains a miniature lens behind a protective window
- The transmission of a light beam by the miniature lens from an optical fiber through the protective windows to the opposite miniature lens into the opposite optical fiber.

TYPE C RECEPTACLE CONNECTOR

Tape, Fiberglass, 1 inch	P212	Permacel
	P213	Permacel
Tape, Polyester	850	3M

**Table 10
NECESSARY MATERIALS FOR REPAIR AND CLEANING OF AN FIBER OPTIC CONNECTOR**

Material	Part Number	Supplier
Canned Air	ES1020	Chemtronics
Alcohol, Ethyl	O-E-760	QPL
Alcohol, Isopropyl	MIL-F-5566	QPL
Lubricant	RTV 160	GE
	Super-O-lube	Parker
Thread Lock	410	Loctite
	222	Loctite

2. REMOVAL OF A FIBER OPTIC CABLE ASSEMBLY

A. General Instructions

WARNING: IF THE EQUIPMENT IS ENERGIZED, THE INVISIBLE LIGHT FROM AN OPTICAL FIBER CAN BE SUFFICIENTLY INTENSE TO CAUSE DAMAGE TO THE EYES. BEFORE THE FACE OF THE CONNECTOR OR THE TERMINUSES ARE EXAMINED, EITHER OF THESE CONDITIONS MUST OCCUR:

- THE CONNECTORS MUST BE DISCONNECTED FROM THE EQUIPMENT AT BOTH ENDS OF THE CABLE ASSEMBLY
- THE POWER TO THE EQUIPMENT MUST BE SET TO THE OFF CONDITION.

(1) Set the power to all the interface equipment to the off condition.

B. Separation of Type A or Type B Plugs and Receptacles

(1) Turn the coupling ring of the plug counterclockwise until it is disengaged from the threads of the receptacle.

20-12-11

707, 727-787

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (2) Carefully pull the plug from the receptacle.
Make sure that the plug and the receptacle stay axially aligned during the separation.
- (3) Put a dust cap or a plastic bag over the plug and the receptacle.

C. Separation of a Type C Receptacle from a Plug

- (1) Carefully pull the plug straight from the receptacle.
Make sure that the plug and the receptacle stay axially aligned during the separation.

CAUTION: DO NOT PULL THE FIBER OPTIC CABLE. DAMAGE TO THE CABLE OR THE CONNECTOR, OR BOTH CAN OCCUR.

- (2) Examine the dust caps on both the plug and the receptacle.
Make sure that the dust caps return to the closed position.

D. Removal of a Fiber Optic Cable Assembly

- (1) Disconnect the connectors from the equipment. Refer to Paragraph 2.B. and Paragraph 2.C.
- (2) Carefully cut the plastic tie straps on the cable clamps.
- (3) If it is necessary, remove:
 - The raceway clamps
 - The cable from the elastomeric inserts.
- (4) Remove the cable from the clamps.
Make sure that the bend radius of the cable is always more than 1.5 inches.

3. FIBER OPTIC CONNECTOR DISASSEMBLY

A. General Instructions

- (1) Put the finger cots on before any disassembly work is done.
- (2) During the connector disassembly, make sure that:
 - The bend radius of any optical fiber is always more than 0.5 inch
 - The bend radius of the optical cable is always more than 1.5 inches.
- (3) Remove the fiber optic cable assembly. Refer to Paragraph 2.

20-12-11

Page 9

D6-54446

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

B. Disassembly of a Type A Plug Connector

COMPONENTS OF THE TYPE A PLUG CONNECTOR
Figure 8

Refer to Figure 8.

- (1) Make a selection of a connector adapter and a backshell removal tool from Table 8.

NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.

- (2) Put the adapter in the backshell removal tool.
- (3) Put the connector in the connector adapter.
- (4) With a syringe, put small quantity isopropyl alcohol into the area between the rear of the backshell and the strain relief boot as a lubricant.
- (5) Manually hold the strain relief boot and the cable.
- (6) Push the strain relief boot and the cable against the connector.

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS LOOSENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.

- (7) Loosen the backshell with a pair of adjustable, soft jaw pliers.
- (8) Move the backshell and the backshell O-ring away from the connector.
- (9) Remove the spacer from the mandrel.
- (10) Remove the three socket head screws, that attach the yoke to the connector shell, with an allen wrench. Refer to Figure 9.

SOCKET HEAD SCREW REMOVAL

Figure 9

- (11) Carefully pull the plug assembly from of the connector shell.

CAUTION: DO NOT APPLY TOO MUCH PRESSURE ON THE CRIMP BODY AS THE TERMINUSES ARE REMOVED FROM THE MANDREL AND THE YOKE. DAMAGE TO THE OPTICAL FIBERS CAN OCCUR.

- (12) Push the crimp body against the mandrel so that the tension on the optical fibers is released.
- (13) Put the jaws of the plastic pliers on the metal part of the terminus. Refer to Figure 10.

LOCATION OF THE JAWS OF THE PLASTIC PLIERS ON THE TERMINUS

Figure 10

- (14) Carefully pull each terminus sideways out of the channel of the yoke.

20-12-11

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (15) Remove the yoke and the mandrel from the cable.
- (16) If it is necessary, remove the socket head screw that attaches the yoke to the mandrel.

CAUTION: THERE IS LOCTITE ADHESIVE BETWEEN THE SURFACES OF THE YOKE AND THE MANDREL. THE YOKE AND THE MANDREL MUST BE SEPARATED CAREFULLY TO PREVENT ANY DAMAGE.

C. Disassembly of a Type A Receptacle Connector

COMPONENTS OF THE TYPE A RECEPTACLE CONNECTOR

Figure 11

Refer to Figure 11.

- (1) Turn the jack screw in the center of the front socket insert counterclockwise until it is free from the threads in the connector shell. Refer to Figure 12.

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

JACK SCREW REMOVAL

Figure 12

- (2) Carefully pull the insert straight out of the connector shell.
Make sure that the retainer ring and the jack screw are not removed from the insert.
- (3) Make a selection of a connector adapter and a backshell removal tool from Table 8.
NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.
- (4) Put the connector adapter in the backshell removal tool.
- (5) Put the connector in the connector adapter.
- (6) With a syringe, put small quantity isopropyl alcohol into the area between the rear of the backshell and the strain relief boot as a lubricant.
- (7) Manually hold the strain relief boot and the cable.
- (8) Push the strain relief boot and the cable against the connector.
- (9) Loosen the backshell with a pair of adjustable, soft jaw pliers.

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS LOOSENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.

- (10) Move the backshell and the backshell O-ring away from the connector.
- (11) Remove the spacer from the mandrel.
- (12) Remove the three socket head screws, that attach the yoke to the connector, with an allen wrench.
- (13) Carefully pull the receptacle assembly from the connector shell.

CAUTION: DO NOT APPLY TOO MUCH PRESSURE ON THE CRIMP BODY AS THE TERMINUSES ARE REMOVED FROM THE MANDREL AND THE YOKE. DAMAGE TO THE OPTICAL FIBERS CAN OCCUR.

- (14) Push the crimp body against the mandrel so that the tension on the optical fibers is released.
- (15) Put the jaws of the plastic pliers on the metal part of the terminus. Refer to Figure 13.

20-12-11

D. Disassembly of a Type B Plug Connector

COMPONENTS OF THE TYPE B PLUG CONNECTOR

Figure 14

Refer to Figure 14.

- (1) Make a selection of a connector adapter and a backshell removal tool from Table 8.
NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.
- (2) Put the connector adapter in the backshell removal tool.
- (3) Put the connector in the connector adapter.
- (4) With a syringe, put small quantity isopropyl alcohol into the area between the rear of the backshell and the strain relief boot as a lubricant.
- (5) Manually hold the strain relief boot and the cable.
- (6) Push the strain relief boot and the cable against the connector.
- (7) Loosen the backshell with a pair of adjustable, soft jaw pliers.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS LOOSENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.

- (8) Move the backshell and the backshell O-ring away from the connector.
- (9) Remove the spacer from the mandrel.

CAUTION: TO PREVENT DAMAGE TO THE CONNECTOR ASSEMBLY, DO NOT REMOVE THE TWO SOCKET HEAD SCREWS THAT ATTACH THE BACKPLATE ASSEMBLY TO THE MANDREL.

- (10) Remove the three socket head screws, that attach the backplate to the connector shell, with an allen wrench.
- (11) Carefully pull the mandrel, the backplate, and the terminuses from of the connector insert.

CAUTION: DO NOT APPLY TOO MUCH PRESSURE ON THE CRIMP BODY AS THE TERMINUSES ARE REMOVED FROM THE MANDREL AND THE YOKE. DAMAGE TO THE OPTICAL FIBERS CAN OCCUR.

- (12) Push the crimp body against the mandrel so that the tension on the optical fibers is released.
- (13) Put the jaws of the plastic pliers on the metal part of the terminus.

LOCATION OF THE JAWS OF THE PLASTIC PLIERS ON THE TERMINUS
Figure 15

- (14) Carefully pull each terminus sideways out of the channel of the backplate.
- (15) Remove the backplate and the mandrel from the cable.
- (16) Examine the backplate spring.
- (17) If there is a crack or a bent edge on the backplate spring:
 - (a) Remove the three screws.
 - (b) Replace the backplate spring.
- (18) If it is necessary, remove the screws that attach the backplate to the mandrel.

CAUTION: THERE IS LOCTITE ADHESIVE BETWEEN THE SURFACES OF THE BACKPLATE AND THE MANDREL. THE BACKPLATE AND THE MANDREL MUST BE SEPARATED CAREFULLY TO PREVENT ANY DAMAGE.

- (19) If more disassembly is necessary:

20-12-11

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (a) Make a selection of necessary tools from Table 8.
- (b) Remove the retainer ring with a retainer ring tool.
- (c) Remove the seal ring with a pair of plastic tweezers.
- (d) Remove the protective glass with a pen vacuum.
- (e) Push the spherical lens and the spacer assemblies from the connector insert with a 0.125 inch diameter, cone shaped plastic rod or an equivalent plastic tool.

E. Disassembly of a Type C Receptacle Connector

COMPONENTS OF THE TYPE C RECEPTACLE CONNECTOR

Figure 16

Refer to Figure 16.

- (1) Make a selection of a connector adapter and a backshell removal tool from Table 8.

NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (2) Put the connector adapter in the backshell removal tool.
- (3) Put the connector in the connector adapter.
- (4) With a syringe, put small quantity isopropyl alcohol into the area between the rear of the backshell and the strain relief boot as a lubricant.
- (5) Manually hold the strain relief boot and the cable.
- (6) Push the strain relief boot and the cable against the connector.
- (7) Loosen the backshell with a pair of adjustable, soft jaw pliers.

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS LOOSENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.

- (8) Move backshell and the backshell O-ring away from the connector.
- (9) Remove the spacer from the mandrel.

CAUTION: TO PREVENT DAMAGE TO THE CONNECTOR ASSEMBLY, DO NOT REMOVE THE TWO SOCKET HEAD SCREWS THAT ATTACH THE BACKPLATE ASSEMBLY TO THE MANDREL.

- (10) Remove the three socket head screws, that attach the mandrel and the backplate assembly to the connector insert, with an allen wrench.
- (11) Carefully pull the mandrel, the backplate, and the terminuses from of the connector insert.

CAUTION: DO NOT APPLY TOO MUCH PRESSURE ON THE CRIMP BODY AS THE TERMINUSES ARE REMOVED FROM THE MANDREL AND THE YOKE. DAMAGE TO THE OPTICAL FIBERS CAN OCCUR.

- (12) Push the crimp body against the mandrel so that the tension on the optical fibers is released.
- (13) Put the jaws of the plastic pliers on the metal part of the terminus.

LOCATION OF THE JAWS OF THE PLASTIC PLIERS ON THE TERMINUS
Figure 17

- (14) Carefully pull each terminus sideways out of the channel of the backplate.
- (15) Remove the backplate and the mandrel from the cable.
- (16) Examine the backplate spring.
- (17) If there is a crack or a bent edge on the backplate spring:
 - (a) Remove the three screws.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (b) Replace the backplate spring.
- (18) If it is necessary, remove the screws that attach the backplate to the mandrel.

CAUTION: THERE IS LOCTITE ADHESIVE BETWEEN THE SURFACES OF THE BACKPLATE AND THE MANDREL. THE BACKPLATE AND THE MANDREL MUST BE SEPARATED CAREFULLY TO PREVENT ANY DAMAGE.

- (19) If more disassembly is necessary:
 - (a) Make a selection of necessary tools from Table 8.
 - (b) Remove the retainer ring with a retainer ring tool.
 - (c) Remove the seal ring with a pair of plastic tweezers.
 - (d) Remove the protective glass with a pen vacuum.
 - (e) Push the spherical lens and the spacer assemblies from the connector insert with a 0.125 inch diameter, cone shaped plastic rod or an equivalent plastic tool.

4. FIBER OPTIC CONNECTOR ASSEMBLY**A. Assembly of a Type A Plug or Receptacle Connector**

Refer to:

- Figure 8 for the Type A plug connector
- Figure 11 for the Type A receptacle connector.

- (1) Assemble the yoke and mandrel:
 - (a) If it is necessary, install one O-Ring on each terminus.
Make sure that the O-Ring does not have any cracks or contamination.
 - (b) Clean the yoke and the mandrel with isopropyl alcohol.
 - (c) Let the yoke and the mandrel fully dry.
 - (d) Apply a layer of Loctite 410 on the surfaces of the yoke and the mandrel that make an interface.
 - (e) Put the yoke on the mandrel.
 - (f) Put a small quantity of Loctite 222 on the threads of the screws that attach the yoke to the mandrel.
 - (g) Tighten the screws.
- (2) Put each terminus through the hexagonal holes of the mandrel.
- (3) Put each terminus in the applicable channel of the yoke.
Make sure that the optical fibers do not make an overlap.

Refer to:

- Figure 18 for the position of the terminuses in a 3-channel yoke
- Figure 19 for the position of the terminuses in a 5-channel yoke.

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

POSITION OF THE TERMINUSES IN THE 3-CHANNEL YOKE
Figure 18

POSITION OF THE TERMINUSES IN THE 5-CHANNEL YOKE
Figure 19

- (4) Put a small quantity of silicone lubricant or isopropyl alcohol on the cable jacket near the crimp body.
- (5) Push the strain relief boot until it is against the shoulder of the crimp body.
- (6) Put the spacer between the shoulder of the crimp body and the mandrel.
- (7) Manually hold the mandrel.
- (8) Align the terminuses with the applicable holes in the connector shell.
 Make sure that the terminuses are in the correct holes.
- (9) Carefully push the terminuses and the yoke into the connector shell.
- (10) Install the socket head screw that attaches the yoke to the connector shell:
 - (a) Tighten the screw with an allen wrench.
 - (b) Torque the screw 5.0 inch-pounds \pm 0.1 inch-pound.
- (11) Assemble the backshell:

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (a) Make a selection of a connector adapter and backshell removal tool from Table 8.

NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.

- (b) Put the connector adapter in the backshell removal tool.
(c) Put the connector shell in the connector adapter.
(d) Push the strain relief boot and the cable against the connector.
(e) Manually tighten the backshell.

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS TIGHTENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.

- (f) Torque the backshell 70.0 inch-pounds \pm 5.0 inch-pounds.

- (12) If the connector is a Type A receptacle:

- (a) Align the holes of the front socket insert with the applicable terminuses.
(b) Carefully push the insert into the receptacle.

NOTE: If it is necessary, carefully turn the insert back and forth when it is pushed into the connector shell.

- (c) Engage the threads the jack screw and the connector shell.
(d) Torque the jack screw 5.0 inch-pounds \pm 0.1 inch-pound.

B. Assembly of a Type B Plug Connector or Type C Receptacle Connector

Refer to:

- Figure 14 for the Type B plug connector
- Figure 16 for the Type C receptacle connector.

- (1) Assemble the backplate, backplate spring, and mandrel:

- (a) Install one O-ring on each terminus.
Make sure that the O-ring does not have any cracks or contamination.
- (b) Clean the backplate and the mandrel with isopropyl alcohol.
- (c) Let the backplate and the mandrel fully dry.
- (d) Apply a layer of Loctite 410 on the surfaces of the backplate and the mandrel that make an interface.
- (e) Put the backplate on the mandrel.
- (f) Put a small quantity of Loctite 222 on the threads of the socket head screws.
- (g) Torque each screw 10 ± 12 ounce-inches.
- (h) Examine the backplate spring.
- (i) If the backplate spring has a bent edge, a crack, or a burr on the edge, discard the spring and use one that does not have any damage.
- (j) Clean the three screws that attach the backplate spring to the backplate with isopropyl alcohol.
- (k) Align the three small holes in the backplate spring with the three threaded holes in the backplate.

NOTE: There is only one correct position for the backplate spring on the backplate.

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (l) Put a small quantity of Loctite 222 on the threads of the screws.
- (m) Engage the threads of the three screws and the backplate spring.
- (n) Tighten the screws with a screw driver.
- (2) Put each terminus through the hexagonal holes of the mandrel.
- (3) Put each terminus in the applicable channel of the backplate. Refer to Figure 20. Make sure that the optical fibers do not make an overlap.

POSITION OF THE TERMINUSES IN THE 5-CHANNEL BACKPLATE

Figure 20

- (4) Put a small quantity of silicone lubricant or isopropyl alcohol on the cable jacket near the crimp body.
- (5) Push the strain relief boot until it is against the shoulder of the crimp body.
- (6) Put the spacer between the shoulder of the crimp body and the mandrel.
- (7) Examine all of the holes in the connector insert for contamination with a microscope.
- (8) If it is necessary, clean the connector insert. Refer to Paragraph 7.
- (9) Install each spherical lens and spacer assembly:
 - (a) Remove the lens and spacer from the storage container with a pair of plastic tweezers.

CAUTION: DO NOT TOUCH THE SPHERICAL LENS AND THE SPACER ASSEMBLY WITH THE FINGERS. THE FINGERS CAN MAKE SCRATCHES OR PUT CONTAMINATION ON THE LENS AND THE SPACER ASSEMBLY.

- (b) Put the lens and spacer in the lens insertion tool.
Make sure that the lens is put into the insertion tool first.
- (c) Hold the lens and spacer vertically.
- (d) Align the lens and spacer with the lens position in the connector shell.
- (e) Put the lens and spacer in the lens position in the connector shell.
- (f) Examine the lens for contamination with a microscope.
- (g) If it is necessary, clean the spherical lens. Refer to Paragraph 7.

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (10) In this order put these components in each hole in the connector insert:
 - A seal ring
 - The protective lens
 - The spacer washer
 - The retainer ring.
- (11) Torque each retainer ring with the retainer ring tool 6.5 inch-pounds to 7.0 inch-pounds.
- (12) Manually hold the mandrel.
- (13) Align the terminuses with the applicable holes in the connector shell.
Make sure that the terminuses are in the correct holes.
- (14) Carefully push the terminuses and the backplate into the connector shell.
- (15) Install the three socket head screws to attach the backplate to the connector shell.
 - (a) Tighten the screws with an allen wrench.
 - (b) Torque the screws 5.0 inch-pounds \pm 0.1 inch-pound.
- (16) Assemble the backshell:
 - (a) Make a selection of a connector adapter and backshell removal tool from Table 8.
NOTE: A vise and a connector adapter are satisfactory alternatives for the Daniels tools.
 - (b) Put the connector adapter in the backshell removal tool.
 - (c) Put the connector shell in the connector adapter.
 - (d) Push and hold the strain relief boot against the connector.
 - (e) Manually tighten the backshell.

CAUTION: DO NOT PERMIT THE STRAIN RELIEF BOOT AND THE CABLE TO TURN WHEN THE BACKSHELL IS TIGHTENED. DAMAGE TO THE COMPONENTS OF THE CONNECTOR CAN OCCUR.
 - (f) Torque the backshell 70.0 inch-pounds \pm 5.0 inch-pounds.

5. INSTALLATION OF A FIBER OPTIC CABLE ASSEMBLY**A. General Installation Instructions**

CAUTION: STRESS MUST NOT BE APPLIED TO THE AREA WHERE THE CABLE IS ATTACHED TO THE CONNECTOR. THE STRESS CAN CAUSE DAMAGE TO THE CABLE OR THE CONNECTOR, OR BOTH.

CAUTION: BEFORE, DURING, AND AFTER THE INSTALLATION, A FIBER OPTIC CABLE MUST NOT BE BENT SO THAT THE BEND RADIUS IS LESS THAN 1.5 INCHES. DAMAGE TO THE CABLE OR AN OPTICAL FIBER CAN OCCUR.

- (1) Before or during the installation:
 - (a) Do not let the cable stay on the floor so that damage to the cable, by the feet or by any objects that can fall on the cable, is prevented.
 - (b) If only a portion of a cable is installed, hang the remaining part of the cable with a plastic tie strap so that it is off the floor.
Make sure that the plastic tie strap is not tightened against the cable.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (2) If it is possible, try to install the cable directly into the correct position so that the cable is not pulled or pushed.
- (3) If a direct installation is not possible and the cable moves freely:
 - (a) Pull or push the cable in the direction that is aligned with the cable.

CAUTION: IF THE CABLE DOES NOT MOVE FREELY, DO NOT TRY TO PULL OR PUSH THE CABLE. DAMAGE TO THE CABLE CAN OCCUR.

- (b) Pull or push the cable into an area where the cable cannot be seen only if it can be made sure that the bend radius is not less than 1.5 inches.
- (4) During the installation, obey these precautions:
 - Gloves must not be worn to hold the cable better when it is pulled or pushed
 - The cable must not be wound around the hand to hold the cable better
 - The cable must not touch or rub against any sharp surfaces or corners
 - The cable must not have any loops except the drip loops
 - The connector or the backshell must not be used as a handle when the cable is pushed or pulled
 - The connector must not rub or move against the aircraft structure
 - The cable must not be installed with any other parts or materials other than those that are specified in this procedure; for example, a plastic tie strap or wire harness tie are not permitted
 - The cable must be separated from a fluid line, an oxygen line, or a water line a distance of 1.0 inch minimum unless it is specified differently.
- (5) Install the fiber optic cable in the cable clamps so that there is sufficient slack:
 - To connect and disconnect the connector
 - For the movement of the aircraft structure.

Refer to Paragraph 5.B.

- (6) Make a drip loop on the cable near the connector so that:
 - Any fluids do not go into the connectors, the junction boxes, and other closed equipment
 - Any fluids do not fall on the electrical equipment below the drip loop
 - The bend radius of the drip loop is more than 1.5 inches.

Refer to Paragraph 5.C.

B. Configuration of Cable Slack for an Installed Fiber Optic Cable

Refer to:

- Figure 21 for the usual configuration of fiber optic cable slack
- Figure 22 for the configuration of fiber optic cable slack in a high vibration area.

20-12-11

STANDARD WIRING PRACTICES MANUAL

D. Installation of a Fiber Optic Cable in a Loop Clamp

**Table 11
FIBER OPTIC CABLE CLAMPS**

Number of Cables		Boeing Specification	Insert	
Minimum	Maximum		Part Number	Supplier
1	1	287T0011-1	94A10391	Elastomeric Silicone Products, Inc.
2	6	287T0011-4	93A10375	Elastomeric Silicone Products, Inc.

CAUTION: STRESS MUST NOT BE APPLIED TO THE AREA WHERE THE CABLE IS ATTACHED TO THE CONNECTOR. THE STRESS CAN CAUSE DAMAGE TO THE CABLE OR THE CONNECTOR, OR BOTH.

- (1) Open the slot in the elastomeric insert.
- (2) Put the cable inside the cable cavity of the insert.
If the insert has multiple cable cavities, make sure that only one cable is put into each cavity.
- (3) Push the insert along the cable until the center of the insert is aligned with the center of the cable clamp.
- (4) Open the cable clamp.
- (5) Push the cable and the insert into the clamp.
Make sure that the center of insert stays approximately aligned with the center of the clamp.
- (6) Put a plastic tie strap in the slots at the opening of the clamp.
- (7) Tighten the plastic tie strap with a tie gun.
Make sure that the cable clamp is fully closed.

E. Installation of a Fiber Optic Cable in a Wire Harness Channel

**Table 12
NECESSARY PARTS FOR CABLE INSTALLATION**

Boeing Standard	Description
BACC10DR()	Wire Harness Channel
BACC10DS3	Raceway Clamp

- (1) Put the fiber optic cables inside the wire harness channel so that:
 - The cables do not go across each other in the channel
 - The cables do not go between any two channels
 - No more than one layer of fiber optic cables are put in a channel.
- (2) Install the raceway clamp on the channel so that the urethane foam of the clamp is compressed a minimum of 1/2 the outside diameter D of the smallest cable. Refer to Figure 27.
Make sure that none of the cables stay between the end of the urethane foam and the side of the channel. Refer to Figure 28.

20-12-11

STANDARD WIRING PRACTICES MANUAL

POSITION OF THE FIBER OPTIC CABLES IN THE RACEWAY CLAMP

Figure 27

INCORRECT POSITION OF A CABLE IN A RACEWAY CLAMP

Figure 28

F. Installation of a Type A or a Type B Connector

- (1) Remove the dust cap or the plastic bag from the connector.
- (2) Align the keys of the plug with the keyways of the receptacle.

NOTE: The plug can be turned a small amount against the receptacle until the keys and the keyways are aligned.

CAUTION: DO NOT TURN THE PLUG MORE THAN A HALF TURN IN EITHER DIRECTION. DAMAGE TO THE CABLE ASSEMBLY CAN OCCUR.

- (3) Push the plug into the receptacle until it stops.
- (4) Manually turn the coupling ring of the plug clockwise, in relation to the rear of the plug, until it is tight. Make sure that a torque wrench is not used to tighten the coupling ring.
- (5) Examine the red line painted around the circumference of the external surface of the receptacle shell.
- (6) If the coupling ring does not make an overlap with part of the red line, try to tighten the coupling ring manually until the ring and the line make an overlap.

20-12-11

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (7) If an overlap of the coupling ring and the red line cannot be made:
 - (a) Turn the coupling ring counterclockwise until it is disengaged from the threads of the receptacle.
 - (b) Do Step (2) through Step (6) again.

G. Installation of a Type C Connector

- (1) Turn the dust caps on the plug and the receptacle until the dust caps are locked in the open position.
- (2) Align the keys of the plug with the keyways of the receptacle.

NOTE: The plug can be turned a small amount against the receptacle until the keys and the keyways are aligned.

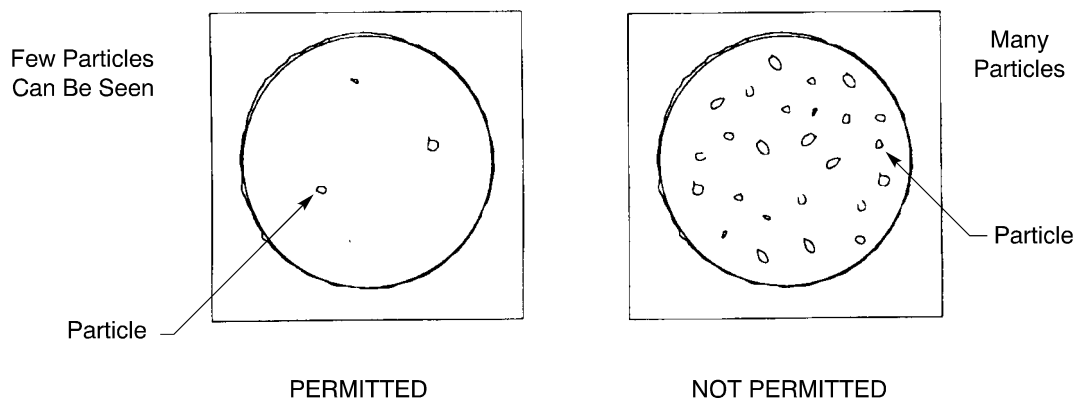

- (3) Push the plug into the receptacle until the plug and the receptacle are locked.

6. INSPECTION AND CLEANING OF A TYPE A FIBER OPTIC CONNECTOR

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

SPALLS ON THE END FACE OF AN OPTICAL FIBER
Figure 35

B. Inspection of a Type A Connector

Refer to Figure 29.

- (1) Put the plug or receptacle adapter on the connector inspection microscope. Refer to Table 8.
- (2) Attach the microscope to the connector.
- (3) Set the magnification power of the microscope between 200X and 250X.
- (4) Examine the end face of each terminus for these types of contamination or damage:
 - Particle contamination; refer to Figure 30
 - Film contamination; refer to Figure 31
 - Scratches; refer to Figure 32
 - Cracks; refer to Figure 33
 - Chips; refer to Figure 34
 - Spalls; refer to Figure 35.
- (5) Reject the cable assembly if the end face of the optical fiber has:
 - Any cracks that are located within 1/4 the radius of the optical fiber
 - Any deep scratches
 - Any chips
 - Any spalls.
- (6) If the connector is a plug and the end faces of the terminuses are clean, install the plug on the equipment immediately.

NOTE: If the plug is not installed immediately, put a dust cap or a plastic bag on the connector.
- (7) If the connector is a receptacle and the end faces of the terminuses are clean, put a dust cap or a plastic bag on the connector.
- (8) If an end face of a terminus has a quantity of particle contamination that is not permitted, remove the contamination. Refer to Paragraph 6.C.
- (9) If the end face of a terminus has any film contamination, remove the contamination. Refer to Paragraph 6.D.

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES****C. Removal of Particle Contamination**

Refer to Table 9 or Table 10 for the necessary materials that are used to clean the connector.

(1) Get these materials:

- Isopropyl or ethyl alcohol
- Swabs
- Tape
- Canned air and trigger assembly.

(2) If the connector is a receptacle, remove the front socket insert.

CAUTION: DO NOT SHAKE OR TWIST THE FRONT SOCKET INSERT TO REMOVE IT FROM THE CONNECTOR SHELL. DAMAGE TO THE CERAMIC TERMINUSES CAN OCCUR.

(a) Turn the jack screw in the center of the insert counterclockwise until it is free from the threads in the connector shell. Refer to Figure 12.

(b) Carefully pull the insert straight out of the connector shell.

Make sure that the retainer ring and the jack screw are not removed from the insert.

(c) Without magnification, examine the alignment sleeves of the insert for contamination.

(d) If any of the alignment sleeves has any contamination, clean the insert. Refer to Paragraph 6.E.

(3) Put on a pair of powder free gloves or finger cots.

NOTE: A satisfactory alternative is to clean the hands.

(4) Remove the particles from the end face of the terminus with a swab or a length of tape.

(5) If a swab is used, roll the swab on the end face of a terminus to remove the particles.

(6) If a piece of tape is used:

(a) Slowly put the tape on the end face of a terminus

(b) Lift the tape up to remove the particles.

(7) Examine the terminuses again with the microscope to make sure that all the particles have been removed.

(8) If the particle contamination cannot be removed with a swab or tape, clean the end face with solvent. Refer to Paragraph 6.D.

(9) If the connector is a plug and the terminuses are clean, install the plug on the equipment immediately.

NOTE: If the connector is not installed immediately, put a dust cap or a plastic bag on the plug.

(10) If the connector is a receptacle and the terminuses are clean:

(a) Align the holes of the front socket insert with the applicable terminuses.

(b) Carefully push the insert into the receptacle.

NOTE: If it is necessary, carefully turn the insert back and forth when it is pushed into the connector shell.

(c) Engage the threads of the jack screw and the connector shell.

(d) Torque the jack screw 5.0 inch-pounds \pm 0.1 inch-pound.

(e) Put a dust cap or a plastic bag on the connector.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES****D. Removal of Film Contamination**

Refer to Table 9 or Table 10 for the necessary materials used to clean the connector.

(1) Get these materials:

- Isopropyl or ethyl alcohol
- Foam swabs
- Woven polyester swabs
- Canned air and trigger assembly.

(2) If the connector is a receptacle, remove the front socket insert.

CAUTION: DO NOT SHAKE OR TWIST THE FRONT SOCKET INSERT TO REMOVE IT FROM THE CONNECTOR SHELL. DAMAGE TO THE CERAMIC TERMINUSES CAN OCCUR.

(a) Turn the jack screw in the center of the insert counterclockwise until it is free from the threads in the connector shell. Refer to Figure 12.

(b) Carefully pull the insert straight out of the connector shell.

Make sure that the retainer ring and the jack screw are not removed from the insert.

(c) Without magnification, examine the alignment sleeves of the insert for contamination.

(d) If any of the alignment sleeves has any contamination, clean the insert. Refer to Paragraph 6.E.

(3) Put on a pair of powder free gloves or finger cots.

NOTE: A satisfactory alternative is to clean the hands.

(4) Put the tip of a foam swab in the alcohol so that the swab becomes moist.

Make sure the swab is not soaked in the alcohol.

(5) With a circular movement, carefully rub the swab on the end face of the terminus.

CAUTION: DO NOT USE MORE THAN THE NECESSARY FORCE WHEN THE SWAB IS ON THE END FACE OF THE TERMINUS. DAMAGE FROM SCRATCHES CAN OCCUR.

(6) If the end face is still wet, dry the end face with either of these materials:

- A woven polyester swab
- Canned air.

(7) Examine the terminuses again with the microscope to make sure that all the contamination has been removed.

(8) If the terminus is not clean, do Step (4) through Step (7) again.

(9) If the connector is a plug and the terminuses are clean, install the plug on the equipment immediately.

NOTE: If the connector is not installed immediately, put a dust cap or a plastic bag on the plug.

(10) If the connector is a receptacle and the terminuses are clean:

(a) Align the holes of the front socket insert with the applicable terminuses.

(b) Carefully push the insert into the receptacle.

NOTE: If it is necessary, carefully turn the insert back and forth when it is pushed into the connector shell.

(c) Engage the threads of the jack screw and the connector shell.

(d) Torque the jack screw 5.0 inch-pounds \pm 0.1 inch-pound.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES**

- (e) Put a dust cap or a plastic bag on the connector.

E. Cleaning of the Front Socket Insert

Refer to Table 9 or Table 10 for the necessary materials used to clean the front socket insert.

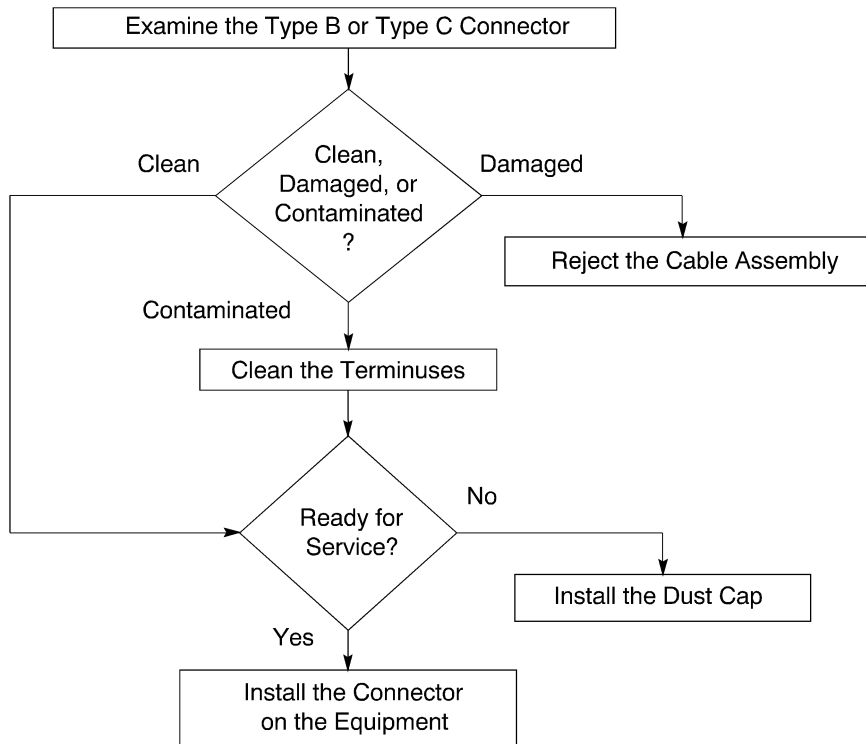

- (1) Get these materials:
 - Isopropyl or ethyl alcohol
 - Tapered swabs
 - Canned air and trigger assembly.
- (2) Remove the contamination from the alignment sleeve with canned air.
- (3) Examine the alignment sleeve again for contamination.
- (4) If the contamination in the sleeve cannot be removed with canned air:
 - (a) Put the tip of a tapered swab into alcohol until it is moist.
 - (b) Push the swab into the alignment sleeve.
 - (c) Twist the swab for 2 or 3 turns.
 - (d) Remove the swab from the sleeve.
 - (e) Dry the insert with canned air.
- (5) Examine the alignment sleeve again for contamination.
- (6) If the contamination in the sleeve cannot be removed with the swab:
 - (a) Get two clean containers to soak the front insert.
 - (b) Put a sufficient quantity of alcohol in one container.
 - (c) Put the insert in the other container.
 - (d) Put a sufficient quantity of distilled water into the container so that the insert is fully under the surface of the distilled water.
 - (e) Shake the container lightly for 1 to 3 minutes.
 - (f) Remove the insert from the container.
 - (g) Dry the insert with canned air.
 - (h) Put the insert in the container with the alcohol for 30 seconds minimum.
 - (i) If it is necessary, clean the insert with the tapered swab.
 - (j) Remove the insert from the container.
 - (k) Let insert dry at room temperature or dry it with canned air.
- (7) Examine the alignment sleeve again.
- (8) If the alignment sleeve still has the contamination, do Step (6) and Step (7) again.

STANDARD WIRING PRACTICES MANUAL

7. INSPECTION AND CLEANING OF A TYPE B OR A TYPE C FIBER OPTIC CONNECTOR

A. General Data

INSPECTION AND CLEANING PROCEDURES FOR A TYPE B OR TYPE C FIBER OPTIC CONNECTOR

Figure 36

B. Inspection of a Type B Connector or a Type C Connector

Refer to Figure 36.

- (1) Hold the connector so that the protective lens is pointed up towards a light source. Refer to Figure 37.

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

INSPECTION OF THE ENGAGING FACE OF A TYPE B OR TYPE C CONNECTOR
Figure 37

- (2) Examine the surface of the protective lens for any contamination.
- (3) If any contamination can be seen on the protective lens, clean the connector. Refer to Paragraph 7.C.

C. Removal of Particle Contamination

Refer to Table 9 or Table 10 for the necessary materials that are used to clean the connector.

- (1) Get these materials:
 - Swabs
 - Tape
 - Canned air and trigger assembly.
- (2) Blow the canned air across the protective lens at an angle.

NOTE: As an alternative, a staticmaster brush can be used to remove the contamination.

CAUTION: DO NOT USE THE STATICMASTER WITH A BARE HAND. THE OIL AND DIRT FROM THE HAND CAN MAKE THE BRUSH LESS EFFECTIVE.

- (3) Examine the protective lens again.
- (4) If the protective lens is clean, install the connector on the equipment immediately.

NOTE: If the connector is not installed immediately, put a dust cap or a plastic bag on the connector.
- (5) If the protective lens has any contamination, do Step (2) and Step (3) again.
- (6) If the contamination cannot be removed with the canned air or a staticmaster brush, remove the particles from the surface of the protective lens with either of these:
 - A swab
 - A length of tape.

Refer to Paragraph 6.C.

- (7) Examine the protective lens again.
- (8) If the contamination cannot be removed with either the swab or the tape, clean the protective lens with solvent. Refer to Paragraph 7.D.

20-12-11

STANDARD WIRING PRACTICES MANUAL**S280W701-() FIBER OPTIC CABLE ASSEMBLIES****D. Removal of Film Contamination**

Refer to Table 9 or Table 10 for the necessary materials used to clean the connector.

(1) Get these materials:

- Isopropyl or ethyl alcohol
- Dry wipes
- Foam swabs
- Woven polyester swabs
- Canned air and trigger assembly.

(2) Put on a pair of powder free gloves or finger cots.

NOTE: A satisfactory alternative is to clean the hands.

(3) Put the tip of a foam or woven polyester swab in the alcohol so that the swab becomes moist. Make sure the swab is not soaked in the alcohol.

(4) With a circular movement, carefully rub the swab on the protective lens.

CAUTION: DO NOT USE MORE THAN THE NECESSARY FORCE WHEN THE SWAB IS ON THE PROTECTIVE LENS. DAMAGE FROM SCRATCHES CAN OCCUR.

(5) If the lens is still wet, dry the lens with any of these materials:

- A dry wipe
- A woven polyester swab
- Canned air.

(6) Examine the protective lens again.

(7) If the protective lens has any contamination, do Step (3) through Step (5) again.

(8) If the protective lens is clean, install the connector on the equipment immediately.

NOTE: If the connector is not installed immediately, put a dust cap or a plastic bag on the connector.

8. REPAIR OF A FIBER OPTIC CABLE ASSEMBLY**A. Replacement of an Optical Fiber**

NOTE: Each new fiber optic cable assembly has one unused or spare optical fiber that can be used to replace an optical fiber that has damage.

(1) Find the optical fiber that has the damage:

- (a) Disconnect the two connectors at each end of the cable. Refer to Paragraph 2.
- (b) Put a low intensity, red or white light on the front face of the connector on one end of the cable.
- (c) Look at the front face of the connector on the other end of the cable.

If the light cannot be seen at the terminus, then that optical fiber is the one that has the damage.

(2) Disassemble both connectors. Refer to Paragraph 3.

(3) On both ends of the cable assembly:

- (a) Remove the terminus of the unused optical fiber from the yoke. Refer to Figure 10.
- (b) Put the terminus of the damaged optical fiber in the old position of the terminus of the unused optical fiber.

20-12-11

707, 727-787

STANDARD WIRING PRACTICES MANUAL

S280W701-() FIBER OPTIC CABLE ASSEMBLIES

- (c) Put the terminus of the unused optical fiber in the old location of the terminus of the damaged optical fiber.
- (4) Assemble the connectors. Refer to Paragraph 4.
- (5) Put the low intensity, red or white light on the front face of the connector on one end of the cable.
- (6) Look at the front face of the connector on the other end of the cable.
Make sure that the light can be seen at each terminus except the one at the end of the optical fiber with the damage.

B. Repair of a Cable Jacket

- (1) Make a selection of fiberglass tape from Table 9.
- (2) Put a layer of the tape on the cable so that:
 - The ends of the layer of tape are approximately 1 inch from the ends of the damage
 - The layer of tape makes a 50 percent overlap.

20-12-20 CONTENTS

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

1. GENERAL DATA

A. Damage Conditions and Repair Conditions

Replacement of the cable assembly is necessary when these types of damage occur:

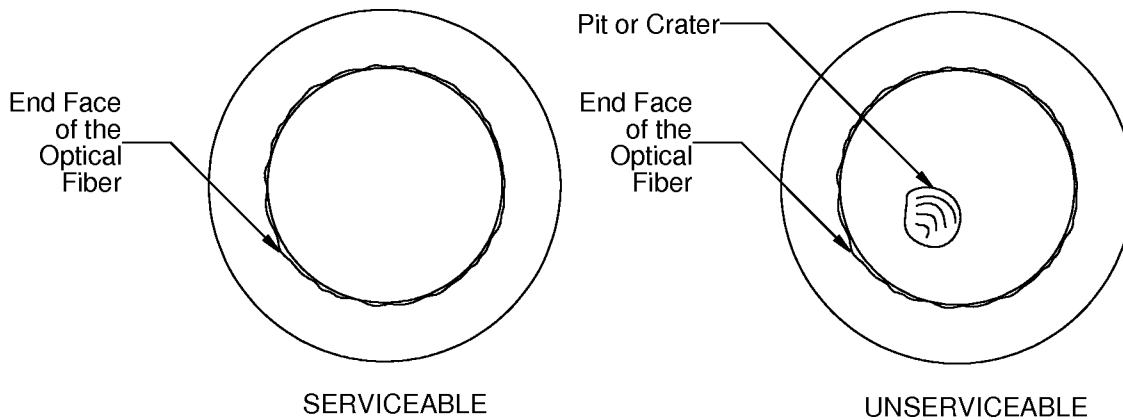

- The end face of the optical fiber has a pit or a crater; refer to Figure 1
- The end face of the optical fiber has a crack that extends more than 1/4 of the radius of the optical fiber from the circumference of the optical fiber; refer to Figure 2
- The end face of the optical fiber has a scratch that has a width that is equal to or more than 1 micrometer; refer to Figure 3
- The cable has a permanent deformation that is caused by a bend to a point where the bend radius is much less than 0.75 inch for BACC69A() cable assemblies or to a point where the bend radius is much less than 2.1 inches for BACC69C() cable assemblies; refer to Subject 20-10-11
- The cable has damage that goes through the jacket.

Repair is not necessary when these types of damage occur:

- A small scratch on the surface of the cable jacket
- Abrasion that makes the surface of the cable jacket rough.

For the conditions that are applicable during the assembly or installation of a wire harness that has a fiber optic cable assembly, refer to:

- Subject 20-10-11
- The Subject that is applicable for the assembly of the connector.

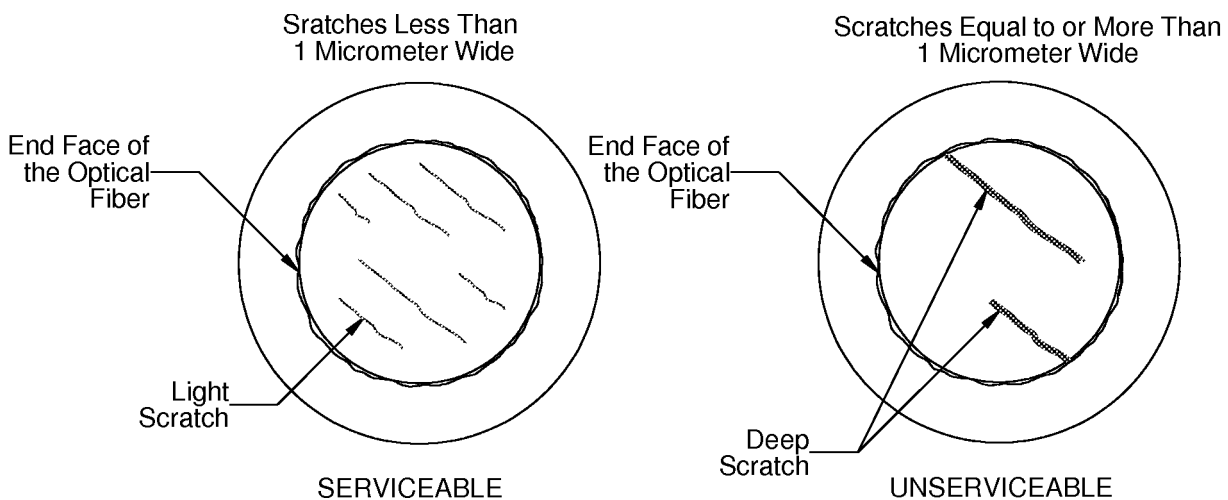

DAMAGE OF THE END FACE OF AN OPTICAL FIBER UNDER 200X MAGNIFICATION - PITS OR CRATERS
Figure 1

DAMAGE OF THE END FACE OF AN OPTICAL FIBER UNDER 200X MAGNIFICATION - CRACKS
Figure 2

DAMAGE OF THE END FACE OF AN OPTICAL FIBER UNDER 200X MAGNIFICATION- SCRATCHES
Figure 3

B. Protection from Damage

These conditions are applicable:

- The weight from a foot, a tool, or other objects must not be put on the cable assembly
- A length of the fiber optic cable must not be pushed or pulled if it does not move freely
- The BACC69A() Cable Assembly must not be bent to a point where the bend radius is less than 0.75 inch
- The BACC69C() Cable Assembly must not be bent to a point where the bend radius is less than 2.1 inches.

CAUTION: DO NOT BEND FIBER OPTIC CABLE TOO MUCH. THE RISK OF DAMAGE TO THE CABLE INCREASES AS BEND RADIUS DECREASES.

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

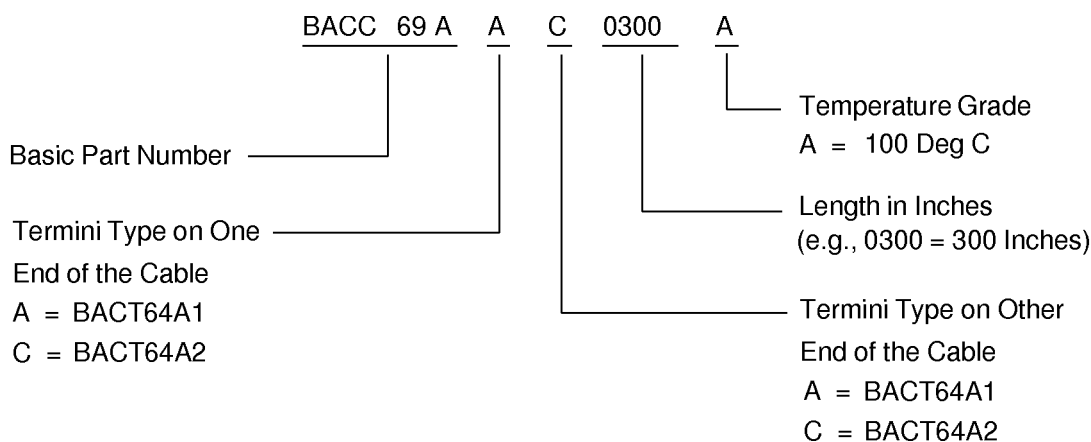

C. Protection from Contamination

These conditions are applicable:

- The engaging end of the contact terminus must not be touched with a finger or tool
- When the contact terminus is not installed in a connector, a clean protection cap must be installed on the contact terminus or the contact terminus must be put in a clean plastic bag.

2. PART NUMBERS AND DESCRIPTION

A. Fiber Optic Cable Assembly Part Numbers

BACC69A FIBER OPTIC CABLE ASSEMBLY PART NUMBER STRUCTURE

B. Inspection and Cleaning Procedures

Figure 8 shows the process to inspect and clean a fiber optic terminus and/or insert alignment sleeve holder.

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

**Inspection and Cleaning Procedure Flowchart
Figure 8**

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

C. Inspection and Cleaning

END FACE OF A CONTACT TERMINUS
Figure 9

Refer to Figure 9.

- (1) Select an Inspection Kit from Table 6.

Table 6
FIBER OPTIC INSPECTION AND CLEANING KITS

Part Number	Description
FBP-ARINC-01	Fiber Optic Termini Inspection Kit with Hand held Video Display
FCL-ARINT-01	Fiber Optic Termini Inspection Kit with a Portable CleanBlast System (Video Display is integrated with the CleanBlast System)
E-250K	Fiber Optic cleaning Kit (Swabs, Alcohol Wipes, Cotton Wipes, Isopropyl Alcohol, Canned Air)

- (2) Select the appropriate adapter from Table 7 for the connector to be examined.

NOTE: The Inspection Kits have the adapters included. The adapters are used so the probe does not come in contact with the ceramic ferrules of the termini and cause damage.

Table 7
FIBER OPTIC ADAPTERS INCLUDED IN INSPECTION KITS

Part Number	Connectors Used With	Description
FBPT-A801-1-002-P FBPT-A801-1-002-P	BACC68D15()06(), BACC68F15()06()	Use with circular plug connectors with the 15-06 insert arrangement
	BACC68C15()06(), BACC68E15()06()	Use with circular receptacle connectors with the 15-06 insert arrangement
FBPT-A801-2-001-P FBPT-A801-2-001-P	BACC65AA() or BACC65AN() with a BAC110AL12F()P Insert	Use with dual and single insert general purpose rectangular plug connectors with the 12F or 12FK pin insert arrangement (no alignment sleeve holder)
	BACC65AB() or BACC65AP() with a BAC110AL12F()S Insert	Use with dual and single insert general purpose rectangular receptacle connectors with the 12F or 12FK socket insert arrangement (with alignment sleeve holder)

20-12-20

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

Table 7 (continued)

Part Number	Connectors Used With	Description
FBPT-A801-2-002-P FBPT-A801-2-002-P	BACC65AA() or BACC65AN() with a BACI10AL12F()S Insert	Use with dual and single insert general purpose rectangular plug connectors with the 12F or 12FK socket insert arrangement (with alignment sleeve holder)
	BACC65AB() or BACC65AP() with a BACI10AL12F()P Insert	Use with dual and single insert general purpose rectangular receptacle connectors with the 12F or 12FK pin insert arrangement (without alignment sleeve holder)
FBPT-A801-1-002-P FBPT-A801-1-002-P	BACC66H(), BACC66K()	Use with ARINC 600 Size 2 or Size 3 plug connectors with the 12F insert arrangement (without alignment sleeve holder)
	BACC66G(), BACC66J()	Use with ARINC 600 Size 2 or Size 3 receptacle connectors with the 12F insert arrangement (with alignment sleeve holder)

- (3) Have an appropriate inspection kit and adapter ready.

Steps to exam the contact terminus:

- (a) Align the cavities of the adapter with the cavities of the connector insert.
 - (b) Insert the adapter into the connector.
 - (c) Use a video scope and probe from the inspection kit to examine the termini end face.
 - (d) Use 200X magnification for an multi-mode fiber optic termini or use 400X magnification for a single-mode fiber optical termini.
 - (e) Insert the probe into the appropriate terminus cavity in the adapter.
- (4) If the end face of the optical fiber has unserviceable damage, replace the cable assembly.

Refer to:

- Figure 1, Figure 2, and Figure 3 for damage conditions
- The Subjects that are applicable for the disassembly and assembly of the connectors
- Subject 20-10-11 for the conditions that are applicable for wire harness assembly and installation.

- (5) If the end face of the optical fiber has contamination from particles, remove the contamination.

Refer to:

- Figure 10
- Paragraph 3.D. for the procedure to remove particle contamination.

STANDARD WIRING PRACTICES MANUAL

BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES

CONTAMINATION OF THE END FACE OF AN OPTICAL FIBER - PARTICLES
Figure 10

(6) If the end face of the optical fiber has contamination from a film, remove the contamination.

Refer to:

- Figure 11
- Paragraph 3.E. for the procedure to remove film contamination.

CONTAMINATION OF THE END FACE OF AN OPTICAL FIBER - FILM
Figure 11

STANDARD WIRING PRACTICES MANUAL**BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES**

- (7) If the end face of the termini are clean, follow these procedures:
- If the connector insert had an alignment sleeve holder installed, examine and clean it if necessary. Refer to Subject. 20-12-21 for inspection and cleaning of a fiber optic alignment sleeve insert. After examining and/or cleaning the alignment sleeve holder, install it . Refer to Subject 20-12-21
 - If the connector is a plug, install the plug on the equipment immediately or put a dust cap or a plastic bag over it. Refer to Table 3
 - If the connector is a receptacle, install the plug or equipment to it immediately or put a dust cap on the connector. Refer to Table 3.

CAUTION: A CLEAN FIBER OPTIC CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

D. Particle Contamination Removal

For the conditions that are applicable for this procedure, refer to Paragraph 3.C.

- (1) If the connector insert has a BACI10AU() insert alignment sleeve holder installed, remove it to gain access to the termini. Refer to Subject 20-12-11 for removal of the alignment sleeve insert.
- (2) Remove the particle contamination from the end face of the optical fiber with method 1. Refer to Paragraph 3.G..

NOTE: The CleanBlast System may not always clean termini to an acceptable condition when termini have particles and dirt.

- (3) Examine the end face of the termini again using inspection kit from Table 6
Make sure that the microscope is set at 200X magnification.
- (4) If the end face of the optical fiber has unserviceable damage, replace the cable assembly.
Refer to:
 - Figure 1, Figure 2, and Figure 3 for damage conditions
 - The Subjects that are applicable for the disassembly and assembly of the connectors
 - Subject 20-10-11 for the conditions that are applicable for wire harness assembly and installation.
- (5) If the end face of the optical fiber has remaining particle or film contamination:
 - (a) Remove the contamination with method 2 and/or method 3. Refer to Paragraph 3.H. and/or 3.G..
 - (b) Examine the end face of the termini again using inspection kit from Table 6
Make sure that the microscope is set at 200X magnification.
 - (c) If the end face of the optical fiber has remaining, unserviceable contamination, replace the cable assembly.

STANDARD WIRING PRACTICES MANUAL**BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES**

Refer to:

- The Subjects that are applicable for the disassembly and assembly of the connectors
- Subject 20-10-11 for the conditions that are applicable for wire harness assembly and installation.

(6) If the end face of the termini are clean, follow these procedures:

- If the connector insert had an alignment sleeve holder installed, examine and clean it if necessary. Refer to Subject. 20-12-21 for inspection and cleaning of a fiber optic alignment sleeve insert. After examining and/or cleaning the alignment sleeve holder, install it . Refer to Subject 20-12-21
- If the connector is a plug, install the plug on the equipment immediately or put a dust cap or a plastic bag over it. Refer to Table 3
- If the connector is a receptacle, install the plug or equipment to it immediately or put a dust cap on the connector. Refer to Table 3.

CAUTION: A CLEAN FIBER OPTIC CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

E. Film Contamination Removal

For the conditions that are applicable for this procedure, refer to Paragraph 3.C.

- (1) If the connector insert has a BACI10AU() insert alignment sleeve holder installed, remove it to gain access to the termini. Refer to Subject 20-12-11 for removal of the alignment sleeve insert.
- (2) Remove the film contamination from the end face of the optical fiber with method 1. Refer to Paragraph 3.F.

NOTE: The CleanBlast System may not always clean termini to an acceptable condition when termini have particle and dirt.

- (3) Examine the end face of the termini again using inspection kit from Table 6
Make sure that the microscope is set at 200X magnification.
- (4) If the end face of the optical fiber has unserviceable damage, replace the cable assembly.

Refer to:

- Figure 1, Figure 2, and Figure 3 for damage conditions
- The Subjects that are applicable for the disassembly and assembly of the connectors
- Subject 20-10-11 for the conditions that are applicable for wire harness assembly and installation.

(5) If the end face of the optical fiber has remaining, unserviceable film contamination:

- (a) Remove the film contamination with method 3. Refer to Paragraph 3.H..
- (b) With the microscope, examine the end face of the optical fiber again.
Make sure that the microscope is set at 200X magnification.
- (c) If the end face of the optical fiber has remaining, unserviceable film contamination, replace the cable assembly.

STANDARD WIRING PRACTICES MANUAL**BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES**

Refer to:

- The Subjects that are applicable for the disassembly and assembly of the connectors
- Subject 20-10-11 for the conditions that are applicable for wire harness assembly and installation.

(6) If the end face of the termini are clean, follow these procedures:

- If the connector insert had an alignment sleeve holder installed, examine and clean it if necessary. Refer to Subject. 20-12-21 for inspection and cleaning of a fiber optic alignment sleeve insert. After examining and/or cleaning the alignment sleeve holder, install it . Refer to Subject 20-12-21
- If the connector is a plug, install the plug on the equipment immediately or put a dust cap or a plastic bag over it. Refer to Table 3
- If the connector is a receptacle, install the plug or equipment to it immediately or put a dust cap on the connector. Refer to Table 3.

CAUTION: A CLEAN FIBER OPTIC CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

F. Removal of Contamination: Method 1 - With the Westover CleanBlast Fiber Optic Cleaning System

For the conditions that are applicable for this procedure, refer to Paragraph 3.D. or 3.E.

- (1) Select the appropriate adapter from Table 20-12-20 for the connector with the termini to be cleaned.
- (2) Align the cavities of the adapter with the cavities of the connector insert.
- (3) Insert the adapter into the connector.
- (4) Follow the Westover CleanBlast Fiber Optic Cleaning System operating instructions to insert the cleaning probe tip into the appropriate termini cavity in the adapter and clean the end face of the termini.

G. Removal of Contamination: Method 2 - With Texwipe Swab or #850 Tape

For the conditions that are applicable for this procedure, refer to Paragraph 3.D.

- (1) Make a selection of a polypropylene swab from Table 4.

NOTE: An acrylic adhesive tape from Table 4 or an equivalent tape is a satisfactory alternative.

- (2) To remove the particles with a swab, roll the swab on the end face of the contact terminus.
- (3) To remove the particles with a length of tape:
 - (a) Carefully apply the adhesive side of the tape against the end face of the contact terminus.
 - (b) Remove the length of tape from the end face of the contact terminus.

H. Removal of Contamination: Method 3 - With E-250K Fiber Optic Cleaning Kit

For the conditions that are applicable for this procedure, refer to Paragraph 3.D. or Paragraph 3.E.

- (1) Make a selection of a solvent from Table 5.

STANDARD WIRING PRACTICES MANUAL**BACC69A AND BACC69C FIBER OPTIC CABLE ASSEMBLIES**

- (2) Make a selection of these tools from Table 4:
- Canned air or a woven polyester swab
 - A foam swab
 - Swab from E-250K Fiber Optic Cleaning Kit.

NOTE: An equivalent canned air is a satisfactory alternative.

- (3) Put a small amount of solvent on the end of the swab to make the swab moist.
Make sure that the swab is not too wet.
- (4) Carefully clean the end face of the contact terminus with the swab.

CAUTION: DO NOT USE MORE THAN THE FORCE NECESSARY TO REMOVE THE CONTAMINATION FROM THE END FACE OF THE OPTICAL FIBER. DAMAGE TO THE OPTICAL FIBER CAN OCCUR.

- (5) Dry the terminus with canned air or a woven polyester swab.

4. APPROVED TOOL SUPPLIERS**A. Inspection and Cleaning Kit Suppliers**

Buy the inspection and cleaning kits only from approved suppliers; refer to Table 8

20-12-21 CONTENTS

STANDARD WIRING PRACTICES MANUAL

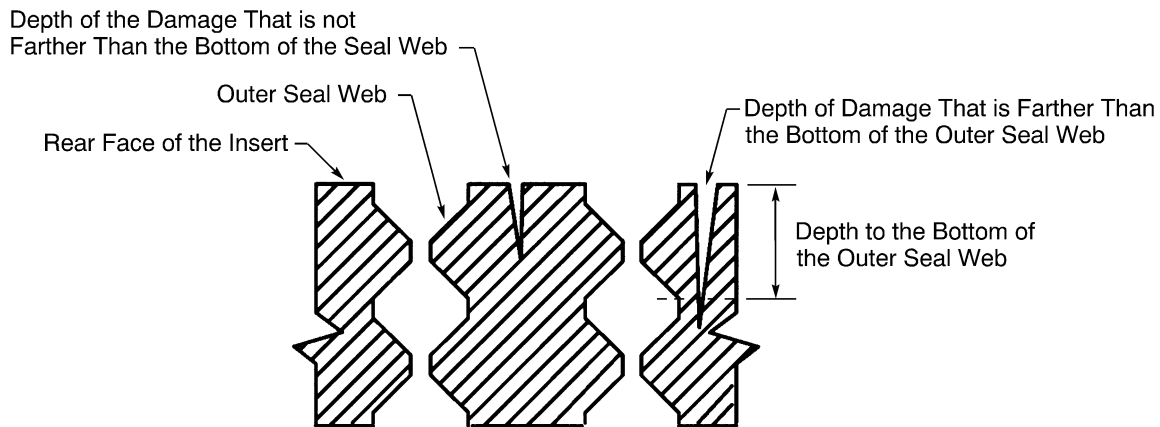

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

The connector must be replaced when one or more of these conditions occur:

- The depth of the damage extends farther than the bottom of the outer seal web. Refer to Figure 1.
- The damage extends from one contact terminus cavity to a different contact terminus cavity. Refer to Figure 2.
- The damage extends from one contact terminus cavity to the outer edge of the insert. Refer to Figure 2.

REAR FACE OF THE INSERT - DEPTH OF DAMAGE
Figure 1

REAR FACE OF THE INSERT - LENGTH OF DAMAGE
Figure 2

B. Damage Conditions - Fiber Optic Cable Assembly

The cable assembly must be replaced when one or more of these conditions occur:

- The fiber optic cable has damage that makes the cable assembly unserviceable. Refer to Subject 20-12-20
- The contact terminus has damage. Refer to Subject 20-12-20.

20-12-21

B. Connector Description

The BACC68C, BACC68D, BACC68E, and BACC68F connectors have these technical features:

- A metal, M38999 type circular connector shell
- Size 16 contact terminus cavities
- Rear release and rear removal of contact termini.

The BACC68D and BACC68F connectors have these extra features:

- A removable alignment sleeve insert
- Two guide posts for the alignment sleeve insert
- A self-locking threaded coupling ring.

The BACC68E and BACC68F connectors have this extra feature:

- The inserts have terminus contact cavities with terminus keyway mark.

C. Fiber Optic Contact Terminus Part Numbers

Table 5
FIBER OPTIC CONTACT TERMINUS PART NUMBERS

Cable Assembly	Contact Terminus		
	Type	Size	Part Number
BACC69()AA	A(Non-keyed)	16	BACT64A1
BACC69()CC	C(Keyed)	16	BACT64A2
BACC69()AC	A(Non-keyed),C(Keyed)	16	BACT64A1,BACT64A2

NOTE: The BACT64A() terminus is part of the cable assembly and cannot be removed. If it is necessary to replace a terminus, the cable assembly must be replaced. Refer to Subject 20-12-20 for the cable assembly part numbers.

STANDARD WIRING PRACTICES MANUAL

Figure 7

15-06 INSERT CONFIGURATION FOR BACC68E (MIRROR IMAGE) AND BACC68F CONNECTORS
Figure 8

4. CONNECTOR DISASSEMBLY

A. Backshell Removal

- (1) Loosen the screws of the strain relief clamp.
- (2) Turn the coupling ring of the backshell in counterclockwise direction until the backshell is disengaged from the connector shell.
- (3) Move the backshell rearward away from the connector.

20-12-21

STANDARD WIRING PRACTICES MANUAL

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

B. Contact Terminus Removal for BACC69AA() and BACC69AC() Fiber Optic Cable Assemblies

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A SEALED CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**Table 8
CONTACT TERMINUS REMOVAL TOOLS**

Terminus Size	Removal Tool	
	Part Number	Color
16	M81969/14-03	White
16	DRK83-16	Blue with White Dot

(1) Make a selection of a contact terminus removal tool from Table 8.

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (2) Remove the wire harness ties that are less than 6 inches from the connector.
- (3) At the rear of the connector, put the tip of the removal tool on the cable.
- (4) Axially align the removal tool and contact terminus cavity.
- (5) Push the removal tool into the contact terminus cavity until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL UNTIL IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

**POSITION OF THE REMOVAL TOOL IN THE CONTACT TERMINUS CAVITY
Figure 9**

(6) Hold the cable against the tool and, at the same time, carefully pull the tool and the contact terminus out of the terminus cavity from the rear of the insert.

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: MAKE SURE NOT TO TOUCH THE FRONT FACE OF THE TERMINUS WITH FINGER OR ANY OTHER ITEMS DURING THE REMOVAL PROCESS. CONTAMINATION CAN OCCUR TO THE FRONT FACE OF THE TERMINUS.

- (7) If the contact terminus is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees on the cable assembly.
 - (c) Do Step (3) through Step (6) again.
- (8) If it is necessary, examine the contact terminus. Refer to Subject 20-12-20.
- (9) If the inspection is not necessary, put a clean protection cap on the contact terminus.
Refer to Subject 20-12-20 for the protection cap part numbers.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

- (10) Put the connector in a clean plastic bag.

CAUTION: THE CONNECTOR MUST HAVE PROTECTION FROM CONTAMINATION WHEN THE CONNECTOR IS NOT CONNECTED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

C. Contact Terminus Removal for BACC69C() Fiber Optic Cable Assemblies

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A SEALED CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (1) Make a selection of a contact terminus removal tool from Table 8.

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (2) Remove the wire harness ties that are less than 6 inches from the connector.

NOTE: IF IT IS NECESSARY TO REMOVE A FIBER OPTIC TERMINUS, THEN YOU MUST REMOVE ALL OF THE TERMINI IN THE CONNECTOR

- (3) Pull out all the contact termini half way through the cavities one by one:

CAUTION: FULLY REMOVING ONE TERMINUS OF A BACC69CCC FIBER OPTIC CABLE ASSEMBLY WITHOUT HAVING THE OTHER TERMINI HALF WAY PULLED OUT CAN DAMAGE THE FIBER OPTIC CABLE.

- (a) At the rear of the connector, put the tip of the removal tool on one of the cables.
- (b) Axially align the removal tool and contact terminus cavity.

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

- (c) Push the removal tool into the contact terminus cavity until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

- (d) Hold the cable against the tool and, at the same time, carefully pull the tool and the contact terminus out towards the rear connector insert just until the rear of the terminus is approximately even with the rear face of the connector insert.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: MAKE SURE NOT TO TOUCH THE FRONT FACE OF THE TERMINUS WITH FINGER OR ANY OTHER ITEMS DURING THE REMOVAL PROCESS. CONTAMINATION CAN OCCUR TO THE FRONT FACE OF THE TERMINUS.

- (e) If the contact terminus is not released, remove the tool and turn it approximately 90 degrees on the cable assembly. Do Step (3a) through Step (3d) again.
- (f) Pull the removal tool fully out of the terminus cavity without removing the terminus.
- (g) Repeat Step (3a) through Step (3d) for all other termini until all the termini are half way pulled out.
- (4) Remove the identified contact termini fully:
- (a) At rear of the connector, put the tip of the removal tool on the identified cable.
- (b) Axially align the removal tool and contact terminus cavity.
- (c) Push the removal tool into the contact terminus cavity until it stops.
- Make sure that:
- The tool stays aligned with the cavity
 - The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

- (d) Hold the cable against the tool and, at the same time, carefully pull the tool and the contact terminus out towards the rear connector insert until the terminus is fully out of the connector insert.

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: MAKE SURE NOT TO TOUCH THE FRONT FACE OF THE TERMINUS WITH FINGER OR ANY OTHER ITEMS DURING THE REMOVAL PROCESS. CONTAMINATION CAN OCCUR TO THE FRONT FACE OF THE TERMINUS.

- (e) If the contact terminus is not released, remove the tool and turn it approximately 90 degrees on the cable assembly. Do Step (4a) through Step (4d) again.
 - (f) Pull the removal tool fully out of the terminus cavity without removing the terminus.
- (5) Fully remove all other contact termini one by one:
- (a) At rear of the connector, put the tip of the removal tool on one of the cables.
 - (b) Axially align the removal tool and contact terminus cavity.
 - (c) Push the removal tool into the contact terminus cavity until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

- (d) Hold the cable against the tool and, at the same time, carefully pull the tool and the contact terminus out towards the rear connector insert until the terminus is fully out of the connector insert.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: MAKE SURE NOT TO TOUCH THE FRONT FACE OF THE TERMINUS WITH FINGER OR ANY OTHER ITEMS DURING THE REMOVAL PROCESS. CONTAMINATION CAN OCCUR TO THE FRONT FACE OF THE TERMINUS.

- (e) If the contact terminus is not released, remove the tool and turn it approximately 90 degrees on the cable assembly. Do Step (5a) through Step (5d) again.
 - (f) Repeat Step (5a) through Step (5d) for all other termini until all the termini are fully removed.
- (6) If it is necessary, examine the contact termini. Refer to Subject 20-12-20.
- (7) If the inspection is not necessary, put a clean protection cap on the contact termini.

20-12-21

STANDARD WIRING PRACTICES MANUAL

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

Refer to Subject 20-12-20 for the protection cap part numbers.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

- (8) Put the connector in a clean plastic bag.

CAUTION: THE CONNECTORS MUST HAVE PROTECTION FROM CONTAMINATION WHEN THE CONNECTOR IS NOT CONNECTED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

D. Seal Plug and Seal Rod Removal

**Table 9
NECESSARY TOOLS**

Tool	Type
Pliers	Needle Nose

- (1) Make a selection of pliers from Table 9.

CAUTION: MAKE SURE THAT THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) Remove the wire harness ties, that are less than 6 inches from the connector, from the wire harness.
- (3) Tightly hold the end of the seal plug or the seal rod in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod out of the contact cavity.

E. Removal of the Alignment Sleeve Insert

CAUTION: DO NOT PULL, SHAKE, OR TWIST THE ALIGNMENT SLEEVE INSERT FROM THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

**Table 10
NECESSARY TOOLS**

Tool	Type	Size (inch)
Driver	Allen Wrench	5/64
	Screwdriver, Hex	5/64

- (1) Make a selection of a driver from Table 10.

NOTE: The driver can have a ball type end.

- (2) Turn the installation screw in a counterclockwise direction until the screw is disengaged from the face of the connector.

CAUTION: DO NOT SHAKE OR TWIST THE ALIGNMENT SLEEVE INSERT TO REMOVE IT FROM THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

FRONT FACE OF THE ALIGNMENT SLEEVE INSERT
Figure 10

- (3) Put the alignment sleeve insert in a clean plastic bag.

CAUTION: KEEP THE ALIGNMENT SLEEVE INSERT IN A CLEAN PLASTIC BAG UNTIL IT IS INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

5. CONNECTOR ASSEMBLY

A. Installation of the Alignment Sleeve Insert

NOTE: The alignment sleeve insert can be installed before or after the contact termini are installed in the connector.

Table 11
NECESSARY TOOLS

Tool	Type	Size (inch)
Driver	Allen Wrench	5/64
	Screwdriver, Hex	5/64
Torque	Allen Wrench	5/64
	Screwdriver, Hex	5/64

- (1) Examine the alignment sleeve insert. Refer to Paragraph 7.B..
- (2) Make a selection of these tools from Table 11:
 - A driver
 - A torque tool.

NOTE: The driver can have a ball type end.

- (3) Align the guide post holes in the rear face of the alignment sleeve insert with the two guide posts in the engaging face of the connector.

CAUTION: DO NOT SHAKE OR TWIST THE ALIGNMENT SLEEVE INSERT WHEN IT IS INSTALLED IN THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

ALIGNMENT SLEEVE INSERT
Figure 11

- (4) Fully engage the threads of the installation screw and the screw hole in the connector.
- (5) Torque the screw 8 inch-pounds \pm 1 inch-pound.

B. Contact Terminus Insertion for BACC69AA() and BACC69AC() Fiber Optic Cable Assemblies

NOTE: A contact terminus can be installed before or after the alignment sleeve insert is installed in the connector.

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

Table 12
CONTACT TERMINUS INSERTION TOOLS

Terminus Size	Insertion Tool	
	Part Number	Color
16	M81969/14-03	Blue
16	DAK83-16	Blue

- (1) Make a selection of a contact terminus insertion tool from Table 12.

CAUTION: DO NOT USE AN INSERTION TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (2) If the contact terminus does not have a protection cap or is not in a plastic bag, examine the contact terminus. Refer to Subject 20-12-20.
- (3) Remove the protection from the contact terminus.
- (4) Carefully put the insertion tool on the cable and the contact terminus.

CAUTION: THE CONTACT TERMINUS MUST BE INSTALLED IN THE CONNECTOR IF IT DOES NOT HAVE PROTECTION FROM CONTAMINATION. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

CAUTION: DO NOT TOUCH THE FRONT FACE OF THE TERMINUS. CONTAMINATION ON THE TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (5) At the rear of the connector, axially align the insertion tool and the terminus with the contact terminus cavity. Refer to Figure 12

STANDARD WIRING PRACTICES MANUAL

BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS

ALIGNMENT OF THE CONTACT TERMINUS, THE INSERTION TOOL, AND THE CONTACT TERMINUS CAVITY
Figure 12

- (6) When installing a BACT64A2 Terminus, align the key on the terminus (refer to Figure 6) with the keyway orientation mark on the rear face of the connector insert. Refer to Figure 8
- (7) Carefully push the insertion tool and the contact terminus into the terminus cavity to until it stops.
 Make sure that:
 - The tool stays aligned with the cavity
 - The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE INSERTION TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: DO NOT PUSH THE CABLE. DAMAGE TO THE FIBER OPTIC CABLE CAN OCCUR.

- (8) Carefully pull the insertion tool out of the terminus cavity.
 Make sure that:
 - The tool stays aligned with the cavity
 - The tool is not turned in the cavity.
- (9) Lightly pull the cable to make sure that the terminus is locked in the terminus cavity.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OF A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE TERMINUS, THE CABLE, OR THE CONNECTOR.

CAUTION: DO NOT MAKE A DENT IN THE CABLE JACKET WITH THE FINGERNAILS. DAMAGE TO THE CABLE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (10) If the terminus is not locked in the cavity:
 - (a) Pull the terminus out of the cavity.
 - (b) Do Step (4) through Step (9) again.
- (11) If the connector is not connected immediately, put the connector in a clean plastic bag.

CAUTION: THE CONNECTOR MUST HAVE PROTECTION FROM CONTAMINATION WHEN THE CONNECTOR IS NOT CONNECTED. UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS****C. Contact Terminus Removal for BACC69C() Fiber Optic Cable Assemblies**

NOTE: A contact terminus can be installed before or after the alignment sleeve insert is installed in the connector.

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (1) Align the key on the terminus with the keyway orientation mark on the rear face of the insert. Refer to Figure 6
- (2) Carefully insert each terminus of a BACC69CCC fiber optic cable assembly by hand into the appropriate terminus cavity until the rear of the terminus is just inside the insert.

NOTE: To prevent the terminus from rotating during installation, the terminus must be partially inserted by hand to ensure the key on the terminus is in the keyway of the terminus cavity of the insert.

NOTE: Pushing too hard on the fiber can damage the fiber optic cables.

- (3) Make a selection of a contact terminus insertion tool from Table 12.

CAUTION: DO NOT USE AN INSERTION TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (4) If the contact terminus does not have a protection cap or is not in a plastic bag, examine the contact terminus. Refer to Subject 20-12-20.
- (5) Remove the protection from the contact terminus.
- (6) Carefully put the insertion tool on the cable and the contact terminus.

CAUTION: THE CONTACT TERMINUS MUST BE INSTALLED IN THE CONNECTOR IF IT DOES NOT HAVE PROTECTION FROM CONTAMINATION. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

CAUTION: DO NOT TOUCH THE FRONT FACE OF THE TERMINUS. CONTAMINATION ON THE TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (7) At the rear of the connector, axially align the insertion tool and the terminus with the contact terminus cavity. Refer to Figure 12.

ALIGNMENT OF THE CONTACT TERMINUS, THE INSERTION TOOL, AND THE CONTACT TERMINUS CAVITY

Figure 13

20-12-21

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

- (8) Carefully push the insertion tool and the contact terminus into the terminus cavity to until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL WHILE IT IS IN THE CAVITY. IF THE INSERTION TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

CAUTION: DO NOT PUSH THE CABLE. DAMAGE TO THE FIBER OPTIC CABLE CAN OCCUR.

- (9) Carefully pull the insertion tool out of the terminus cavity.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

- (10) Lightly pull the cable to make sure that the terminus is locked in the terminus cavity.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OF A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE TERMINUS, THE CABLE, OR THE CONNECTOR.

CAUTION: DO NOT MAKE A DENT IN THE CABLE JACKET WITH THE FINGERNAILS. DAMAGE TO THE CABLE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (11) If the terminus is not locked in the cavity:

- (a) Pull the terminus out of the cavity.
- (b) Do Step (4) through Step (9) again.

- (12) Carefully pull the insertion tool out of the termini cavity. Remove the insertion tool from the cable.

- (13) Repeat Step (6) through Step (11) for other cables with termini need to be inserted into connectors

- (14) If the connector is not connected immediately, put the connector in a clean plastic bag.

CAUTION: THE CONNECTOR MUST HAVE PROTECTION FROM CONTAMINATION WHEN THE CONNECTOR IS NOT CONNECTED. UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

D. Seal of an Empty Contact Terminus Cavity

An empty contact terminus cavity must be sealed with a seal plug or a seal rod. Refer to Subject 20-60-08.

NOTE: The size of the contact terminus cavity is equivalent to a size 16 contact cavity.

E. Backshell Assembly

Refer to Subject 20-60-09.

6. CONNECTOR INSTALLATION**A. Plug and Receptacle Connection**

Refer to Subject 20-60-06.

20-12-21

STANDARD WIRING PRACTICES MANUAL

7. INSPECTION AND CLEANING OF A FIBER OPTIC ALIGNMENT SLEEVE INSERT

A. Necessary Tools and Materials

**Table 13
NECESSARY TOOLS**

Tool	Description	Part Number	Supplier
Air, Canned	Tetrafluoroethane	ES1620	Chemtronics

**Table 14
SOLVENTS**

Solvent	Specification	Supplier
Alcohol, Ethyl	O-E-760	Available source
Alcohol, Isopropyl	TT-I-735	Available source
Water, Distilled	-	Available source

B. Inspection and Cleaning

**ALIGNMENT SLEEVE INSERT
Figure 14**

Refer to Figure 14.

- (1) Without magnification, examine each end of the alignment sleeves of the insert.

NOTE: If the alignment sleeve insert is clean, it can be installed in the connector.

CAUTION: A CLEAN ALIGNMENT SLEEVE INSERT MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory protection from contamination.

- (2) If an alignment sleeve has contamination, clean the sleeve without solvent. Refer to Paragraph 7.C..
- (3) If an alignment sleeve is broken, replace the BACI10AU() alignment sleeve holder with an equivalent BACI10AU() alignment sleeve holder and install it. Refer to Paragraph 5.A..

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

- (4) Without magnification, examine each end of the alignment sleeves again.

NOTE: If the alignment sleeve insert is clean, it can be installed in the connector.

CAUTION: A CLEAN ALIGNMENT SLEEVE INSERT MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory protection from contamination.

- (5) If an alignment sleeve has remaining contamination, clean the sleeve with solvent. Refer to Paragraph 7.D..

- (6) Without magnification, examine each end of the alignment sleeves again.

NOTE: If the alignment sleeve insert is clean, it can be installed in the connector.

CAUTION: A CLEAN ALIGNMENT SLEEVE INSERT MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory protection from contamination.

- (7) If an alignment sleeve has remaining contamination, clean the sleeve with solvent again. Refer to Paragraph 7.D..

- (8) Without magnification, examine the alignment sleeves again.

NOTE: If the alignment sleeve insert is clean, it can be installed in the connector.

CAUTION: A CLEAN ALIGNMENT SLEEVE INSERT MUST HAVE PROTECTION FROM CONTAMINATION WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: A clean plastic bag is a satisfactory protection from contamination.

- (9) If an alignment sleeve has remaining contamination, replace the alignment sleeve insert. Refer to Paragraph 5.A..

C. Contamination Removal - Without Solvent

For the conditions that are applicable for this procedure, refer to Paragraph 7.B.

Refer to Figure 14.

- (1) Make a selection of canned air from Table 13.

NOTE: An equivalent canned air is a satisfactory alternative.

- (2) Apply the canned air in each alignment sleeve that has contamination.

D. Contamination Removal - With Solvent

For the conditions that are applicable for this procedure, refer to Paragraph 7.B.

20-12-21

STANDARD WIRING PRACTICES MANUAL**BACC68C, BACC68D, BACC68E, AND BACC68F FIBER OPTIC CONNECTORS**

WARNING: SOME SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF A FLAMMABLE SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE ALIGNMENT SLEEVE INSERT.

Refer to Figure 14.

- (1) Make a selection of a canned air from Table 13.

NOTE: An equivalent canned air is a satisfactory alternative.

- (2) Make a selection of these solvents from Table 14:

- An alcohol
- Distilled water.

- (3) Put a quantity of alcohol in a small container that can be sealed with a lid.

Make sure that:

- The container is clean
- The size of the container is sufficient to hold the alignment sleeve insert
- The quantity of alcohol is sufficient to put the body of the alignment sleeve insert below the surface of the alcohol.

- (4) Put a quantity of distilled water in a small container that can be sealed with a lid.

Make sure that:

- The container is clean
- The size of the container is sufficient to hold the alignment sleeve insert
- The quantity of distilled water is sufficient to put the body of the alignment sleeve insert below the surface of the alcohol.

- (5) Put the alignment sleeve insert in the container that has alcohol for 30 seconds minimum.

Make sure that the body of the alignment sleeve insert is below the surface of the alcohol.

- (6) Remove the alignment sleeve insert from the alcohol.

- (7) Seal the alignment sleeve insert in the container that has distilled water.

Make sure that the body of the alignment sleeve insert is below the surface of the distilled water.

- (8) Lightly shake the container for 1 to 3 minutes.

- (9) Remove the alignment sleeve insert from the water.

- (10) Dry the alignment sleeve insert with the canned air.

- (11) Put the alignment sleeve insert in the container that has alcohol for 30 seconds minimum.

Make sure that the body of the alignment sleeve insert is below the surface of the alcohol.

- (12) Remove the alignment sleeve insert from the alcohol.

- (13) Dry the alignment sleeve insert with the canned air.

20-14-11 CONTENTS

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES**

This Subject gives the conditions and the procedures for the repair or replacement of these Primary Flight Control System (PFCS) components:

- The S280W501-() cable
- The S280W654-() jumper cable assemblies
- The S280W655-() cable assemblies
- The S280W657-() jumper cable assemblies.

1. CONDITIONS FOR REPAIR OR REPLACEMENT OF A CABLE ASSEMBLY**A. General Conditions**

A PFCS wire harness repair can be:

- A splice assembled on a cable
- The replacement of a connector
- A layer of tape to repair the damage of a cable jacket
- A layer of tape to repair the damage of a cable shield.

These conditions are applicable:

- A cable must be replaced if a necessary repair makes the total number of repairs greater than 3
- The location of repair must not be under a clamp or any other support
- The location of repair must not be inside a connector backshell
- Any repair of a cable jacket with damage that does not go through the jacket is a permanent repair.

B. S280W501-() Cables and S280W655-() Cable Assemblies

Repair of the cable is necessary if:

- The cable jacket has damage that goes through the jacket
- Either shield of the cable has damage
- A connector has any damage.

A cable with any repair must be replaced in less than 6000 flight hours. If it is necessary to install a new wire harness with a 287W1619-() vapor seal assembly, refer to Paragraph 7.

C. S280W654-() and S280W657-() Jumper Cable Assemblies

These repairs are not permitted:

- A splice assembled on a cable
- The replacement of a connector.

Repair of the cable is necessary if:

- The cable jacket has damage that goes through the jacket
- Either shield of the cable has damage.

A cable with any repair must be replaced in less than 100 flight hours. If it is necessary to install a new wire harness with a 287W1619-() vapor seal assembly, refer to Paragraph 7.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES****2. CABLE PART NUMBERS AND DESCRIPTION****A. Cable Configurations**

The S280W501-() cable has:

- A yellow, extruded ETFE jacket
- Two nickel-plated copper shields
- BMS 13-48 conductors
- 5 cable configurations; refer to Figure 1 through Figure 5.

The S280W655-() cable assembly has:

- An S280W501-() cable
- An overmolded connector and backshell.

The cable of the S280W654-() and S280W657-() jumper cable assemblies have:

- A yellow, PTFE wrapped tape jacket
- Two nickel-plated shields
- Nickel plated 65 strand copper conductors
- An overmolded connector and backshell
- 7 cable configurations.

20-14-11

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES****3. PFCS WIRE HARNESS REPAIR****A. Selection of a Repair Procedure**

(1) Repair the cable jacket if all of these conditions are applicable:

- The jacket of the cable is damaged
- Both of the shields of the cable are not damaged.

Refer to the procedure to repair the insulation of a wire or cable in Subject 20-10-13.

(2) Repair the cable jacket and the shields if all of these conditions are applicable:

- Either of the shields of the cable is damaged
- The damage of the shield or shields is less than 1 inch in length and less than 25 percent of the circumference of the shield
- The wires of the cable are not damaged.

Refer to the procedure to repair the shield of a wire or cable in Subject 20-10-13.

(3) Repair the cable with a splice if all of these conditions are applicable:

- Either of the shields of the cable is damaged
- The damage of the shield or shields is greater than 1 inch in length or greater than 25 percent of the circumference of the shield
- The wires of the cable are not damaged.

Refer to Paragraph 4.

(4) Repair the cable with a splice if any of the wires of a cable are damaged.

Refer to Paragraph 4.

(5) Repair the connector if all of these conditions are applicable:

- The connector is damaged
- The connector has a backshell that is not potted.

Refer to:

- Subject 20-61-11 for the connector disassembly and assembly procedures
- Paragraph 6. for the backshell assembly procedure.

(6) Replace the connector if any of these conditions are applicable:

- The connector of an overmolded cable assembly is damaged
- A connector with a potted backshell is damaged and the cable has the sufficient length for the replacement.

Refer to:

- Paragraph 5. for the connector replacement procedure
- Paragraph 6. for the backshell assembly procedure.

4. SPLICE ASSEMBLY FOR PFCS WIRE HARNESS CABLES**A. Conditions for Repair with a Splice**

NOTE: The replacement of a cable assembly is recommended over the repair of that cable with a splice.

NOTE: The maximum number of splices that a cable can have is 3.

20-14-11

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSES

A splice must not be assembled or installed:

- Under a clamp or other support
- Inside a connector backshell or adapter
- On the wire harness where the wire harness is frequently bent.

B. Cable and Splice Configurations

	M22520/5-01	QLP		

- (1) Find the cable in Table 1.
- (2) Find the splice assembly data for the cable. Refer to the applicable paragraph for the cable configuration.
- (3) Remove the length of cable that is damaged:
 - (a) On one side of the damage, cut the cable so that the end of the cable is perpendicular to the longitudinal axis of the cable.
 - (b) On the other side of the damage, cut the cable so that the end of the cable is perpendicular to the longitudinal axis of cable.
- (4) Put a temporary identification label on each cable:

20-14-11

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (a) Identify one cable as Cable A.
- (b) Identify the other cable as Cable B.
- (5) Put these components on Cable A:
 - The cold shrinkable sleeve
 - The specified length of the large wire tube.
- (6) Remove the necessary length of cable jacket from the end of each cable. Refer to Table 5.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

**Table 5
REMOVAL LENGTH OF THE CABLE JACKET**

Cable	Removal Length (inch)
S280W501-11	4
S280W501-12	5
S280W501-13	6
S280W501-14	2.25
S280W501-15	5

- (7) Fold the end of the shield back over each cable jacket
- (8) Remove the necessary length of each shield so that the distance from the end of the shield to the end of the cable jacket is 0.5 inch

CAUTION: DO NOT CUT THE CABLE JACKET. DAMAGE TO THE CABLE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (9) Put a temporary layer of tape around the end of each shield so that the shields do not move.
- (10) Move the wires apart on each cable.
- (11) Cut the end of each wire so that the distance from the end of the cable jacket to the end of the wire is the specified length in the splice assembly data.

Refer to:

- Table 8 and Figure 11 for the S280W501-11 cable
- Table 10 and Figure 12 for the S280W501-12 cable
- Table 12 and Figure 13 for the S280W501-13 cable
- Table 14 and Figure 14 for the S280W501-14 cable
- Table 16 and Figure 15 for the S280W501-15 cable.
- (12) If the cable has a twisted pair, assemble a splice of the shield and the two wires of the twisted pair. Refer to Paragraph 4.E.
- (13) Remove 0.25 inch of insulation from the end of each wire in Cable A and Cable B.

CAUTION: DO NOT CUT THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (14) Make a selection of a splice crimp tool from Table 3.
- (15) For each wire in Cable A and Cable B:

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (a) Put the end of the Cable A wire in one end of the conductor splice.
 - (b) Crimp the splice
 - (c) Put the 1.15 inch length of heat shrinkable sleeve on the longer of the Cable A wire or the Cable B wire with the same color.
 - (d) Put the end of the Cable B wire with the same color as the Cable A wire in the other end of the conductor splice.
- Make sure the same color wire is in both ends of the splice.
- (e) Crimp the splice
 - (f) Wind a 0.75 inch to 1.0 inch length of tape around the conductor splice assembly so that:
 - The tape is smooth and symmetrical around the circumference of the splice assembly
 - The center of the layer of tape is aligned with the center of the conductor splice
 - The splice assembly has a minimum of two layers of tape.
- (16) Align the center of each heat shrinkable sleeve with the center of the each conductor splice assembly. Refer to Figure 7.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONDUCTOR SPLICE ASSEMBLY
Figure 7

- (17) If a sleeve cannot be moved over the tape
 - (a) Remove the necessary amount of tape.
 - (b) Make the tape smooth.
 - (c) Do Step (16) again.
- (18) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool for the larger Shield-Kon from Table 4.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the wire tube with the end of the cable shield. Refer to Figure 8.

Make sure that the heat shrinkable sleeves on the conductor splice assemblies are not moved.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

POSITION OF THE WIRE TUBE ON THE CABLE

Figure 8

- (d) Put one of the large Shield-Kons into the die of the crimp tool so that the center of the Shield-Kon is aligned with the center of the die.
- (e) Put crimp tool and the large Shield-Kon on the cable so that the edge of the Shield-Kon is approximately aligned with the end of the wire tube and shields of the cable.
- (f) Crimp the Shield-Kon.
- (g) Make the tube smooth and tight.
- (h) Put the other large Shield-Kons into the die of the crimp tool so that the center of the Shield-Kon is aligned with the center of the die.
- (i) Put the crimp tool and the large Shield-Kon on the other end of the cable so that the edge of the Shield-Kon is approximately aligned with the end of the wire tube and shields of the cable.
- (j) Crimp the Shield-Kon.
- (k) Remove the unwanted ends of the shield and wire tube so that each end is aligned with the outside edge of each Shield-Kon. Refer to Figure 9.

SHIELD SPLICE ASSEMBLY

Figure 9

- (19) Align the center of the cold shrinkable sleeve with the center of the shield splice assembly. Make sure that the Shield-Kons are fully under the sleeve.
- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (21) On each end of the sleeve, apply a layer of sealant around the circumference of the sleeve and cable. Make sure that the layer of sealant makes an overlap with the end of the sleeve and the cable jacket.
- (22) Remove the temporary identification label from each cable. Refer to Step (4).
- (23) Do a loop impedance test of the cable.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

Refer to Subject 05-55-41 of the 777 Aircraft Maintenance Manual.

NOTE: A satisfactory alternative to a loop impedance test is an electrical continuity test from one Shield-Kon to the other Shield-Kon.

E. Splice Assembly on a Twisted Pair Cable

- (1) Remove the necessary length of cable jacket from the end of each twisted pair cable. Refer to Table 6.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

**Table 6
REMOVAL LENGTH OF THE TWISTED PAIR CABLE JACKET**

Cable	Cable A Twisted Pair Removal Length (inch)	Cable B Twisted Pair Removal Length (inch)
S280W501-11	3	3
S280W501-12	4	3.25
S280W501-13	3	3
S280W501-15	4	3.25

- (2) Fold the end of the shield back over each cable jacket.
- (3) Remove the necessary length of each shield so that the distance from the end of the shield to the end of the cable jacket is 0.5 inch.

CAUTION: DO NOT CUT THE CABLE JACKET. DAMAGE TO THE CABLE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (4) Move the wires apart on each twisted pair.
- (5) Cut the end of each wire so that the distance from the end of the jacket of the twisted pair cable to the end of the wire is the specified length in the splice assembly data.

Refer to:

- Table 8 and Figure 11 for the S280W501-11 cable
- Table 10 and Figure 12 for the S280W501-12 cable
- Table 12 and Figure 13 for the S280W501-13 cable
- Table 16 and Figure 15 for the S280W501-15 cable.

- (6) Put the specified length of the small wire tube on the Cable B twisted pair.
- (7) Remove 0.25 inch of insulation from the end of each wire in the Cable A and Cable B twisted pairs.

CAUTION: DO NOT CUT THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE

- (8) Assemble a splice of each of the twisted pair wires:
 - (a) Put the end of the shorter Cable A wire in one end of the conductor splice.
 - (b) Crimp the splice.
 - (c) Put the end of the shorter Cable B wire in one end of another conductor splice.
 - (d) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (e) Put a 1.15 inch length of heat shrinkable sleeve on the longer wire in the Cable B twisted pair.
- (f) Put the end of the longer Cable B wire in the other end of the conductor splice with the shorter Cable A wire.
Make sure the same color wire is in both ends of the splice.
- (g) Crimp the splice.
- (h) Put a 1.15 inch length of heat shrinkable sleeve on the longer wire in the Cable A twisted pair.
- (i) Put the end of the longer Cable A wire in the other end of the conductor splice with the shorter Cable B wire.
Make sure the same color wire is in both ends of the splice.
- (j) Crimp the splice.
- (9) Wind a 0.75 inch to 1.0 inch length of tape around each conductor splice assembly so that:
 - The tape is smooth and symmetrical around the circumference of the splice assembly
 - The center of the layer of tape is aligned with the center of the conductor splice
 - The splice assembly has a minimum of two layers of tape.
- (10) Align the center of each heat shrinkable sleeve with the center of the each conductor splice assembly. Refer to Figure 10.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONDUCTOR SPLICE ASSEMBLY
Figure 10

- (11) If a sleeve cannot be moved over the tape:
 - (a) Remove the necessary amount of tape.
 - (b) Make the tape smooth
 - (c) Do Step (10) again.
- (12) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool for the smaller Shield-Kon from Table 4.
 - (b) Align one end of the wire tube with the end of the cable shield. Refer to Figure 8.
Make sure that the heat shrinkable sleeves on the conductor splice assemblies are not moved
 - (c) Put one of the small Shield-Kons on the cable so that the edge of the Shield-Kon is approximately aligned with the end of the wire tube and shields of the cable.
 - (d) Crimp the Shield-Kon.
 - (e) Make the tube smooth and tight
 - (f) Put the other small Shield-Kon on the other end of the cable so that the edge of the Shield-Kon is approximately aligned with the end of the wire tube and shields of the cable.
 - (g) Crimp the Shield-Kon.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (h) Remove the unwanted ends of the shield and wire tube so that the ends are aligned with the outside edges of each Shield-Kon. Refer to Figure 9.
- (13) Wind a minimum of two layers of tape around the shield splice assembly so that:
 - The end of the tape is a minimum of 1/2 inch beyond each end of the outside edges of each Shield-Kon
 - The tape makes a 50 percent overlap on each layer.
- (14) Make the tape smooth.

F. S280W501-11 Cable Splice Data

5. CONNECTOR REPLACEMENT

A. Connector Selection

CAUTION: FOR THIS REPAIR PROCEDURE, THE SPECIFIED CONNECTORS DO NOT HAVE ACCEPTABLE ALTERNATIVE PART NUMBERS. IF THE SPECIFIED CONNECTOR IS NOT USED, THE SYSTEM CAN GIVE UNSATISFACTORY PERFORMANCE.

Refer to Subject 20-61-11 for:

- The part number structures
- The insert configurations
- The contact part numbers
- The acceptable alternative contact part numbers.

**Table 17

C. Necessary Parts and Materials

Table 20
NECESSARY PARTS AND MATERIALS

Material	Specification or Part Number	Supplier	Size
Shield-Kon	RSK301	Thomas & Betts	-
Sleeve, Solder	BACS13CT-2-B	QPL	-
	SO63-2-9030	Raychem	-

D. Connector Removal

- (1) Find the location where the overmold starts on the cable.
- (2) Cut the cable at that location so that the end of the cable is perpendicular to the longitudinal axis of the cable.
- (3) Examine the end of the cable.
- (4) If it is necessary, remove the necessary length of cable so that the cable has no remaining overmolded material inside the outer diameter of the cable.

E. Cable Preparation

Table 21
REMOVAL LENGTH OF THE CABLE JACKET

Backshell		Removal Length (inch)	
Shell Size	Configuration	Target	Tolerance
12	Straight	2.00	± 0.05
	45 degrees	2.30	± 0.05

Backshell		Removal Length (inch)	
Shell Size	Configuration	Target	Tolerance
16	Straight	2.00	± 0.05
	45 degrees	2.30	± 0.05
20	Straight	2.00	± 0.05
	45 degrees	2.30	± 0.05
22	Straight	2.00	± 0.05
	90 degrees	3.20	± 0.05

(1) If it is necessary, put a permanent label on the cable to show:

- The equipment number
- The hookup number

(2) Make a selection of the connector. Refer to Table 17.

CAUTION: THE SPECIFIED CONNECTORS DO NOT HAVE ACCEPTABLE ALTERNATIVE PART NUMBERS. IF THE SPECIFIED CONNECTOR IS NOT USED, THE SYSTEM CAN GIVE UNSATISFACTORY PERFORMANCE

(3) Make a selection of a backshell. Refer to Table 18.

(4) Put the strain relief adapter of the backshell on the cable. Refer to Figure 17.

Make sure that the end with the saddle clamp is pointed away from the end of the cable.

POSITION OF THE STRAIN RELIEF ADAPTER ON THE CABLE

Figure 17

(5) Remove the necessary length of the jacket from the end of the cable. Refer to Table 21.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

(6) Fold the shield back over the cable jacket. Refer to Figure 18.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

SHIELD FOLDED BACK OVER THE JACKET OF THE CABLE

Figure 18

- (7) Prepare the shielded twisted pair. Refer to Figure 19.

NOTE: If it is permitted to use a heat source, the assembly of a shield ground wire with a solder sleeve is a satisfactory alternative to the assembly of a shield ground wire with an RSK Shield-Kon. Refer to Subject 20-10-15.

PREPARATION OF THE SHIELDED TWISTED PAIR

Figure 19

- (a) Remove 1.5 inches ± 0.1 inch of jacket from the end of the shielded twisted pair.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (b) Remove the necessary length of shield so that the distance from the end of the shield to the end of the jacket is 0.35 inch ± 0.10 inch.
- (c) Make a selection of these components from Table 20:
- A solder sleeve with a shield ground wire
 - A Shield-Kon.
- (d) Remove the ground wire from the solder sleeve.
- (e) Discard the solder sleeve.
- (f) Assemble the shield ground wire.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSES

Refer to:

- Figure 20
- Subject 20-10-15 for the procedure to assemble a shield ground wire with an RSK Shield-Kon.

SHIELD GROUND WIRE OF THE TWISTED PAIR
Figure 20

F. Connector Assembly

- (1) Put the backshell adapter on the cable so that the forward end of the adapter is pointed toward the end of the cable. Refer to Figure 21.

POSITION OF THE BACKSHELL ADAPTER ON THE CABLE
Figure 21

- (2) Assemble the connector. Refer to Subject 20-61-11.

6. BACKSHELL ASSEMBLY

A. Necessary Materials

Table 22
NECESSARY MATERIALS

Material	Specification or Part Number	Supplier	Description
Alcohol, Isopropyl	-	Any source	-
Lacquer, Marking	F925 Yellow	Organic Products	-

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

Table 22 (continued)

Material	Specification or Part Number	Supplier	Description
Sealant, Standard Cure	BMS 5-95 Class B	QPL	-
	Pro-Seal 870 B-1/2	Courtaulds Aerospace	-
	Pro-Seal 870 B-2		-
Sealant, Fast Cure	PR-1826 Class B	Courtaulds Aerospace	-
	PR-1828 Class B	Courtaulds Aerospace	-
Tape, Adhesive	-	Any source	-
Tape, Protective	P-440	Permacel	0.50 inch width
Tape, Insulation	Scotch 70	3M	0.75 inch width

B. Installation of the Backshell Adapter

**Table 23
BACKSHELL INSTALLATION TORQUE VALUES**

Shell Size	Torque (inch-pound)	
	Minimum	Maximum
12	55	65
14	70	80
16	80	90
20	115	125
22	115	125

NOTE: It is not necessary to install safety wire to hold the backshell adapter in position on the connector.

- (1) Push the backshell adapter toward the connector until the forward end of the adapter is against the rear of the connector. Refer to Figure 22.

Make sure that the end of each shield ground wire goes through the backshell adapter.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

POSITION OF THE BACKSHELL ADAPTER AND SHIELD GROUND WIRE

Figure 22

- (2) Engage the threads of the backshell adapter and the connector.
- (3) Turn the backshell adapter until the teeth of the adapter are fully engaged with the teeth of the connector.
- (4) Look in the inspection hole of the backshell adapter. Refer to Figure 23.
Make sure that the teeth of the backshell adapter are fully engaged with the teeth of the MIL-C-26500 connector.

POSITION OF THE MIL-C-26500 TEETH AND THE BACKSHELL TEETH

Figure 23

- (5) Tighten the backshell to the specified value in Table 23 with a torque wrench.
- (6) Make a selection of an electrical bond meter. Refer to Subject 20-20-00.
- (7) Measure the resistance between the backshell adapter and the connector. Refer to Figure 24.
Make sure that resistance between the backshell adapter and the connector is not greater than 0.5 milliohms.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

RESISTANCE MEASUREMENT BETWEEN THE BACKSHELL ADAPTER AND THE CONNECTOR SHELL

Figure 24

C. Installation of the Shield Terminator Band

CAUTION: THE INCORRECT INSTALLATION OF THE SHIELD TERMINATOR BAND, THE SHIELD OF THE CABLE, AND THE SHIELD GROUND WIRE ON THE SHIELD TERMINATION PLATFORM CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

**Table 24
SHIELD TERMINATOR BAND INSTALLATION TOOLS**

Shield Band	Installation Tool		
	Type	Part Number	Supplier
BACB42F3	Manual	600-058	Glenair
		A40199	Band-It Idex
	Pneumatic	600-051	Glenair
		A75099	Band-It Idex

(1) Make a selection of a shield terminator band from Table 19.

CAUTION: IF A SHIELD TERMINATOR BAND HAS BEEN USED, IT MUST NOT BE USED AGAIN. THE INSTALLATION OF A USED BAND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

(2) Make a selection of a shield terminator band installation tool from Table 24.

(3) Clean these components with isopropyl alcohol and a brush:

- The band
- The shield of the cable
- The shield ground wire.

(4) Fold the shield ground wire back over the shield termination platform of the backshell adapter.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESES**

- (5) Fold the shield of the cable back over the termination platform so that the end of the shield is:
 - Aligned with the forward edge of the termination platform
 - Over the shield ground wire
 - Smooth and tight.
- (6) If the band is flat, make a coil. Refer to Figure 25.

**COIL CONFIGURATION OF THE SHIELD TERMINATOR BAND****Figure 25**

- (a) Put the free end of the band through the thin slot in the buckle.
 - (b) Pull the free end through the buckle until the diameter of the loop is smallest size that can freely move over the flange of the connector.
 - (c) Put the free end of the band through the thin slot in the buckle again.
 - (d) Pull the free end through the buckle until the inner surface of the second loop touches the surface of the first loop.
- (7) Pull the release trigger of the installation tool in the direction of the pull-up handle.
 - (8) Put a minimum of 2.5 inches of the free end of the band into the tool. Refer to Figure 26.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

POSITION OF THE SHIELD TERMINATOR BAND IN THE INSTALLATION TOOL
Figure 26

- (9) Pull the pull-up handle toward the tool frame so that the band is held in the internal grip mechanism of the tool. Refer to Figure 27.

POSITION OF THE PULL-UP HANDLE TO PULL THE BAND
Figure 27

- (10) Put the connector and backshell adapter assembly through the coil of the band.
- (11) Put the band against the connector shell.
- (12) Pull the pull-up handle through the necessary cycles until the band is almost tight on the knurled or ribbed area of the termination platform.

20-14-11

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

Make sure that the buckle of the band does not make an overlap with the shield ground wire.

NOTE: Always let the pull-up handle return to the initial open position before the handle is pulled again. If the handle stops in a cycle, push the handle down to the initial open position. Refer to Figure 26.

- (13) Align the edges of the two loops of the band so that the edge of either loop is not more than 0.03 inch beyond the edge of the other.

Refer to Figure 28.

ALIGNMENT OF THE LOOPS OF THE SHIELD TERMINATOR BAND

Figure 28

- (14) Pull the pull-up handle through the necessary cycles until the band is tight on the knurled or ribbed area of the termination platform. Refer to Figure 29.

Make sure that pull-up handle is locked against the tool frame. Refer to Figure 27.

CAUTION: DO NOT USE FORCE TO OPEN THE PULL-UP HANDLE AFTER IT IS LOCKED IN POSITION. IF FORCE IS USED, DAMAGE TO THE TOOL OCCURS.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

POSITION OF THE SHIELD TERMINATOR BAND ON THE BACKSHELL ADAPTER

Figure 29

- (15) Examine the alignment of the loops of the band. Refer to Figure 28.
- (16) If the alignment is incorrect, loosen the band. Refer to Figure 30.

OPERATION OF THE TENSION RELEASE LEVER

Figure 30

- (a) Hold the pull-up handle tightly.
 - (b) Push the tension release lever forward.
 - (c) Release the pull-up handle.
- NOTE: The pull-up handle opens automatically.
- (d) Pull the release trigger toward the tool frame.
 - (e) Loosen the band.
 - (f) Do the installation again from Step (7).
- (17) Pull the cut-off handle until it is fully closed against the tool frame.
 - (18) Pull the release trigger in the direction of the pull-up handle to remove the unwanted length of band from the tool.
 - (19) Cut the end of the shields and the shield ground wire so that the distance from the forward edge of the band to the end of the shields and ground wire is 0.1 inch \pm 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

Refer to Figure 31.

LOCATION OF THE END OF THE SHIELDS AND SHIELD GROUND WIRE
Figure 31

- (20) Make a selection of an electrical bond meter. Refer to Subject 20-20-00.
- (21) Measure the resistance between the buckle of the shield terminator band and the backshell adapter. Refer to Figure 32.

CAUTION: DO NOT LET THE TEST PROBE OF THE METER TOUCH THE SHIELD. IF THE PROBE OF THE METER TOUCHES THE SHIELD, DAMAGE TO THE SHIELD CAN OCCUR WHICH CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

Make sure that resistance between the buckle of the band and the backshell adapter is not greater than 2 milliohms.

RESISTANCE MEASUREMENT BETWEEN THE BUCKLE OF THE SHIELD TERMINATOR BAND AND THE BACKSHELL ADAPTER
Figure 32

- (22) If the installation of the shield terminator band is incorrect, remove the band. Refer to Figure 33.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES****REMOVAL OF THE SHIELD TERMINATOR BAND****Figure 33**

- (a) Hold the end of the band at the buckle with pliers or wire cutters.
 - (b) Bend the buckle back in the direction of the top loop of the coil until the loop is released.
 - (c) Discard the used band.
 - (d) Do the installation again from Step (6) with an unused band.
- (23) Put a stripe of yellow marking lacquer so that the stripe:
- Is approximately 0.125 inch wide
 - Is on the joint between the backshell adapter and the coupling ring of the backshell adapter
 - Goes 0.25 inch beyond on each side of the joint.

D. Assembly of the Backshell Adapter Seal

- (1) Make a selection of these materials from Table 22:
 - An adhesive tape
 - An insulation tape
 - A standard cure time sealant or a fast cure sealant.
- (2) Clean these components with isopropyl alcohol and a brush:
 - The jacket of the cable
 - The shield of the cable
 - The shield terminator band
 - The shoulder of the backshell adapter.
- (3) Put a layer of 0.75 inch wide insulation tape on the shield so that the layer of tape:
 - Starts on the shoulder of the backshell adapter
 - Stops on the jacket of the cable
 - Does not prevent the installation of the strain relief adapter.

Refer to Figure 34.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

LOCATION OF THE LAYER OF INSULATION TAPE
Figure 34

- (4) Put a piece of adhesive tape over one of the three inspection holes in the backshell adapter.
 - (5) Put the sealant into the second inspection hole until the sealant comes out of the third inspection hole.
- NOTE:** It is not necessary to use a primer for this assembly.
- (6) Remove the adhesive tape from the first inspection hole.
 - (7) Continue to put the sealant into the second inspection hole until the sealant starts to come out of the first inspection hole.
 - (8) Remove all of the sealant from the outer surface of the backshell adapter.
 - (9) Do Step (4) through Step (8) again for the drain holes of the backshell adapter. Refer to Figure 34.
 - (10) Let the sealant cure:

NOTE: The strain relief adapter can be installed and the seal of the strain relief adapter can be assembled before the sealant is fully cured. Refer to Paragraph 6.E. and Paragraph 6.F.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (a) If the sealant has a standard cure time, let the sealant cure for approximately 8 hours.
 - (b) If the sealant has a fast cure time, let the sealant cure for approximately 1 hour.
- (11) Examine the sealant.

Make sure that the distance from the surface of the sealant in the inspection and drain holes to the outer surface of the backshell adapter is less than 0.041 inch.

Refer to:

- Figure 35 for satisfactory levels of sealant
- Figure 36 for an unsatisfactory level of sealant.

SATISFACTORY LEVELS OF SEALANT IN THE BACKSHELL ADAPTER
Figure 35

UNSATISFACTORY LEVEL OF SEALANT IN THE BACKSHELL ADAPTER
Figure 36

- (12) If the level of sealant in any inspection hole or drain hole is unsatisfactory:
- (a) Put more sealant in the hole.
NOTE: Use the same sealant as in Step (1).
 - (b) Remove all of the sealant from the outer surface of the backshell adapter.
 - (c) Let the sealant cure.
 For the correct cure time, refer to Step (10).

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSES****E. Installation of the Strain Relief Adapter**

- (1) Make a selection of these materials from Table 22:
 - A protective tape
 - A standard cure time sealant or a fast cure sealant.
- (2) Push the strain relief adapter toward the connector until the end of the strain relief adapter is against the backshell adapter.
- (3) Make a mark on the cable under the center of the saddle clamp
- (4) Move the strain relief adapter away from the backshell adapter and the shield.
- (5) Put the necessary layers of tape around the circumference of the cable at the mark to sufficiently increase the diameter of the cable for the saddle clamp.

Make sure that:

- The center of the tape is aligned with the mark
 - Each layer makes a 100 percent overlap.
- (6) Apply a layer of sealant layer on the layer of insulation tape so that the layer of sealant:
 - Makes an overlap with the cable jacket
 - Makes an overlap with the shoulder of the backshell adapter
 - Has a smaller diameter than the diameter of the strain relief adapter.

Refer to Figure 37.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

LAYER OF SEALANT ON THE LAYER OF INSULATION TAPE

Figure 37

- (7) Engage the threads of the strain relief adapter and the backshell adapter.
- (8) Tighten the strain relief adapter with a strap wrench or an equivalent tool.
- (9) Tighten the screws of the saddle clamp. Refer to Figure 38.

Make sure that the saddle clamp is tight against:

- The surface of the strain relief adapter
- The layers of protective tape on the cable.

POSITION OF THE SADDLE CLAMP ON THE CABLE

Figure 38

20-14-11

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESES

F. Assembly of the Strain Relief Adapter Seal

- (1) Put the cable and connector assembly in the position where the face of the connector is pointed down.
- (2) Fill the inner cavity of the strain relief adapter with sealant so that:
 - The lowest level of the surface of the sealant is equal to or higher than the level of the rear surface of the adapter
 - The highest level of the surface of the sealant is lower than the lower edge of the protective tape under the saddle clamp.

Refer to:

- Figure 39 for a satisfactory level of sealant
- Figure 40 for an unsatisfactory level of sealant.

SATISFACTORY LEVEL OF SEALANT IN THE STRAIN RELIEF ADAPTER

Figure 39

UNSATISFACTORY LEVEL OF SEALANT IN THE STRAIN RELIEF ADAPTER

Figure 40

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

- (3) Remove all of the sealant from the outer surface of the strain relief adapter.
- (4) Let the sealant cure for approximately 8 hours.
- (5) After eight hours, examine the seal.

Make sure that:

- The lowest level of the surface of the sealant is equal to or higher than the level of the rear surface of the adapter
- The highest level of the surface of the sealant is lower than the lower edge of the protective tape under the saddle clamp.

Refer to Figure 39 and Figure 40.

- (6) If the level of sealant is unsatisfactory:
 - (a) Put more sealant in the strain relief adapter.
 - (b) Remove all of the sealant from the outer surface of the strain relief adapter.
 - (c) Let the sealant cure for approximately 8 hours.

7. INSTALLATION OF A 287W1619 VAPOR SEAL

A. Vapor Seal Part Numbers

**Table 25
VAPOR SEAL ASSEMBLY PART NUMBERS**

Boeing Standard	Supplier
287W1619-()	QPL

B. Necessary Materials

**Table 26
NECESSARY MATERIALS**

Material	Boeing Specification	Part Number	Supplier
Filler Material	BMS 8-300 Type I Grade 0.06	Solimide AC-406	Imi-Tech
Sealant	BMS 5-95 Class B-2	Pro-Seal 870 B-2	Courtaulds Aerospace

STANDARD WIRING PRACTICES MANUAL

REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESSSES

C. Vapor Seal Installation

VAPOR SEAL INSTALLATION
Figure 41

- (1) Assemble the components of the seal in the structure so that the wire harness is in one of the holes of the seal. Refer to Figure 41.
- (2) If the wire harness does not have a tight fit in the hole of the seal assembly:
 - (a) Make a selection of a filler material from Table 26.
 - (b) Cut the sufficient length of the material so that the width is 0.625 ± 0.125 inch.
 - (c) Remove one half of the seal assembly.
 - (d) Wind the necessary length of the material around the wire harness at the location of the seal to increase the diameter of the wire harness.
 - (e) Install the half of the seal assembly again.
 Make sure that the wire harness has a tight fit in the hole of the seal.
- (3) If the seal assembly has a hole that is not used:
 - (a) Make a selection of a filler material from Table 26.
 - (b) Cut the sufficient length of the material so that the width is 0.625 ± 0.125 inch.
 - (c) Make a coil with the length of the material.
 - (d) Compress the coil.
 - (e) Put the coil in the hole.
 Make sure that the coil has a tight fit in the hole of the seal.
- (4) Make a selection of a sealant from Table 26.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF PRIMARY FLIGHT CONTROL SYSTEM WIRE HARNESES**

- (5) Put a layer of sealant on both sides of the seal assembly so that:
- The flat side of the seal has a layer of sealant that makes an overlap with the structure
 - The holes of the other side of the seal has a layer of sealant that makes an overlap with the seal retainer.

Refer to Figure 42.

LOCATION OF THE SEALANT ON THE VAPOR SEAL ASSEMBLY

707, 727-787

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

1. GENERAL DATA

A. General Conditions

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-10-13.

B. Airworthiness Limitations

The configuration and repair of Fuel Quantity Indicator System wiring are specified as Critical Design Configuration Control Limitations (CDCCL).

WARNING: IT IS MANDATORY THAT THE SPECIFIED REPAIR PROCEDURES ARE OBEYED FULLY.

To find more data about CDCCL wiring, refer to Table 1 for the document that is applicable for the airplane model.

Table 1
BOEING DOCUMENTS FOR AIRWORTHINESS LIMITATIONS

Boeing Document	Airplane Model
D6-7552-AWL	707
D6-8766-AWL	727
D6-38278-CMR	737-100,-200,-200C,-300,-500
D6-13747-CMR	747-100,-200,-300,-SP
Maintenance Planning Document, Section 9	737-600,-700,-800 and later 737 models
	747-400 and later 747 models
	757
	767
	777

C. Applicable Repair Conditions

These conditions are applicable:

- The condition that is the cause of the damage must be removed to prevent more damage.
- A repair must be done with clean hands and clean tools to prevent contamination that can cause a bad seal of the insulation materials.
- If an FQIS wire bundle is replaced or repaired, do not change the initial FQIS bundle to airplane wiring separation. The sleeving installed on the initial FQIS wire bundle can be used again.
- Tape is not permitted in the fuel tank.
- The maximum number of splices that a wire or a cable can have is three.
- The end of the splice assembly must be a minimum distance of 1 inch and a maximum distance of 1.5 inches from a clamp.
- The repair with a splice is permanent.

3. REPAIR OF A LOW-Z OR A HIGH-Z WIRE WITH GREEN OUTER BRAID

A. Repair of the Green Braid - Temporary

CAUTION: REPLACEMENT OF A WIRE WITH TEMPORARY REPAIR IS NECESSARY. THE WIRE MUST BE REPLACED AT A MAXIMUM OF 4000 FLIGHT HOURS.

**Table 12
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12-234	An available source

**CONFIGURATION OF THE SLEEVE ON WIRE
Figure 1**

- (1) Measure the distance from the outer edge of one clamp to the outer edge of the other clamp.
- (2) Make a selection of a 1.5 inch diameter sleeve from Table 12.
Make sure that the length of the sleeve is a minimum of two inches greater that the distance from outer edge of the clamp to the outer edge of the other clamp.
- (3) Make a cut along the longitudinal axis of the sleeve.
- (4) Loosen the clamp on each side of the damage.
- (5) Put the sleeve on the wire.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

Make sure that:

- The longitudinal edges of the sleeve make an overlap of not less than 50 percent of the circumference of the wire harness
- The sleeve goes through each clamp
- The end of the sleeve extends a minimum of 1 inch farther than the outer edge of each clamp.

(6) Tighten each clamp.

B. Repair of the Green Braid - Permanent Repair

**Table 13
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Transparent Heat Shrinkable	AMS-DTL-23053/12-228	An available source
	TFE 2X	Chemplast
		Zeus Industrial Products

**Table 14
NECESSARY TOOLS**

Tool	Supplier
Brush, Soft Bristle	An available source

(1) Make a selection of a solvent from Table 9.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE OR CABLE.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE OR CABLE MUST NOT BE APPLIED. DAMAGE TO THE WIRE OR CABLE CAN OCCUR.

(2) Make a selection of a brush from Table 14.

(3) Make a selection of a wiper from Table 10.

(4) Make a selection of an injection tool from Table 10.

(5) Make a selection of a 2 inch length of 3/8 inch diameter transparent heat shrinkable sleeve from Table 13.

NOTE: An equivalent transparent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

(6) Cut the loose outer braid strands at the area of damage.

CAUTION: DO NOT MAKE A CUT OR A NICK IN THE WIRE JACKET. DAMAGE TO THE WIRE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

(7) Clean the outer braid with a brush moist with alcohol.

Make sure that the cleaned area extends a minimum of 2 inches from the end of the area with damage.

20-14-12

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

- (8) Dry the cleaned area with a wiper.
- (9) Disconnect one end of the wire.
- (10) Put the end of the wire through the sleeve.
- (11) Apply a continuous layer of sealant on the area of braid with damage. Refer to Figure 2.

LAYER OF SEALANT ON THE DAMAGED GREEN OUTER BRAID
Figure 2

- (12) Align the center of the sleeve with the center of the area with damage. Refer to Figure 3.

POSITION OF THE SLEEVE ON THE CABLE
Figure 3

- (13) Put a layer of sealant between each end of the sleeve and wire. Refer to Figure 4.

Make sure that:

- The layer is continuous around the circumference of the wire
- The distance from the end of the sleeve to the end of the sealant is 0.5 inch minimum
- The area between the outer braid and the sleeve is full of sealant.

CONFIGURATION OF THE SLEEVE AND THE SEALANT
Figure 4

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

(14) Let the sealant cure for the specified cure time. Refer to Table 15.

**Table 15
SEALANT CURE TIME**

Sealant	Minimum Cure Time (Hours)
BMS 5-45 Class B	48
Proseal 860	8

(15) Put the wire harness in its initial installed configuration.

4. REPAIR OF AN UNSHIELDED LOW-Z WIRE

A. Wire Preparation

(1) Cut the wire.

Make sure that the area of the wire with damage is removed.

(2) Make a selection of a solvent from Table 9.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE OR CABLE.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE OR CABLE MUST NOT BE APPLIED. DAMAGE TO THE WIRE OR CABLE CAN OCCUR.

(3) Make a selection of a wiper from Table 10.

(4) Clean each end of the wire:

- With a wiper moist with alcohol
- From the end of the wire to a minimum of 2 inches from the end of the wire.

(5) Dry the cleaned area with a new wiper.

(6) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 5
- Table 16 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**INSULATION REMOVAL LENGTH
Figure 5**

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

**Table 16
INSULATION REMOVAL LENGTH**

Splice	Removal Length L (inch)	
	Target	Tolerance
31818	0.28	± 0.03
NAS1387-4	0.28	± 0.03

- (7) Remove the contamination from the end of the conductor and the cable jacket a minimum of 1.5 inch from the end of the wire.
- (8) Dry the cleaned area with a new wiper.

B. Assembly of a Splice

**Table 17
CRIMP TOOLS**

	49935	-	-	22-18
	69005	300454	-	-
	M22520/5-01	-	Y641	22-18
	PHRPU2	PHMT1005	-	-

- (1) Make a selection of a splice from Table 2.
- (2) Make a selection of a crimp tool from Table 17.
- (3) Make a selection of a 1.5 ± 0.1 inch length of 3/8 inch diameter transparent heat shrinkable sleeve from Table 7.

NOTE: An equivalent transparent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (4) Put the sleeve on the end of one wire.
- (5) Assemble one end of the splice:
 - (a) Put the splice in the crimp tool.
 - (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

- (c) Hold the splice in position with light pressure.
- (d) Put the wire in the end of the splice. Refer to Figure 7.

Make sure that:

- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- The end of the wire insulation is not more than 0.13 inch from the end of the crimp barrel.

- (e) Crimp the splice.
- (6) Do Step (5) again to assemble the other end of the splice.

C. Seal of a Splice Assembly

- (1) Make a selection of a solvent from Table 9.

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE WIRE.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A WIRE MUST NOT BE APPLIED. DAMAGE TO THE WIRE CAN OCCUR.

- (2) Make a selection of an injection tool from Table 10.
- (3) Make a selection of a wiper from Table 10.
- (4) Remove the contamination with a wiper moist with alcohol from:
 - The splice
 - The splice to a minimum of 2 inches from each end of the splice.
- (5) Dry the cleaned area with a new wiper.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

- (6) Make a selection of a sealant from Table 7.
- (7) Align the center of the sleeve with the center of the splice. Refer to Figure 8.

POSITION OF THE SLEEVE ON THE SPLICE ASSEMBLY
Figure 8

- (8) Put a layer of sealant between the sleeve and the splice. Refer to Figure 9.
- Make sure that:
- The layer is continuous
 - The distance from the end of the sleeve to the end of the sealant is 0.5 inch minimum
 - The area between the splice and the sleeve is full of sealant.

AREA OF SEALANT
Figure 9

- (9) Let the sealant cure for the specified cure time. Refer to Table 18.

Table 18
SEALANT CURE TIME

Sealant	Minimum Cure Time (Hours)
BMS 5-45 Class B	48
Proseal 860	8

5. REPAIR OF A SHIELDED HI-Z WIRE

A. Cable Preparation

- (1) Cut the cable at each edge of the area of damage.
Make sure that the area of the cable with damage is removed.
- (2) Make a selection of a solvent from Table 9.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE CABLE.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A CABLE MUST NOT BE APPLIED. DAMAGE TO THE CABLE CAN OCCUR.

- (3) Make a selection of a wiper from Table 10.
- (4) Clean each end of the cable:
 - With a wiper moist with alcohol
 - From the end of the cable to a minimum of 2 inches from the end of the cable.
- (5) Dry the cleaned area with a new wiper.
- (6) Prepare the cable. Refer to:
 - Figure 10
 - Table 19 for the removal lengths
 - Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 10

Table 19
INSULATION REMOVAL LENGTH

Contact	Removal Length L		
	Dimension	Target (inch)	Tolerance (inch)

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

Table 19 (continued)

Contact	Removal Length L		
	Dimension	Target (inch)	Tolerance (inch)
CN0940-44	A	0.50	± 0.03
	B	0.22	± 0.03
	C	0.18	± 0.03

- (a) Remove the necessary length of jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE AND RELIABILITY OF THE CABLE.

- (b) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE CABLE.

- (c) Remove the necessary length of the dielectric to make the distance from the end of the conductor to the end of the dielectric equal to Dimension C.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE CABLE.

- (7) Clean each end of the cable again:
- With a wiper moist with alcohol
 - From the end of the cable to a minimum of 2 inches from the end of the cable.
- (8) Dry the cleaned area with a new wiper.

B. Contact Assembly

WT-202	-	-
WT-202-06-08	-	S

- (1) Make a selection of a socket contact and a pin contact from Table 3.
- (2) Discard these items from the contact kit:
 - The seal boot
 - The outer ferrule.
- (3) Make a selection of an outer ferrule from Table 5.
- (4) Make a selection of one 2.5 inch ± 0.1 inch length of 3/8 inch diameter transparent heat shrinkable sleeve from Table 7.

NOTE: An equivalent transparent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (5) Make a selection of a center contact crimp tool from Table 20.
- (6) Make a selection of a ferrule crimp tool from Table 21.
- (7) Put the sleeve on the end of one cable.

20-14-12

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

- (8) Assemble the contact:
 - (a) Put the outer ferrule on the end of the cable.
 - (b) If the strands of the center conductor are apart, twist the strands together in their initial direction.
 - (c) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 11.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 11

- (d) Crimp the center contact.
Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

- (9) Move the strands of the shield apart. Refer to Figure 12.

CONFIGURATION OF THE SHIELD STRANDS

Figure 12

- (10) Put the body assembly on the center contact. Refer to Figure 13.
Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT
Figure 13

- (11) Push the center contact into the body assembly until it is locked in the body assembly.
- (12) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (13) If the center contact moves out of the body assembly, do Step (11) and Step (12) again.
- (14) Put the strands of the shield on the inner ferrule. Refer to Figure 14.
 Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 14

- (15) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 15.

POSITION OF THE OUTER FERRULE
Figure 15

- (16) Crimp the outer ferrule.

C. Seal of Engaged Contacts

- (1) Make a selection of a solvent from Table 9.

STANDARD WIRING PRACTICES MANUAL**REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES**

WARNING: SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE CABLE ASSEMBLY.

CAUTION: A SOLVENT THAT IS NOT SPECIFIED FOR THE MATERIALS AND THE COMPONENTS IN A CABLE ASSEMBLY MUST NOT BE APPLIED. DAMAGE TO THE CABLE ASSEMBLY CAN OCCUR.

- (2) Make a selection of a wiper from Table 10.
- (3) Clean the cable from the forward end of the contact to a minimum of 2 inches from the end of the contact.
- (4) Dry the cleaned area with a new wiper.
- (5) Engage the pin and socket contact. Refer to Figure 16.

ENGAGED PIN AND SOCKET CONTACTS
Figure 16

- (6) Apply a continuous layer of sealant on the area of the engaged contacts. Refer to Figure 17.

LAYER OF SEALANT ON THE ENGAGED CONTACTS
Figure 17

- (7) Slowly push the sleeve until the center of the sleeve is aligned with the center of the engaging contacts. Refer to Figure 18.

POSITION OF THE SLEEVE ON THE ENGAGED CONTACTS
Figure 18

- (8) Apply a continuous layer of sealant between the sleeve and the engaged contacts. Refer to Figure 19.

20-14-12

STANDARD WIRING PRACTICES MANUAL

REPAIR OF FUEL QUANTITY INDICATOR SYSTEM (FQIS) WIRE HARNESSSES

Make sure that:

- The engaged contacts has a full layer of sealant on the length and circumference of the contact surface
- The sealant extends a minimum of 0.12 inch farther than each end of the sleeve.

AREA OF SEALANT
Figure 19

- (9) Apply pressure with the fingers to the sleeve to push the air bubbles out.
- (10) Let the sealant cure for the specified time. Refer to Table 22.

2. CONNECTOR DISSASSEMBLY

Refer to Subject 20-61-11.

3. CONNECTOR ASSEMBLY

A. Contact Assembly

(1) Assemble each contact. Refer to Subject 20-61-11.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE FLIGHT RECORDER-AIDS WIRE HARNESS WITH A BACC63AF() FIREWALL CONNECTOR

B. Contact Insertion

- (1) Put the strain relief clamp on the wire harness.
- (2) Make a selection of a heat shrinkable sleeve from Table 2.
- (3) Put a 3.0 inch \pm 0.10 inch length of heat shrinkable sleeve on the wire harness.
- (4) Install each contact. Refer to Subject 20-61-11.

C. Backshell Assembly

- (1) Make a selection of these materials from Table 2:
 - A filler rod
 - A filler tape.

- (2) Put a 2.75 inch length of the filler rod in the center of the wires at the rear of the connector. Refer to Figure 1.

Make sure that the forward end of the rod is between 0.25 inch and 0.34 inch from the grommet.

POSITION OF THE FILLER ROD AND THE HEAT SHRINKABLE SLEEVE

Figure 1

- (3) Push the heat shrinkable sleeve forward until the forward end of the sleeve is 0.34 inch \pm 0.03 inch from the rear end of the connector grommet.
- (4) Shrink the sleeve in position. Refer to Subject 20-10-14.
- (5) Make a selection of a thread lock compound. Refer to Subject 20-00-11.
Refer to Table 3 for satisfactory alternative thread lock compounds.
- (6) Put a thin layer of the compound on one or two threads of the clamp around the circumference of the clamp.
- (7) Put a thin layer of the compound on one or two threads of the connector around the circumference of the connector.
- (8) Engage the threads of the clamp and the connector.
Make sure that the threads of the connector and the clamp are fully engaged.

NOTE: Isopropyl alcohol can be put on the connector grommet to make the installation easier. Refer to Table 1.

- (9) Manually tighten the coupling nut of the clamp.
- (10) Make a selection of a strap wrench from Table 2.
- (11) Tighten the clamp and the connector with the strap wrench.

20-14-51

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF THE FLIGHT RECORDER-AIDS WIRE HARNESS WITH A BACC63AF() FIREWALL CONNECTOR**

Make sure that the clamp does not make more than 1/8 turn with the strap wrench.

CAUTION: DO NOT TIGHTEN THE CLAMP MORE THAN NECESSARY. DAMAGE OF THE CONDUCTOR OR THE WIRED CONTACT CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (12) Try to loosen the clamp manually.

NOTE: The clamp is installed correctly when the clamp does not move in relation to the connector.

- (13) If the clamp is loose, do Step (11) and Step (12) again.

- (14) Put the necessary layers of tape on the wire harness to make a tight fit in the saddle clamp.

Make sure that:

- Each layer of tape makes a 100 percent overlap
- The center of the layers of tape is aligned with the center of the saddle clamp
- The forward edge of the tape extends a minimum of 0.06 inch farther than the forward edge of the clamp
- The rear edge of the tape extends a minimum of 0.06 inch farther than the rear edge of the clamp.

- (15) Tighten the saddle clamp screws.

Make sure that the wire harness has a tight fit in the clamp.

- (16) Assemble the a wire harness tie 0.5 inch \pm 0.06 inch from the rear end of the layers of filler tape.

- (17) Assemble the necessary wire harness ties every two inches on the remaining length of the wire harness.

- (18) Put the wire identification sleeve 4 inches from the rear of the connector.

20-14-52 CONTENTS

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

1. GENERAL DATA

A. Conditions for Repair or Replacement

The cable assembly must be replaced or repaired when one or more of these conditions occur:

- The connector has a crack
- The connector has damage that causes a short circuit between two or more contact cavities
- A contact has damage
- A contact retention mechanism does not lock a contact in a contact cavity
- The jackscrew hardware does not tightly hold the receptacle and the plug together
- A wire has damage; refer to Subject 20-10-13 for damage conditions of wire.

A cable assembly repair can be:

- The replacement of a damaged connector with a new connector
- The replacement of a damaged connector with a connector of a new cable assembly
- The repair or replacement of a damaged wire; refer to Subject 20-10-13 for applicable wire repair procedure.

B. Necessary Conditions for the Connection of the Plug and the Receptacle

The interfacial seal of the plug connector on the equipment must be replaced when one or more of these conditions occur:

- The interfacial seal is missing
- The interfacial seal has damage that extends from one contact cavity to a different contact cavity
- The interfacial seal has damage that extends from the outer edge of the seal to a contact cavity
- The interfacial seal has damage that extends from a jackscrew hole to a contact cavity.

2. PART NUMBERS AND DESCRIPTION

A. Cable Assembly Part Numbers

NOTE: The contacts in the connectors of the cable assemblies that are specified in Table 1 cannot be replaced.

D. Connector Description

The connectors have these technical features:

- Rectangular shape
- 3 rows of contacts
- 0.075 inch center-to-center contact spacing
- Two jackscrew coupling devices
- Size 24 crimp socket contacts
- Contacts installed from the connector rear.

4. CABLE ASSEMBLY REPAIR

A. Replacement of a Connector with a New Connector

**Table 7
NECESSARY TOOLS**

Tool	Type
Cutter	Diagonal Cutter

- (1) Make a selection of the applicable connector from Table 2.
- (2) Make a selection of a cutter from Table 7.
- (3) Disconnect the receptacle from the plug. Refer to Paragraph 5.A.
- (4) Cut one of the wires on the old connector as close as possible to the rear of the connector.
- (5) Assemble a contact with the wire. Refer to Paragraph 6.A.
- (6) Install the contact in the new connector. Refer to Paragraph 6.B.
- (7) Do Step (4) through Step (6) for each wire in the old connector.
- (8) Seal the new connector. Refer to Paragraph 6.C.

B. Replacement of a Connector with the Connector of a New Cable Assembly

**Table 8
NECESSARY TOOLS**

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

LOCATION OF SPLICE ASSEMBLIES

Figure 11

Refer to Figure 11.

- (1) Make a selection of the applicable cable assembly from Table 1.
- (2) Make a selection of a cutter from Table 8.
- (3) Disconnect the receptacle from the plug. Refer to Paragraph 5.A.
- (4) Cut one of the wires that is nearest to one of the ends of the old connector 2.0 inches ± 0.1 inch from the rear of the connector.
- (5) Cut the wire in the same contact position of the new connector 2.0 inches ± 0.1 inch from the rear of the new connector.
- (6) Assemble a sealed butt splice with the wire of the new connector and the wire of the harness.
Refer to Subject 20-30-12 for the selection of a sealed splice configuration.
- (7) Cut the next wire of the old connector at the location that is the same distance from the rear of the connector as the last wire plus 1.0 inch ± 0.1 inch.
- (8) Cut the wire in the same contact position of the new connector at the location that is the same distance from the connector as the last wire plus 1.0 inch ± 0.1 inch.
- (9) Assemble a sealed butt splice with the wire of the new connector and the wire of the harness.
Refer to Subject 20-30-12 for the selection of a sealed splice.
- (10) Do Step (7) through Step (9) again until approximately half of the wires of the harness have a splice.
- (11) Do Step (4) through Step (9) again for each of the remaining wires of the old connector.
Make sure to start with the next wire on the old connector.

Figure 12**

Refer to Figure 12.

- (1) Make a selection of a driver from Table 9.

NOTE: The driver can have a ball style end.

- (2) On one end of the receptacle, loosen the jackscrew hardware a small amount.
- (3) On the other end of the receptacle, loosen the jackscrew hardware a small amount.
- (4) Do Step (2) and Step (3) again until the jackscrews and the jackscrew sockets are fully disengaged.
- (5) Pull the receptacle from the plug.

B. Contact Removal

NOTE: If the connector is sealed, the contacts cannot be removed.

**Table 10
CONTACT REMOVAL TOOLS**

Engaging End Size	Removal Tool
24	CDG8161

- (1) Make a selection of a removal tool from Table 10.

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. A REMOVAL TOOL THAT HAS A DEFECT CAN CAUSE DAMAGE TO THE RETENTION CLIP.

- (2) Put the tip of the removal tool on the wire near the rear of the connector.
- (3) Axially align the removal tool and the contact cavity.
- (4) Carefully push the removal tool straight into the contact cavity until it stops.
- (5) Carefully pull the wire and the removal tool straight out of the contact cavity at the same time.
- (6) If the contact is not released:
 - (a) Pull the contact removal tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.
 - (c) Do Step (2) through Step (5) again.

6. CONNECTOR ASSEMBLY

A. Contact Assembly

**Table 11
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Crimp Barrel Size	Removal Length L (inch)	
		Target	Tolerance
24	24	0.15	±0.03

**Table 12
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool	
		Basic Unit	Locator
24	24	M22520/2-01	CDG4602

- (1) Make a selection of a crimp tool from Table 12.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 13
- Table 11 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**INSULATION REMOVAL LENGTH
Figure 13**

- (3) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 14.

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 14

(4) Crimp the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Contact Insertion

- (1) Carefully push the contact assembly straight into the contact cavity until it stops.
- (2) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (3) If the contact assembly is not locked in the contact cavity:
 - (a) Pull the contact assembly from the contact cavity.
 - (b) Do Step (1) and Step (2) again.

C. Seal of the Connector

NOTE: After the connector is sealed, the contacts cannot be removed.

Table 13
NECESSARY MATERIALS

Material	Specification	Part Number	Supplier
Sealant	BMS 5-92 Type 1	EC-2216	3M

- (1) Make a selection of a sealant from Table 13.
- (2) Make a selection of a contact from Table 4.

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

- (3) Install an unwired contact in each empty contact cavity.
Make sure that each unwired contact is locked in the contact cavity.
- (4) Apply a layer of sealant on the rear surface of the connector:
 - Around each wire
 - On each contact cavity with an unwired contact.

Make sure that the sealant is not applied on the jackscrew hardware.

NOTE: A piece of tape or paper can be used as a temporary barrier to keep the sealant away from the jackscrew hardware.

CAUTION: THE SEALANT MUST NOT BE APPLIED ON THE JACKSCREW HARDWARE. THE SEALANT PREVENTS THE CORRECT OPERATION OF THE JACKSCREWS.

- (5) Let the sealant cure for 120 minutes ± 10 minutes.

D. Plug and Receptacle Connection

**Table 14
NECESSARY TOOLS**

Tool	Type	Size (inch)
Driver	Allen Wrench	5/64
	Screwdriver, Hex	5/64
Torque	Allen Wrench	5/64
	Screwdriver, Hex	5/64

**LOCATION OF THE JACKSCREW HARDWARE
Figure 15**

Refer to Figure 15.

- (1) Make a selection of a driver from Figure 15.

NOTE: The driver can have a ball style end.

STANDARD WIRING PRACTICES MANUAL

AIRBORN RM342() CABLE ASSEMBLIES

- (2) If the plug connector does not have an interfacial seal:
 - (a) Make a selection of an interfacial seal from Table 3.
 - (b) Install the seal on the engaging face of the plug.

Make sure that:

 - The engaging end of each pin contact in the plug goes through the applicable hole in the seal.
 - The jackscrew hardware on each end of the plug goes through the applicable hole in the seal.
- (3) Align the jackscrew and the jackscrew socket of the receptacle with the jackscrew socket and the jackscrew of the plug.

CAUTION: IF THE INTERFACIAL SEAL IS NOT INSTALLED ON THE ENGAGING FACE OF THE PLUG CONNECTOR, DAMAGE TO THE PLUG CONNECTOR CAN OCCUR.

- (4) Push the receptacle straight against the plug.
- (5) On one end of the receptacle, engage the threads of the jackscrew and the jackscrew socket a small amount.
- (6) On the other end of the receptacle, engage the threads of the jackscrew socket and the jackscrew a small amount.
- (7) Tighten the jackscrew a small amount.
- (8) Tighten the jackscrew socket a small amount.
- (9) Do Step (7) and Step (8) again until the receptacle is against the interfacial seal of the plug connector.
- (10) Torque the jackscrew and jackscrew socket 3.75 inch-pounds ± 0.25 inch-pound.

CAUTION: DO NOT APPLY MORE THAN THE SPECIFIED TORQUE. DAMAGE TO THE PLUG CONNECTOR CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: WIRE INSULATION REMOVAL

1. GENERAL DATA

A. Necessary Conditions

Refer to Subject 20-00-15 for the necessary conditions that are applicable for:

- The removal of an outer jacket from the end of a shielded wire
- The removal of the primary insulation from the end of a wire.

2. SHIELDED WIRE JACKET AND WIRE INSULATION REMOVAL

A. Jacket and Insulation Removal Tools

CAUTION: THE TOOLS SPECIFIED IN TABLE 1 AND TABLE 2 MUST NOT BE USED TO REMOVE THE OUTER JACKET FROM A SHIELDED CABLE OR A SHIELDED WIRE THAT DOES NOT HAVE A CIRCULAR CROSS SECTION. DAMAGE TO THE SHIELD AND THE WIRES OF THE CABLE CAN OCCUR.

**Table 1

B. Insulation Removal for AWG 10 and Smaller Wire

This Paragraph gives the procedure to remove the primary insulation from the end of a wire.

For the procedure to remove the outer jacket from the end of a shielded wire, refer to Paragraph 2.D.

NOTE: It is recommended that a test of the tool with a sample of the wire is done before the operation is done on a wire that is installed or must be installed on the airplane.

- (1) Make a selection of a wire insulation removal tool from Table 1.
- (2) Put the wire in the correct hole in the tool.
- (3) Close the handles of the tool until the tool makes a click.
Make sure the handles stay closed.
- (4) Remove the wire from the tool.
- (5) Release the handles of the tool.
- (6) Examine the wire for damage. Refer to Paragraph 1.A.

C. Insulation Removal for AWG 8 and Larger Wire

This Paragraph gives the procedure to remove the primary insulation from the end of a wire.

For the procedure to remove the outer jacket from the end of a shielded wire, refer to Paragraph 2.D.

NOTE: It is recommended that a test of the tool with a sample of the wire is done before the operation is done on a wire that is installed or must be installed on the airplane.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: WIRE INSULATION REMOVAL

- (1) Make a selection of a wire insulation removal tool from Table 1.
- (2) Adjust the blades of the tool for the correct depth that is applicable for the wire.
- (3) Put the wire in the hole in the tool.
- (4) Close the handles of the tool until the tool makes a click.
Make sure the handles stay closed.
- (5) Remove the wire from the tool.
- (6) Release the handles of the tool.
- (7) Examine the wire for damage. Refer to Paragraph 1.A.

D. Shielded Wire Jacket Removal

This Paragraph gives the procedure to remove the outer jacket from the end of a shielded wire.

For the procedure to remove the primary insulation from the end of:

- An AWG 10 or smaller wire, refer to Paragraph 2.B.
- An AWG 8 or larger wire, refer to Paragraph 2.C.

NOTE: It is recommended that a test of the tool with a sample of the wire is done before the operation is done on a wire that is installed or must be installed on the airplane.

- (1) Make a selection of a wire insulation removal tool from Table 2.
- (2) Adjust the blades of the tool for the correct depth that is applicable for the wire.
- (3) Put the wire in the hole in the tool.
- (4) Close the handles of the tool until the tool makes a click.
Make sure the handles stay closed.
- (5) Remove the wire from the tool.
- (6) Release the handles of the tool.
- (7) Examine the wire for damage. Refer to Paragraph 1.A.

14	Blue	525691	1
12	Yellow	525692	1
10	Yellow	525692	1

- (1) Make a selection of a crimp tool from Table 5.
- (2) Remove the necessary length of insulation from the end of the wire. Refer to Subject 20-15-04.
- (3) Put the terminal lug in the crimp tool.
- (4) Put the wire in the crimp barrel of the terminal lug. Refer to Figure 1.

Make sure that:

- The end of the conductor can be seen
- The maximum distance from the end of the conductor to the forward end of the crimp barrel is 0.06 inch.

**POSITION OF THE WIRE IN THE CRIMP BARREL

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: SPLICES

CONFIGURATION OF THE SEALED BUTT SPLICE ASSEMBLY
Figure 1

- (1) Make a selection of a crimp tool from Table 7.
- (2) Put the heat shrinkable sleeve on one wire of the wires.
- (3) Remove 0.28 inch \pm 0.03 inch of insulation from the end of the wires. Refer to Subject 20-15-04.
- (4) Put the splice in the crimp tool.
- (5) If the splice has a seam, align the seam opposite the indenter.
- (6) Hold the splice in the tool with light pressure.
- (7) Put the end of one wire in the splice.
- (8) Crimp the splice.
- (9) Do Step (4) through Step (8) again for the other end of the splice.
- (10) Align the center of the heat shrinkable sleeve with the center of the splice.
- (11) Shrink the sleeve in position. Refer to Subject 20-10-14.

C. Assembly of Parallel Splices

Table 8
PARALLEL SPLICE CRIMP TOOLS

CONFIGURATION OF THE PARALLEL SPLICE ASSEMBLY
Figure 2

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: SPLICES

- (1) Make a selection of a heat shrinkable end cap from Table 5.
- (2) Make a selection of a crimp tool from Table 8.
- (3) Remove the 0.34 inch \pm 0.03 inch from the end of the wires. Refer to Subject 20-15-04.
- (4) Put the splice in the crimp tool.
- (5) If the splice has a seam, align the seam opposite the indenter.
- (6) Hold the splice in the tool with light pressure.
- (7) Put the wires in the splice.
- (8) Crimp the splice.
- (9) Put the end cap on the splice
- (10) Shrink the end cap in position. Refer to Subject 20-10-14.

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

C. Jackscrew Part Numbers

**Table 5
JACKSCREW PART NUMBERS**

Part Number	Type	Supplier
40-741-1759	Male	Smiths Industries
40-741-1760	Female	Smiths Industries

**MALE AND FEMALE JACKSCREWS
Figure 2**

2. CONNECTOR DISASSEMBLY

A. Separation of the Plug and the Receptacle

**Table 6
NECESSARY TOOLS**

Tool	Size (inch)
Screwdriver, Flat	-
Nut Driver	1/4

- (1) Make a selection of a tool from Table 6.
- (2) Turn one jackscrew counterclockwise two or three turns.
- (3) Turn the other jackscrew counterclockwise two or three turns.
- (4) Do Step (2) through Step (3) again until the jackscrews are fully disengaged.
- (5) Pull the connector away from the contactor.

B. Removal of the Plug from a Panel

**Table 7
NECESSARY TOOLS**

Tool	Description
Screwdriver	Phillips

- (1) Make a selection of a tool from Table 7.
- (2) Remove the two connector installation screws.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

- (3) Pull the connector out of the slot in the panel.

C. Contact Removal

**Table 8
CONTACT REMOVAL TOOLS**

Contact Size	Removal Tool	
	Part Number	Color
20	M81969/1-02	White

- (1) Make a selection of a contact removal tool from Table 8.
- (2) Examine the removal tool.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) Put the tip of the removal tool on the wire near the grommet.
- (4) Axially align the removal tool and the contact cavity.
- (5) Carefully push the removal tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the wire and the removal tool out of the contact cavity at the same time.
- (7) If the contact cannot be released:
 - (a) Pull the contact removal tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.
 - (c) Do Step (3) through Step (6) again.

3. CONNECTOR ASSEMBLY

A. Assembly of the Connector Installation Hardware

**Table 9
JACKSCREWS PART NUMBERS AND POSITIONS**

Contactor	Position Code	Jackscrew Position	Jackscrew
ELM1057-1	B	1	40-741-1759
		2	40-741-1759
ELM1058-1	C	1	40-741-1759
		2	40-741-1760
ELM1059-1	A	1	40-741-1760
		2	40-741-1759

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

**Table 10
NECESSARY MATERIALS**

Material	Part Number	Supplier
Thread Locking Compound	221	Loctite Corporation

**Table 11
NECESSARY TOOLS**

Tool	Size (inch)
Allen Wrench	0.05

**ASSEMBLY OF THE JACKSCREW
Figure 3**

Refer to Figure 3.

- (1) Make a selection of a thread locking compound from Table 10.
- (2) Make a selection of an Allen wrench from Table 11.
- (3) Make a selection of the necessary jackscrews from Table 9.
- (4) From the front face of the connector, put a jackscrew through the installation hole in the specified position. Refer to Table 9.
- (5) Put the washer on the jackscrew.
- (6) Put the jackscrew head on the jackscrew.
- (7) Put a drop of thread locking compound on the first two threads of the setscrew.
- (8) Engage the threads of the setscrew with the threads in the jackscrew head.
- (9) Tighten the setscrew.
- (10) Do Step (4) through Step (9) again for the other jackscrew.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

B. Contact Assembly

**Table 12
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Crimp Barrel Size	Removal Length L (inch)	
		Target	Tolerance
22	20	0.15	0.03
20	20	0.15	0.03

**Table 13
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool		
		Basic Unit		Locator
		Part Number	Setting	
22	20	M22520/2-01	6	M22520/2-08
20	20	M22520/2-01	7	M22520/2-08

- (1) Make a selection of a crimp tool from Table 13.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 4
- Table 12 for the insulation removal length
- Subject 20-15-04 for the insulation removal procedures.

**WIRE PREPARATION
Figure 4**

- (3) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 5.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 5

- (4) Crimp the contact.
- (5) Examine the contact assembly for these types of damage:
 - A strand of the conductor is broken
 - The base metal of a strand of the conductor can be seen
 - The crimp barrel of the contact has a crack.
- (6) If the contact or the wire has damage, replace the contact.

C. Contact Insertion

Table 14
CONTACT INSERTION TOOLS

Contact Size	Insertion Tool	
	Part Number	Color
20	M81969/1-02	Red

- (1) Make a selection of a contact insertion tool from Table 14.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT:

- IS BENT
- IS FLARED
- IS BROKEN
- HAS A CRACK.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

NOTE: As an alternative, the contacts can be inserted with the hand.

- (2) Put the contact assembly into the applicable end of the insertion tool.
- (3) At the rear face of the connector, axially align the contact and the tool with the contact cavity.
- (4) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully remove the tool from the contact cavity.
 Make sure to keep the tool perpendicular to the rear face of the connector.
- (6) Lightly pull the wire to make sure that the contact is locked in position.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: D SUBMINIATURE CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact out of the cavity.
 - (b) Do Step (2) through Step (6) again.

4. CONNECTOR INSTALLATION

A. Connection of the Plug and the Receptacle

**Table 15
NECESSARY TOOLS**

Tool	Size (inch)
Screwdriver, Flat	-
Nut Driver	1/4

- (1) Make a selection of a tool from Table 15.
- (2) Push the plug into the receptacle in the contactor.
- (3) Engage the threads of each jackscrew with the threads in the contactor.
- (4) Turn one jackscrew clockwise two or three turns.
- (5) Turn the other jackscrew clockwise two or three turns.
- (6) Do Step (4) through Step (5) again until the jackscrews are fully engaged.

B. Installation of the Connector in the Panel

- (1) Push the connector into the slot in panel until the connector flange is against the panel.
- (2) Engage the threads of the connector installation screws with the threads of the panel.
- (3) Tighten each screw.

5. APPROVED TOOL SUPPLIERS

2. CONNECTOR DISASSEMBLY

A. Separation of the Plug and the Receptacle

**Table 10
NECESSARY TOOLS**

Tool	Size (inch)
Flat screwdriver	-
Nut Driver	1/8

Refer to Figure 2 and Figure 3 for the different configurations of the jackscrews.

- (1) Make a selection of a tool from Table 10.
- (2) Turn one jackscrew counterclockwise two or three turns.
- (3) Turn the other jackscrew counterclockwise two or three turns.
- (4) Do Step (2) through Step (3) again until the jackscrews are fully disengaged.
- (5) Pull the plug away from the receptacle.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

B. Backshell Removal

BACKSHELL REMOVAL
Figure 4

Refer to Figure 4.

- (1) Remove the backshell installation screws.
- (2) Lift the free backshell half off the wire harness and the connector shell.
- (3) Remove the cable clamp installation screws.
- (4) Remove the cable clamp.
- (5) Pull the other backshell half off the wire harness and the connector shell.

C. Contact Removal

Table 11
CONTACT REMOVAL TOOLS

Engaging End Size	Removal Tool	
	Basic Unit	Tip
22	DHK 160	DHK160-PR-2

- (1) Make a selection of a contact removal tool from Table 11.
- (2) Examine the removal tool.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) At the front face of the connector, axially align the tool and the contact cavity.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR GROMMET OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (4) Push the tool until the shoulder of the contact is pushed out farther than the retention clips.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
- (6) Pull the contact out of the rear of the connector.

D. Connector Installation Hardware Removal

- (1) Remove the two dowel pins in the endcap. Refer to Figure 5.

**DOWEL PIN REMOVAL
Figure 5**

- (a) Put the point of a pointed metal tool on the side of the dowel pin.
 - (b) Push the dowel pin out of the end cap until the dowel pin can be held with pliers.
 - (c) Pull the dowel pin out of the end cap with pliers.
 - (d) Do Step (a) through Step (c) again for the other dowel pin.
- (2) Pull the jackscrew and the index keyway out of the installation hole.
 - (3) Do Step (1) through Step (2) again to remove the other index keyway and jackscrew.
 - (4) Put the connector installation hardware in a safe location, they are necessary to install the connector again.
 - (5) If new connector installation hardware is necessary, refer to Table 7 for replacement hardware.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

3. CONNECTOR ASSEMBLY

A. Assembly of the Connector Installation Hardware

CONNECTOR INSTALLATION HARDWARE ASSEMBLY

Figure 6

INDEX KEYWAY POLARIZATION POSITIONS

Figure 7

Refer to Figure 6 and Figure 7.

- (1) Put an end cap on installation flange of the connector.
Make sure the dowel pin holes are on the rear side of the connector.
- (2) Align the hole in the end cap with the hole of the flange.
- (3) For an index keyway with two halves, put each half of the index keyway around the jackscrew.
- (4) From the rear of the connector, put the jackscrew assembly in the installation hole with the long index keyway in the specified polarization position.

Refer to:

- Figure 1 for the location of the index keyways at the front face of the connector
- Figure 2 and Figure 3 for the different configurations of the jackscrews
- Figure 7 for the index keyway polarization positions.

- (5) Push a dowel pin into each hole from the outer edge of the end cap through the groove in the index keyway.

Make sure that the dowel pins are fully installed.

- (6) Do Step (1) through Step (5) again for the connector installation hardware on the other side of the connector.

Make sure that from the front face of the connector, the left and right index keyways are in the specified polarization position.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

Refer to:

- Figure 1 for the location of the index keyways at the front face of the connector
- Figure 7 for the polarization positions.

B. Contact Assembly

**Table 12
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Crimp Barrel Size	Removal Length L (inch)	
		Target	Tolerance
22	22	0.125	0.03

**Table 13
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool		
		Basic Unit		Locator Part Number
		Part Number	Setting	
22	22	M22520/2-01	5	K154

- (1) Make a selection of a crimp tool from Table 13.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 8
- Table 12 for the insulation removal length
- Subject 20-15-04 for the insulation removal procedures.

**WIRE PREPARATION
Figure 8**

- (3) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 9.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 9

- (4) Crimp the contact.
- (5) Examine the contact assembly for these types of damage:
 - A strand of the conductor is broken
 - The base metal of a strand of the conductor can be seen
 - The crimp barrel of the contact has a crack.
- (6) If the contact or the wire has damage, replace the contact.

C. Contact Insertion

Table 14
CONTACT INSERTION TOOLS

Crimp Barrel Size	Removal Tool	
	Basic Unit	Tip
22	DHK 160	DHK160-26-2

- (1) Make a selection of a contact insertion tool from Table 14.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT:

- IS BENT
- IS FLARED
- IS BROKEN
- HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (2) Put the contact in the applicable end of the insertion tool.
- (3) At the rear face of the connector, axially align the contact and the tool with the contact cavity.
- (4) Carefully push the tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in its position.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact out of the cavity.
 - (b) Do Step (2) through Step (6) again.

D. Backshell Assembly

BACKSHELL ASSEMBLY
Figure 10

Refer to Figure 10.

Table 15
NECESSARY MATERIALS

Material	Part Number	Supplier
Tape	Scotch 70	3M

- (1) Make a selection of a tape from Table 15.
- (2) Increase the O.D. of the wire harness with tape:
 - (a) Put a backshell half on the connector.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HIGH DENSITY D SUBMINIATURE CONNECTORS

- (b) Make a mark on the wire harness at the location of the center of the cable clamp.
 - (c) Remove the backshell.
 - (d) Wind the necessary layers of tape around the wire harness at the mark to make a tight fit in the cable clamp.
- (3) Put a backshell half on the connector shell and the wire harness.
- (4) Put the cable clamp on the wire harness.
- (5) Install each cable clamp screw.
- Make sure that:
- The screws are tight
 - The clamp holds the wire harness tightly.
- (6) Put the other half of the backshell on the connector shell and the wire harness.
- (7) Install each backshell installation screw.
- Make sure that the screws are tight.

4. CONNECTOR INSTALLATION

A. Connection of the Plug and the Receptacle

**Table 16
NECESSARY TOOLS**

Tool	Size (inch)
Flat screwdriver	-
Nut Driver	1/8

- (1) Make a selection of a tool from Table 16.
- (2) Align the plug and the receptacle.
- (3) Push the plug into the receptacle.
- (4) Engage the threads of each jackscrew with the threads in the nut.
- (5) Turn one jackscrew on the plug clockwise two or three turns.
- (6) Turn the other jackscrew on the plug clockwise two or three turns.
- (7) Do Step (5) through Step (6) again until the jackscrews are fully engaged.
- (8) Torque each screw 1.3 inch-pounds.

A. Connector Separation

**Table 6
NECESSARY TOOLS**

Tool	Type	Size
Cutter	Diagonal Cutters	-
	Knife	-
Driver	Nutdriver, Hex	1/8 inch
	Screwdriver, Flat Blade	Small

- (1) Make a selection of these tools from Table 6:
 - A cutter
 - A driver.
- (2) Cut the lockwire on the jackscrew assembly on the receptacle. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

LOCKWIRE REMOVAL
Figure 1

- (3) Remove the lockwire from the receptacle and the jackscrew.
- (4) Disengage the jackscrews:
 - (a) On one end of the receptacle, loosen the jackscrew a small amount.
 - (b) On the other end of the receptacle, loosen the jackscrew a small amount.
 - (c) Do Step (a) and Step (b) again until the jackscrews are fully disengaged.
- (5) Pull the receptacle from the plug. Refer to Figure 1.

RECEPTACLE AND PLUG SEPARATION
Figure 2

- (1) Make a selection of a heat shrinkable sleeve from Table 5.

STANDARD WIRING PRACTICES MANUAL**777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS**

Make sure that the sleeve has the smallest diameter that can move easily on the wire.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Make a selection of a crimp tool from Table 9.
- (3) Put a 1 inch length of the heat shrinkable sleeve on the wire.
- (4) Remove the necessary length of insulation from the end of the wire. Refer to Table 8.
- (5) Put the end of the wire in the crimp barrel of the contact.
- (6) Crimp the contact.

B. Contact Insertion

- (1) Align the flat sides of the body of the contact with the flat sides of the contact cavity. Refer to Figure 3.

ALIGNMENT OF THE CONTACT AND CONTACT CAVITY
Figure 3

- (2) Carefully push the contact into the contact cavity until it stops.
- (3) Lightly pull the wire to make sure the contact is locked in the contact cavity.
- (4) If the contact is not locked in the contact cavity, do Step (1) through Step (3) again.
- (5) Push the heat shrinkable sleeve forward until the forward end of the sleeve is against the rear surface of the connector.
- (6) Shrink the sleeve into position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

4. CONNECTOR INSTALLATION

A. Assembly of the Plug Jackscrew Socket

**Table 10
NECESSARY MATERIALS**

Material	Part Number	Supplier
Activator	Loctite 7471	Loctite
Sealant	Loctite 221	Loctite

**Table 11
NECESSARY TOOLS**

Tool	Type	Size
Driver	Nutdriver, Hex	1/4 inch

- (1) Make a selection of these materials from Table 10:
 - A sealant
 - An activator.
- (2) Make a selection of a driver from Table 11.
- (3) Put the jackscrew socket in the hole in the left side of the front face of the plug. Refer to Figure 4. Make sure that the polarization keyway is aligned with the correct letter indicator.

**LEFT JACKSCREW SOCKET POLARIZATION
Figure 4**

- (4) Put the jackscrew socket in the hole in the right side of the front face of the plug. Refer to Figure 5. Make sure that the polarization keyway is aligned with the correct number indicator.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

RIGHT JACKSCREW SOCKET POLARIZATION
Figure 5

- (5) Prepare the installation nuts:
 - (a) Put a small amount of the activator on the threads of each installation nut.
 - (b) Let the activator dry for 10 minutes minimum.
 - (c) Put a small amount of sealant on the threads of each nut.
- (6) Install the plug. Refer to Figure 6.

PLUG INSTALLATION
Figure 6

- (a) Put the threads of the jackscrew socket in the installation holes of the structure.
- (b) Put a washer on each of the jackscrew sockets.
- (c) Put a lock washer on each of the jackscrew sockets.
- (d) Fully engage the threads of each nut with the threads of the applicable jackscrew socket.

20-15-43

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

(e) Torque each nut 4 inch-pounds \pm 0.4 inch-pounds.

B. Assembly of the Receptacle Jackscrew

**Table 12
NECESSARY TOOLS**

Tool	Type	Size
Driver	Nutdriver, Hex	1/4 inch

- (1) Make a selection of a driver from Table 12.
- (2) Put one of the jackscrew guides in the hole in the right side of the front face of the receptacle. Refer to Figure 7.

Make sure that the polarization key:

- Is aligned with the correct letter indicator
- Is pointed away from the connector.

**RIGHT JACKSCREW POLARIZATION
Figure 7**

- (3) Put a washer on the end of one of the jackscrews.
- (4) From the rear of the connector, fully engage the threads of the jackscrew and the jackscrew guide.
- (5) Put the other jackscrew guide in the hole in the left side of the front face of the receptacle.

Make sure that the polarization key:

- Is aligned with the correct number indicator
- Is pointed away from the connector.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

LEFT JACKSCREW POLARIZATION

Figure 8

- (6) Put a washer on the end of the other jackscrew.
- (7) From the rear of the connector, fully engage the threads of the jackscrew and the jackscrew guide.
- (8) From the rear of the connector, torque each jackscrew nut 4 inch-pounds \pm 0.4 inch-pounds. Refer to Figure 9.

RECEPTACLE JACKSCREW ASSEMBLY

Figure 9

C. Plug and Receptacle Connection

**Table 13
NECESSARY TOOLS**

Pliers	Lock	-
	Wire Twister	-

20-15-43

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

RECEPTACLE AND PLUG CONNECTION

Figure 10

Refer to Figure 10.

- (1) Make a selection of a driver from Table 13.
- (2) Align the engaging face of the receptacle with the engaging face of the plug.
- (3) Push the receptacle straight against the plug.
- (4) On one end of the receptacle, engage the threads of the jackscrew and the jackscrew a small amount.
- (5) On the other end of the receptacle, engage the threads of the jackscrew and the jackscrew a small amount.
- (6) Tighten one of the jackscrews a small amount.
- (7) Tighten the other jackscrew a small amount.
- (8) Do Step (6) and Step (7) again until the jackscrews are fully tightened.
- (9) Torque each jackscrew 1.3 inch-pounds \pm 0.1 inch-pounds.
- (10) Install the necessary length of lockwire on one end of the receptacle. Refer to Figure 11.

20-15-43

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: HYPERTAC HPW CONNECTORS

LOCKWIRE INSTALLATION
Figure 11

- (a) Make a selection of lockwire from Table 5.
- (b) Make a selection of pliers from Table 13.
- (c) Push one end of the lockwire through the hole in the jackscrew.
- (d) Push the same end of the lockwire into the hole on the rear surface of the receptacle.
- (e) Pull the end of the lockwire from the hole on the top surface of the receptacle.
- (f) Twist the ends of the lockwire together.
- (g) Remove the necessary length of the twisted lockwire to make the distance from the end of the lockwire to the jackscrew equal to approximately 0.25 inch.
- (h) Fold the end of the twisted lockwire:
 - Back against the rear surface of the receptacle
 - Away from the nearest contact cavities.

Tool	Size (inch)
Hex Nut Driver	5/32

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

RELAY REMOVAL - TYPE 1 INSTALLATION CONFIGURATION
Figure 5

Refer to Figure 5.

- (1) Make a selection of a hex nut driver from Table 10.
- (2) Remove the 4-40 hex lock nut.
- (3) Remove the flat washer.
- (4) Do Step (2) and Step (3) again for each remaining relay installation hardware.
- (5) Pull the relay from the relay socket.

B. Relay Removal - Type 2 and Type 3 Installation Configurations

Table 11
NECESSARY TOOLS

Tool	Type
Screwdriver	Phillips

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

RELAY REMOVAL - TYPE 2 INSTALLATION CONFIGURATION
Figure 6

RELAY REMOVAL - TYPE 3 INSTALLATION CONFIGURATION
Figure 7

Refer to:

- Figure 6 for a Type 2 installation configuration
- Figure 7 for a Type 3 installation configuration.

- (1) Make a selection of a screwdriver from Table 11.
- (2) Remove the Phillips screw.
- (3) Remove the lock washer.
- (4) Remove the flat washer.
- (5) Do Step (2) through Step (4) again for each relay installation hardware.
- (6) Pull the relay from the relay socket.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

C. Contact Removal

**Table 12
CONTACT REMOVAL TOOLS**

Contact Size		Part Number
Engaging End	Crimp Barrel	
22	22	M81969/8-04
		M81969/14-01
	20	M81969/8-06
		M81969/14-02

	12	M81969/8-10
		M81969/14-04

- (1) Make a selection of a contact removal tool from Table 12.
- (2) Examine the removal tool.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) Put the tip of the removal tool on the wire near the grommet.
- (4) Axially align the removal tool and the contact cavity.
- (5) Carefully push the removal tool straight into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the wire and the removal tool straight out of the contact cavity at the same time.
- (7) If the contact cannot be released:
 - (a) Pull the contact removal tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.
 - (c) Do Step (3) through Step (6) again.

STANDARD WIRING PRACTICES MANUAL

D. Relay Socket Removal - Type 1 Installation Configuration

**Table 13
NECESSARY TOOLS**

Tool	Size (inch)
Hex Nut Driver	7/32

**RELAY SOCKET REMOVAL - TYPE 1 INSTALLATION CONFIGURATION
Figure 8**

Refer to Figure 8.

- (1) Remove the relay. Refer to Paragraph 3.A.
- (2) Make a selection of a hex nut driver from Table 13.
- (3) Remove the 8-32 hex lock nut.
- (4) Remove the spacer.
- (5) Do Step (3) and Step (4) again for each remaining installation hardware for the relay socket.
- (6) Pull the relay socket from the panel.

E. Relay Socket Removal - Type 2 Installation Configuration

Tool	Size (inch)
Hex Nut Driver	1/4

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

RELAY SOCKET REMOVAL - TYPE 2 INSTALLATION CONFIGURATION
Figure 9

Refer to Figure 9.

- (1) Remove the relay. Refer to Paragraph 3.B.
- (2) Make a selection of a hex nut driver from Table 14.
- (3) Remove the 4-40 hex lock nut.
- (4) Remove the flat washer.
- (5) Remove the mounting stud.
- (6) Do Step (3) through Step (5) again for each remaining installation hardware for the relay socket.
- (7) Pull the relay socket from the panel.

F. Relay Socket Removal - Type 3 Installation Configuration

Table 15
NECESSARY TOOLS

Tool	Size (inch)
Hex Nut Driver	3/16

RELAY SOCKET REMOVAL - TYPE 3 INSTALLATION CONFIGURATION
Figure 10

Refer to Figure 10.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

- (1) Remove the relay. Refer to Paragraph 3.B.
- (2) Make a selection of a hex nut driver from Table 15.
- (3) Remove the 4-40 hex nut.
- (4) Remove the lock washer.
- (5) Remove the flat washer.
- (6) Remove the mounting stud.
- (7) Remove the spacer.
- (8) Do Step (3) through Step (7) again for each remaining installation hardware for the relay socket.
- (9) Pull the relay socket from the panel.

4. RELAY SOCKET ASSEMBLY

A. Relay Socket Installation - Type 1 Installation Configuration

**Table 16
NECESSARY TOOLS**

Tool	Size (inch)	Special Instructions
Torque	-	Tool must measure 9 inch-pounds minimum
Socket	7/32	-

**RELAY SOCKET INSTALLATION - TYPE 1 INSTALLATION CONFIGURATION
Figure 11**

Refer to Figure 11.

- (1) Make a selection of a torque tool from Table 16.
- (2) Make a selection of a spacer for a Type 1 installation configuration from Table 6.
- (3) Make a selection of a 8-32 hex lock nut for a Type 1 installation configuration from Table 6.
- (4) Align the studs on the relay socket with the holes in the panel.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

- (5) Put the relay socket against the panel.
- (6) Put the spacer on the stud.
- (7) Engage the threads of the 8-32 hex lock nut with the threads of the stud.
- (8) Torque the lock nut to 10 inch-pounds \pm 1 inch-pound.
- (9) Do Step (2) through Step (8) again for each remaining installation hardware for the relay socket.

B. Relay Socket Installation - Type 2 Installation Configuration

**Table 17
NECESSARY TOOLS**

Tool	Size (inch)	Special Instructions
Torque	-	Tool must measure 6 inch-pounds minimum
Socket	1/4	-

**RELAY SOCKET INSTALLATION - TYPE 2 INSTALLATION CONFIGURATION
Figure 12**

Refer to Figure 12.

- (1) Make a selection of a torque tool from Table 17.
- (2) Make a selection of a socket from Table 17.
- (3) Make a selection of a mounting stud for a Type 2 installation configuration from Table 6.
- (4) Make a selection of a flat washer for a Type 2 installation configuration from Table 6.
- (5) Make a selection of a 4-40 hex lock nut for a Type 2 installation configuration from Table 6.
- (6) Put the relay socket against the panel.
- (7) Install the mounting stud through the panel and the relay socket.
- (8) Put the flat washer on the mounting stud.
- (9) Engage the threads of the 4-40 hex lock nut with the threads of the mounting stud.
- (10) Torque the hex lock nut to 6.5 inch-pounds \pm 0.5 inch-pound.
- (11) Do Step (3) through Step (10) again for each remaining installation hardware for the relay socket.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

C. Relay Socket Installation - Type 3 Installation Configuration

**Table 18
NECESSARY TOOLS**

Tool	Size (inch)	Special Instructions
Torque	-	Tool must measure 6 inch-pounds minimum
Socket	3/16	-

**RELAY SOCKET INSTALLATION - TYPE 3 INSTALLATION CONFIGURATION
Figure 13**

Refer to Figure 13.

- (1) Make a selection of a torque tool from Table 18.
- (2) Make a selection of a socket from Table 18.
- (3) Make a selection of a mounting stud for a Type 3 installation configuration from Table 6.
- (4) Make a selection of a 4-40 hex nut for a Type 3 installation configuration from Table 6.
- (5) Make a selection of a lock washer for a Type 3 installation configuration from Table 6.
- (6) Make a selection of a flat washer for a Type 3 installation configuration from Table 6.
- (7) Put the relay socket against the panel.
- (8) Install the mounting stud through the panel and the relay socket.
- (9) Put the flat washer on the mounting stud.
- (10) Put the lock washer on the flat washer.
- (11) Engage the threads of the 4-40 hex nut with the threads of the mounting stud.
- (12) Torque the hex nut to 6.5 inch-pounds ± 0.5 inch-pound.
- (13) Do Step (3) through Step (12) again for each remaining installation hardware for the relay socket.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

14	12	12	0.25	0.03	-
12	12	12	0.25	0.03	-

- (1) Make a selection of a crimp tool from Table 19.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 14
- Table 20 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 14**

- (3) If it is specified, fold the conductor back. Refer to Figure 15.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

CONDUCTOR FOLDED BACK

Figure 15

(4) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 16.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL

Figure 16

(5) Crimp the contact.

(6) Examine the wired contact for these types of damage:

- A strand of the conductor is broken
- The base metal of a strand of the conductor can be seen
- The crimp barrel of the contact has a crack.

(7) If the contact or the wire has damage, replace the contact.

E. Contact Insertion

**Table 21

Table 21 (continued)

Contact Size		Part Number
Engaging End	Crimp Barrel	
12	16	M81969/8-09
		M81969/14-04
	12	M81969/8-09
		M81969/14-04

- (1) Make a selection of a contact insertion tool from Table 21.

NOTE: As an alternative, the contacts can be inserted with the hand.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT:

- IS BENT
- IS FLARED
- IS BROKEN
- HAS A CRACK.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

- (2) Put the contact assembly into the applicable end of the insertion tool.
 (3) At the rear face of the relay socket, axially align the contact and the tool with the contact cavity.
 (4) Push the tool into the contact cavity until the tool stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully remove the tool from the contact cavity.
 Make sure to keep the tool perpendicular to the face of the relay socket.
 (6) Lightly pull the wire to make sure that the contact is locked in position.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE RELAY SOCKET OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 (a) Pull the contact out of the cavity.
 (b) Do Step (2) through Step (6) again.

F. Relay Installation - Type 1 Installation Configuration

**Table 22
NECESSARY TOOLS**

Tool	Size (inch)	Special Instructions
Torque	-	Tool must measure 3 inch-pounds minimum
Socket	3/32	-

**RELAY INSTALLATION - TYPE 1 INSTALLATION CONFIGURATION
Figure 17**

Refer to Figure 17.

- (1) Make a selection of a torque tool from Table 22.
- (2) Make a selection of a socket from Table 22.
- (3) Make a selection of a flat washer for a Type 1 installation configuration from Table 6.
- (4) Make a selection of 4-40 hex lock nut for a Type 1 installation configuration from Table 6.
- (5) Align the relay with the relay socket.
- (6) Push the relay into the relay socket.
- (7) Put the flat washer on the stud.
- (8) Engage threads of the lock nut with the threads of the stud.
- (9) Torque the lock nut to 4 inch-pounds \pm 1 inch-pound.
- (10) Do Step (3) through Step (9) again for each remaining relay installation hardware.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: RELAY SOCKETS AND RELAYS

G. Relay Installation - Type 2 Installation Configuration

**Table 23
NECESSARY TOOLS**

Tool	Special Instructions
Torque	Tool must measure 3 inch-pounds minimum
Phillips Bit	-

**RELAY INSTALLATION - TYPE 2 INSTALLATION CONFIGURATION
Figure 18**

Refer to Figure 18.

- (1) Make a selection of a torque tool from Table 23.
- (2) Make a selection of a Phillips bit from Table 23.
- (3) Make a selection of a lock washer for a Type 2 installation configuration from Table 6.
- (4) Make a selection of a flat washer for a Type 2 installation configuration from Table 6.
- (5) Make a selection of a Phillips pan head screw for a Type 2 installation configuration from Table 6.
- (6) Align the relay with the relay socket.
- (7) Push the relay into the relay socket.
- (8) Put the lock washer on the screw.
- (9) Put the flat washer on the screw.
- (10) Engage the threads of the screw with the threads of the mounting stud.
- (11) Torque the screw to 4 inch-pounds \pm 1 inch-pound.
- (12) Do Step (3) through Step (11) again for each remaining relay installation hardware.

**Table 24
NECESSARY TOOLS**

Tool	Special Instructions
Torque	Tool must measure 3 inch-pounds minimum
Phillips Bit	-

**RELAY INSTALLATION - TYPE 3 INSTALLATION CONFIGURATION
Figure 19**

Refer to Figure 19.

- (1) Make a selection of a torque tool from Table 24.
- (2) Make a selection of a Phillips bit from Table 24.
- (3) Make a selection of a lock washer for a Type 3 installation configuration from Table 6.
- (4) Make a selection of a flat washer for a Type 3 installation configuration from Table 6.
- (5) Make a selection of a Phillips pan head screw for a Type 3 installation configuration from Table 6.
- (6) Align the relay with the relay socket.
- (7) Push the relay into the relay socket.
- (8) Put the lock washer on the screw.
- (9) Put the flat washer on the screw.
- (10) Engage the threads of the screw with the threads of the mounting stud.
- (11) Torque the screw to 4 inch-pounds \pm 1 inch-pound.
- (12) Do Step (3) through Step (11) again for each remaining relay installation hardware.

3. TERMINAL JUNCTION SYSTEM DISASSEMBLY

A. Contact Removal

**Table 13
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool	
	Part Number	Color
22	M81969/8-04	-
	M81969/14-01	White
20	M81969/8-06	-
	M81969/14-02	White
16	M81969/8-08	-
	M81969/14-03	White
12	M81969/8-10	-
	M81969/14-04	White

- (1) Make a selection of a contact removal tool from Table 13.
- (2) Put the end of the removal tool on the wire.
- (3) Carefully push the tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CONTACT CAVITY. DAMAGE TO THE RETENTION CLIPS CAN OCCUR.

- (4) Pull the wire and the tool out of the contact cavity at the same time.
- (5) If the contact does not come out of the contact cavity:

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: AIR LB TERMINAL JUNCTION SYSTEM

- (a) Pull the tool out of the contact cavity.
- (b) Turn the tool 90 degrees.
- (c) Do Step (2) through Step (4) again.

B. Removal of a Terminal Module from a Track

- (1) Put a flat screwdriver or an equivalent tool on the module against the side of the track that is opposite the rail. Refer to Figure 11.

POSITION OF THE TOOL
Figure 11

- (2) Push the module up until it is disengaged from the track.

4. TERMINAL JUNCTION SYSTEM ASSEMBLY

A. Contact Assembly

Table 14
CONTACT CRIMP TOOLS

16	16	0.28	0.03	-
14	12	0.28	0.03	-
12	12	0.28	0.03	-

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 12
- Table 15 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 12**

(2) If it is specified, fold the conductor back. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: AIR LB TERMINAL JUNCTION SYSTEM

CONDUCTOR FOLDED BACK

Figure 13

- (3) Make a selection of a crimp tool from Table 14.
- (4) Push the conductor into the crimp barrel of the contact. Refer to Figure 14.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is a maximum of 0.03 inch.

THE POSITION OF THE WIRE IN THE CRIMP BARREL

Figure 14

- (5) Crimp the contact.
- (6) Examine the wired contact for these types of damage:
 - A strand of the conductor is broken
 - The base metal of a strand of the conductor can be seen
 - The crimp barrel of the contact has a crack.
- (7) If the contact or the wire has damage, replace the contact.

B. Contact Insertion

	M81969/14-04	Yellow

20-15-48

STANDARD WIRING PRACTICES MANUAL**777 ELMS PANEL REPAIR: AIR LB TERMINAL JUNCTION SYSTEM**

- (1) Make a selection of a contact insertion tool from Table 16.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT:

- IS BENT
- IS FLARED
- IS BROKEN
- HAS A CRACK.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (2) Put the contact in the insertion end of the insertion tool.

CAUTION: AN UNWIRED CONTACT MUST NOT BE INSTALLED IN A MODULE. IT CANNOT BE REMOVED.

- (3) Axially align the contact and the tool with the contact cavity.

- (4) Carefully push the tool straight into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool straight out of the contact cavity.

- (6) Lightly pull the wire to make sure that the contact is locked in position.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE TERMINAL MODULE OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:

- (a) Pull the contact out of the cavity.
- (b) Do Step (2) through Step (6) again.

C. Installation of a Terminal Module on a Track

POSITION OF THE MODULE IN THE TRACK

Figure 15

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: AIR LB TERMINAL JUNCTION SYSTEM

Refer to Figure 15.

- (1) Put the tab of the terminal module in the slot below the rail of the track.
- (2) Align the tab on the opposite side of the module with the cutout on the opposite side of the track.
- (3) Push the module down until it makes click and the module is locked in position.

D. Installation of a Ground Module on a Panel

**Table 17
GROUND MODULE INSTALLATION FASTENERS**

Fastener	Size	Quantity
Screw, Hex	6-32	2
Washer, Flat	6	2
Washer, Lock	6	2

- (1) Make a selection of the necessary fasteners from Table 17.
- (2) Put a lock washer on each screw.
- (3) Put a flat washer on each screw.
- (4) Align the installation screw holes on the ground module with the installation holes in the panel.
- (5) Engage the threads of the screws and the installation holes.
- (6) Torque each screw 13 inch-pounds \pm 1 inch-pound.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

1. PART NUMBERS AND DESCRIPTION

A. Terminal Junction System Description

The terminal junction system has these components:

- Terminal modules
- Tracks
- Ground modules.

B. Terminal Module Part Numbers

**Table 1
TERMINAL MODULE PART NUMBERS**

Part Number	Size	Mount Type	Supplier
53710-001	22	Track	Smiths Industries
53710-002	22	Track	Smiths Industries
53710-003	22	Track	Smiths Industries

**Table 2
EQUIVALENT TERMINAL MODULE PART NUMBERS**

Terminal Module	Equivalent Terminal Module	
	Part Number	Supplier
53710-001	M81714/60-22-01	QPL
53710-002	M81714/60-22-02	QPL
53710-003	M81714/60-22-06	QPL

C. Terminal Module Track Part Numbers

**Table 3
TRACK PART NUMBERS**

Part Number	Supplier	Maximum Number of Modules
53270-002	Smiths Industries	4
53270-003	Smiths Industries	8

	M81969/16-01	White
16	M81969/14-03	White
	M81969/16-02	White

- (1) Make a selection of a contact removal tool from Table 11.
- (2) Put end of the removal tool on the wire near the grommet.
- (3) Carefully push the tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHILE IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (4) Pull the wire and the tool out of the contact cavity at the same time.
- (5) If the contact does not come out of the contact cavity:
 - (a) Pull the tool out of the contact cavity.
 - (b) Pull the tool out of the contact cavity.
 - (c) Turn the tool 90 degrees.
 - (d) Do Step (2) through Step (4) again.

B. Removal of a Terminal Module from a Track

**Table 12
MODULE REMOVAL TOOLS**

Terminal Module Size	Tool Part Number
22	CNA051300
	M81714/69-01

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

REMOVAL OF THE MODULE
Figure 4

Refer to Figure 4.

- (1) Make a selection of a terminal module removal tool from Table 12.
- (2) Put each end of the tool on opposite sides of the module.
- (3) Push the tool to the track until it is fully inserted.
- (4) Push the ends of the tool together.
- (5) Pull the module from the track.

4. TERMINAL JUNCTION SYSTEM ASSEMBLY

A. Contact Assembly

Table 13
INSULATION REMOVAL LENGTH

	16	M22520/7-01	6	M22520/7-13
20	20	M22520/7-01	5	M22520/7-12
	16	M22520/7-01	6	M22520/7-13
18	16	M22520/7-01	7	M22520/7-13
16	16	M22520/7-01	8	M22520/7-13

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 5
- Table 13 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 5**

(2) If it is specified, fold the conductor back. Refer to Figure 6.

**CONDUCTOR FOLDED BACK
Figure 6**

(3) Make a selection of a crimp tool from Table 14.

(4) Push the end of the wire into the crimp barrel of the contact. Refer to Figure 7.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel a maximum of 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 7

- (5) Crimp the contact.
- (6) Examine the wired contact for these types of damage:
 - A strand of the conductor is broken
 - The base metal of a strand of the conductor can be seen
 - The crimp barrel of the contact has a crack.
- (7) If the contact or the wire has damage, replace the contact.

B. Contact Insertion

Table 15
CONTACT INSERTION TOOLS

Crimp Barrel Size	Insertion Tool	
	Part Number	Color
22	M81969/14-01	Green
	M81969/16-04	Green
20	M81969/14-02	Red
	M81969/16-01	Red
16	M81969/14-03	Blue
	M81969/16-02	Blue

- (1) Make a selection of a contact insertion tool from Table 15.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT:

- IS BENT
- IS FLARED
- IS BROKEN
- HAS A CRACK.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (2) Put the contact in the insertion end of the insertion tool.

CAUTION: AN UNWIRED CONTACT MUST NOT BE INSTALLED IN A MODULE. IT CANNOT BE REMOVED.

- (3) Axially align the contact and the tool with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

(4) Carefully push the tool straight into the contact cavity until it stops.

CAUTION: DO NOT TURN THE TOOL WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

(5) Carefully pull the tool straight out of the contact cavity.

(6) Lightly pull the wire to make sure that the contact is locked in position.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE TERMINAL MODULE OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

(7) If the contact is not locked in the contact cavity:

- (a) Pull the contact out of the cavity.
- (b) Do Step (2) through Step (6) again.

C. Installation of a Diode

(1) Prepare the lead wires of the diode. Refer to Figure 8.

LEAD WIRE PREPARATION
Figure 8

- (a) Bend one lead wire back to make it parallel with the other lead wire.
Make sure that the bend is not less than 0.03 inch from the body of the diode.
- (b) Cut each lead wire on the diode to make the length from the end of the diode to the end of the wire equal to 0.48 inch.

(2) Assemble a contact on the end of each lead wire. Refer to Paragraph 4.A.

(3) Put a length of heat shrinkable sleeve on the diode and the lead wires. Refer to Figure 9.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 9

(4) Insert the contacts of the diode into the terminal module. Refer to Paragraph 4.B. and Figure 10.

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

INSTALLATION OF THE DIODE
Figure 10

D. Installation of a Resistor

- (1) Prepare the lead wires of the resistor. Refer to Figure 11.

LEAD WIRE PREPARATION
Figure 11

- (a) Bend one lead wire back to make it parallel with the other lead wire.
Make sure that the bend is not less than 0.03 inch from the body of the resistor.
- (b) Cut each lead wire on the resistor to make the length from the end of the resistor to the end of the wire equal to 0.48 inch.
- (2) Assemble a contact on the end of each lead wire. Refer to Paragraph 4.A.
- (3) Put a length of heat shrinkable sleeve on the resistor. Refer to Figure 12.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 12

20-15-49

STANDARD WIRING PRACTICES MANUAL

777 ELMS PANEL REPAIR: M81714 SERIES II TERMINAL JUNCTION SYSTEM

- (4) Insert the contacts of the resistor into the terminal module. Refer to Paragraph 4.B. and Figure 13.

INSTALLATION OF THE RESISTOR
Figure 13

E. Installation of a Terminal Module on a Track

- (1) Put the terminal module in the correct position on the top of the rail.
- (2) Push down on the module until it makes a click is heard and the module is locked in position.

F. Installation of a Ground Module on a Panel

Table 16
GROUND MODULE INSTALLATION FASTENERS

Fastener	Size	Quantity
Screw, Hex	8-32	2
Washer, Flat	8	2
Washer, Lock	8	2

- (1) Make a selection of the necessary fasteners from Table 16.
- (2) Put a lock washer on each screw.
- (3) Put a flat washer on each screw.
- (4) Align the installation screw holes on the ground module with the installation holes in the panel.
- (5) Engage the threads of the screws and the installation holes.
- (6) Torque each screw 17 inch-pounds \pm 2 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

This Subject gives the necessary conditions and procedures for electrical bonds and electrical grounds.

1. GENERAL DATA

A. Definitions

**Table 1
DEFINITIONS**

Term	Definition
Basic Structure	The major, electrically integral, metallic part of an airplane
Case Ground	A current return path through the equipment mounting surface
Critical Ground	An important current return path; the voltage drop (resistance) from the wire terminal to the structure must be measured after the assembly of each wire terminal to a ground
Current-Return Ground	A current path or connection that is established between the ground side of the circuit of an electrical or electronic device and the basic structure; made with a designated ground lead or wire on the non-case grounded equipment with either a direct case to the structure ground or a jumper on the Case Grounded equipment
Designated Bond	An important bond; the maximum permitted resistance and the other major conditions are directly specified; are designed to permit the operation of a circuit-protective device, reduce any fire or explosion hazards, avoid electric shocks to personnel, minimize radio interference; examples include bonds for lightning protection, static bleed-off, and case bonds for electrical and electronic equipment in flammable leakage zones
Dual Ground	A type of connection that has two physical paths of the current return to structure
Dual Terminated Ground	An alternative term for Dual Ground
Electrical Bond	A stable connection between two objects that has the result of electrical conductivity between those objects
Explosion Hazard Area	A work area, or the area of an airplane or any other manufactured product that is identified by the responsible organization as a hazard because of the combustible or explosive substances in the area
Faying Surface	A surface that is prepared to have the correct fit against a second surface so that an electrical bond is made between the two surfaces
Ground	An electrically conductive path between a component or an electrical circuit and the basic structure, or a connection between the conductive frame or housing of an object and the earth-ground connection point in a facility
Inherent Bond	When the materials that are used and the assembly procedure gives the low resistance junction without special installation procedures; included are parts that are welded, brazed, sweated, or swaged; also included are any major structural components that are attached by a large number of fasteners
Non-Designated Bond or Ground	A bond or ground that is not directly specified, but occurs with any parts that are inherently bonded or that have no specific electrical function; the parts must be satisfactorily bonded to structure so that the ECM static dissipation and shock hazard conditions of MIL-B-5087 are obeyed

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

B. Applicable Conditions for the Separation of Grounds

These are the types of grounds:

- A direct current or DC ground
- An alternating current or AC ground
- A static ground.

For the conditions that are applicable for:

- Ground wires in one termination, refer to Table 2
- Ground connections, refer to Table 3.

**Table 2
APPLICABLE CONDITIONS FOR GROUNDS IN A WIRE TERMINATION**

Wire Termination	Applicable Condition
A Contact	More than one type of ground is not permitted
A Terminal Lug	More than one type of ground is not permitted

**Table 3
APPLICABLE CONDITIONS FOR GROUNDS IN A GROUND CONNECTION**

Ground Connection	Wire Termination	Applicable Condition
Ground Module	A Contact	More than one type of ground is permitted
Ground Stud	A Terminal Lug	More than one type of ground is not permitted

C. Applicable Conditions for the Seal of a Ground Stud Ground Assembly

For the conditions that are applicable for a ground assembly in a flammable leakage zone, refer to 20-30-00.

For a location that is not a flammable leakage zone, the ground assembly must be sealed if the initial configuration of the ground assembly is sealed.

D. Damage Limits and Service Conditions for a Bond and Ground Jumper Assembly

This paragraph gives the damage limits and service conditions for electrical bond and ground jumper assemblies.

For the applicable:

- Assemblies, refer to Table 4
- Damage limits and service conditions, refer to Table 5.

**Table 4

Table 5
APPLICABLE SERVICE CONDITIONS FOR JUMPER ASSEMBLIES

Assembly Configuration	Type of Damage	Permitted Number of Broken Strands	Service Condition
Installed in a Fuel Tank	All	0	If the assembly has one or more broken strands, it must be replaced immediately
Insulated Jumper	All	0	If the assembly has one or more broken strands, it must be replaced immediately
			If the assembly has damage to the insulation, repair of the insulation can be necessary; refer to Subject 20-10-13

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Table 5 (continued)

Assembly Configuration	Type of Damage	Permitted Number of Broken Strands	Service Condition
Uninsulated Jumper shorter than or equal to 12 inches	Abrasion	6	The source of abrasion must be removed immediately
			The assembly must be replaced at the next scheduled maintenance
	Not Abrasion	6	If the assembly has more than 6 broken strands, it must be replaced at the next scheduled maintenance
			If the assembly has less than 7 broken strands, it must be inspected at each scheduled maintenance
Uninsulated Supported Jumper longer than 12 inches	Abrasion	6	The source of abrasion must be removed immediately
			The assembly must be replaced at the next scheduled maintenance
	Not Abrasion	6	If the assembly has more than 6 broken strands, it must be replaced at the next scheduled maintenance
			If the assembly has less than 7 broken strands, it must be inspected at each scheduled maintenance
Uninsulated Unsupported Jumper longer than 12 inches	All	0	If the assembly has one or more broken strands, it must be replaced at next scheduled maintenance

E. General Conditions for the Preparation of a Faying Surface

All faying surfaces in the current path must be cleaned. Refer to Table 6.

These conditions are applicable:

- Lye, alkaline paint remover, hydroxides, or other caustic solutions must not be used to clean any bonding surface
- Abrasive cleaning materials or wire brushes must not be used to clean plated surfaces, clad surfaces, or unpainted metals such as corrosion resistant or stainless steel and 6061 aluminum
- If the bond will be made immediately after cleaning, the faying surfaces must be cleaned again with a clean cloth that is free of lint to make sure that any remaining, abrasive particles are removed
- If a cleaned faying surface shows any sign of contamination, clean the surface again.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

CAUTION: DO NOT PERMIT ANY CONTAMINATION FROM THE ABRASIVE MATERIALS THAT ARE USED TO PREPARE A SURFACE FOR AN ELECTRICAL BOND TO GO INTO ANY MECHANISM OR ELECTRICAL EQUIPMENT.

**Table 6
FAYING SURFACE PREPARATION PROCEDURES**

Faying Surface	Finish	Preparation Procedure
Aluminum Alloy	Bare with or without grease, oil, corrosion inhibiting compound, or other contaminants	Paragraph 2.E.
	Bare with oxide film contamination	Paragraph 2.
	Paint, primer or enamel	Paragraph 2.
	Chemical conversion coating	Paragraph 2.
	Anodize	Paragraph 2.
BMS10-21 Type III Anti-Static Coating	Bare	Paragraph 2.E.
	Paint, primer or enamel	Paragraph 2.
Flame Spray	Bare	Paragraph 2.E.
	Paint, primer or enamel	Paragraph 2.
Magnesium	Bare	Paragraph 2.E.
Nickel Alloy 625	Bare	Paragraph 2.E.
Stainless Steel	Bare	Paragraph 2.E.
	Paint, primer or enamel	Paragraph 2.
Stainless Steel with Cadmium Plating	Bare	Paragraph 2.E.
Titanium	Bare	Paragraph 2.E.
	Paint, primer or enamel	Paragraph 2.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

F. Replacement of a Surface Finish After a Bond Is Made

After the bond is made, these conditions are applicable for the cleaned surfaces that are not part of the faying surface:

- All finishes must be applied again
- The applicable surface finish must be applied within one week after the original finish is been removed
- A minimum of one layer of primer and one layer of the equivalent finish must be applied where the original paint finish is removed
- Machine finished flanges of fuel or hydraulic pumps, valves, and equivalent equipment that must have a seal for liquids at the mounting surface must not be painted
- A chemical conversion coating can be applied if the original finish is anodized
- A layer of alodine or chemical conversion coating must be applied to all bare aluminum surfaces that have no protection.

After the bond is made, these conditions are applicable for the cleaned magnesium surfaces that are not part of the faying surface:

- A layer of primer must be applied 24 hours after the original finish has been removed
- If the specified finish is Dow 17 Anodize or equivalent, a minimum of one coat of zinc chromate primer must be applied.

2. CLEANING OF FAYING SURFACES

A. Cleaning Procedure 1 - Abrasives Applied Manually

**Table 7
ABRASIVE MATERIALS**

Description	Specification	Supplier
Scotch-Brite Pad	Type A Very Fine	3M
Garnet Sandpaper	ANSI B74.18	An available source
Wet/Dry Sandpaper	ANSI B74.18 Grit size 280 or finer	An available source

- (1) Make a selection of an abrasive material. Refer to Table 7.
- (2) Manually apply the abrasive to the specified faying surface or spot area with a circular or an elliptical movement.

Make sure that the area is cleaned until:

- The surface is smooth and even
- Bright metal can be seen.

B. Cleaning Procedure 2 - Stainless Steel Rotary Brush

This paragraph gives the procedure to satisfactorily remove:

- Paint from any metal
- Alodine, iridite, or light anodize from aluminum.

NOTE: Anodic films can have different thickness and can be difficult to remove with the wire brush. A better alternative for these surfaces is Cleaning Procedure 3. Refer to Paragraph 2.C.

STANDARD WIRING PRACTICES MANUAL

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Table 10
APPROVED SUPPLIERS OF BOEING STANDARD ROTARY BRUSHES

Boeing Specification	Supplier
ST913K-()	Alvord-Polk Tool Company

- (1) Make a selection of a rotary brush from Table 8.

Make sure that the brush:

- Has the correct size to clean the specified area
- Has the correct color for the type of bond surface; refer to Table 9.

CAUTION: DO NOT USE A CARBON STEEL BRUSH. DAMAGE FROM CORROSION CAN OCCUR BECAUSE OF THE POSSIBLE CONTAMINATION OF THE SURFACE OF THE MATERIAL WITH PARTICLES FROM THE BRUSH.

CAUTION: DO NOT USE A BRUSH THAT IS SPECIFIED FOR A DIFFERENT BOND SURFACE.

- (2) Put the brush in a drill motor or an applicable drive.

- (3) Clean the specified area:

- (a) Apply the brush to the bond surface for a short time.

Make sure to keep the cleaning surface of the brush parallel to the bond surface.

- (b) Examine the bond surface.

Make sure that the bond surface is clean.

- (c) If the bond surface is not clean, do Step (a) and Step (b) again until the specified area is fully clean.

CAUTION: MAKE SURE TO KEEP THE LOSS OF MATERIAL OF THE BOND SURFACE TO A MINIMUM.

C. Cleaning Procedure 3 - Rotary Abrasive Disc

This paragraph gives the procedure to satisfactorily remove:

- Anodize
- Iridite
- Alodine
- Skydrol Resistant Finish (SRF)
- Similar hard finishes.

NOTE: Paint can also be removed, but frequent replacement of the abrasive disc is necessary.

Table 12
APPROVED SUPPLIERS OF BOEING STANDARD MANDRELS

Boeing Specification	Supplier
ST913M-()	Manufacturing Tool Services
	West Coast Industries

- (1) Make a selection of an abrasive disc.
Make sure that the disc has the correct size to clean the specified spot area.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

CAUTION: DO NOT USE AN ABRASIVE DISC THAT HAS BEEN USED ON A DIFFERENT TYPE OF BOND SURFACE.

- (2) Make a selection of the applicable mandrel from Table 11.
- (3) Put the mandrel into a drill motor or an applicable drive.
- (4) Put the disc on the mandrel.
- (5) Clean the specified area:
 - (a) Lightly apply the disc to the surface of the material for a short time.
Make sure to keep the cleaning surface of the disc parallel to the surface of the material.
 - (b) Examine the surface of the disc to see if it is clogged.
If it is necessary, replace the disc.
 - (c) Examine the bond surface.
Make sure that the bond surface is clean.
 - (d) If the bond surface is not clean, do Sub-step 5(a) through Sub-step 5(c) again until the specified area is fully clean.

CAUTION: MAKE SURE TO KEEP THE LOSS OF MATERIAL OF THE BOND SURFACE TO A MINIMUM.

D. Cleaning Procedure 4 - Removal of Paint with Lacquer Thinner

NOTE: This procedure is recommended to satisfactorily remove these types of paint from clad aluminum or other metal surfaces:

- MIL-P-6889 primer
- Lacquer-based paint
- Enamel paint.

- (1) Apply lacquer thinner or methyl ethyl ketone to the specified area with a clean cotton or linen cloth, or a gauze applicator until the area is fully clean.

Make sure to use a clean part of the cloth each time the thinner is applied.

CAUTION: APPLY THE THINNER ONLY TO THE SPECIFIED AREA OF THE BOND.

- (2) Immediately dry the area with another clean cloth.

E. Cleaning Procedure 5 - Removal of Contamination with Cleaning Solvent

NOTE: This procedure is recommended to satisfactorily remove contamination from these types of metal:

- Bare metal
- Clad metal
- Plated metal.

- (1) Make a selection of a solvent. Refer to Table 20.
- (2) Apply the cleaning solvent to the bond surfaces with a nonmetallic brush or a cloth applicator.
- (3) If it is necessary, scrub the area to remove any contamination that can be seen.

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

CAUTION: DO NOT USE ABRASIVE MATERIALS. IF ABRASIVE MATERIALS ARE USED, DAMAGE TO THE FAYING SURFACE OCCURS.

3. GROUND STUD ASSEMBLY AND TERMINAL LUG INSTALLATION

A. General Conditions for Ground Stud Assembly

These washers must not be used in the conductive path of a bond:

- Steel washers
- Dyed washers
- Other types of washers with a non-conductive layer on the surface.

Only these hardware are permitted:

- Table 13 for aluminum and magnesium structure
- Table 15 for stainless steel and titanium structure
- Table 16 for different tube materials.

Steel, Stainless	AN735C()	Passivated	QPL
Titanium	AN735C()	Passivated	QPL

B. General Conditions for Terminal Lug Installation - Configuration

These conditions are applicable:

- Tin plated copper terminal lugs must be used on aluminum structure
- Nickel plated terminal lugs must be used on steel and titanium structure
- When a clamp is used to attach a terminal lug to a metallic tube, the clamp must be tightened carefully to make sure that damage to the tube does not occur

A terminal lug of a ground wire must not make an interference with the operation of:

- A control surface that moves
- A shock mount the moves
- Other equipment that is attached to a fixed point that moves.

When more than one terminal lug is attached with one fastener to the basic structure, these conditions are applicable:

- The largest terminal lug must be adjacent to the structure
- The remaining terminal lugs must be in the sequence of the next largest size to the smallest size
- The terminal lugs must be even and symmetrical around the stud
- The terminal lugs must not make an interference with another part or a structure
- No more than 4 terminal lugs are permitted on one fastener with threads.

C. General Conditions for Terminal Lug Installation - Torque

For a size 10 or larger ground stud, the nut must be torqued; refer to Table 17.

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

For a size 8 or smaller ground stud:

- A lock washer must be tightened until it is fully compressed
- A self lock nut must be tightened until movement of connection hardware does not occur
- When the connection is tightened, the connection hardware must not be deformed or damaged
- Tightness must be checked only in the direction that the nut is tightened.

Table 17
GROUND STUD TERMINAL LUG INSTALLATION TORQUE VALUES

D. Necessary Materials

NOTE: The cure times and the tack free times that are specified in Table 18 are applicable for 77 degrees F \pm 5 degrees F and 50 percent relative humidity.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

NOTE: The cure time and tack free time:

- Increase at lower temperature and lower humidity
- Decrease at higher temperature and higher humidity.

NOTE: A fuel vapor area is an area where fuel vapors are present.

F. Seal of a Ground Stud Ground Assembly

This paragraph gives the procedure to seal a ground stud ground assembly with the terminal lugs or the bond jumper terminals installed.

For the procedure to:

- Seal a ground stud assembly before the terminal lugs or the bond jumper terminals are installed, refer to Paragraph 3.G.
- Seal a sealed ground stud ground connection after the terminal lugs or the bond jumper terminals are installed, refer to Paragraph 3.H.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

SEAL OF A NUT PLATE GROUND STUD ASSEMBLY

Figure 14

- (1) Make a selection of a sealant from Table 18.
- (2) Make a selection of a solvent from Table 20.
- (3) Make a selection of a tool to apply the sealant.
Make sure that the tool:
 - Can make a small fillet
 - Can make a smooth, continuous layer of sealant
 - Does not cause damage to the structure or the finish when the sealant is applied.
- (4) Remove the contamination with a clean cloth and solvent from these surfaces:
 - The outer surfaces of the ground stud ground assembly on each side of the structure and the terminal lug
 - A 1 inch minimum area around the ground assembly on each side of the structure.

CAUTION: THE SURFACES THAT THE SEALANT IS APPLIED ON MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

- (5) Let the area dry.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

(6) Apply a continuous layer of sealant on:

- The ground stud ground assembly hardware on each side of the structure
- The tongue and the forward end of the crimp barrel of the terminal lug.

For the seal of:

- A pre-installed ground stud ground assembly, refer to Figure 11
- A standard ground stud ground assembly, refer to Figure 12
- A BACS53B or a MIL-T-83454 ground stud ground assembly, refer to Figure 13
- A nut plate ground stud ground assembly, refer to Figure 14.

Make sure that the layer of sealant:

- Is a small fillet
- Is smooth and continuous
- Does not have air bubbles or voids
- Does not have contamination in it.

(7) Let the sealant fully cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

G. Seal of a Ground Stud Assembly Before the Electrical Connection

This paragraph gives the procedure to seal these ground stud assemblies before the terminal lugs or the bond jumper terminals are installed:

- A pre-installed ground stud
- A BACS53B ground stud
- A MIL-T-83454 ground stud.

After the terminal lugs or the bond jumper terminals are installed, the ground stud ground assembly must be sealed. Refer to Paragraph 3.H.

SEAL OF A PRE-INSTALLED GROUND STUD ASSEMBLY

Figure 15

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

SEAL OF A BACS53B OR A MIL-T-83454 GROUND STUD ASSEMBLY
Figure 16

- (1) Make a selection of a sealant from Table 18.
- (2) Make a selection of a solvent from Table 20.
- (3) Make a selection of a tool to apply the sealant.

Make sure that the tool:

- Can make a small fillet
 - Can make a smooth, continuous layer of sealant
 - Does not cause damage to the structure or the finish when the sealant is applied.
- (4) Remove the contamination with a clean cloth and solvent from these surfaces:
 - The outer surfaces of the ground stud assembly on each side of the structure
 - A 1 inch minimum area around the ground assembly on each side of the structure.

CAUTION: THE SURFACES THAT THE SEALANT IS APPLIED ON MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

- (5) Let the area dry.
- (6) Apply a continuous layer of sealant on the ground stud assembly on each side of the structure.

For the seal of:

- A pre-installed ground stud assembly, refer to Figure 15
- A BACS53B or a MIL-T-83454 ground stud assembly, refer to Figure 16.

Make sure that the sealant:

- Is a small fillet
- Is smooth and continuous
- Does not have air bubbles or voids
- Does not have contamination in it
- Does not touch the faying surfaces of the ground stud components or the terminal lug.

CAUTION: SEALANT ON THE FAYING SURFACES CAN CAUSE UNSATISFACTORY RESISTANCE OF THE GROUND ASSEMBLY.

- (7) If sealant touches a faying surface:
 - (a) Remove all contamination from the faying surface with a clean cloth and naphtha or an equivalent solvent.
 - (b) Let the surface dry.
 - (c) If the sealant must be applied again, do Step (6) again.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

(8) Let the sealant cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

H. Seal of a Ground Stud Ground Assembly After the Electrical Connection

This paragraph gives the procedure to seal a sealed ground stud ground assembly after the terminal lugs or the bond jumper terminals are installed.

SEAL OF A PRE-INSTALLED GROUND STUD GROUND ASSEMBLY
Figure 17

SEAL OF A STANDARD GROUND STUD GROUND ASSEMBLY
Figure 18

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

SEAL OF A BACS53B OR A MIL-T-83454 GROUND STUD GROUND ASSEMBLY
Figure 19

SEAL OF A NUT PLATE GROUND STUD GROUND ASSEMBLY
Figure 20

- (1) Make a selection of a sealant from Table 18.
- (2) Make a selection of a solvent from Table 20.
- (3) Make a selection of a tool to apply the sealant.
 Make sure that the tool:
 - Can make a small fillet
 - Can make a smooth, continuous layer of sealant
 - Does not cause damage to the structure or the finish when the sealant is applied.
- (4) Remove the contamination with a clean cloth and solvent from these surfaces:
 - The outer surfaces of the ground stud ground assembly on each side of the structure and the terminal lug
 - A 1 inch minimum area around the ground assembly on each side of the structure.

CAUTION: THE SURFACES THAT THE SEALANT IS APPLIED ON MUST BE CLEAN. A CONTAMINATION ON A SURFACE CAN CAUSE AN UNSATISFACTORY BOND BETWEEN THE SEALANT AND THE SURFACE.

- (5) Let the area dry.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

(6) Apply a continuous layer of sealant on:

- The surface of the ground stud ground assembly without sealant
- The tongue and the forward end of the crimp barrel of the terminal lug.

For the seal of:

- A pre-installed ground stud ground assembly, refer to Figure 11
- A standard ground stud ground assembly, refer to Figure 12
- A BACS53B or a MIL-T-83454 ground stud ground assembly, refer to Figure 13
- A nut plate ground stud ground assembly, refer to Figure 14.

Make sure that the sealant:

- Is a small fillet
- Is smooth and continuous
- Does not have air bubbles or voids
- Does not have contamination in it
- Makes an overlap with the sealant that was applied on the other ground stud components.

(7) Let the sealant cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

I. Category 2 Fay Sealed Direct Standard Ground Stud Installation

This paragraph gives the procedure to seal a ground stud assembly while the terminal lugs are being installed.

Bonding Surface		Cleaning Method	
Material	Finish	Description	Reference
Stainless Steel	Bare with or without grease, oil, CIC, or other contaminants	Solvent Cleaning	Paragraph 2.E.
	Paint, Primer, or Enamel	Abrasive Cleaning	Paragraph 2.A.
			Paragraph 2.C.
Cadmium plating with or without grease, oil, CIC, or other contaminants	Solvent Cleaning	Paragraph 2.E.	
Titanium	Bare with or without grease, oil, CIC, or other contaminants	Solvent Cleaning	Paragraph 2.E.
	Paint, Primer, or Enamel	Abrasive Cleaning	Paragraph 2.A.
			Paragraph 2.C.

- (1) Make a selection of a surface cleaning method. Refer to Table 21.
- (2) Clean the faying surface of the structure that touches Corrosion Protective Washer 1. Refer to Figure 21, Figure 22, and Table 21.
- (3) Clean these components using solvent. Refer to Paragraph 2.E., Figure 21 and Figure 22:
 - The faying surface of the structure
 - Corrosion Protective Washer 1
 - Terminal Lug or Terminal Lugs.

CAUTION: REMOVAL OF PLATING ON THE TERMINALS CAN CAUSE AN UNSATISFACTORY ELECTRICAL BOND.

CAUTION: USING THE WRONG PARTS CAN CAUSE AN UNSATISFACTORY ELECTRICAL BOND.

Table 22

SEALANT FOR FAY SEALED DIRECT STANDARD GROUND STUD INSTALLATION

Applicable Condition	Cure Time (Hours)	Tack Free Time (Hours)	Squeeze-Out Life (Hours)	Part Number	Supplier
Fuel Tank Areas	48	24	6	P/S 890 B-2 AMS-S-8802	PRC-Desoto International
	48	24	6	PR-1440 B-2 AMS-S-8802	PRC-Desoto International
Non-Fuel Tank Areas	48	36	6	BMS5-95 B-2	Boeing

- (4) Make a selection of a sealant that is applicable for the area the Ground Stud is located in. Refer to Table 22.
- (5) Make a selection of a tool to apply the sealant.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

Make sure that the tool:

- Can make a small fillet
 - Can make a smooth, continuous layer of sealant
 - Does not cause damage to the structure or the finish when the sealant is applied.
- (6) Apply a continuous layer of sealant to the fastener threads, fastener head, and the fastener shank. Refer to Figure 21 and Figure 22.
- (7) Apply a sealant bead to the following components:
- Corrosion Protective Washer 2
 - The cleaned surface of the structure
 - Corrosion Protective Washer 1
 - Terminal or Terminals
 - Pressure Washer

Refer to Figure 21 and Figure 22.

NOTE: It is necessary to apply the sealant on the surface of one component of two adjacent components.

NOTE: It is satisfactory to apply the sealant to the parts with a brush. Make sure that a uniform coat of sealant covers the mating surface.

CAUTION: THE SEALANT MUST HAVE SUFFICIENT THICKNESS TO FILL THE SPACE BETWEEN THE TERMINAL LUG AND THE STRUCTURE. EMPTY SPACES BETWEEN THE TERMINAL LUG AND THE STRUCTURE THAT ARE NOT FILLED WITH SEALANT CAN CAUSE AN UNSATISFACTORY ELECTRICAL BOND.

- (8) Put the threads of the Fastener through the Corrosion Protective Washer 2.
- (9) Put the threads of the Fastener through the hole in the structure.
- (10) Put the remaining parts on the assembly in this order:
- Corrosion Protective Washer 1
 - Terminal or Terminals
 - Pressure Washer
 - Self Locking Nut

Refer to Figure 21 and Figure 22.

- (11) Torque the self locking nut with a manual torque wrench. Refer to Table 17.

Make sure that:

- The torque is applied before the end of the squeeze-out life of the sealant. Refer to Table 22
- You see the sealant come out from between each component of the assembly when the self-locking nut is tightened
- There are no empty spaces between the terminal lug and the structure
- The sealant is continuous around each component.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

CAUTION: FAILURE TO APPLY THE TORQUE BEFORE THE END OF THE SQUEEZE-OUT LIFE OF THE SEALANT CAN CAUSE AN UNSATISFACTORY ELECTRICAL BOND.

CAUTION: FAILURE TO SEE THE SEALANT COME OUT FROM BETWEEN EACH COMPONENT CAN CAUSE AN UNSATISFACTORY ELECTRICAL BOND.

NOTE: It is satisfactory to use a power tool to apply 75[pct] of the torque value followed by the use of a manual torque tool to apply the final torque value.

NOTE: If the terminal or jumper rotates when applying torque to the self-locking nut, hold the self-locking nut with a wrench and apply torque to the fastener head. Refer to Table 23.

**Table 23
FASTENER HEAD TORQUE VALUES**

Stud Size	Structure Material	Torque (inch pounds)	
		Minimum	Maximum
10-32 (3/16)	Aluminum	32	38
	Stainless Steel or Titanium	35	45
1/4-28	Aluminum	63	77
	Stainless Steel or Titanium	95	115
5/16-24	Aluminum	130	160
	Stainless Steel or Titanium	180	220
3/8-24	Aluminum	180	220
	Stainless Steel or Titanium	315	385
1/2-20	Aluminum	470	570
	Stainless Steel or Titanium	755	925

- (12) Smooth out the sealant using a brush or clean wiper. Refer to Figure 23 and Figure 24.
Make sure that:
 - The sealant is continuous around each component
 - There are no empty spaces between the terminal lug and the structure
 - The sealant makes a seal around each component.
- (13) Do a test of the electrical resistance between the terminal lug and the structure. Refer to Paragraph 10.A.
- (14) If the measured electrical resistance is more than the specified maximum resistance in Table 30:
 - (a) Disassemble the components and do Step (b) and Step (d) or Step (c) and Step (d).
 - (b) Clean the components with solvent. Refer to Paragraph 2.E.
 - (c) Discard the components and get new components.
 - (d) Do Step (1) through Step (13) again.
- (15) If the area adjacent to the ground stud has bare metal, replace the surface finish on the bare metal. Refer to Paragraph 1.F.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

4. BONDING OF CIRCULAR RECEPTACLE CONNECTORS IN AN UNPRESSURIZED AREA

This paragraph gives the procedures to make an electrical bond between a receptacle connector and the airplane structure or a bracket.

A. General Conditions

An electrical bond of a receptacle and the installation surface is necessary when the bond is specified for the connector in the WDM 91-05-05.

The bond must be assembled again if the connector is specified in the WDM 91-05-05 and any of these conditions occur:

- The wire harness is replaced
- The connector is repaired or replaced
- The specified bond has an electrical resistance that is greater than the maximum permitted resistance.

Refer to:

- Paragraph 10.D. for the maximum resistance values
- Paragraph 11.H. for the test procedure for the bond.

B. Surface Preparation.

**Table 24
FAYING SURFACE PREPARATION**

Installation Surface	Preparation Procedure	Reference

INSTALLATION SURFACE PREPARATION FOR THE BONDING OF CIRCULAR CONNECTOR RECEPTACLES

Figure 25

- (1) To prepare the faying surface:
 - (a) Clean the faying surface of the structure.

Refer to:

 - Table 24 for the procedure to clean the faying surface
 - Figure 25 for the area to clean.

Make sure that the area where the receptacle flange touches the structure is clean.
 - (b) For an aluminum faying surfaces that are cleaned using Paragraph 2.A., apply Alodine to the faying surface.
- (2) Clean the surface that is under the fastener head and washer.

Refer to:

 - Table 24 for the procedure to clean the faying surface
 - Figure 26 for the area to clean.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

OPPOSITE SIDE SURFACE PREPARATION FOR THE BONDING OF CIRCULAR RECEPTACLE CONNECTORS

Figure 26

- (a) If the surface is masked, remove the mask.
- (b) For aluminum and steel structure, use the cleaning procedure specified in Paragraph 2.A.. Make sure that the area covered by the fastener head and the washer is clean.

CAUTION: DO NOT APPLY ALODINE TO ALUMINUM SURFACE AREA BELOW THE FASTENER HEAD AND WASHER. THESE ARE TO STAY BARE ALUMINUM.

- (c) For nickel plated composite structure, prepare the faying surface with the cleaning procedure specified in Paragraph 2.E.. Make sure that the area below the fastener heads and washers is clean.
- (3) Clean both sides of the receptacle. Refer to Paragraph 2.E..

C. Receptacle Installation

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. Refer to Paragraph 4.B. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

- (1) Put a washer on each of the four screws. Refer to Figure 26.
- (2) To attach the receptacle with lock nuts:
 - (a) Align the mounting holes of the receptacle flange and the installation surface.
 - (b) Install each screw from the side opposite to the receptacle flange.
 - (c) Put a washer and a lock nut on each screw.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

- (d) Tighten each nut until the nut and washer are against the surface of the receptacle flange.
 - (e) Tighten each nut a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
 - (f) Torque each nut on size 4 fasteners 8 to 15 inch-pounds.
 - (g) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
 - (h) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (3) To attach the receptacle with a nut plate:
- (a) Put the nut plate on the receptacle flange.
 - (b) Align the mounting holes of the nut plate, the receptacle flange, and the installation surface.
 - (c) From the side opposite to the receptacle flange, engage the threads of the fasteners and the threads of the nut plate.
 - (d) Tighten each fastener a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
 - (e) Torque each nut on size 4 fasteners 8 to 15 inch-pounds.
 - (f) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
 - (g) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (4) Do the test of the electrical bond.
- Refer to:
- Paragraph 10.D. for the maximum resistance value
 - Paragraph 11.H. for the test procedure.

D. Sealing of a Receptacle Assembly

NOTE: The cure times and tack free times given in Table 26 are applicable for 77degrees \pm 5degrees F and 50% Relative Humidity.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

NOTE: The cure time and tack free time:

- Increase at lower temperature and lower humidity
- Decrease at higher temperature and higher humidity.

CAUTION: THE SEALING OF THE RECEPTACLE ASSEMBLY MUST BE DONE WITHIN 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH. SEALING THE ASSEMBLY AFTER 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE SEAL.

FINISH MATERIALS

Description	Specification	Supplier
Chemical Conversion Coating	Alodine 600	Henkel
		Nihon Parkerizing

SEALING A RECEPTACLE CONNECTOR BOND IN AN UNPRESSURIZED AREA
Figure 27

- (1) Make a selection of a sealant from Table 26.

NOTE: The cure times and tack free times given in Table 26 are applicable for 77degrees ± 5degrees F and 50% Relative Humidity.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

NOTE: The cure time and tack free time:

- Increase at lower temperature and lower humidity
- Decrease at higher temperature and higher humidity.

(2) Apply a fillet seal to the following areas shown in Figure 27.

- The area around the receptacle flange
- The area around the receptacle shell
- If a nut ring is used, apply a fillet seal around all edges of the nut ring flange
- The fastener, washer, and installation surface joints.

NOTE: It is permitted to seal the fastener heads and washers.

NOTE: It is permitted to seal the nut ring flange, nuts, washers, and connector receptacle barrel with sealant. Refer to Figure 27. Sealant on the backshell coupling nut is permitted. Do not apply sealant to the knurled area of the backshell coupling nut.

CAUTION: THE SEALING OF THE RECEPTACLE ASSEMBLY MUST BE DONE WITHIN 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH. SEALING THE ASSEMBLY AFTER 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE SEAL.

(3) If the area adjacent to the seal has bare metal, replace the surface finish on the bare metal. Refer to Paragraph 1.E.

NOTE: If an aluminum part had an anodized surface that was removed during the surface preparation, it is permitted to manually apply chemical conversion coating on the bare metal. Refer to Table 28.

(4) Let the sealant cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

5. BONDING OF CIRCULAR RECEPTACLE CONNECTORS IN A PRESSURIZED AREA**A. General Conditions**

For the general conditions applicable to the electrical bonding of circular connectors in a pressurized area, refer to Paragraph 4.A.

B. Surface Preparation

(1) To prepare the faying surface:

(a) Clean the faying surface of the structure.

Refer to:

- Table 24 for the procedure to clean the faying surface
- Figure 27 for the area to clean.

Make sure that the area where the receptacle flange touches the structure is clean.

(b) For an aluminum faying surface that are cleaned using Paragraph 2.A., apply Alodine to the faying surface.

(2) To prepare the surface that is under the fastener head and washer:

(a) Prepare the faying surface. Refer to Table 6.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

Make sure that the area covered by the fastener head and the washer is clean. Refer to Figure 27.

- (3) For an aluminum faying surface that is cleaned using Paragraph 2.A., apply Alodine to the faying surface.
- (4) Clean both sides of the receptacle. Refer to Paragraph 2.E.

C. Receptacle Installation

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

- (1) Put a washer on each of the four screws.
- (2) To attach the receptacle with lock nuts:
 - (a) Align the mounting holes of the receptacle flange and the installation surface.
 - (b) Install each screw from the side opposite to the receptacle flange. Refer to Figure 26.
 - (c) Put a washer and a lock nut on each screw.
 - (d) Tighten each nut until the nut and washer are against the surface of the receptacle flange.
 - (e) Tighten each nut a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
 - (f) Torque each nut on size 4 fasteners 8 to 15 inch-pounds.
 - (g) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
 - (h) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (3) To attach the receptacle with a nut plate:
 - (a) Put the nut plate on the receptacle flange. Refer to Figure 25.
 - (b) Align the mounting holes of the nut plate, the receptacle flange, and the installation surface.
 - (c) From the side opposite to the receptacle flange, engage the threads of the fasteners and the threads of the nut plate.
 - (d) Tighten each fastener a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
 - (e) Torque each nut on size 4 fasteners 8 to 15 inch-pounds.
 - (f) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
 - (g) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (4) Do the test of the electrical bond.

Refer to:

- Paragraph 10.D. for the maximum resistance value
- Paragraph 11.H. for the test procedure.

NOTE: Perform the test of the electrical bond within 24 hours of surface preparation.

- (5) Apply finish to any bare metal areas around the receptacle flange and fastener head and washers. Refer to Paragraph 1.F.

NOTE: If an aluminum that had an anodized surface was cleaned and the anodized finish was removed, manually apply chemical conversion coating to the bare metal.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

CAUTION: APPLY ALL FINISHES WITHIN 7 DAYS OF WHEN THE ORIGINAL FINISH WAS REMOVED. FINISHES APPLIED AFTRE 7 DAYS OF REMOVING THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE ELECTRICAL BOND.

6. BONDING OF BACC65AB, BACC65AP, AND BACC65AV RECEPTACLE CONNECTORS IN AN UNPRESSURIZED AREA**A. General Conditions**

For the general conditions applicable to the electrical bonding of BACC65AB, BACC65AP, and BACC65AV receptacle connectors in an unpressurized area, refer to Paragraph 4.A.

B. Preparation of the Faying Surface**PREPARATION OF THE FAYING SURFACE****Figure 28**

(1) To prepare the faying surface:

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

- (a) Clean the faying surface of the structure.
Refer to:
 - Table 24 for the procedure to clean the faying surface
 - Figure 28 for the area to clean.

Make sure that the area where the receptacle flange touches the structure is clean.
 - (b) For an aluminum faying surface that are cleaned using Paragraph 2.A., apply Alodine to the faying surface.
- (2) To prepare the surface that is under the fastener head and washer:
- (a) For aluminum and steel structure, use the cleaning procedure specified in Paragraph 2.A..
Make sure that the area covered by the fastener head and the washer is clean.
- CAUTION:** DO NOT APPLY ALODINE TO ALUMINUM SURFACE AREA BELOW THE FASTENER HEAD AND WASHER. THESE AREAS ARE TO STAY BARE ALUMINUM.
- (b) For nickel plated composite structure, prepare the faying surface with the cleaning procedure specified in Paragraph 2.E..
Make sure that the area below the fastener heads and washers is clean.
- (3) Clean both sides of the receptacle. Refer to Paragraph 2.E.

C. Receptacle Installation

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

RECEPTACLE INSTALLATION
Figure 29

- (1) Align the mounting holes of the receptacle flange and the installation surface. Refer to Figure 29.
- (2) Install each fastener from the side opposite to the receptacle flange.

20-20-00

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

- (3) Tighten each fastener until the fastener head is against the surface of the mounting structure.
- (4) Tighten each fastener a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
- (5) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
- (6) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (7) Do a test of the electrical resistance.

Refer to:

- Paragraph 10.D. for the maximum resistance value
- Paragraph 11.H. for the test procedure.

NOTE: Perform the test of the electrical bond within 24 hours of surface preparation.

D. Sealing of a Receptacle Assembly

CAUTION: THE SEALING OF THE RECEPTACLE ASSEMBLY MUST BE DONE WITHIN 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH. SEALING THE ASSEMBLY AFTER 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE SEAL.

- (1) Make a selection of a sealant from Table 26.

NOTE: The cure times and tack free times given in Table 26 are applicable for 77degrees \pm 5degrees F and 50% Relative Humidity.

NOTE: The cure time and tack free time:

- Increase at lower temperature and lower humidity
- Decrease at higher temperature and higher humidity.

- (2) Apply a fillet seal to the following areas:
 - The area around the receptacle flange
 - The fastener, washer, and installation surface joints.

NOTE: It is permitted to seal the fastener heads.

NOTE: It is permitted to seal the nuts and washers with sealant. Refer to Figure 29.

CAUTION: THE SEALING OF THE RECEPTACLE ASSEMBLY MUST BE DONE WITHIN 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH. SEALING THE ASSEMBLY AFTER 7 DAYS OF REMOVAL OF THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE SEAL.

- (3) If the area adjacent to the seal has bare metal, replace the surface finish on the bare metal. Refer to Paragraph 1.E.

NOTE: If an aluminum part had an anodized surface that was removed during the surface preparation, it is permitted to manually apply chemical conversion coating on the bare metal. Refer to Table 28.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

CAUTION: APPLY ALL FINISHES WITHIN 7 DAYS OF WHEN THE ORIGINAL FINISH WAS REMOVED. FINISHES APPLIED AFTRE 7 DAYS OF REMOVING THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE ELECTRICAL BOND.

- (4) Let the sealant cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

7. BONDING OF BACC65AB, BACC65AP, AND BACC65AV AND MTCPQKT RECEPTACLE CONNECTORS IN A PRESSURIZED AREA

A. General Conditions

For the general conditions applicable to the electrical bonding of BACC65AB, BACC65AP, and BACC65AV receptacle connectors in a pressurized area, refer to Paragraph 4.A.

B. Preparation of the Faying Surface

- (1) To prepare the faying surface:

- (a) Clean the faying surface of the structure.

Refer to:

- Table 24 for the procedure to clean the faying surface
- Figure 29 for the area to clean.

Make sure that the area where the receptacle flange touches the structure is clean.

- (b) For an aluminum faying surface that are cleaned using Paragraph 2.A., apply Alodine to the faying surface.

- (2) To prepare the surface that is under the fastener head:

- (a) If the surface is masked, remove the mask.

- (b) For an aluminum faying surface that is cleaned using Paragraph 2.A., apply Alodine to the faying surface.

- (3) Clean both sides of the receptacle. Refer to Paragraph 2.E.

C. BACC65AB, BACC65AP, and BACC65AV Receptacle Installation

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

- (1) Align the mounting holes of the receptacle flange and the installation surface. Refer to Figure 29.
- (2) Install each fastener from the side opposite to the reeptacle flange.
- (3) Tighten each fastener until the fastener head is against the surface of the mounting structure.
- (4) Tighten each fastener a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
- (5) Torque each nut on size 6 fasteners 12 to 15 inch-pounds.
- (6) For the torque values of different size fasteners, refer to SOPM 20-50-01.
- (7) Do a test of the electrical resistance.

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Refer to:

- Paragraph 10.D. for the maximum resistance value
- Paragraph 11.H. for the test procedure.

NOTE: Perform the test of the electrical bond within 24 hours of surface preparation.

- (8) If the area adjacent to the seal has bare metal, replace the surface finish on the bare metal. Refer to Paragraph 1.E.

NOTE: If an aluminum part had an anodized surface that was removed during the surface preparation, it is permitted to manually apply chemical conversion coating on the bare metal. Refer to Table 28.

CAUTION: APPLY ALL FINISHES WITHIN 7 DAYS OF WHEN THE ORIGINAL FINISH WAS REMOVED. FINISHES APPLIED AFTRE 7 DAYS OF REMOVING THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE ELECTRICAL BOND.

D. MTCPQKT Receptacle Installation

INSTALLATION OF THE RECEPTACLE

Figure 30

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

- (1) Align the mounting holes of the receptacle flange and the installation surface. Refer to Figure 30.
- (2) Install the quick disconnect posts on the opposite side of the receptacle flange.
- (3) Torque each fastener 18 to 22 inch-pounds.
- (4) Do a test of the electrical resistance.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Refer to:

- Paragraph 10.D. for the maximum resistance value
- Paragraph 11.H. for the test procedure.

NOTE: Perform the test of the electrical bond within 24 hours of surface preparation.

- (5) If the area adjacent to the seal has bare metal, replace the surface finish on the bare metal. Refer to Paragraph 1.E.

NOTE: If an aluminum part had an anodized surface that was removed during the surface preparation, it is permitted to manually apply chemical conversion coating on the bare metal. Refer to Table 28.

CAUTION: APPLY ALL FINISHES WITHIN 7 DAYS OF WHEN THE ORIGINAL FINISH WAS REMOVED. FINISHES APPLIED AFTRE 7 DAYS OF REMOVING THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE ELECTRICAL BOND.

8. BONDING OF ARINC 404 AND 600 SERIES PLUG CONNECTORS IN A PRESSURIZED AREA

A. General Conditions

For the general conditions applicable to the electrical bonding of ARINC 404 and 600 series plug connectors in a pressurized area, refer to Paragraph 4.A.

20-20-00

Page 49
Feb 01/2008

D6-54446

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

B. Preparation of the Faying Surface

INSTALLATION OF THE ARINC 600 CONNECTOR
Figure 31

- (1) To prepare the faying surface that mates with the fastener bolt head:
 - (a) Clean the faying surface of the structure.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

Refer to:

- Table 24 for the procedure to clean the faying surface
- Figure 31 for the area to clean.

Make sure that the area where the fastener head touches the structure is clean.

- (b) For an aluminum faying surface that are cleaned using Paragraph 2.A., apply Alodine to the faying surface.
- (2) To prepare the surface that is under the fastener head:
 - (a) For an aluminum faying surface that is cleaned using Paragraph 2.A., apply Alodine to the faying surface.
- (3) Clean both sides of the plug flange. Refer to Paragraph 2.E.

C. Plug Installation

NOTE: Installation of the receptacle must be done within 24 hours of surface preparation and cleaning. If installation is not done within 24 hours, the surface must be prepared and cleaned again.

- (1) Align the mounting holes of the plug flange and the installation surface. Refer to Figure 31.
- (2) Install each fastener from the side opposite to the plug flange.
- (3) Tighten each fastener until the fastener head is against the surface of the mounting structure.
- (4) Tighten each fastener a small amount until the faying surface of the receptacle flange is fully flat against the installation surface.
- (5) Torque each nut 6 to 8 inch-pounds.
- (6) Do a test of the electrical resistance.

Refer to:

- Paragraph 10.D. for the maximum resistance value
- Paragraph 11.H. for the test procedure.

NOTE: Perform the test of the electrical bond within 24 hours of surface preparation.

- (7) Apply finish to any bare metal areas around the plug flange and fastener head and nut. Refer to Paragraph 1.F.

NOTE: If an aluminum part that had an anodized surface was cleaned and the anodized finish was removed, manually apply chemical conversion coating to the bare metal.

CAUTION: APPLY ALL FINISHES WITHIN 7 DAYS OF WHEN THE ORIGINAL FINISH WAS REMOVED. FINISHES APPLIED AFTRE 7 DAYS OF REMOVING THE ORIGINAL FINISH CAN CAUSE AN UNSATISFACTORY PERFORMANCE OF THE ELECTRICAL BOND.

9. CLAMP AND TUBE OR CONDUIT BONDS

This paragraph gives the procedures to make an electrical bond between a tube or a conduit and a clamp.

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

A. Preparation of the Faying Surfaces

FAYING SURFACE PREPARATION
Figure 32

Refer to Figure 32.

- (1) Clean the faying surface of the terminal lug. Refer to Paragraph 2.E.
- (2) Clean the faying surface of the clamp. Refer to Paragraph 2.E.
- (3) If the tube or conduit has a layer of corrosion inhibiting compound, remove the compound from an area that is 0.23 inch larger on all sides than the area of the faying surface. Refer to Paragraph 2.E.
- (4) Clean an area that is 0.13 inches larger on all sides than the area of the faying surface. Refer to Paragraph 2.

B. Installation of the Clamp

Table 29
TORQUE VALUES FOR SELF-LOCKING NUTS

Installation Hardware Material		Fastener Size	Torque (inch-pound)	
Terminal Lug	Clamp		Minimum	Maximum
Tin Plated Copper	Aluminum	10-32	28	35
		1/4-28	65	70
		5/16-24	135	145
		3/8-24	180	200
		1/2-20	480	520

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Table 29 (continued)

Installation Hardware Material		Fastener Size	Torque (inch-pound)	
Terminal Lug	Clamp		Minimum	Maximum
Nickel Plated Copper	Stainless Steel or Titanium	10-32	33	40
		1/4-28	90	105
		5/16-24	170	200
		3/8-24	300	350
		1/2-20	730	840

CLAMP INSTALLATION
Figure 33

Refer to Figure 33.

- (1) Put the clamp on the tube or conduit assembly.
Make sure that the cleaned surface extends 0.13 inch farther than the sides of the clamp.
- (2) Align the holes of the clamp and the terminal lug.
- (3) Install the fastener and the self-locking nut.
- (4) Torque the nut. Refer to Table 29.

CAUTION: MORE THAN THE NECESSARY AMOUNT OF TORQUE MUST NOT BE APPLIED. DAMAGE TO THE TUBE OR CONDUIT CAN OCCUR.

- (5) Replace the finish of the tube or conduit. Refer to Paragraph 1.F.

10. MAXIMUM PERMITTED RESISTANCE OF ELECTRICAL BONDS

NOTE: Unless it is specified differently, the resistance values given in the tables in this Paragraph refer to the overall resistance as it is measured across the bond from the object to the basic structure.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

A. Resistance of Ground Stud Bonds

A current return ground must be tested if it is:

- Changed
- Added to
- Temporarily disconnected.

Table 30 specifies the maximum bond resistance of a ground stud and the structure for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of a current return ground, refer to Paragraph 11.E.

Table 30
MAXIMUM RESISTANCE OF BONDS FOR CURRENT RETURN GROUNDS

Ground Stud Size	Maximum Resistance (ohm)
10-32	0.001
1/4-18	0.001
5/16-24	0.0007
3/8-24	0.0001
1/2-20	0.0001
BACS53B	0.0005
MIL-T-83534	0.0005

B. Resistance of Faying Surface Bonds

Table 31 specifies the maximum resistance between the different surfaces of a faying surface bond for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of faying surfaces, refer to Paragraph 11.D.

Table 31
MAXIMUM RESISTANCE OF FAYING SURFACE BONDS

Surface Material	Configuration	Maximum Resistance (ohm)
Composite	Single Structure Only One Junction	1.0
Metal	Single Structure Only One Junction	0.0005
	Ground Module	0.001
	For Each Different Structure Interface	0.0005

C. Resistance of Composite Panel Bonds

Table 32 specifies the maximum resistance of the bond of a fastener and a composite structure with conductive finish for a new installation or a repair where the faying surfaces are prepared for a bond again.

20-20-00

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Table 33 specifies the maximum resistance of the bond of a removable composite panel with conductive finish and a fixed composite panel with conductive finish for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of composite panels, refer to Paragraph 11.I.

NOTE: The resistance values in Table 32 and in Table 33 are not applicable for radomes.

Table 32

MAXIMUM RESISTANCE OF THE BOND OF A FASTENER AND A COMPOSITE STRUCTURE WITH A CONDUCTIVE FINISH

Finish Material	Maximum Resistance (ohm)
BMS10-21 Antistatic Conductive Paint	300,000
BMS8-278 Aluminum Coated Fabric	10
Expanded Aluminum Foil	0.5
Flamespray	0.5

Table 33

MAXIMUM RESISTANCE OF THE BOND OF A REMOVABLE COMPOSITE PANEL WITH A CONDUCTIVE FINISH AND A FIXED COMPOSITE PANEL WITH A CONDUCTIVE FINISH

Finish Material	Maximum Resistance (ohm)
BMS10-21 Antistatic Conductive Paint	300,000
Flamespray	0.5

D. Resistance of Receptacle Connector Shell Bonds

The maximum resistance between the receptacle flange and the installation surface:

- Is given in Table 34 for a new installation or a repair where the faying surfaces are prepared for a bond again.
- Is 2.5 milliohms for a wire harness that is in service and the wire harness components have not been replaced or repaired.
- Is 10.0 milliohms for a 737-600, 737-700, 737-800, 737-900, or 737-900ER Wing to Body feedthrough connector that is in service and has not been replaced or repaired. Refer to WDM 91-04-13.

Table 35 specifies the maximum bond resistance between the shield termination and the installation surface for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of connector shells, refer to Paragraph 11.H.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

Table 34

E. Resistance of Static Discharger Bases Installed on Composite Surfaces

Table 36 specifies the maximum bond resistance of a static discharger base that is mounted on a composite structure for a new installation or a repair where the faying surfaces are prepared for a bond again.

Table 36
MAXIMUM RESISTANCE OF STATIC DISCHARGER BASES

Discharger Base	Surface Mounted On	Maximum Resistance (ohm)	Measured Between
Aluminum	Aluminum	0.1	Discharger and Bond Structure
	BMS8-278 Aluminum Coated Fabric	0.01	Discharger and Basic Structure
	Flamespray	0.1	Discharger and Bond Structure
Titanium	Graphite	1.0	Discharger and Bond Structure
	Epoxy	1.0	Discharger and Bond Structure

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

F. Resistance of Hydraulic Fitting Bonds Inside a Fuel Tank

Table 37 specifies the maximum bond resistance of a hydraulic fitting inside a fuel tank for a new installation or a repair where the faying surfaces are prepared for a bond again.

Table 38 specifies the maximum bond resistance of a hydraulic tube and a bulkhead fitting inside a fuel tank for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of hydraulic fittings inside a fuel tank, refer to Paragraph 11.F.

NOTE: For hydraulic union or tee fitting bonds:

- The resistance is measured from the surface of one hydraulic tube to the surface of the other through the union or the tee
- The resistance that is specified for the larger size of tube is applicable for a reducer fitting.

NOTE: For a hydraulic tube and a bulkhead fitting bond inside a fuel tank, the resistance is measured from the surface of the hydraulic tube to the surface of the bulkhead.

**Table 37
MAXIMUM RESISTANCE OF A HYDRAULIC UNION OR TEE FITTING BOND INSIDE A FUEL TANK**

Tube		Maximum Resistance (ohm)
Size	Material	
-04	Stainless Steel	0.012
	Titanium	0.012

		Weld-On	0.005
-10	Aluminum	All	0.00041
	Titanium	Permaswage	0.0015
		Weld-On	0.003

G. Resistance of Bulkhead Fitting Bonds

The maximum resistance between the basic structure and the bulkhead fitting is 0.001 ohm for a new installation or a repair where the faying surfaces are prepared for a bond again.

H. Resistance of Clamp and Conduit or Tube Bonds

Table 39 specifies the maximum resistance between a conduit or a tube and a clamp that holds the conduit or the tube for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of hydraulic fittings inside a fuel tank, refer to Paragraph 11.G.

Table 39

MAXIMUM RESISTANCE OF BONDS BETWEEN A CONDUIT OR TUBE AND A CLAMP

Electrical Bond	Maximum Resistance (ohm)
Conduit or Tube to a Clamp	0.0015

I. Resistance of S280W555-() and YHLZG-() Ground Module Bonds

The maximum resistance from the basic structure to the body of the ground module is 0.001 ohm for a new installation or a repair where the faying surfaces are prepared for a bond again.

For the bond test of S280W555-() and YHLZG-() ground modules, refer to Paragraph 11.J.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

11. TEST PROCEDURES FOR ELECTRICAL BONDS

A. General Conditions for Bond Resistance Tests

For any bond that has a jumper or a designated ground wire, a control point that is used to measure the resistance must be:

- In the cleaned area for the terminal
- 0.25 inch maximum from the terminal.

Two points must be used to calibrate the meter to zero ohms:

- One point is on one side of the cleaned area
- The other point is on the opposite side of the same cleaned area.

NOTE: Either of the two points can be used as the control point.

B. Conditions for Bond Resistance Tests - Not Explosion Hazard Areas

Refer to Table 40 for the recommended bond resistance meters.

Other bond resistance meters are acceptable if all of these conditions occur:

- The meter is calibrated
- The meter has an accuracy of ± 5 percent of the reading in the range specified by the manufacturer of the equipment
- The value of the resistance is not less than 10 percent of the full range of the meter
- The meter has a four probe design
- The meter has separate current and potential probes.

NOTE: The satisfactory alternatives to measure resistances that are greater than 1 ohm are:

- An ohmmeter
- A multimeter.

NOTE: To measure AC and DC current return grounds:

- With Model M1 bond resistance meter, it is not necessary to disconnect each plug from the equipment
- With other bond resistance meters, it is necessary to disconnect each plug from the equipment.

**Table 40

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL BONDS AND GROUNDS

C. Conditions for Bond Resistance Tests - Explosion Hazard Areas

WARNING: BEFORE A METER IS USED IN AN EXPLOSION HAZARD AREA, MAKE SURE THAT DANGEROUS VAPORS ARE NOT IN THE AREA. INJURY CAN OCCUR.

WARNING: THE PROBES OF THE METER MUST NOT BE PUT DIRECTLY ON:

- THE TERMINAL OF AN EXPLOSIVE SQUIB
- A PART OF THE CIRCUIT THAT IS CONNECTED TO AN EXPLOSIVE SQUIB.

Refer to Table 41 for the permitted bond resistance meters.

NOTE: To measure AC and DC current return grounds:

- With Model M1 bond resistance meter, it is not necessary to disconnect each plug from the equipment
- With other bond resistance meters, it is necessary to disconnect each plug from the equipment.

J. Bond Test of S280W555-()and YHLZG-() Ground Modules

Refer to Paragraph 10.I. for the maximum resistance.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL BONDS AND GROUNDS**

If designated grounds are terminated in a ground module, it is not necessary to measure the resistance between each individual wire and the basic structure. The ground module and the basic structure are sufficient as test points. Refer to Figure 50.

NOTE: To measure the resistance in a stow bin, the test points are either of these pairs:

- The ground module and the adjacent support structure of the stow bin
- The ground stud and the adjacent support structure of the stow bin.

**TEST POINTS FOR A GROUND MODULE****Figure 50**

STANDARD WIRING PRACTICES MANUAL

REPLACEMENT OF GROUND STUDS

1. GROUND STUD REMOVAL

A. Removal of a BACS53B Ground Stud

NOTE: The ST2336A-1 tools is used as:

- A structure backup device
- A reamer clamp assembly.

**Table 1
GROUND STUD REMOVAL TOOLS**

Tool	Part Number	Supplier
C-clamp Assembly	ST2336A-11	Boeing
Drill Bushing	ST2336A-3	Boeing
Handle	ST2336A-9	Boeing
Reamer Clamp Assembly	ST2336A-1	Boeing
Structure Backup Device	ST2336A-1	Boeing

- (1) Remove the ground stud mandrel.

Refer to Figure 1.

**REMOVAL OF THE GROUND STUD MANDREL
Figure 1**

- (a) Make a selection of a structure backup device from Table 1.

NOTE: As an alternative, a special C-clamp assembly can be used. Refer to Table 1.

- (b) Put the device against the basic structure so that it is over the end of the ground stud that is opposite the long part of the mandrel.
- (c) Carefully hit the end of the mandrel with a hammer until it becomes loose.
Make sure that the force is applied in the direction that is parallel to the longitudinal axis of the mandrel.

- (2) Remove the ground stud sleeve.

Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL**REPLACEMENT OF GROUND STUDS****REMOVAL OF THE GROUND STUD SLEEVE****Figure 2**

- (a) Make a selection of these tools from Table 1:
 - A reamer clamp assembly
 - A handle.
 - (b) Put the reamer clamp over the sleeve shoulder of the ground stud so that the hole of the clamp is aligned with the hole of the sleeve.
 - (c) Put the drill bushing in the hole of the reamer clamp.
 - (d) Tighten the clamp screw until the sleeve should be tightly held.
 - (e) Put the handle on the reamer clamp so that the sleeve does not turn when it is drilled.
 - (f) Drill the sleeve out with a 0.260 inch x 0.309 inch diameter, 2 step drill.
 - (g) Remove the reamer clamp.
 - (h) Remove any remaining part of the sleeve.
- (3) If it is necessary, remove any oxide film from the hole with a 5/16 inch diameter expansion reamer or a stainless steel brush.

STANDARD WIRING PRACTICES MANUAL

REPLACEMENT OF GROUND STUDS

CAUTION: IF A REAMER IS USED, MAKE SURE THAT THE HOLE DOES NOT BECOME LARGER. IF THE HOLE DIAMETER IS GREATER THAN 0.317 INCH, A NEW GROUND STUD CANNOT BE SATISFACTORILY INSTALLED.

CAUTION: DO NOT PERMIT ANY INSULATION MATERIAL OR OTHER CONTAMINATION TO GO INTO THE HOLE.

2. GROUND STUD INSTALLATION

A. Installation of a BACS53B Ground Stud

**Table 2
BACS53B() GROUND STUDS**

GROUND STUD PULLER HEAD CONFIGURATIONS

Figure 3

- (1) Make a selection an installation tool from Table 3. Refer to Figure 3.
- (2) Make an inspection of the ground stud hole to make sure that there is not any insulation material or other contamination in the hole.
- (3) Put the ground stud in the puller head of the tool.

CAUTION: DO NOT MOVE THE TRIGGER UNTIL THE GROUND STUD IS IN THE CORRECT POSITION IN RELATION TO THE HOLE AND THE STRUCTURE.

- (4) Put the ground stud into the hole with the puller head so that:
 - The puller head of the tool is against the structure
 - The longitudinal axis of the ground stud is perpendicular to the structure.

Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

REPLACEMENT OF GROUND STUDS

POSITION OF THE GROUND STUD AND THE INSTALLATION TOOL

Figure 4

- (5) Pull the trigger of the power unit of the installation tool.
- (6) Make an inspection of the ground stud head in relation to the structure. Refer to Figure 5.

NOTE: A Boeing ST8711T tool can be used for to measure the distance from the top of the head of the ground stud to the structure.

Make sure that Dimension H is not greater than the specified value in Table 2.

INSTALLED BACS53B GROUND STUD

Figure 5

- (7) Put a nut on the ground stud.
- (8) Torque the nut 35 inch-pounds.
- (9) If the ground stud does not turn when it is torqued, remove the nut.
- (10) If the ground stud turns when it is torqued:
 - (a) Remove the ground stud. Refer to Paragraph 1.
 - (b) Replace the ground stud with a 1/4-28 ground stud assembly. Refer to Subject 20-20-00.
 - (c) Remove the terminals from the wires that will be attached to the ground stud.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

REPLACEMENT OF GROUND STUDS

- (d) Assemble a terminal of the correct size on each ground wire. Refer to Subject 20-30-11.

CONTACT REMOVAL
Figure 3

- (1) Make a selection of a contact removal tool from Table 3.

CAUTION: ONLY THE REMOVAL TOOLS THAT ARE GIVEN IN TABLE 3 PERMITTED. OTHER REMOVAL TOOLS CAN CAUSE DAMAGE TO THE MODULE.

- (2) Put the tip of the removal tool in the slot that is adjacent to the contact cavity. Refer to Figure 3.
- (3) Push the tool into the slot and into the module until it stops.

This releases the lock spring that holds the contact in position. Refer to Figure 3.

CAUTION: IF REMOVAL OF THE CONTACT IS TRIED BEFORE THE LOCK SPRING IS RELEASED, DAMAGE TO THE CONTACT, THE MODULE, OR THE WIRE CAN OCCUR.

- (4) Carefully pull the wired contact from the contact cavity.
- (5) Pull the removal tool out of the slot.

3. GROUND BLOCK MODULE ASSEMBLY

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY YHLZG GROUND BLOCK MODULES

- (1) Use BACC47DE4 or BACC47DE4A contacts for these wires:
 - BMS 13-51 Type XXVI AWG 22
 - BMS 13-48 Type IX AWG 20
 - Haveg 51-04570
 - Haveg 51-04569.
- (2) For BMS 13-48 Type VIII AWG 20 wire, use BACC47DE7 or BACC47DE7A contacts.
- (3) For all other wires:
 - Find the wire size.
 - Measure the outer diameter of the insulation of the wire.
 - Make a selection of the contact from Table 4.

B. Contact Assembly

**Table 5
CONTACT CRIMP TOOLS**

Basic Unit	Die	Locator	Supplier
M10S-1	S-1	SL-53	Burndy
11210	-	612245	Astro

- (1) Remove 0.22 inch \pm 0.05 inch of insulation from the end of the wire. Refer to Figure 4.

**WIRE PREPARATION
Figure 4**

- (2) If the diameter of the wire insulation is not within the minimum and maximum diameter for the contact:
 - (a) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
 - (b) Put a 0.5 inch \pm 0.13 inch length of the heat shrinkable sleeve on the wire. Refer to Figure 4.
Make sure that:
 - The sleeve has the smallest diameter that will fit over the wire
 - The forward end of the sleeve is aligned with or is within 0.03 inch of the end of the insulation of the wire.
 - (c) Shrink the sleeve in its position. Refer to Subject 20-10-14.
Make sure that the forward end of the sleeve is aligned with, or is within 0.03 inch of the end of the insulation of the wire.
- (3) Put the conductor into the wire barrel of the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY YHLZG GROUND BLOCK MODULES

Make sure that:

- The conductor can be seen in the inspection hole
- The wire insulation is against the bottom of the insulation shroud of the contact.

(4) Make a selection of a crimp tool from Table 5.

(5) Crimp the contact. Refer to Figure 5.

Make sure that there are 4 crimp indents on:

- The insulation shroud of the contact to hold the insulation
- The wire barrel of the contact to hold the wire.

POSITION OF THE CRIMP INDENTS ON THE CONTACT
Figure 5

C. Contact Insertion

ST2220-3-34A-2	Boeing

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BURNDY YHLZG GROUND BLOCK MODULES**

CONTACT INSERTION
Figure 6

Refer to Figure 6.

- (1) Make a selection of a contact insertion tool from Table 6.
- (2) Put the wired contact into the contact cavity of the module.
- (3) Push the tip of the insertion tool onto the end of the contact.
- (4) Push the tool and the contact into the contact cavity until it is fully inserted.
- (5) Make sure the contact is locked in the contact cavity of the module:
 - (a) Lightly hold the wire between the thumb and the forefinger.
 - (b) Pull slowly until the thumb and the forefinger move on the wire.

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRE INSULATION WITH THE FINGERNAILS.

2/0	BACT12G202	2.00	0.06

- (1) Cut the wire so that the end of the wire is perpendicular to its longitudinal axis.
- (2) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (3) Put a 1 inch length of the heat shrinkable sleeve on the wire.
- (4) Remove the necessary length of insulation from the end of the wire.

Refer to Table 2 and Figure 1.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF A DUAL GROUND

FLAG TERMINAL ASSEMBLY FOR A DUAL GROUND

Figure 1

- (1) Make a selection of a crimp tool from Table 3.
NOTE: Refer to Paragraph 3. for the operation of the Burndy MY28 crimp tool.
- (2) Put both of the flag terminals in the correct position on the wire. Refer to Figure 1.
 Make sure that the tongues of the terminals are in the same plane.
 - (a) Push the inner terminal toward the wire insulation until the rear edge of the terminal is 1/4 inch from the end of the insulation.
 - (b) Push the outer terminal toward the inner terminal until the rear edge of the terminal is 3/8 inch from the forward edge of the inner terminal.
- (3) Crimp the outer terminal so that the conductor strands do not move apart.
- (4) Put the inner terminal in the correct position. Refer to Figure 1.
- (5) Crimp the inner terminal.
- (6) Push the heat shrinkable sleeve forward until the end of the sleeve is aligned with the rear end of the inner terminal.
- (7) Shrink the sleeve into position. Refer to Subject 20-10-14.

3. OPERATION OF THE BURNDY MY28 CRIMP TOOL

A. Tool Description

The MY28 crimp tool is an adjustable hand crimp tool. Refer to Figure 2.

BURNDY MY28 HAND CRIMP TOOL

Figure 2

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF A DUAL GROUND

B. Tool Operation

- (1) Adjust the crimp depth. Refer to Figure 3.

LOCATION OF THE INDENTER POINT ON THE CRIMP TOOL
Figure 3

- (a) Move the tool handles to the closed position.
- (b) Make a selection of the correct size of gauge pin from Table 3.
- (c) Put the gauge pin directly under the indenter point.
- (d) Tighten the nest die with the adjustment screw.
- (2) Fully open the handles of the tool.
- (3) Put the terminal in the tool so that the flat side of the terminal is toward the indenter point.
- (4) Put the end of the wire in the crimp barrel of the terminal.
- (5) Close the handles fully.

STANDARD WIRING PRACTICES MANUAL

GE90 POWER PLANT: WIRING REPAIR

1. GENERAL DATA

A. **Applicable Conditions for the Repair of GE90 Power Plant Wiring**

Unserviceable GE90 power plant wire harnesses that have General Electric part numbers must be returned to General Electric for repair.

CAUTION: THE DATA AND PROCEDURES IN THE SWPM ARE NOT APPLICABLE FOR THE REPAIR OF THE GE90 POWER PLANT WIRE HARNESSSES THAT HAVE A GENERAL ELECTRIC PART NUMBER. REPAIRS THAT ARE NOT APPROVED CAN CAUSE UNSATISFACTORY PERFORMANCE OR RELIABILITY OF A WIRE HARNESS.

Refer to:

- The remainder of the SWPM for a GE90 power plant wire harness that has a Boeing part number
- General Electric for problems with a GE90 power plant wire harness that has a General Electric part number.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

1. GENERAL DATA

A. Applicable Conditions for the RB 211 Trent 800 Power Plant Wiring Repair Data

The data and procedures that are given in Subject 20-23-00 through Subject 20-23-39 are applicable only for the RB 211 Trent 800 power plant wire harnesses that have Rolls-Royce part numbers.

CAUTION: THE DATA AND PROCEDURES IN Subject 20-23-00 THROUGH Subject 20-23-39 ARE NOT APPLICABLE FOR THE REPAIR OF THE WIRING OF OTHER POWER PLANTS, OF OTHER POWER PLANT MANUFACTURERS, OR OF RB 211 TRENT 800 WIRING THAT HAS A BOEING PART NUMBER. REPAIRS THAT ARE NOT APPROVED CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRING.

Refer to:

- The remainder of the SWPM for an RB 211 Trent 800 power plant wire harness that has a Boeing part number
- Rolls-Royce for problems with the RB 211 Trent 800 power plant wiring repair data and procedures.

	The terminal lug has corrosion	Replacement of the terminal lug	Paragraph 2.E.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRING REPAIR****2. WIRING COMPONENT REPLACEMENT****A. Applicable Conditions for the Replacement of a Wiring Component**

If it is necessary to replace a component, the component must be replaced with a component that:

- Has the same part number
- Is a specified alternative component
- Is an equivalent component.

Refer to the WDM equipment list to find:

- The connector part number
- The backshell part number.

Refer to the WDM wire list to find:

- The wire type
- The wire size
- The wire color
- The wire length.

NOTE: For alternative wires and cables, refer to Subject 20-23-03.

Refer to the Aircraft Illustrated Parts Catalog (AIPC) to find:

- The contact part numbers
- The support bushing part numbers
- The part numbers of alternative connectors.

B. Replacement of a Contact

For the general conditions that are applicable for the replacement of a wiring component, refer to Paragraph 2.A.

- (1) Find the contact part number.

Refer to:

- The WDM to find the connector equipment number
- The Aircraft Illustrated Parts Catalog (AIPC) for the contact part number.

- (2) Cut the contact at the center of the crimp barrel.
- (3) Remove the remaining length of the contact crimp barrel from the end of the wire.
- (4) Examine the length of the wire.
- (5) If a wire is too short to install a new contact assembly in the connector, replace the wire or cable.

For the replacement of a shielded cable as:

- A temporary repair, refer to Paragraph 2.F.
- A permanent repair, refer to Paragraph 2.G.

NOTE: As an alternative, a new length of wire or cable can be added to the wire or cable with a splice. Refer to Subject 20-23-17.

- (6) Assemble the contact. Refer to Subject 20-23-37.

C. Replacement of a Connector

For the general conditions that are applicable for the replacement of a wiring component, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRING REPAIR**

- (1) Find the connector part number.

Refer to:

- The WDM for the part number
- The Aircraft Illustrated Parts Catalog (AIPC) for the alternative connector part number.

- (2) Disassemble the connector. Refer to Subject 20-23-37.
- (3) Assemble the new connector. Refer to Subject 20-23-37.

D. Replacement of a Backshell

For the general conditions that are applicable for the replacement of a wiring component, refer to Paragraph 2.A.

- (1) Find the backshell part number.

Refer to:

- The WDM for the part number
- The Aircraft Illustrated Parts Catalog (AIPC) for the alternative backshell part number.

- (2) Disassemble the backshell. Refer to Subject 20-23-37.
- (3) Assemble the new backshell. Refer to Subject 20-23-39.

E. Replacement of a Terminal Lug

For the general conditions that are applicable for the replacement of a wiring component, refer to Paragraph 2.A.

- (1) Find the terminal lug part number. Refer to the WDM.
- (2) Remove the installation nut or the installation bolt that holds the terminal lug.
- (3) Remove the heat shrinkable sleeve from the terminal lug and the wire.
- (4) Cut the terminal lug at the center of the crimp barrel.
- (5) Carefully remove the remaining length of the terminal lug crimp barrel from the conductor.
- (6) Examine the length of the wire.
- (7) If the wire is too short to install a new terminal lug assembly on the stud, replace the wire or the cable.

For the replacement of a shielded cable as:

- A temporary repair, refer to Paragraph 2.F.
- A permanent repair, refer to Paragraph 2.G.

- (8) Assemble the new terminal lug on the wire. Refer to Subject 20-23-32.

F. Replacement of a Shielded Cable - Temporary Repair

For the general conditions that are applicable for this procedure, refer to Paragraph 2.A.

This Paragraph gives the procedure to replace a cable as a temporary repair. For the procedure to replace a cable as a permanent repair, refer to Paragraph 2.G.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

CAUTION: REPLACEMENT OF A CABLE WITHOUT REMOVAL OF THE OLD CABLE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED AT THE SUBSEQUENT SCHEDULED AIRPLANE MAINTENANCE.

**Table 7
NECESSARY MATERIALS**

Material	Specification	Description	Supplier
Tape	A-A-5479	PTFE, Pressure Sensitive	An available source

(1) Make a selection of a tape from Table 7.

NOTE: An equivalent tape is a satisfactory alternative.

(2) Find the identification of the cable with damage.

(3) Find the part numbers of the contacts.

Refer to:

- The WDM to for the connector equipment number
- The Aircraft Illustrated Parts Catalog (AIPC) for the contact part numbers.

(4) Find the cable part number.

For wire type, wire class, wire size and wire length data, refer to the WDM.

NOTE: An equivalent cable is a satisfactory alternative. Refer to Subject 20-23-03.

NOTE: It is not necessary to have the same wire color.

(5) Disassemble the connector on one end of the cable. Refer to Subject 20-23-37.

(6) Remove the wire harness ties between the end of the cable and the first wire harness clamp.

(7) Cut the cable between the first and second wire harness clamp approximately two inches (51 millimeters) from the first clamp. Refer to Figure 1.

**LOCATION TO CUT THE SHIELDED CABLE
Figure 1**

(8) Remove the end of cable held by the first clamp.

(9) Wind two layers of tape around the remaining end of the cable.

(10) Fold the end of the cable back on the wire harness.

(11) Assemble a wire harness tie on the cable to hold it in its position. Refer to Subject 20-23-30.

(12) Do Step (5) through Step (11) again for the other end of the cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

- (13) If the damaged cable goes through a fire seal and it is known where the damaged cable goes through the seal:
 - (a) Remove the wire harness ties between one side of the seal and the first wire harness clamp.
 - (b) Cut the cable approximately 2 inches (51 millimeters) from the seal. Refer to Figure 2.

LOCATION TO CUT THE SHIELDED CABLE AT A FIRE SEAL
Figure 2

- (c) Wind two layers of tape around the end of the cable.
 - (d) Fold the end of the wire back against the wire harness.
 - (e) Assemble a wire harness tie on the end of the cable and the wire harness to hold the end of the cable in its position. Refer to Subject 20-23-30.
 - (f) Do Step (a) through Step (e) again on the other side of the seal.
 - (g) Remove the short piece of cable from the seal.
 - (h) Put the new cable through the hole in the seal.
- (14) If the damaged cable goes through a fire seal and it is not known where the cable goes through the seal:
 - (a) Disassemble the seal. Refer to Figure 3.

DISASSEMBLY OF THE FIRE SEAL
Figure 3

- (b) Remove a ceramic seal plug from the seal. Refer to Figure 3.
 - (c) Assemble the seal.
 - (d) Put the new cable through the hole in the seal.
- (15) Attach the new cable to the wire harness. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

INSTALLATION OF A NEW CABLE

Figure 4

- (a) Put the new cable along the outer surface of the wire harness and the wire harness clamps. Make sure that the cable does not touch adjacent components and cannot rub against them.
 - (b) Put each end of the new cable through the clamp that is nearest the connector at each end of the cable.
 - (c) Assemble wire harness ties along the new cable. Refer to Subject 20-23-30.
- NOTE:** It is not necessary to assemble a wire harness tie at a clamp.
- (16) Prepare one end of the new cable.
- (a) Remove necessary length of the cable jacket. Make sure that the length of jacket that is removed on the new cable is the same as the length of jacket that is removed on the damaged cable.
 - (b) Push the shield rearward to expand it at the end of the jacket.
 - (c) Make a hole in the shield near the end of the cable jacket with a nylon tool. Refer to Figure 5.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE INSULATION OF THE WIRES. DAMAGE TO THE INSULATION CAN CAUSE A SHORT TO OCCUR.

PREPARATION OF THE HOLE IN THE SHIELD

Figure 5

- (d) Carefully bend the cable until the component wires can be seen in the hole. Refer to Figure 6.

POSITION OF THE COMPONENT WIRES

Figure 6

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRING REPAIR**

- (e) Pull one wire at a time through the hole in the shield.
- (f) Pull the shield tight to make a flat conductor. Refer to Figure 7.

**PREPARATION OF THE SHIELD GROUND WIRE****Figure 7**

- (g) Assemble the new contacts. Refer to Subject 20-23-37.
 - (h) Remove the identification marker for each contact from the old wires.
 - (i) Put the identification marker for each contact on the new wires.
- (17) Assemble the connectors at each end of the new cable. Refer to Subject 20-23-37.

G. Replacement of a Shielded Cable - Permanent Repair

For the general conditions that are applicable for this procedure, refer to Paragraph 2.A.

This Paragraph gives the procedure to replace a cable as a permanent repair. For the procedure to replace a cable as a temporary repair, refer to Paragraph 2.F.

- (1) Find the identification of the cable that has damage.
- (2) Find the part numbers of the contacts.

Refer to:

- The WDM to for the connector equipment number
- The Aircraft Illustrated Parts Catalog (AIPC) for the contact part numbers.

- (3) Find the cable part number.

For wire type, wire class, wire size, wire color, and wire length data, refer to the WDM.

Make sure that the new cable is a minimum of 0.75 inch (19 millimeters) longer than the length necessary to connect the connectors on the ends of the cable.

NOTE: An equivalent cable is a satisfactory alternative. Refer to Subject 20-23-03.

- (4) Remove the black equipment identification marker from the wire harness.

Make sure to put the identification marker in a safe place.

- (5) Disassemble the connector on one end of the cable. Refer to Subject 20-23-37.

- (6) Remove the damaged cable from the backshell and the support bushing.

- (7) Prepare one end of the new cable.

- (a) Remove necessary length of the cable jacket.

Make sure that the length of jacket that is removed is the same as the length of jacket that is removed on the damaged cable.

- (b) Push the shield rearward to expand it at the end of the jacket.

- (c) Make a hole in the shield near the end of the cable jacket with a nylon tool. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE INSULATION OF THE WIRES. DAMAGE TO THE INSULATION CAN CAUSE A SHORT TO OCCUR.

PREPARATION OF THE HOLE IN THE SHIELD
Figure 8

- (d) Carefully bend the cable until the component wires can be seen in the hole. Refer to Figure 9.

POSITION OF THE COMPONENT WIRES
Figure 9

- (e) Pull one wire at a time through the hole in the shield.
- (f) Pull the shield tight to make a flat conductor. Refer to Figure 10.

PREPARATION OF THE SHIELD GROUND WIRE
Figure 10

- (g) Assemble the new contacts. Refer to Subject 20-23-37.
- (h) Remove the identification marker of each contact from the old wires.
- (i) Put the identification marker of each contact on the new wires.
- (8) Remove the necessary length of cable from the other end of the cable.
- (9) Do Step (7) again to prepare the other end of the cable.
- (10) Put the ends of the cable through the backshell and the support bushing of each connector.
- (11) Assemble the connector. Refer to Subject 20-23-37.
- (12) Assemble the backshell. Refer to Subject 20-23-39.
- (13) Remove the damaged cable from the wire harness. Refer to Subject 20-23-30.
- (14) Install the new cable in the wire harness. Refer to Subject 20-23-30.
- (15) Install the black identification marker on the wire harness.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

- (16) Install the receptacles in the engine bracket. Refer to Subject 20-23-37.
- (17) Connect the plug and the receptacle. Refer to Subject 20-23-37.
- (18) Do the necessary tests. Refer to the AMM.

3. CLEANING OF ELECTRICAL CONNECTORS

A. Removal of Liquid and Solid Contamination

**Table 8
NECESSARY TOOLS**

Tool	Specification	Description	Supplier
Brush	-	Solvent Resistant	An available source
Wiper	A-A-59323	Cloth, Lint Free	An available source
Spray Equipment	-	For solvent	An available source

**Table 9
SOLVENTS**

Specification	Description	Supplier
BDH 10224	Isopropanol, Analar Grade	An available source

- (1) Make a selection of these tools from Table 8:
 - A wiper
 - A brush or a spray equipment.

NOTE: An equivalent tool is a satisfactory alternative.

- (2) Make a selection of a solvent from Table 9.

NOTE: An equivalent solvent is a satisfactory alternative.

- (3) Apply the solvent to the contamination.
- (4) Use the brush or the solvent spray to remove the contamination.
- (5) Use a wiper to absorb the used solvent.

NOTE: Clean, dry compressed air is a satisfactory alternative to remove the remaining solvent.

CAUTION: DO NOT USE A COMPRESSED AIR SUPPLY WITH A PRESSURE THAT IS MORE THAN 15 POUNDS PER SQUARE INCH (1.03 BAR). DAMAGE TO THE CONNECTOR CAN OCCUR.

- (6) Dry the connector with clean, dry, compressed air.

CAUTION: DO NOT USE A COMPRESSED AIR SUPPLY WITH A PRESSURE THAT IS MORE THAN 15 POUNDS PER SQUARE INCH (1.03 BAR). DAMAGE TO THE CONNECTOR CAN OCCUR.

- (7) Examine the connector for remaining contamination.
- (8) If the connector has remaining contamination:
 - (a) Do Step (4) through Step (6) again.
 - (b) Examine the connector.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRING REPAIR

- (c) If the connector has remaining contamination, replace the connector. Refer to Paragraph 2.C.

For the conditions that are applicable to the data of this Subject, refer to Subject 20-23-00.

2. REPLACEMENT OF A DISCONNECT OR A WIRE HARNESS MARKER**A. Location of a Marker**

A marker for:

- A disconnect identification that is on the harness near each connector and backshell assembly
- A harness identification marker that is on the wire harness assembly at one location.

B. Replacement of a Marker

Table 1
NECESSARY MATERIALS

Description	Part Number	Supplier
Tape, Electrical, White Glass Cloth	Scotch 69	3M

Table 2
NECESSARY TOOLS

Description	Specification	Supplier
Pen, Ball Point, Black	DIN 16554/2	An available source

- (1) Make a selection of a tape from Table 1.

NOTE: An equivalent tape is a satisfactory alternative.

- (2) Make a selection of a pen from Table 2.

NOTE: An equivalent pen is a satisfactory alternative.

- (3) Record the identification number that is printed on the marker.
- (4) Cut the marker along the longitudinal axis of the marker.
- (5) Remove the marker.
- (6) Put two layers of tape on the wire harness assembly at the location of the old marker.

Make sure that:

- The edge of the tape is perpendicular to the longitudinal axis of the wire harness assembly
- Each layer of tape makes a 100 percent overlap.

- (7) Put the identification mark from the old marker on the tape with the pen.

20-23-17 CONTENTS

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

1. GENERAL DATA

A. General Conditions

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-23-00.

B. Applicable Conditions for the Repair of a Cable with a Splice

These conditions are applicable for the new length of cable of a splice assembly:

- The cable must be the same type of cable as the initial cable
- The cable have the same color as the initial cable
- The cable can be a specified alternative; refer to Subject 20-23-03.

A splice of a cable is not permitted:

- In a drip loop
- In a generator feeder cable
- In a location where a clamp holds the wire harness
- In a location that makes it necessary to change the position of the wire harness
- At a distance of less than 6.0 inches (150 millimeters) from the strain relief clamp of the connector backshell.

CAUTION: IF THE SPLICE OF A CABLE IS NOT A PERMITTED REPAIR, THE CABLE MUST BE REPLACED.

2. REPAIR OF A CABLE JACKET

A. Repair of the Cable Jacket with Tape

For the conditions that are applicable for this procedure, refer to Subject 20-23-15.

CAUTION: REPAIR OF THE CABLE JACKET IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED AT THE SUBSEQUENT, SCHEDULED AIRPLANE MAINTENANCE.

**Table 1

PTFE, 1 inch width	Scotch 92	3M

20-23-17

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (1) Make a selection of a wiper from Table 1.

NOTE: An equivalent tool is a satisfactory alternative.

- (2) Make a selection of a solvent from Table 2.

NOTE: An equivalent solvent is a satisfactory alternative.

- (3) Make a selection of these tapes from Table 3:

- A polyimide tape
- A PTFE tape.

NOTE: An equivalent tape is a satisfactory alternative.

- (4) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.

- (5) Clean the area of the cable that has damage with solvent and a wiper. Refer to Figure 1.

Make sure to clean a minimum of 3.0 inches (75 millimeters) on each side of the damage.

AREA TO CLEAN
Figure 1

- (6) Dry the solvent with a wiper.

- (7) Wind one layer of polyimide tape on the area with damage. Refer to Figure 2.

Make sure that the layer of tape:

- Starts a minimum of 1.0 inch (25 millimeters) from one side of the damage
- Stops a minimum of 1.0 inch (25 millimeters) from the other side of the damage
- Makes a 20 percent overlap.

INSTALLATION OF THE FIRST LAYER OF TAPE
Figure 2

- (8) Wind one layer of PTFE tape on the polyimide tape. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 20 percent overlap.

(9) Assemble a wire harness tie on each end of the second layer of tape.

Refer to:

- Figure 2
- Subject 20-23-30 for the procedure to assemble a wire harness tie.

(10) Put the wire harness in its initial configuration.

(11) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.

(12) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

3. SELECTION OF A SPLICE ASSEMBLY

A. Selection of a Splice Assembly Configuration

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

**Table 4
SPLICE ASSEMBLY CONFIGURATIONS**

Cable Class	Splice Assembly Configuration	Procedure
1	New length of cable with the connector on the end	Paragraph 4.A.
	New length of cable between the connectors	Paragraph 4.B.
2	New length of cable with the connector on the end	Paragraph 4.C.
	New length of cable between the connectors	Paragraph 4.D.
3	New length of cable with the connector on the end	Paragraph 4.E.
	New length of cable between the connectors	Paragraph 4.F.

4. REPAIR OF A SHIELDED CABLE WITH A SPLICE

A. Class 1 Cable - New Length of Cable with the Connector on the End

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES****SPLICE WITH A NEW LENGTH OF CABLE WITH THE CONNECTOR ON THE END****Figure 3**

Refer to Figure 3.

- (1) Find the cable part number. Refer to the WDM.

NOTE: For alternative cables, refer to Subject 20-23-03.

- (2) Make a selection of a wiper from Table 12.

NOTE: An equivalent wiper is a satisfactory alternative.

- (3) Make a selection of a solvent from Table 8.

NOTE: An equivalent solvent is a satisfactory alternative.

- (4) Make a selection of a shield material from Table 10.

NOTE: An equivalent shield material is a satisfactory alternative.

- (5) Make a selection of these tapes from Table 9:

- A polyimide tape
- A PTFE tape.

NOTE: An equivalent tape is a satisfactory alternative.

- (6) Make a selection these fire resistant sleeves from Table 11:

- An inner sleeve
- An outer sleeve.

NOTE: An equivalent sleeve is a satisfactory alternative.

- (7) Make a selection of two inner ferrules and two outer ferrules from Table 5.

- (8) Make a selection of a insulation removal tool from Table 13.

- (9) Make a selection of a ferrule crimp tool from Table 14.

- (10) Make a selection of a splice crimp tool from Table 15.

- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.

- (12) Find the location on the damaged cable to put the cable splice.

Make sure that the location of the splice is in a permitted location; refer to Subject 20-23-15.

- (13) Cut the cable.

Make sure that area of the cable with damage is fully removed.

- (14) Clean the end of the cable with solvent and a wiper.

Make sure to clean a minimum of 12.0 inches (305 millimeters) from the end of the cable.

- (15) Prepare the end of the damaged cable.

20-23-17

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (a) Remove 4.0 inches (102 millimeters) of the jacket from the end of the cable. Refer to Figure 4.

JACKET REMOVAL
Figure 4

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 4.
- (c) Remove the necessary length of the component wire to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 5.

CABLE PREPARATION
Figure 5

- (16) Do Step (15) again for one end of the new length of cable.
- (17) Put the mechanical ferrules on the cables.
- (a) Put the inner and outer ferrules on the end of each cable in this sequence:
- The outer ferrule
 - The inner ferrule.
- (b) Move the outer ferrules back on the cable away from the splice area.
- (18) Install the inner ferrule on the end of the cable.
- (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE INNER FERRULE
Figure 6

- (b) Crimp the inner ferrule.
- (19) Fold the shield back on the inner ferrule.
 - Make sure that:
 - The shield is smooth
 - The strands are symmetrical around the circumference of the ferrule.
- (20) Do Step (18) through Step (19) again for each inner ferrule on each cable.
- (21) Put the fire resistant sleeves on the component wire in this sequence:
 - The inner sleeve
 - The outer sleeve.

Refer to Figure 7.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient to extend farther than each end of the splice.

WIRE PREPARATION
Figure 7

- (22) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end of the component wire. Refer to Figure 7.
- (23) Put the new length of cable in its position for the assembly of the cable splice.
- (24) Assemble a splice of the each component wire. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

ASSEMBLY OF THE CONDUCTOR SPLICE

Figure 8

- (a) Put a conductor in each end of the splice.
Make sure all of the strands are in the crimp barrel.
 - (b) Crimp the splice.
 - (c) Lightly pull each conductor to make sure that they are held tightly in the splice.
 - (d) Move the inner fire resistant sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (e) Move the outer fire resistant sleeve on the inner sleeve.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (25) Wind a layer of shield material on the splice area. Refer to Figure 8.
Make sure that the layer of shield material:
- Starts at the end of the folded back shield on one end of the splice assembly
 - Ends at the end of the folded back shield on the other end of the splice assembly
 - Makes a 0.5 inch (13 millimeters) overlap.
- (26) Move the outer ferrule into its position on the inner ferrule.
- (27) Crimp the outer ferrule.
- (28) Remove the shield material that extends farther than the rear end of each outer ferrule.
- (29) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 9.
Make sure that the layer of tape:
- Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
 - Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
 - Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF POLYIMIDE TAPE

Figure 9

(30) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 9.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(31) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 10.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the one end of the layer of the polyimide tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the layer of polyimide tape
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 10

(32) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 10.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of PTFE tape
- Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
- Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
- Makes a 50 percent overlap.

(33) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (34) Put the wire harness in its initial configuration.
- (35) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.
- (36) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

B. Class 1 Cable - New Length of Cable Between the Connectors

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

NOTE: The procedure to assemble a splice with a new length of cable with the connector on the end is a satisfactory alternative to this procedure. Refer to Paragraph 4.A.

SPLICE WITH A NEW LENGTH OF CABLE BETWEEN THE CONNECTORS
Figure 11

Refer to Figure 11.

- (1) Find the cable part number. Refer to the WDM.
 - NOTE:** For alternative cables, refer to Subject 20-23-03.
- (2) Make a selection of a wiper from Table 12.
 - NOTE:** An equivalent wiper is a satisfactory alternative.
- (3) Make a selection of a solvent from Table 8.
 - NOTE:** An equivalent solvent is a satisfactory alternative.
- (4) Make a selection of a shield material from Table 10.
 - NOTE:** An equivalent shield material is a satisfactory alternative.
- (5) Make a selection of these tapes from Table 9:
 - A polyimide tape
 - A PTFE tape.
 - NOTE:** An equivalent tape is a satisfactory alternative.
- (6) Make a selection these fire resistant sleeves from Table 11:
 - An inner sleeve
 - An outer sleeve.
 - NOTE:** An equivalent sleeve is a satisfactory alternative.
- (7) Make a selection of four inner ferrules and four outer ferrules from Table 5.

20-23-17

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (8) Make a selection of a insulation removal tool from Table 13.
- (9) Make a selection of a ferrule crimp tool from Table 14.
- (10) Make a selection of a splice crimp tool from Table 15.
- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.
- (12) Find the location on the damaged cable to put the cable splice.
Make sure that the location of the splice on each end of the splice assembly is in a permitted location; refer to Subject 20-23-15.
- (13) Cut the cable on each side of the area with damage.
- (14) Clean the ends of the cable with solvent and a wiper.
Make sure to clean a minimum of 12.0 inches (305 millimeters) from the end of the cable.
- (15) Prepare the ends of the damaged cable and the new length of cable.
 - (a) Remove 4.0 inches (102 millimeters) of the jacket from the end of the cable. Refer to Figure 12.

JACKET REMOVAL
Figure 12

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 12.
- (c) Remove the necessary length of the component wire to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 13.

CABLE PREPARATION
Figure 13

- (d) Do Step (a) through Step (c) again for the other end of the damaged cable and the ends of the new length of cable.
- (16) Put the mechanical ferrules on the cables.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (a) Put an inner and outer ferrule on the end of each cable in this sequence:
 - The outer ferrule
 - The inner ferrule.
- (b) Move the outer ferrules back on the cables away from the splice area.
- (17) Install the inner ferrule on the end of the cable.
 - (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 14.

INSTALLATION OF THE INNER FERRULE
Figure 14

- (b) Crimp the inner ferrule.
- (18) Fold the shield back on the inner ferrule.
 - Make sure that:
 - The shield is smooth
 - The strands are symmetrical around the circumference of the ferrule.
- (19) Do Step (17) through Step (18) again for each inner ferrule on each cable.
- (20) Put necessary length of fire resistant sleeves on the component wire in this sequence:
 - The outer sleeve
 - The inner sleeve.

Refer to Figure 15.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

WIRE PREPARATION
Figure 15

- (21) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end of the component wire. Refer to Figure 15.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (22) Put the new length of cable in its position for the cable splice.
- (23) Assemble a splice of the component wire. Refer to Figure 16.

ASSEMBLY OF THE CONDUCTOR SPLICE
Figure 16

- (a) Put a conductor in each end of the splice.
Make sure that all of the strands are in the crimp barrel.
 - (b) Crimp the splice.
 - (c) Lightly pull each conductor to make sure that they are held tightly in the splice.
 - (d) Move the inner fire resistant sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (e) Move the outer fire resistant sleeve on the inner sleeve.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (24) Wind a layer of shield material on the splice area. Refer to Figure 16.
Make sure that the layer of shield material:
 - Starts at the end of the folded back shield on one end of the splice
 - Ends at the end of the folded back shield on the other end of the splice assembly
 - Makes a 0.5 inch (13 millimeters) overlap.
 - (25) Move the outer ferrule into its position on the inner ferrule.
 - (26) Crimp the outer ferrule.
 - (27) Remove the shield material that extends farther than the rear end of each outer ferrule.
 - (28) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 17.
Make sure that the layer of tape:
 - Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
 - Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
 - Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF POLYIMIDE TAPE

Figure 17

(29) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 17.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(30) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 18.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the end of the layer of polyimide tape at one end of the splice assembly
- Stops a minimum of 0.5 inch (13 millimeters) from the end of the polyimide tape at the other end of the splice assembly
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 18

(31) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 18.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of PTFE tape
- Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
- Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
- Makes a 50 percent overlap.

- (32) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (33) Put the wire harness in its initial configuration.
- (34) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.
- (35) Do an insulation resistance of the component wires in the cable. Refer to Paragraph 5.B.

C. Class 2 Cable - New Length of Cable with the Connector on the End

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

SPLICE WITH A NEW LENGTH OF CABLE WITH THE CONNECTOR ON THE END
Figure 19

Refer to Figure 19.

- (1) Find the cable part number. Refer to the WDM.

NOTE: For alternative cables, refer to Subject 20-23-03.

- (2) Make a selection of a wiper from Table 12.

NOTE: An equivalent wiper is a satisfactory alternative.

- (3) Make a selection of a solvent from Table 8.

NOTE: An equivalent solvent is a satisfactory alternative.

- (4) Make a selection of a shield material from Table 10.

NOTE: An equivalent shield material is a satisfactory alternative.

- (5) Make a selection of these tapes from Table 9:

- A polyimide tape
- A PTFE tape.

NOTE: An equivalent tape is a satisfactory alternative.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (6) Make a selection these fire resistant sleeves from Table 11:
 - An outer sleeve
 - An inner sleeve.

NOTE: An equivalent sleeve is a satisfactory alternative.

- (7) Make a selection of two inner ferrules and two outer ferrules from Table 5.
- (8) Make a selection of a insulation removal tool from Table 13.
- (9) Make a selection of a ferrule crimp tool from Table 14.
- (10) Make a selection of a splice crimp tool from Table 15.
- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.
- (12) Find the location on the damaged cable to put the cable splice.

Make sure that the location of the splice on each end of the splice assembly is in a permitted location; refer to Subject 20-23-15.
- (13) Cut the cable.

Make sure that area of the cable with damage is removed.
- (14) Clean the end of the cable with solvent and a wiper.

Make sure to clean a minimum of 12.0 inches (305 millimeters) from the end of the cable.
- (15) Prepare the ends of the damaged cable.
 - (a) Remove 6.0 inches (152 millimeters) of the jacket from the end of the cable. Refer to Figure 20.

JACKET REMOVAL
Figure 20

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 20.
- (c) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 21 and Figure 22.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

COMPONENT WIRE CONFIGURATION
Figure 21

CABLE PREPARATION
Figure 22

- (d) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 21 and Figure 22.
- (16) Prepare the new length of cable.
 - (a) Cut the necessary length of cable.
Make sure that the length is 12.0 inches (305 millimeters) longer than the distance between the two ends of the damaged cable.
 - (b) Clean the ends of the cable with solvent and a wipe.
Make sure to clean a minimum of 12.0 inches (305 millimeters) from each end of the cable.
 - (c) Remove 6.0 inches (152 millimeters) of the jacket from the end of the cable. Refer to Figure 23.

JACKET REMOVAL
Figure 23

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (d) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 23.
- (e) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 21 and Figure 24.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

CABLE PREPARATION
Figure 24

- (f) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 21 and Figure 24.
- (17) Put the mechanical ferrules on the end of each cable.
 - (a) Put the ferrules on the end of the cables in this sequence:
 - The outer ferrule
 - The inner ferrule.
 - (b) Move the ferrules back on the cable away from the splice area.
- (18) Install the inner ferrule on the end of the cable.
 - (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 25.

INSTALLATION OF THE INNER FERRULE
Figure 25

- (b) Crimp the inner ferrule.
- (19) Fold the shield back on the inner ferrule.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

Make sure that:

- The shield is smooth
- The strands are symmetrical around the circumference of the ferrule.

(20) Do Step (18) through Step (19) again for the inner ferrule on each cable.

(21) Put the necessary lengths of fire resistant sleeves on the longest component wire of the new length of cable in this sequence:

- The outer layer
- The inner layer.

Refer to Figure 26.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient to extend farther than each end of the splice.

POSITION OF THE FIRE RESISTANT SLEEVES

Figure 26

(22) Put the necessary lengths of fire resistant sleeves on the longest component wire of the damaged cable in this sequence:

- The outer layer
- The inner layer.

Refer to Figure 26.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient to extend farther than each end of the splice.

(23) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end of each component wire. Refer to Figure 26.

(24) Put the new length of cable in position for the assembly of the cable splice.

(25) Assemble a splice of the each component wire. Refer to Figure 27.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

ASSEMBLY OF THE CONDUCTOR SPLICE

Figure 27

- (a) Put a conductor in each end of the splice.
Make sure all of the strands are in the crimp barrel.
 - (b) Crimp the splice.
 - (c) Lightly pull each conductor to make sure that they are held tightly in the splice.
 - (d) Move the inner fire resistant sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (e) Move the outer fire resistant sleeve on the inner sleeve.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (26) Wind a layer of shield material on the splice area. Refer to Figure 27.
Make sure that the layer of shield material:
- Starts at the end of the folded back shield on one end of the splice
 - Ends at the end of the folded back shield on the other end of the splice assembly
 - Makes a 0.5 inch (13 millimeters) overlap.
- (27) Move the outer ferrule into its position on the inner ferrule.
- (28) Crimp the outer ferrule.
- (29) Remove the shield material that extends farther than the rear end of each outer ferrule.
- (30) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 28.
Make sure that the layer of tape:
- Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
 - Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
 - Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF POLYIMIDE TAPE

Figure 28

(31) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 28.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(32) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 29.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the end of the layer of polyimide tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the layer of polyimide tape
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 29

(33) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 29.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of PTFE tape
- Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
- Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
- Makes a 50 percent overlap.

(34) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.

(35) Prepare the end of the new length of cable.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES**

- (a) Remove necessary length of the cable jacket.
Make sure that the length of jacket that is removed on the new cable segment is the same as the length of jacket that is removed on the damaged cable.
- (b) Push the shield rearward to expand it at the end of the jacket.
- (c) Make a hole in the shield near the end of the cable jacket with a nylon tool. Refer to Figure 30.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE INSULATION OF THE WIRES. DAMAGE TO THE INSULATION CAN CAUSE A SHORT TO OCCUR.

**PREPARATION OF THE HOLE IN THE SHIELD****Figure 30**

- (d) Carefully bend the cable until the component wires can be seen in the hole. Refer to Figure 31.

**POSITION OF THE COMPONENT WIRES****Figure 31**

- (e) Pull one wire at a time through the hole in the shield.
- (f) Pull the shield tight to make a flat conductor. Refer to Figure 32.

**PREPARATION OF THE SHIELD GROUND WIRE****Figure 32**

- (g) Assemble the new contacts. Refer to Subject 20-23-37.
- (h) Remove the identification marker for each contact from the old wires.
- (i) Put the identification marker for each contact on the new wires.
- (36) Disassemble the connector on the end of the damaged cable. Refer to Subject 20-23-37.
- (37) Remove the damaged cable from the wire harness clamps.
- (38) Put the wire harness in its initial configuration.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (39) Assemble the connector. Refer to Subject 20-23-37.
- (40) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.
- (41) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

D. Class 2 Cable - New Length of Cable Between the Connectors

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

NOTE: The procedure to assemble a splice with a new length of cable with the connector on the end is a satisfactory alternative to this procedure. Refer to Paragraph 4.C.

SPLICE WITH A NEW LENGTH OF CABLE BETWEEN THE CONNECTORS

Figure 33

Refer to Figure 33.

- (1) Find the cable part number. Refer to the WDM.
 - NOTE:** For alternative cables, refer to Subject 20-23-03.
- (2) Make a selection of a wiper from Table 12.
 - NOTE:** An equivalent wiper is a satisfactory alternative.
- (3) Make a selection of a solvent from Table 8.
 - NOTE:** An equivalent solvent is a satisfactory alternative.
- (4) Make a selection of a shield material from Table 10.
 - NOTE:** An equivalent shield material is a satisfactory alternative.
- (5) Make a selection of these tapes from Table 9:
 - A polyimide tape
 - A PTFE tape.
 - NOTE:** An equivalent tape is a satisfactory alternative.
- (6) Make a selection these fire resistant sleeves from Table 11:
 - An inner sleeve
 - An outer sleeve.
 - NOTE:** An equivalent sleeve is a satisfactory alternative.
- (7) Make a selection of four inner ferrules and four outer ferrules from Table 5.

20-23-17

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (8) Make a selection of a insulation removal tool from Table 13.
- (9) Make a selection of a ferrule crimp tool from Table 14.
- (10) Make a selection of a splice crimp tool from Table 15.
- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.
- (12) Find the location on the damaged cable to put the cable splice.
Make sure that the location of the splice on each end of the splice assembly is in a permitted location; refer to Subject 20-23-15.
- (13) Cut the damaged cable on each side of the area with damage.
- (14) Clean the ends of the damaged cable with solvent and a wiper.
Make sure to clean a minimum of 12.0 inches (305 millimeters) from each end of the cable.
- (15) Prepare the ends of the damaged cable.
 - (a) Remove 6.0 inches (152 millimeters) of the jacket from the end of the cable. Refer to Figure 34.

JACKET REMOVAL
Figure 34

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 34.
- (c) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 35 and Figure 36.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

COMPONENT WIRE CONFIGURATION
Figure 35

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

CABLE PREPARATION

Figure 36

- (d) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 35 and Figure 36.
- (e) Do Step (a) through Step (d) again for the other end of the cable.
- (16) Prepare the new length of cable. Refer to Figure 34.
 - (a) Cut the necessary length of cable.
Make sure that the length is 12.0 inches (305 millimeters) longer than the distance between the two ends of the damaged cable.
 - (b) Clean the ends of the cable with solvent and a wiper.
Make sure to clean a minimum of 12.0 inches (305 millimeters) from each end of the cable.
 - (c) Remove 6.0 inches (152 millimeters) of the jacket from the end of the cable. Refer to Figure 37.

JACKET REMOVAL

Figure 37

- (d) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 34.
- (e) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 35 and Figure 38.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

CABLE PREPARATION
Figure 38

- (f) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 35 and Figure 38.
- (g) Do Step (c) through Step (f) again for the other end of the new length of cable.
- (17) Put the mechanical ferrules on the cables.
 - (a) Put an inner and outer ferrule on the end of each cable in this sequence:
 - The outer ferrule
 - The inner ferrule.
 - (b) Move the outer ferrules back on the cables away from the splice area.
- (18) Install the inner ferrule on the end of the cable.
 - (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 39.

INSTALLATION OF THE INNER FERRULE
Figure 39

- (b) Crimp the inner ferrule.
- (19) Fold the shield back on the inner ferrule.

Make sure that:

 - The shield is smooth
 - The strands are symmetrical around the circumference of the ferrule.
- (20) Do Step (18) through Step (19) again for each inner ferrule on each cable.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES**

(21) Put necessary length of fire resistant sleeves on the component wire of the new length of cable in this sequence:

- The outer sleeve
- The inner sleeve.

Refer to Figure 40.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

POSITION OF THE FIRE RESISTANT SLEEVES

Figure 40

(22) Put necessary length of fire resistant sleeves on the component wire of the damaged cable in this sequence:

- The outer sleeve
- The inner sleeve.

Refer to Figure 40.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

(23) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end of the component wire. Refer to Figure 40.

(24) Put the new length of cable in its position for the assembly of the cable splice.

Make sure that:

- The component wires on the new length of cable are aligned with the same color of the component wires of the damaged cable
- The shorter component wire of the new length of cable is aligned with the longer component wire of the damaged cable.

(25) Assemble a splice of each component wire. Refer to Figure 41.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

ASSEMBLY OF THE CONDUCTOR SPLICE

Figure 41

- (a) Put a conductor in each end of the splice.
Make sure all of the strands are in the crimp barrel.
 - (b) Crimp the splice.
 - (c) Lightly pull each conductor to make sure that they are held tightly in the splice.
 - (d) Move the inner fire resistant sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (e) Move the outer fire resistant sleeve on the inner sleeve.
Make sure that the center of the sleeve is aligned with the center of the splice.
 - (f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (26) Wind a layer of shield material on the splice area. Refer to Figure 41.
Make sure that the layer of shield material:
 - Starts at the end of the folded back shield on one end of the splice
 - Ends at the end of the folded back shield on the other end of the splice assembly
 - Makes a 0.5 inch (13 millimeters) overlap.
 - (27) Move the outer ferrule into its position on the inner ferrule.
 - (28) Crimp the outer ferrule.
 - (29) Remove the shield material that extends farther than the rear end of each outer ferrule.
 - (30) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 42.
Make sure that the layer of tape:
 - Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
 - Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
 - Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF TAPE

Figure 42

(31) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 42.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(32) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 43.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from one end of the layer of polyimide tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of layer of polyimide tape
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 43

(33) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 43.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of PTFE tape
- Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
- Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
- Makes a 50 percent overlap.

(34) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.

(35) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

(36) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

E. Class 3 Cable - New Length of Cable with the Connector on the End

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

SPLICE WITH A NEW LENGTH OF CABLE WITH THE CONNECTOR ON THE END
Figure 44

Refer to Figure 44.

(1) Find the cable part number. Refer to the WDM.

NOTE: For alternative cables, refer to Subject 20-23-03.

(2) Make a selection of a wiper from Table 12.

NOTE: An equivalent wiper is a satisfactory alternative.

(3) Make a selection of a solvent from Table 8.

NOTE: An equivalent solvent is a satisfactory alternative.

(4) Make a selection of a shield material from Table 10.

NOTE: An equivalent shield material is a satisfactory alternative.

(5) Make a selection of these tapes from Table 9:

- A polyimide tape
- A PTFE tape.

NOTE: An equivalent tape is a satisfactory alternative.

(6) Make a selection these fire resistant sleeves from Table 11:

- An inner sleeve
- An outer sleeve.

NOTE: An equivalent sleeve is a satisfactory alternative.

(7) Make a selection of two inner ferrules and two outer ferrules from Table 5.

(8) Make a selection of a insulation removal tool from Table 13.

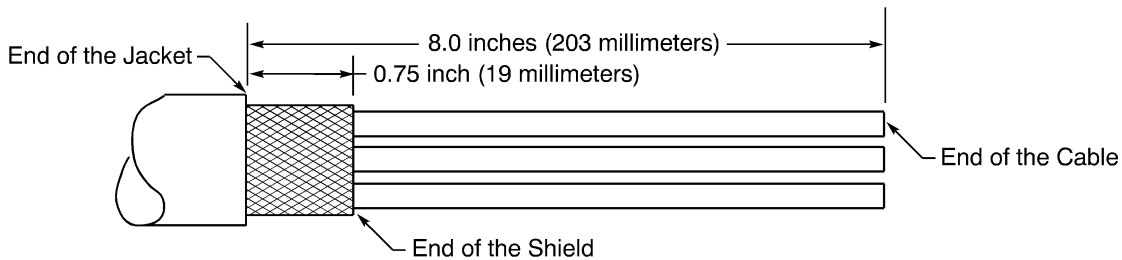

(9) Make a selection of a ferrule crimp tool from Table 14.

(10) Make a selection of a splice crimp tool from Table 15.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.
- (12) Find the location on the damaged cable to put the cable splice.
Make sure that the location of the splice on each end of the splice assembly is in a permitted location; refer to Subject 20-23-15.
- (13) Cut the cable.
Make sure that area with damage is on the end of the cable that is replaced.
- (14) Clean the end of the cable with solvent and a wiper.
Make sure to clean a minimum of 16 inches (406 millimeters) from the end of the cable.
- (15) Prepare the ends of the damaged cable.
 - (a) Remove 8.0 inches (203 millimeters) of the jacket from the end of the cable. Refer to Figure 45.

JACKET REMOVAL
Figure 45

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of shield equal to 0.75 inch (19 millimeters). Refer to Figure 45.
- (c) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 6.0 inches (152 millimeters). Refer to Figure 46 and Figure 47.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

COMPONENT WIRE CONFIGURATION

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

CABLE PREPARATION
Figure 47

- (d) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 46 and Figure 47.
 - (e) Remove the necessary length of component wire C to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 46 and Figure 47.
- (16) Prepare the new length of cable.
- (a) Cut the necessary length of cable.
Make sure that the length is 8.0 inches (203 millimeters) longer than the distance from the end of the damaged cable to the location of the connector on the end of the cable.
 - (b) Clean the ends of the cable with solvent and a wiper.
Make sure to clean a minimum of 16.0 inches (406 millimeters) from each end of the cable.
 - (c) Remove 8.0 inches (203 millimeters) of the jacket from the end of the cable. Refer to Figure 48.

JACKET REMOVAL
Figure 48

- (d) Remove the necessary length of shield to make the distance from the end of the jacket to the end of shield equal to 0.75 inch (19 millimeters). Refer to Figure 48.
- (e) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 46 and Figure 49.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

CABLE PREPARATION
Figure 49

- (f) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 46 and Figure 49.
- (g) Remove the necessary length of component wire C to make the distance from the end of the jacket to the end of the wire equal to 6.0 inches (152 millimeters). Refer to Figure 46 and Figure 49.
- (17) Put the mechanical ferrules on the end of each cable.
 - (a) Put the ferrules on the end of the cables in this sequence:
 - The outer ferrule
 - The inner ferrule.
 - (b) Move the ferrules back on the cable away from the splice area.
- (18) Install the inner ferrule on the end of the cable.
 - (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 50.

INSTALLATION OF THE INNER FERRULE
Figure 50

- (b) Crimp the inner ferrule.
- (19) Fold the shield back on the inner ferrule.
Make sure that:
 - The shield is smooth
 - The strands are symmetrical around the circumference of the ferrule.
- (20) Do Step (18) through Step (19) again for the inner ferrule on each cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

(21) Put the necessary length of fire resistant sleeves on the longest component wire of the new cable segment in this sequence:

- The outer sleeve
- The inner sleeve.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

(22) Put the necessary length of fire resistant sleeves on the two longest component wires of the damaged cable in this sequence:

- The outer sleeve
- The inner sleeve.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

(23) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end of each component wire.

(24) Put the new length of cable in position for the assembly of the cable splice.

(25) Assemble a splice of each component wire. Refer to Figure 51.

ASSEMBLY OF THE CONDUCTOR SPLICE

Figure 51

(a) Put a conductor in each end of the splice.

Make sure that all of the strands are in the crimp barrel.

(b) Crimp the splice.

(c) Lightly pull each conductor to make sure that they are held tightly in the splice.

(d) Move the inner fire resistant sleeve on the splice.

Make sure that the center of the sleeve is aligned with the center of the splice.

(e) Move the outer fire resistant sleeve on the inner sleeve.

Make sure that the center of the sleeve is aligned with the center of the splice.

(f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.

(26) Wind a layer of shield material on the splice area. Refer to Figure 51.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

Make sure that the layer of shield material:

- Starts at the end of the folded back shield on one end of the splice
- Ends at the end of the folded back shield on the other end of the splice assembly
- Makes a 0.5 inch (13 millimeters) overlap.

(27) Move the outer ferrule into its position on the inner ferrule.

(28) Crimp the outer ferrule.

(29) Remove the shield material that extends farther than the rear end of each outer ferrule.

(30) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 52.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
- Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF POLYIMIDE TAPE

Figure 52

(31) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 52.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(32) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 53.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from one end of the layer of polyimide tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the layer of polyimide tape
- Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 53

- (33) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 53.
 Make sure that the layer of tape:
- Is in the opposite direction of the first layer of PTFE tape
 - Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
 - Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
 - Makes a 50 percent overlap.
- (34) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (35) Prepare the end of the new length of cable.
- (a) Remove necessary length of the cable jacket.
 Make sure that the length of jacket removed on the new cable segment is the same as the length of jacket that is removed on the damaged cable segment.
 - (b) Push the shield rearward to expand it at the end of the jacket.
 - (c) Make a hole in the shield near the end of the cable jacket with a nylon tool. Refer to Figure 54.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE INSULATION OF THE WIRES. DAMAGE TO THE INSULATION CAN CAUSE A SHORT TO OCCUR.

PREPARATION OF THE HOLE IN THE SHIELD

Figure 54

- (d) Carefully bend the cable until the component wires can be seen in the hole. Refer to Figure 55.

STANDARD WIRING PRACTICES MANUAL

POSITION OF THE COMPONENT WIRES
Figure 55

- (e) Pull one wire at a time through the hole in the shield.
- (f) Pull the shield tight to make a flat conductor. Refer to Figure 56.

PREPARATION OF THE SHIELD GROUND WIRE
Figure 56

- (g) Assemble the new contacts on the wires. Refer to Subject 20-23-37.
 - (h) Remove the identification marker for each contact from the old wires.
 - (i) Put the identification marker for each contact on the new wires.
- (36) Disassemble the connector on the end of the damaged cable. Refer to Subject 20-23-37.
 - (37) Remove the damaged cable from the wire harness clamps.
 - (38) Put the wire harness in its initial configuration.
 - (39) Assemble the connector. Refer to Subject 20-23-37.
 - (40) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.
 - (41) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

F. Class 3 Cable - New Length of Cable Between the Connectors

For the conditions that are applicable for:

- The damage and repair of shielded cables, refer to Subject 20-23-15
- The repair of a cable with a splice, refer to Paragraph 1.B.

CAUTION: REPAIR OF A CABLE WITH A SPLICE IS A TEMPORARY REPAIR. THE CABLE MUST BE REPLACED WHEN THE SUBSEQUENT, SCHEDULED ENGINE MAINTENANCE IS DONE.

NOTE: The procedure to assemble a splice with a new length of cable with the connector on the end is a satisfactory alternative to this procedure. Refer to Paragraph 4.E.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

SPLICE WITH A NEW LENGTH OF CABLE BETWEEN THE CONNECTORS

Figure 57

Refer to Figure 57.

- (1) Find the cable part number. Refer to the Subject 20-23-15 and the WDM.
NOTE: For alternative cables, refer to Subject 20-23-03.
- (2) Make a selection of a wiper from Table 12.
NOTE: An equivalent wiper is a satisfactory alternative.
- (3) Make a selection of a solvent from Table 8.
NOTE: An equivalent solvent is a satisfactory alternative.
- (4) Make a selection of a shield material from Table 10.
NOTE: An equivalent shield material is a satisfactory alternative.
- (5) Make a selection of these tapes from Table 9:
 - A polyimide tape
 - A PTFE tape.NOTE: An equivalent tape is a satisfactory alternative.
- (6) Make a selection these fire resistant sleeves from Table 11:
 - An inner sleeve
 - An outer sleeve.NOTE: An equivalent sleeve is a satisfactory alternative.
- (7) Make a selection of four inner ferrules and four outer ferrules from Table 5.
- (8) Make a selection of a insulation removal tool from Table 13.
- (9) Make a selection of a ferrule crimp tool from Table 14.
- (10) Make a selection of a splice crimp tool from Table 15.
- (11) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the cable that has damage.
- (12) Find the location on the damaged cable to put the cable splice.
 Make sure that the location of the splice on the cable is in a permitted location; refer to Subject 20-23-15.
- (13) Cut the damaged cable on each side of the area with damage.
- (14) Clean the ends of the damaged cable with solvent and a wiper.
 Make sure to clean a minimum of 16.0 inches (406 millimeters) from each end of the cable.
- (15) Prepare the ends of the damaged cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (a) Remove 8.0 inches (203 millimeters) of the jacket from the end of the cable. Refer to Figure 58.

JACKET REMOVAL
Figure 58

- (b) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 58.
- (c) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 6.0 inches (152 millimeters). Refer to Figure 59 and Figure 60.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

COMPONENT WIRE CONFIGURATION
Figure 59

CABLE PREPARATION
Figure 60

- (d) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 59 and Figure 60.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (e) Remove the necessary length of component wire C to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 59 and Figure 60.
- (f) Do Step (a) through Step (d) again for the other end of the cable.
- (16) Prepare the length of new length of cable.
 - (a) Cut the necessary length of cable.
Make sure that the length is 16.0 inches (406 millimeters) longer than the distance between the two ends of the damaged cable.
 - (b) Clean the ends of the cable with solvent and a wiper.
Make sure to clean a minimum of 12.0 inches (305 millimeters) from each end of the cable.
 - (c) Remove 8.0 inches (203 millimeters) of the jacket from the end of the cable. Refer to Figure 61.

JACKET REMOVAL
Figure 61

- (d) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.75 inch (19 millimeters). Refer to Figure 61.
- (e) Remove the necessary length of component wire A to make the distance from the end of the jacket to the end of the wire equal to 2.0 inches (51 millimeters). Refer to Figure 59 and Figure 62.

NOTE: The component wires have been given letters to help make sure that the same wires are cut to the correct length on the end of each cable.

CABLE PREPARATION
Figure 62

- (f) Remove the necessary length of component wire B to make the distance from the end of the jacket to the end of the wire equal to 4.0 inches (102 millimeters). Refer to Figure 59 and Figure 62.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES**

- (g) Remove the necessary length of component wire C to make the distance from the end of the jacket to the end of the wire equal to 6.0 inches (152 millimeters). Refer to Figure 59 and Figure 62.
- (h) Do Step (c) through Step (f) again for the other end of the new cable segment.
- (17) Put the mechanical ferrules on the cables.
- (a) Put an inner and outer ferrule on the end of each cable in this sequence:
- The outer ferrule
 - The inner ferrule.
- (b) Move the outer ferrules back on the cables away from the splice area.
- (18) Install the inner ferrule on the end of the cable.
- (a) Push the inner ferrule forward on the cable until the forward end of the inner ferrule is aligned with the end of the jacket. Refer to Figure 63.

**INSTALLATION OF THE INNER FERRULE****Figure 63**

- (b) Crimp the inner ferrule.
- (19) Fold the shield back on the inner ferrule. Refer to Figure 63.
- Make sure that:
- The shield is smooth
 - The strands are symmetrical around the circumference of the ferrule.
- (20) Do Step (18) through Step (19) again for each inner ferrule on each cable.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

- (21) Put the necessary lengths of fire resistant sleeves on the longest component wire of the new length of cable in this sequence:

- The outer sleeve
- The inner sleeve.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

- (22) Put the necessary lengths of fire resistant sleeves on the two longest component wires of the damaged cable in this sequence:

- The outer sleeve
- The inner sleeve.

Make sure that:

- The sleeve is expanded
- The length of the sleeve is sufficient extend farther than each end of the splice.

- (23) Remove 0.25 inch (6 millimeters) to 0.28 inch (7 millimeters) of insulation from the end each the component wire.

- (24) Put the new length of cable in its position for the assembly of the cable splice.

- (25) Assemble a splice of the each component wire. Refer to Figure 64.

ASSEMBLY OF THE CONDUCTOR SPLICE

Figure 64

- (a) Put a conductor in each end of the splice.
Make sure all of the strands are in the crimp barrel.
- (b) Crimp the splice.
- (c) Lightly pull each conductor to make sure that they are held tightly in the splice.
- (d) Move the inner fire resistant sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
- (e) Move the outer fire resistant sleeve on the inner sleeve.
Make sure that the center of the sleeve is aligned with the center of the splice.
- (f) Assemble a wire harness tie on each end of the sleeves. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (26) Wind a layer of shield material on the splice area. Refer to Figure 64.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

Make sure that the layer of shield material:

- Starts at the end of the folded back shield on one end of the splice
- Ends at the end of the folded back shield on the other end of the splice assembly
- Makes a 0.5 inch (13 millimeters) overlap.

(27) Move the outer ferrule into its position on the inner ferrule.

(28) Crimp the outer ferrule.

(29) Remove the shield material that extends farther than the rear end of each outer ferrule.

(30) Tightly wind a layer of polyimide tape on the splice assembly. Refer to Figure 65.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at one end of the splice assembly
- Stops a minimum of 0.5 inch (13 millimeters) from the rear of outer ferrule at the other end of the splice assembly
- Makes a 50 percent overlap.

INSTALLATION OF THE LAYERS OF POLYIMIDE TAPE

Figure 65

(31) Tightly wind a second layer of polyimide tape on the splice assembly. Refer to Figure 65.

Make sure that the layer of tape:

- Is in the opposite direction of the first layer of tape
- Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
- Makes a 50 percent overlap.

(32) Tightly wind a layer of PTFE tape on the splice assembly. Refer to Figure 66.

Make sure that the layer of tape:

- Starts a minimum of 0.5 inch (13 millimeters) from the end of the layer of polyimide tape
- Stops a minimum of 0.5 inch (13 millimeters) from the other end of the layer of polyimide tape
- Makes a 50 percent overlap.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

INSTALLATION OF THE LAYERS OF PTFE TAPE

Figure 66

- (33) Tightly wind a second layer of PTFE tape on the splice assembly. Refer to Figure 66.
Make sure that the layer of tape:
 - Is in the opposite direction of the first layer of PTFE tape
 - Starts a minimum of 1.0 inch (25 millimeters) from one end of the first layer of PTFE tape
 - Stops a minimum of 1.0 inch (25 millimeters) from the other end of the first layer of PTFE tape
 - Makes a 50 percent overlap.
- (34) Assemble a wire harness tie approximately 1 inch (25 millimeters) from each end of the splice assembly. Refer to Subject 20-23-30 for the procedure to assemble a wire harness tie.
- (35) Do a wire continuity check of the component wires in the cable. Refer to Paragraph 5.A.
- (36) Do an insulation resistance check of the component wires in the cable. Refer to Paragraph 5.B.

5. WIRE CHECKS

A. Wire Continuity Check

- (1) Find the wire termination data. Refer to the WDM.
- (2) Disconnect each connector on the circuit that must have a wire continuity check.

CAUTION: EACH CONNECTOR ON THE CIRCUIT THAT MUST HAVE A TEST MUST BE DISCONNECTED. IF THE CONNECTORS ARE NOT DISCONNECTED, UNSATISFACTORY RESISTANCE INDICATIONS OR DAMAGE TO THE CONNECTOR CAN OCCUR.

- (3) Measure the resistance on all wires.

Make sure that each circuit has continuity from one end of the wire to the other end of the wire.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

B. Insulation Resistance Check

- (1) Make a selection of a multimeter.

WARNING: DO NOT USE A MEGOHMMETER FOR THE INSULATION RESISTANCE TEST OF THE ON-WING WIRING REPAIR. INJURY TO PERSONNEL OR DAMAGE TO THE AIRPLANE CAN OCCUR.

- (2) Set the meter to the 100 megohm scale.
- (3) Attach one meter test lead to the contact assembly on the connector.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF SHIELDED CABLES

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (4) Attach the other meter test lead to a contact assembly on a wire that does not connect to the same circuit.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (5) Read the meter.
Make sure that the resistance is a minimum of 100 megohm.
- (6) Do Step (3) through Step (5) for each contact in the connector.
- (7) Attach the one meter test lead to the backshell.
- (8) Attach the other meter test lead to the contact assembly on the wire that must have a test.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (9) Read the meter.
Make sure that the resistance is a minimum of 100 megohm.
- (10) Do Step (8) through Step (9) for each wire that must have a test.

RB 211 TRENT 800 POWER PLANT: REPAIR OF ALTERNATOR LEAD WIRES

1. GENERAL DATA

A. Applicable Conditions

For the conditions that are applicable to the data of this Subject, refer to Subject 20-23-00.

2. ALTERNATOR LEAD WIRE REPAIR

A. Cable Jacket Repair

For the conditions that are applicable for this procedure, refer to Subject 20-23-15.

**Table 1
SOLVENTS**

Description	Specification	Supplier
Alcohol, Isopropyl	TT-I-735	An available source

**Table 2
TAPES**

Description	Part Number	Supplier
Polyimide, 1 inch width	Scotch 62	3M
PTFE, 1 inch width	Scotch 92	3M

**Table 3
NECESSARY TOOLS**

Description	Part Number	Supplier
Disposable Tissue	Kimwipe 7105	Kimberly-Clark

- (1) Make a selection of a solvent from from Table 1.

NOTE: An equivalent solvent is a satisfactory alternative.

- (2) Make a selection of a wiper from Table 3.

NOTE: An equivalent wiper is a satisfactory alternative.

- (3) Make a selection of these tapes from Table 2:

- A polyimide tape
- A PTFE tape.

NOTE: An equivalent tape is a satisfactory alternative.

- (4) Remove the necessary wire harness support clamps and wire harness ties to get access to the area of the wire that has damage.

- (5) Clean the area of the cable that has damage with solvent and a wiper. Refer to Figure 1.

Make sure to clean a minimum of 3.0 inches (75 millimeters) on each side of the damage.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: REPAIR OF ALTERNATOR LEAD WIRES

AREA TO CLEAN
Figure 1

- (6) Dry the solvent with a wiper.
- (7) Wind one layer of polyimide tape on the area with damage. Refer to Figure 2.

Make sure that the layer of tape:

- Starts a minimum of 1.0 inch (25 millimeters) from one side of the damage
- Stops a minimum of 1.0 inch (25 millimeters) from the other side of the damage
- Makes a 20 percent overlap.

INSTALLATION OF THE FIRST LAYER OF TAPE
Figure 2

- (8) Wind one layer of PTFE tape on the polyimide tape. Refer to Figure 2.
Make sure that the layer of tape:
 - Is in the opposite direction of the first layer of tape
 - Starts a minimum of 0.5 inch (13 millimeters) from one end of the first layer of tape
 - Stops a minimum of 0.5 inch (13 millimeters) from the other end of the first layer of tape
 - Makes a 20 percent overlap.
- (9) Assemble a wire harness tie on each end of the second layer of tape. Refer to Subject 20-23-30.

20-23-30 CONTENTS

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY****1. GENERAL DATA****A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-23-00.

2. WIRE HARNESS DISASSEMBLY**A. Replacement of a Damaged Cable**

- (1) Loosen the first wire harness clamp that is next to the connector on one end of the wire harness.
- (2) Remove all of the wire harness ties between the first clamp and the second clamp.
- (3) Remove the damaged cable from the first clamp.
- (4) Put the new cable in its position in the first clamp.
- (5) Fully install the first clamp.
- (6) Assemble wire harness ties on the wire harness between the first clamp and the second clamp. Refer to Paragraph 3.C. for the procedure to assemble a wire harness tie.
Make sure that a new wire harness tie is assembled at the same position as the wire harness tie that is removed.
- (7) Loosen the second wire harness clamp.
- (8) Remove all of the wire harness ties between the second clamp and the third clamp.
- (9) Remove the damaged cable from the third clamp.
- (10) Put the new cable in its position in the second clamp.
- (11) Fully install the second clamp.
- (12) Assemble wire harness ties on the wire harness between the first clamp and the second clamp. Refer to Paragraph 3.C. for the procedure to assemble a wire harness tie.
Make sure that a new wire harness tie is assembled at the same position as the wire harness tie that is removed.
- (13) Do Step (7) through Step (9) again for each clamp location until the damaged cable is fully removed and the new cable is fully installed.
Make sure that a new wire harness tie is assembled at the same position as the wire harness tie that is removed.

3. WIRE HARNESS ASSEMBLY**A. General Conditions**

These conditions are applicable for the location of a wire harness tie:

- A replacement wire harness tie must be assembled at the same location as the initial wire harness tie that was removed
- A wire harness tie must be assembled at a maximum distance of 2 inches (51 millimeters) from an adjacent wire harness tie.

These conditions are applicable for the assembly of a wire harness tie:

- All wires must be parallel before the wire harness tie is assembled on the wire harness
- A wire harness tie must be assembled on two or more wires or cables that are together.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

B. Wire Harness Tie Materials

**Table 1
LACING TAPE PART NUMBERS**

Part Number or Specification	Description	Supplier
BMS13-54 Type III Finish C	Nomex, flat braid; 0.110 inch \pm 0.010 inch wide, 0.014 inch \pm 0.003 inch thick	Gudebrod
		Western Filament
ESW-1900	Nomex, flat braid; 0.110 inch \pm 0.010 inch wide, 0.014 inch \pm 0.003 inch thick	Polamco
MIL-T-43435 Type V Finish C	Nomex, flat braid; 0.110 inch \pm 0.010 inch wide, 0.014 inch \pm 0.003 inch thick	QPL
T085	Nomex, flat braid; 0.110 inch \pm 0.010 inch wide, 0.014 inch \pm 0.003 inch thick	Raydex/CDT

C. Assembly of a Wire Harness Tie

This paragraph gives the procedure to assemble a wire harness tie when no special conditions occur.

For the procedures to assemble a wire harness tie:

- Where a wire harness tie goes across a different wire harness, refer to Paragraph 3.D.
- At a junction, refer to Paragraph 3.E.
- At a 90 degree branch, refer to Paragraph 3.F.
- At a branch, refer to Paragraph 3.G.

**ASSEMBLY OF A WIRE HARNESS TIE
Figure 1**

Refer to Figure 1.

- (1) Make a selection of a lacing tape from Table 1.

NOTE: An equivalent lacing tape is a satisfactory alternative.

- (2) Make the wires parallel with a minimum number of twists.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY**

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (3) Make a clove hitch knot on the wire harness. Refer to Figure 2.

CAUTION: DO NOT CAUSE DEFORMATION OF THE INSULATION OF THE WIRE OR THE CABLE DURING THE ASSEMBLY OF THE CLOVE HITCH. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

CLOVE HITCH KNOT
Figure 2

- (4) Make a square knot on top of the clove hitch knot. Refer to Figure 3.

CAUTION: MAKE SURE THAT THE TIE IS NOT TOO TIGHT. DAMAGE TO THE WIRE INSULATION CAN OCCUR.

SQUARE KNOT
Figure 3

- (5) Cut each end of the lacing tape.

Make sure that the distance from the knot to the end of the lacing tape is between 0.25 inch (6 millimeters) and 0.50 inch (13 millimeters).

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

D. Assembly of a Wire Harness Tie Where a Wire Harness Goes Across a Different Wire Harness

CONFIGURATION OF TWO WIRE HARNESSSES THAT GO ACROSS EACH OTHER
Figure 4

Refer to Figure 4.

- (1) Make a selection of a lacing tape from Table 1.
- (2) Make the wires parallel with minimum of twists.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (3) Assemble a clove hitch on one wire harness where the wire harnesses goes across the other wire harness. Refer to Figure 5.

CAUTION: DO NOT CAUSE DEFORMATION OF THE INSULATION OF THE WIRE OR THE CABLE DURING THE ASSEMBLY OF THE CLOVE HITCH. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

CLOVE HITCH
Figure 5

- (4) Make a figure 8 wind around the wire harnesses.
- (5) Pull the lacing tape tight.
- (6) Do Step (4) through Step (5) again 5 times.
- (7) Make a wind around the lacing tape between the two wire harnesses.
- (8) Pull the lacing tape tight.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY**

- (9) Do Step (7) through Step (8) again 2 times.
- (10) Make a square knot. Refer to Figure 6.

CAUTION: MAKE SURE THAT THE TIE IS NOT TOO TIGHT. DAMAGE TO THE WIRE INSULATION CAN OCCUR.

SQUARE KNOT
Figure 6

- (11) Cut each end of the lacing tape.

Make sure that the distance from the knot to the end of the lacing tape is between 0.25 inch (6 millimeters) and 0.50 inch (13 millimeters).

E. Assembly of a Wire Harness Tie at a Junction

CONFIGURATION OF A WIRE HARNESS JUNCTION
Figure 7

Refer to Figure 7.

- (1) Make a selection of a lacing tape from Table 1.
- (2) Make the wires parallel with a minimum number of twists.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (3) Assemble a clove hitch on one wire harness. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

CAUTION: DO NOT CAUSE DEFORMATION OF THE INSULATION OF THE WIRE OR THE CABLE DURING THE ASSEMBLY OF THE CLOVE HITCH. DAMAGE TO THE WIRE OR THE CABLE CAN OCCUR.

CLOVE HITCH
Figure 8

- (4) Make a figure 8 wind around the wire harnesses. Refer to Figure 9.

FIGURE 8 WINDS OF THE LACING TAPE
Figure 9

- (5) Pull the lacing tape tight.
- (6) Do Step (4) and Step (5) again 5 times.
- (7) Put the one end of the lacing tape through the two harnesses.
- (8) Make a wind around the lacing tape between the branches.
- (9) Pull the lacing tape tight.
- (10) Do Step (8) through Step (9) again 2 times.
- (11) Assemble a square knot. Refer to Figure 10.

CAUTION: DO NOT CAUSE DEFORMATION OF THE WIRE OR THE CABLE DURING ASSEMBLY OF THE SQUARE KNOT. DAMAGE TO THE WIRE OR CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

SQUARE KNOT
Figure 10

- (12) Cut each end of the lacing tape.

Make sure that the distance from the knot to the end of the lacing tape is between 0.25 inch (6 millimeters) and 0.50 inch (13 millimeters).

F. Assembly of a Wire Harness Tie at a 90 Degree Branch

CONFIGURATION OF A 90 DEGREE WIRE HARNESS BRANCH
Figure 11

Refer to Figure 11.

- (1) Make a selection of a lacing tape from Table 1.
- (2) Make the wires parallel with a minimum number of twists.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (3) Assemble a wire harness tie at the location of the branch. Refer to Paragraph 3.C. for the procedure to assemble a wire harness tie.
- (4) Move each wire to make a 90 degree branch.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

Make sure that:

- Each side of the branch has an equal number of wires
 - The distance between the wires on one side of the tie are a 0.75 inch (19 millimeters) minimum from wires on the other side of the tie.
- (5) Assemble a wire harness tie on the branch between 1 inch (25 millimeters) and 2 inches (51 millimeters) from the main wire harness. Refer to Paragraph 3.C. for the procedure to assemble a wire harness tie.

G. Assembly of a Wire Harness Tie at a Branch

This paragraph gives the procedure to assemble a wire harness tie at a branch that is not 90 degrees. For the procedure to assemble a wire harness tie at a 90 degree branch, refer to Paragraph 3.F.

CONFIGURATION OF A WIRE HARNESS BRANCH THAT IS NOT 90 DEGREES

Figure 12

Refer to Figure 12.

- (1) Make a selection of a lacing tape from Table 1.
- (2) Make the wires parallel with a minimum number of twists.

CAUTION: THE WIRES OR THE CABLES MUST NOT GO ACROSS EACH OTHER. DAMAGE TO THE WIRE OR THE CABLES CAN OCCUR.

- (3) Assemble a wire harness tie on the main wire harness branch a maximum of 2 inches (51 millimeters) before the branch. Refer to Paragraph 3.C. for the procedure to assemble a wire harness tie.
- (4) Assemble a wire harness tie on the main wire harness a maximum of 2 inches (51 millimeters) from the location of the wire harness branch.

Refer to:

- Figure 13
 - Paragraph 3.C. for the procedure to assemble a wire harness tie.
- (5) Assemble a clove hitch on the main wire harness at the location of the wire harness branch. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

CLOVE HITCH
Figure 13

- (6) Make a figure 8 wind around the wire harnesses Refer to Figure 14.

FIGURE 8 WINDS OF THE LACING TAPE
Figure 14

- (7) Pull the lacing tape tight.
- (8) Do Step (6) and Step (7) again 5 times.
- (9) Put the one end of the lacing tape through the two harnesses.
- (10) Make a wind around the strands of the lacing tape between the branches.
- (11) Pull the lacing tape tight.
- (12) Do Step (10) through Step (11) again 2 times.
- (13) Assemble a square knot. Refer to Figure 15.

CAUTION: DO NOT CAUSE DEFORMATION OF THE WIRE OR THE CABLE DURING ASSEMBLY OF THE SQUARE KNOT. DAMAGE TO THE WIRE OR CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: WIRE HARNESS DISASSEMBLY AND ASSEMBLY

SQUARE KNOT
Figure 15

- (14) Cut each end of the lacing tape.

Make sure that the distance from the knot to the end of the lacing tape is between 0.25 inch (6 millimeters) and 0.50 inch (13 millimeters).

Crimp Barrel Size	Crimp Tool	
	Part Number	Supplier
22-16	46673	AMP

**TERMINAL LUG ASSEMBLY
Figure 1**

Refer to Figure 1.

- (1) Make a selection of an insulation removal tool from Table 2.
- (2) Make a selection of crimp tool from Table 3.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF TERMINAL LUGS**

- (3) Make a selection of a tape from Table 1.

NOTE: An equivalent tape is a satisfactory alternative.

- (4) Remove 0.25 inch (6 millimeters) of the length of the insulation from the end of the wire.

- (5) Put the end of the wire in the crimp barrel of the terminal lug.

Make sure that the end of the conductor can be seen at the front of the crimp barrel.

- (6) Crimp the terminal lug.

(a) Align the number printed on the terminal lug with the number printed on the jaws of the crimp tool.

(b) Put the terminal lug in the center of the jaws of the crimp tool.

(c) Move the crimp tool handles together until the ratchet releases.

(d) Pull gently on the wire to make sure that the wire is held tightly in the terminal lug.

- (7) Do a continuity test:

(a) Set the multimeter to the 100 ohm scale.

(b) Attach one meter test lead to a backshell in the wire harness.

(c) Insert the other meter test lead to the terminal lug.

(d) Measure the resistance.

Make sure that the resistance is less than 1 ohm.

- (8) Wind two layers of tape on the crimp barrel and the wire.

3. TERMINAL LUG INSTALLATION**A. Installation on a Stud**

- (1) Put the terminal lug on the stud.
- (2) If a washer is specified, put the washer on the stud.
- (3) Fully engage the threads of the nut and the threads of the stud.
- (4) Tighten the nut to the specified torque. Refer to the AMM.
- (5) Do the necessary tests. Refer to the AMM.

B. Installation with a Nut and a Bolt

- (1) Put the terminal lug in its position on the engine bracket.
- (2) Install the boot on the terminal lug.
- (3) If a washer is specified, put the washer on the bolt.
- (4) Put the bolt through the hole in the terminal lug and the bracket.
- (5) Tighten the nut to the specified torque. Refer to the AMM.
- (6) Do the necessary tests. Refer to the AMM.

20-23-37 CONTENTS

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

1. GENERAL DATA

A. Applicable Conditions

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-23-00.

2. CONNECTOR DISASSEMBLY OF THE ESC() CONNECTORS

A. Separation of the ESC() Plug and Receptacle

NOTE: If disassembly of the backshell of the plug is necessary, the plug must stay connected to the receptacle.

**Table 1
NECESSARY TOOLS**

Tool	Part Number	Supplier
Pliers, Soft Jaw	BT-SJ-468	Daniels
	TG69	Daniels
		Glenair

- (1) Make a selection of pliers from Table 1.
- (2) Disengage the threads of the coupling ring of the plug connector and the receptacle with the pliers.
- (3) Pull the plug from the receptacle.

B. Removal of an ESC() Receptacle from a Bracket

NOTE: If disassembly of the backshell of the receptacle is necessary, the receptacle must stay installed in the bracket.

**Table 2
NECESSARY TOOLS**

Tool	Part Number	Supplier
Marker	Sharpie	Sanford
Screwdriver, Number 3 Phillips	-	An available source

- (1) Make a selection of a screwdriver from Table 2.
- (2) For a connector that has a 90 degree backshell or a 45 degree backshell:
 - (a) Make a selection of a marker from Table 2.

NOTE: An equivalent marker is a satisfactory alternative.
 - (b) Make a mark on the engine bracket on the same side as the keyway of the connector.

NOTE: This records the master keyway clock position on the engine bracket.
- (3) Remove the nuts and the bolts that attach the receptacle to the engine bracket.
- (4) Remove the receptacle from the engine bracket.

C. Disassembly of a ESC() Plug Connector

NOTE: For the removal of the strain relief backshell or the backshell extension, the plug must be connected to the receptacle.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

**Table 3
NECESSARY TOOLS**

Tool	Part Number	Supplier
Marker	Sharpie	Sanford
Pliers, Soft Jaw	BT-SJ-468	Daniels
	TG69	Daniels
		Glenair
Screwdriver, Number 3 Phillips	-	An available source

- (1) Make a selection of pliers from Table 3:

NOTE: An equivalent pliers is a satisfactory alternative.

- (2) Make a selection of a screwdriver from Table 3:

NOTE: An equivalent screwdriver is a satisfactory alternative.

- (3) Examine the plug and the receptacle.

Make sure that:

- The receptacle connector is attached to the engine bracket
- The plug and the receptacle are connected.

- (4) Loosen the saddle bar screws sufficiently to let the support bushing move rearward on the wire harness. Refer to Figure 1.

**ESC() CONNECTOR AND BACKSHELL DISASSEMBLY
Figure 1**

- (5) If the saddle bars do not let the bushing move rearward on the harness, remove the screws and the saddle bars. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

- (6) If the saddle bars are removed, put these strain relief assembly components in a safe place:
 - The screws
 - The washers
 - The saddle bars.

NOTE: These components are necessary to assemble the backshell again.

- (7) Push the support bushing rearward on the wire harness. Refer to Figure 1.
- (8) Loosen the coupling ring of the strain relief backshell with the pliers. Refer to Figure 1.
- (9) Loosen the coupling ring of the backshell extension with the pliers. Refer to Figure 1.
Make sure that you do not turn the backshell extension if the backshell is a 45 degree or a 90 degree backshell.

NOTE: The position of the angled backshell extension is the backshell clock position.

- (10) Disengage the threads of the coupling ring of the plug connector and the receptacle with the pliers. Refer to Figure 1.
- (11) Pull the plug from the receptacle.
- (12) For a 45 degree or a 90 degree backshell, record the backshell clock position. Refer to Figure 2.
 - (a) Make a selection of a marker from Table 3.

NOTE: An equivalent marker is a satisfactory alternative.

- (b) Make a mark on the backshell extension on the same side as the master key of the connector.

THE POSITION OF THE MARK ON THE ESC() BACKSHELL EXTENSION
Figure 2

NOTE: This records the backshell clock position on the backshell extension.

- (13) Disengage the threads of the coupling ring of the strain relief backshell from the backshell extension. Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

DISASSEMBLY OF THE ESC() STRAIN RELIEF BACKSHELL
Figure 3

- (14) Carefully push the strain relief backshell rearward on the wire harness. Refer to Figure 3.
- (15) Carefully cut the wire harness tie that holds the shields. Refer to Figure 3.

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRES, CABLES OR SHIELDS OF THE WIRE HARNESS.

- (16) Push the ground ring rearward on the wire harness.
- (17) Fold the shields rearward on the wire harness.
- (18) Disengage the threads of the coupling ring of the backshell extension from the connector.
- (19) Push the backshell extension rearward on the wire harness, away from the connector.

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRES, CABLES OR SHIELDS OF THE WIRE HARNESS.

- (20) Remove the contacts from the connector. Refer to Paragraph 2.F.
- (21) Remove these backshell components from the end of the harness:
 - The backshell extension
 - The ground ring
 - The backshell strain relief clamp
 - The support bushing.

Refer to Figure 4.

THE POSITION OF THE ESC() BACKSHELL EXTENSION, THE GROUND RING, THE STRAIN RELIEF BACKSHELL, AND THE SUPPORT BUSHING
Figure 4

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

D. Disassembly of a ESC() Receptacle Connector

NOTE: For the removal of the strain relief backshell or the backshell extension, the receptacle must be installed in the engine bracket.

**Table 4
NECESSARY TOOLS**

Tool	Part Number	Supplier
Marker	Sharpie	Sanford
Pliers, Soft Jaw	TG69	Glenair
		Daniels
	BT-SJ-468	Daniels
Screwdriver, Number 3 Phillips	-	An available source

- (1) Make a selection of pliers from Table 4:

NOTE: An equivalent pliers is a satisfactory alternative.

- (2) Make a selection of a screwdriver from Table 4:

NOTE: An equivalent screwdriver is a satisfactory alternative.

- (3) Examine the receptacle.

Make sure that the receptacle connector is attached to the engine bracket.

- (4) Loosen the saddle bar screws sufficiently to let the support bushing move rearward on the wire harness. Refer to Figure 5.

**ESC() CONNECTOR AND BACKSHELL DISASSEMBLY
Figure 5**

- (5) If the saddle bars do not let the bushing move rearward on the harness, remove the screws and the saddle bars. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

- (6) If the saddle bars are removed, put these strain relief assembly components in a safe place:
- The screws
 - The washers
 - The saddle bars.

NOTE: These components are necessary to assemble the backshell again.

- (7) Push the support bushing rearward on the wire harness. Refer to Figure 5.
 (8) Loosen the coupling ring of the strain relief backshell with the pliers. Refer to Figure 5.
 (9) Loosen the coupling ring of the backshell extension with the pliers. Refer to Figure 5.
 Make sure that you do not turn the backshell extension if the backshell is a 45 degree or a 90 degree backshell.

NOTE: The position of the angled backshell extension is the backshell clock position.

- (10) Disengage the threads of the coupling ring of the plug connector and the receptacle with the pliers. Refer to Figure 5.
 (11) Pull the plug from the receptacle.
 (12) For a 45 degree or a 90 degree backshell, record the backshell clock position. Refer to Figure 6.

- (a) Make a selection of a marker from Table 4.

NOTE: An equivalent marker is a satisfactory alternative.

- (b) Make a mark on the backshell extension on the same side as the master keyway of the connector.

THE POSITION OF THE MARK ON THE ESC() BACKSHELL EXTENSION
Figure 6

NOTE: This records the backshell clock position on the backshell extension.

- (13) Remove the receptacle from the engine bracket. Refer to Paragraph 2.B.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

- (14) Disengage the threads of the coupling ring of the strain relief backshell from the backshell extension. Refer to Figure 7.

DISASSEMBLY OF THE ESC() STRAIN RELIEF BACKSHELL
Figure 7

- (15) Carefully push the strain relief backshell rearward on the wire harness. Refer to Figure 7.
 (16) Carefully cut the wire harness tie that holds the shields. Refer to Figure 7.

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRES, CABLES OR SHIELDS OF THE WIRE HARNESS.

- (17) Push the ground ring rearward on the wire harness.
 (18) Fold the shields rearward on the wire harness.
 (19) Disengage the threads of the coupling ring of the backshell extension from the connector.
 (20) Push the backshell extension rearward on the wire harness, away from the connector.

CAUTION: DO NOT CAUSE DAMAGE TO THE WIRES, CABLES OR SHIELDS OF THE WIRE HARNESS.

- (21) Remove the contacts from the connector. Refer to Paragraph 2.F.
 (22) Remove these backshell components from the end of the harness:
- The backshell extension
 - The ground ring
 - The backshell strain relief clamp
 - The support bushing.

Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

THE POSITION OF THE ESC() BACKSHELL EXTENSION, THE GROUND RING, THE STRAIN RELIEF BACKSHELL, AND THE BUSHING

Figure 8

E. Seal Plug and Seal Rod Removal

- (1) Make a selection of a needle nose pair of pliers.

CAUTION: MAKE SURE THAT THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

F. Contact Removal - ESC() Rear Release Connectors

Table 5
CONTACT REMOVAL TOOLS - REAR RELEASE CONNECTORS

Contact Size	Removal Tool	Supplier
16	M83723/31-16	Daniels
20	M83723/31-20	Daniels

- (1) Make a selection of a contact removal tool from Table 5.
- (2) Put the tip of the tool on the wire.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP. AN INJURY CAN OCCUR.

- (3) At the rear of the connector, axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops.

Make sure that the tool stays aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT CAVITY CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out from the contact cavity at the same time.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

Make sure that the tool stays aligned with the contact cavity.

- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (2) through Step (6) again.

3. CONNECTOR DISASSEMBLY OF THE CA66279-106 CONNECTOR

A. Separation of the CA66279-106 Plug and the Receptacle

NOTE: If disassembly of the backshell of the plug is necessary, the plug must stay connected to the receptacle.

**Table 6
NECESSARY TOOLS**

Tool	Part Number	Supplier
Adapter, Coupling Ring	MT0011	Daniels
Drive Extension	-	An available source
Wrench, Socket	-	An available source

- (1) Make a selection of these tools from Table 6:
 - A coupling ring adapter
 - A drive extension
 - A socket wrench.
- (2) Disengage the threads of the coupling ring of the plug connector and the receptacle with the coupling ring adapter, the drive extension, and the socket wrench.
- (3) Pull the plug from the receptacle.

B. Disassembly of a CA66279-106 Plug Connector

NOTE: For the removal of the strain relief backshell, the plug must be connected to the receptacle and the receptacle must be installed in the bracket.

**Table 7
NECESSARY TOOLS**

Tool	Part Number	Supplier
Pliers, Soft Jaw	BT-SJ-468	Daniels
	TG69	Daniels
		Glenair
Screwdriver, Number 3 Phillips	-	An available source
Adapter, Coupling Ring	MT0011	Daniels
Drive Extension	-	An available source
Wrench, Socket	-	An available source

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

- (1) Make a selection of pliers from Table 7:
NOTE: An equivalent pliers is a satisfactory alternative.
- (2) Make a selection of a screwdriver from Table 7.
NOTE: An equivalent screwdriver is a satisfactory alternative.
- (3) Remove the saddle bar screws and the saddle bars.
- (4) Push the support bushing rearward on the wire harness.
- (5) Loosen the strain relief backshell with the pliers.
- (6) Push the strain relief backshell rearward on the wire harness. Refer to Figure 9.

BACKSHELL REMOVAL
Figure 9

- (7) Make a selection of these tools from Table 7:
 - A coupling ring adapter
 - A drive extension
 - A socket wrench.
- (8) Disengage the threads of the coupling ring using the coupling ring adapter, the socket extension, and the socket wrench.
- (9) Pull the plug from the receptacle.
- (10) Remove the contacts from the connector. Refer to Paragraph 2.F.
- (11) Remove the strain relief backshell from the wire harness.
 Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

C. Contact Removal - CA66279-106 Front Release Connectors

**Table 8
CONTACT REMOVAL TOOLS - FRONT RELEASE CA66279-106 CONNECTORS**

Engaging End	Removal Tool	Supplier
4	294-239	Amphenol
	CET-FRF-4	ITT Cannon
	M81969/19-04	QPL
	MS90456-4	QPL
16	294-219	Amphenol
	CET-FRF-16-22A	ITT Cannon
	M81969/19-02	QPL
	MS90456-3	QPL

- (1) Make a selection of a contact removal tool from Table 8.
- (2) Axially align the tool and the contact cavity at the front face of the connector.
Make sure that the plunger of the removal tool is fully retracted.
- (3) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT CAVITY CAN OCCUR.

- (4) Push the plunger of the tool until the contact starts to come out of the contact cavity.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out from the contact cavity.
Make sure that the tool stays aligned with the contact cavity.
- (6) Pull the contact out of the contact cavity from the rear of the connector.

4. CONNECTOR ASSEMBLY OF THE ESC() CONNECTOR

A. ESC() Contact Assembly

**Table 9
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool		
		Basic Unit Part Number	Locator Part Number	Supplier
16	16	M22520/7-01	M22520/7-03	Daniels
20	20	M22520/7-01	M22520/7-02	Daniels

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

**Table 10
INSULATION REMOVAL LENGTH**

Wire Size	Crimp Barrel Size	Removal Length L (inch)		Removal Length L (millimeters)	
		Minimum	Maximum	Minimum	Maximum
20	20	0.11	0.15	3	4
16	16	0.21	0.25	5	6

- (1) Make a selection of a crimp tool from Table 9.
- (2) Assemble the crimp tool. Refer to Figure 10.

CAUTION: TO PREVENT DAMAGE TO THE CRIMP TOOL, THE HANDLE OF THE BASIC UNIT MUST BE IN THE OPEN POSITION WHEN THE LOCATOR IS:

- INSTALLED
- REMOVED
- RELEASED.

**CONTACT CRIMP TOOL
Figure 10**

- (a) Remove the lock clip from the lock ring on the locator.
 - (b) Put the locator in the lock plate of the basic unit.
 - (c) Align the locator pins with the ring slots on the lock plate.
 - (d) Push the locator into the basic unit.
 - (e) Turn the locator in a clockwise direction until it locks in its position, approximately 90 degrees.
 - (f) Put the lock clip in the lock ring.
- (3) Adjust the crimp tool.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

CAUTION: IF THE SELECTOR KNOB OF THE BASIC UNIT IS IN AN INCORRECT POSITION WHEN THE CONTACT IS CRIMPED:

- DAMAGE TO THE CONTACT CAN OCCUR
- UNSATISFACTORY RELIABILITY AND PERFORMANCE OF THE CONTACT ASSEMBLY CAN OCCUR.

- (a) Remove the lock clip from the lock ring hole in the selector knob.
 - (b) Lift and turn the selector knob of the basic unit until the number on the knob is the same as the number on the locator data plate for the size of the wire.
 - (c) Put the lock clip in the lock ring hole.
 - (d) Align the number on the knob to the index mark on the basic unit.
 - (e) Release the knob.
- (4) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 11
- Table 10 for the insulation removal length.

INSULATION REMOVAL LENGTH

Figure 11

- (5) Put the conductor in the crimp barrel of the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch (1 millimeter).

POSITION OF THE WIRE IN THE CRIMP BARREL OF THE CONTACT

Figure 12

- (6) Put the wire and the contact in the locator of the crimp tool. Refer to Figure 13.

Make sure that the forward end of the contact is against the bottom of the locator.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

ALIGNMENT OF THE WIRE, THE CONTACT, AND THE CRIMP TOOL
Figure 13

(7) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- You can see the conductor in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch (1 millimeter).

(a) Close the handles of the basic unit until the ratchet is released.

CAUTION: DO NOT RELEASE THE LATCH FOR THE LOCATOR WHEN THE BASIC UNIT HANDLE IS IN THE CLOSED POSITION.

(b) Remove the contact assembly from the tool.

(8) Hold the wire and lightly pull the contact to make sure that the contact is crimped on the conductor.

B. ESC() Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be put on the wire harness before the insertion of the contacts into the connector. Refer to Subject 20-23-39.

Table 11
CONTACT INSERTION TOOLS - REAR RELEASE CONNECTORS

Contact Size	Insertion Tool	Supplier
20	M83723/31-20	QPL
16	M83723/31-16	QPL

Table 12
CONTACT RETENTION TEST TOOLS

Contact		Contact Retention Test Tool		Supplier
Engaging End Size	Type	Basic Unit	Tip	
20	Pin	HT250-4	68-020-01	Daniels
	Socket	HT250-4	67-020-01	Daniels

20-23-37

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

Table 12 (continued)

Contact		Contact Retention Test Tool		Supplier
Engaging End Size	Type	Basic Unit	Tip	
16	Pin	HT250-4	68-016-01	Daniels
	Socket	HT250-4	67-016-01	Daniels

- (1) Make a selection of an insertion tool from Table 11.
- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) Put the contact assembly in the insertion tool.
- (4) At the rear of the connector, axially align the tool and the contact cavity.
- (5) Carefully push the contact into the contact cavity until it stops.

Make sure that the tool and the contact cavity stay axially aligned.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (7) Do a contact retention test:

NOTE: The retention test tool applies a known force to the contact to make sure that the connector holds the contact.

- (a) Make a selection of a contact retention test tool basic unit from Table 12.
- (b) Make a selection of a contact retention test tool tip from Table 12:
 - A tip for a pin to test a pin contact
 - A tip for a socket to test a socket contact.
- (c) Axially align the retention test tool, the tip, and the engaging end of the contact.
- (d) Apply hand pressure with the test tool against the contact until the indicator located on the tip is aligned with the body of the test tool.

CAUTION: KEEP THE RETENTION TEST TOOL AXIALLY ALIGNED TO THE CONTACT. DAMAGE TO THE CONTACT CAN OCCUR.

- (e) If the contact stays locked in the contact cavity, the contact retention is satisfactory.
- (f) Do steps (7a) through (7d) again for all the contacts in the connector.
- (8) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

C. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

If a stub wire is necessary, the length of the stub wire must be 4 inches to 6 inches.

D. ESC() Backshell Assembly

(1) Assemble the backshell. Refer to Subject 20-23-39.

(2) Do an insulation resistance check for each wire that terminates in the connector. Refer to Paragraph 6.B.

(3) Do a wire continuity check for each wire that terminates in the connector. Refer to Paragraph 6.A.

5. CONNECTOR ASSEMBLY OF THE CA66279-106 CONNECTOR

A. CA66279-106 Contact Assembly

**Table 15
INSULATION REMOVAL LENGTH**

Wire Size	Engaging End	Crimp Barrel	Removal Length L (inch)		Removal Length L (millimeter)		Special Instructions
			Minimum	Maximum	Minimum	Maximum	
16	16	16	0.22	0.28	6	7	-
8	4	8	0.50	0.56	13	14	Increase the O.D. of the wire

**Table 16
NECESSARY MATERIALS**

Description	Part Number	Approved Supplier
Tape, self-bonding silicone rubber, high temperature, 0.012 inch thick, 1 inch wide	912-10X12	Arlon, Silicone Technologies Division

- (1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 14
- Table 15 for the insulation removal length.

**INSULATION REMOVAL LENGTH
Figure 14**

- (2) Make a selection of a crimp tool from:
 - Table 13 for size 16 contacts
 - Table 13 or Table 14 for size 4 contacts.
- (3) Put the conductor in the crimp barrel of the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch (1 millimeter).

**POSITION OF THE WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 15**

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

- (4) If the crimp tool is an indenter type crimp tool, crimp the contact.
- (5) If the crimp tool is a hex type crimp tool:
 - (a) Put the contact in the primary crimp die. Refer to Figure 16.

Make sure that the distance from the rear end of the crimp barrel to the rear edge of the die is between 0 inch (0 millimeter) and 0.03 inch (1 millimeter).

POSITION OF THE CONTACT AND WIRE IN THE CRIMP TOOL DIE

Figure 16

- (b) Crimp the contact with the primary crimp die.
- (c) Turn the contact 60 degrees on the longitudinal axis of the contact.
- (d) Put the crimp barrel end of the contact in the secondary crimp die. Refer to Figure 16.

Make sure that the distance from the rear end of the crimp barrel to the rear edge of the die is between 0 inch (0 millimeter) and 0.03 inch (1 millimeter).
- (e) Crimp the contact with the secondary crimp die.
- (f) If the contact crimp barrel has flash, do Step (c) through Step (e) again.

NOTE: Copper that can be seen on the edges of the crimp barrel is permitted.

- (6) Hold the wire and lightly pull the contact to make sure that the contact is crimped on the conductor.
- (7) To increase the outside diameter of the 8 AWG wire, make a selection of tape from Table 16.

NOTE: An equivalent tape is a satisfactory alternative.

- (8) Increase the outside diameter of the 8 AWG wire by winding 4.5 to 5.0 layers of tape around the wire.

Make sure that:

- The distance from the forward edge of the tape to the end of the contact crimp barrel is 0.09 inches (2 millimeters) maximum
- Each layer of tape has a 100 percent overlap
- The minimum outside diameter of the wire and tape is 0.23 inch (6 millimeter) minimum.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

LOCATION OF THE TAPE ON THE WIRE
Figure 17

B. CA66279-106 Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be put on the wire harness before the insertion of the contacts into the connector. Refer to Subject 20-23-39.

Table 17
CONTACT INSERTION TOOLS - FRONT RELEASE CONNECTORS

Contact Size	Insertion Tool	Supplier
16	294-192	Amphenol
	CIT-16	ITT Cannon
	M81969/17-01	QPL
	M81969/17-04	QPL
4	294-236	Amphenol
	M81969/17-08	QPL

- (1) Make a selection of an insertion tool from Table 17.
- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) Put the contact assembly in the insertion tool.
- (4) At the rear of the connector, axially align the tool and the contact cavity.
- (5) Carefully push the contact into the contact cavity until it stops.

Make sure that the tool and the contact cavity stay axially aligned.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (7) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY**

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) Do Step (7) again for all the contacts in the connector.
- (9) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

C. CA66279-106 Backshell Assembly

- (1) Assemble the backshell. Refer to Subject 20-23-39.
- (2) Do an insulation resistance check for each wire that terminates in the connector. Refer to Paragraph 6.B.
- (3) Do a wire continuity check for each wire that terminates in the connector. Refer to Paragraph 6.A.

6. WIRE CHECKS**A. Wire Continuity Check**

- (1) Find the wire termination data. Refer to the WDM.
- (2) Disconnect each connector on the circuit that must have a wire continuity check.

CAUTION: EACH CONNECTOR ON THE CIRCUIT THAT MUST HAVE A TEST MUST BE DISCONNECTED. IF THE CONNECTORS ARE NOT DISCONNECTED, UNSATISFACTORY RESISTANCE INDICATIONS OR DAMAGE TO THE CONNECTOR CAN OCCUR.

- (3) Measure the resistance on all wires.

Make sure that each circuit has continuity from one end of the wire to the other end of the wire.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

B. Insulation Resistance Check

- (1) Make a selection of a multimeter.

WARNING: DO NOT USE A MEGOHMMETER FOR THE INSULATION RESISTANCE TEST OF THE ON-WING WIRING REPAIR. INJURY TO PERSONNEL OR DAMAGE TO THE AIRPLANE CAN OCCUR.

- (2) Set the meter to the 100 megohm scale.
- (3) Attach one meter test lead to the contact assembly on the connector.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (4) Attach the other meter test lead to a contact assembly on a wire that does not connect to the same circuit.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (5) Read the meter.
Make sure that the resistance is a minimum of 100 megohm.
- (6) Do Step (3) through Step (5) for each contact in the connector.
- (7) Attach the one meter test lead to the backshell.
- (8) Attach the other meter test lead to the contact assembly on the wire that must have a test.

CAUTION: DO NOT BEND OR PUT STRESS ON THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (9) Read the meter.
Make sure that the resistance is a minimum of 100 megohm.
- (10) Do Step (8) through Step (9) for each wire that must have a test.

7. CONNECTOR INSTALLATION OF THE ESC() CONNECTOR

A. ESC() Receptacle Installation in a Bracket

**Table 18
RECEPTACLE INSTALLATION FASTENER TORQUE**

Fastener Thread Size	Fastener Torque		Connector Shell Size
	(pound-inches)	(Newton-meters)	
4-40	5.0	0.57	08
			10
			12
			14
			16
			18
			20
6-32	10.0	1.13	22
			24
			28

**Table 19
NECESSARY TOOLS**

Tool	Special Instructions	Supplier
Screwdriver, Number 3 Phillips	-	An available source
Torque	Tool must measure 10 inch-pounds (1.13 newton-meters) minimum	An available source

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY**

- (1) Make a selection of these tools from Table 19.
 - A screwdriver
 - A torque tool.
- (2) For a connector that has a 90 degree backshell or a 45 degree backshell, align the keyway of the connector with the mark that was made on the engine bracket.
- (3) Put the receptacle in its installation location in the engine bracket.
- (4) Put the screws through the installation holes in the engine bracket and the installation holes in the receptacle flange.
- (5) Engage the threads of the installation nuts and the screws.
- (6) Tighten the nuts to the specified torque. Refer to Table 18.

B. Connection of the ESC() Plug and Receptacle**CONNECTION OF THE PLUG AND RECEPTACLE****Figure 18**

- (1) Align the key of the receptacle and the keyway of the plug.
Make sure that the contacts are correctly aligned.
Make sure that the wire harness has sufficient slack for the plug:
 - To move forward
 - To make a satisfactory connection with the receptacle
 - To prevent tension on the contact assemblies in the plug.
- (2) Engage the threads of the plug and the receptacle.
Make sure that the threads of the plug and receptacle are correctly engaged.
- (3) Push the plug into the receptacle.
- (4) Tighten the coupling ring with the hand.
- (5) Move the backshell from side to side and continue to tighten the coupling ring of the plug with the hand.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: CONNECTOR DISASSEMBLY AND ASSEMBLY**

- (6) Tighten the coupling ring of the plug connector with the hand until you cannot see the blue line. Refer to Figure 18.

NOTE: If you can see the blue line on the connector, the connector is not installed correctly.

8. CONNECTOR INSTALLATION OF THE CA66279-106 CONNECTOR**A. Connection of the CA66279-106 Plug and a Receptacle**

Table 20
NECESSARY TOOLS

Tool	Part Number	Supplier
Adapter, Coupling Ring	MT0011	Daniels
Drive Extension	-	An available source
Wrench, Torque	-	An available source

- (1) Make a selection of these tools from Table 20:
- A coupling ring adapter
 - A drive extension
 - A torque wrench.
- (2) Align the key of the receptacle and the keyway of the plug.
Make sure that the contacts are correctly aligned.
Make sure that the wire harness has sufficient slack for the plug:
- To move forward
 - To make a satisfactory connection with the receptacle
 - To prevent tension on the contact assemblies in the plug.
- (3) Engage the threads of the plug and the receptacle.
Make sure that the threads of the plug and receptacle are correctly engaged.
- (4) Push the plug into the receptacle.
- (5) Tighten the coupling ring with the hand.
- (6) Move the backshell from side to side and continue to tighten the coupling ring of the plug with the hand.

STANDARD WIRING PRACTICES MANUAL

Table 5

NECESSARY MATERIALS

Material	Description	Supplier
Tape	Adhesive	An available source

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

**Table 6
BACKSHELL INSTALLATION TOOLS**

Tool	Part Number	Supplier
Pliers, Soft Jaw, Adjustable	BT-SJ-468	Daniels
	TG69	Daniels
		Glenair
Screwdriver	Number 3 Phillips	An available source

- (1) Make a selection of a tape from Table 5.
NOTE: An equivalent tape is a satisfactory alternative.
- (2) Make a selection of pliers from Table 6.
NOTE: An equivalent pliers is a satisfactory alternative.
- (3) Make a selection of a screwdriver from Table 6.
- (4) If the diameter of the wire harness is not the same as the initial configuration, make a selection of a new support bushing from Table 3.
Make sure that the new support bushing is the correct size for the wire harness diameter and the diameter of the cable clamp of the strain relief backshell.
- (5) Put the necessary backshell components on the wire harness in this sequence:
 - The support bushing
 - The strain relief backshell
 - The ground ring
 - The backshell extension.

Refer to Figure 3.

Make sure that:

- The end of the strain relief backshell that has the coupling ring is pointed forward to the end of the wire harness
- The end of the ground ring that has the larger diameter is pointed rearward away from the end of the wire harness
- The end of the backshell extension that has the coupling ring is pointed forward to the end of the wire harness.

BACKSHELL COMPONENTS ON THE WIRE HARNESS

Figure 3

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

- (6) Install the contacts in the connector. Refer to Subject 20-23-37.
- (7) Fold the shields back on the wire harness.

Make sure that:

- The shields are symmetrical around the circumference of the wire harness
 - The shields are flat against the wire harness.
- (8) Wind a layer of tape on the ends of the shields to temporarily hold the shields on the harness.
 - (9) Fully engage the threads of the coupling ring of the backshell extension and the connector. Refer to Figure 4.

ENGAGED THREADS OF THE BACKSHELL EXTENSION AND THE CONNECTOR
Figure 4

- (10) To remove the play between the backshell extension and the connector:
 - (a) Tighten the coupling ring of the backshell extension with the hand and, at the same time, twist the backshell extension clockwise and counterclockwise approximately 1/8 inch in each direction.
 - (b) Move the backshell extension from side to side and continue to tighten the coupling ring.
 - (c) Twist the backshell extension clockwise and counterclockwise approximately 1/8 inch in each direction and fully tighten the coupling ring.
- (11) Remove the tape that holds the shields on the wire harness.
- (12) Carefully fold the shields forward on the backshell extension.
- (13) Push the ground ring forward into the backshell extension.
- (14) Carefully fold the shields back against the wire harness.
 Make sure that the shields are even and symmetrical around the ground ring.
- (15) Assemble a wire harness tie on the ends of the shields at the rear end of the ground ring.
 Refer to:
 - Figure 5
 - Subject 20-23-30 for the procedure to assemble a wire harness tie.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

POSITION OF THE WIRE HARNESS TIE ON THE ENDS OF THE SHIELDS

Figure 5

- (16) Fully engage the threads of the coupling ring of the strain relief backshell and the backshell extension.
- (17) Align the center of the support bushing with the saddle bar installation screw holes in the legs of the strain relief backshell.
- (18) Align the installation screw holes of the saddle bars and the legs of the strain relief backshell.
- (19) Install the saddle bar screws.
Make sure that the screws are not fully tightened.
- (20) If the connector is a receptacle, install it. Refer to Subject 20-23-37.
- (21) If the connector is a plug, connect it to the related receptacle. Refer to Subject 20-23-37.
NOTE: The receptacle must be installed before the coupling ring can be fully tightened.
- (22) Move the backshell extension from side to side and, at the same time, tighten the backshell extension coupling ring with the pliers until the pliers move on the surface of the coupling ring.
- (23) Move the strain relief backshell from side to side and, at the same time, tighten the strain relief backshell coupling ring with the pliers until the pliers move on the surface of the coupling ring.
- (24) Fully tighten the saddle bar screws. Refer to Figure 6.
Make sure that:
 - The saddle bar screws are tight
 - The saddle bars are against the legs of the strain relief backshell
 - The wire harness cannot be moved in the cable clamp.

- (1) Make a selection of a tape from Table 7.
NOTE: An equivalent tape is a satisfactory alternative.
- (2) Make a selection of a marker from Table 8.
NOTE: An equivalent marker is a satisfactory alternative.
- (3) Make a selection of pliers from Table 8.
NOTE: An equivalent pliers is a satisfactory alternative.
- (4) Make a selection of a screwdriver from Table 8.

STANDARD WIRING PRACTICES MANUAL**RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS**

- (5) If the diameter of the wire harness is not the same as the initial configuration, make a selection of a new support bushing from Table 3.

Make sure that the new support bushing is the correct size for the wire harness diameter and the diameter of the cable clamp of the strain relief backshell.

- (6) Make a mark on the new backshell extension in the same location as the mark on the backshell extension in the initial installation.

Refer to:

- Figure 7
- Subject 20-23-37 for the procedure to record the clock position of the backshell extension of the initial installation.

**MARK ON THE NEW BACKSHELL EXTENSION IN THE SAME LOCATION AS THE MARK ON THE OLD BACKSHELL EXTENSION****Figure 7**

- (7) Put the necessary backshell components on the wire harness in this sequence:

- The support bushing
- The strain relief backshell
- The ground ring
- The backshell extension.

Refer to Figure 8.

Make sure that:

- The end of the strain relief backshell that has the coupling ring is pointed forward to the end of the wire harness
- The end of the ground ring that has the larger diameter is pointed rearward away from the end of the wire harness
- The end of the backshell extension that has the coupling ring is pointed forward to the end of the wire harness.

BACKSHELL COMPONENTS ON THE WIRE HARNESS
Figure 8

(8) Install the contacts in the connector. Refer to Subject 20-23-37.

(9) Fold the shields back on the wire harness.

Make sure that:

- The shields are symmetrical around the circumference of the wire harness
- The shields are flat against the wire harness.

(10) Wind a layer of tape on the ends of the shields to temporarily hold the shields on the harness.

(11) Align the mark on the backshell extension with the master key or the master keyway of the connector. Refer to Figure 9.

ALIGNMENT OF THE BACKSHELL EXTENSION AND THE CONNECTOR
Figure 9

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

- (12) Fully engage the threads of the coupling ring of the backshell extension and the connector.
Make sure that the mark on the backshell extension stays aligned with the master key or the master keyway of the connector. Refer to Figure 9.
- (13) To remove the play between the backshell extension and the connector:
 - (a) Tighten the coupling ring of the backshell extension with the hand and, at the same time, twist the backshell extension clockwise and counterclockwise approximately 1/8 inch in each direction.
 - (b) Move the backshell extension from side to side and continue to tighten the coupling ring.
 - (c) Twist the backshell extension clockwise and counterclockwise approximately 1/8 inch in each direction and fully tighten the coupling ring.
- (14) Remove the tape that holds the shields on the wire harness.
- (15) Carefully fold the shields forward on the backshell extension.
- (16) Push the ground ring forward into the backshell extension.
- (17) Carefully fold the shields back against the wire harness.
Make sure that the shields are even and symmetrical around the ground ring.
- (18) Assemble a wire harness tie on the ends of the shields at the rear end of the ground ring.

Refer to:

- Figure 10
- Subject 20-23-30 for the procedure to assemble a wire harness tie.

POSITION OF THE WIRE HARNESS TIE ON THE ENDS OF THE SHIELDS

Figure 10

- (19) Fully engage the threads of the coupling ring of the strain relief backshell and the backshell extension.

20-23-39

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

- (20) Align the center of the support bushing with the saddle bar installation screw holes in the legs of the strain relief backshell.
 - (21) Align the installation screw holes of the saddle bars and the legs of the strain relief backshell.
 - (22) Install the saddle bar screws.
- Make sure that the screws are not fully tightened.
- (23) If the connector is a receptacle, install it. Refer to Subject 20-23-37.
 - (24) If the connector is a plug, connect it to the related receptacle. Refer to Subject 20-23-37.

NOTE: The receptacle must be installed before the coupling ring can be fully tightened.

- (25) Move the backshell extension from side to side and, at the same time, tighten the backshell extension coupling ring with the pliers until the pliers move on the surface of the coupling ring.
- (26) Move the strain relief backshell from side to side and, at the same time, tighten the strain relief backshell coupling ring with the pliers until the pliers move on the surface of the coupling ring.
- (27) Fully tighten the saddle bar screws. Refer to Figure 11.

Make sure that:

- The saddle bar screws are tight
- The saddle bars are against the legs of the strain relief backshell
- The wire harness cannot be moved in the cable clamp.

FULLY ASSEMBLED BACKSHELL
Figure 11

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

C. Strain Relief Assembly Without a Support Bushing

**Table 9
NECESSARY MATERIALS**

Material	Specification	Description	Supplier
Tape	A-A-59474	TFE, High Temperature, Pressure Sensitive	An available source

**Table 10
NECESSARY TOOLS**

Tool	Description	Supplier
Screwdriver	Number 3 Phillips	An available source

**FULLY ASSEMBLED BACKSHELL
Figure 12**

Refer to Figure 12.

- (1) Make a selection of a screwdriver from Table 10.
- (2) Align the installation screw holes of the saddle bars and the legs of the strain relief backshell.
- (3) Install the saddle bar screws.
- (4) Fully tighten the saddle bar screws.

Make sure that:

- The saddle bar screws are tight
 - The saddle bars do not crush or pinch the wire harness
 - The wire harness does not move in the cable clamp.
- (5) If the wire harness can be moved in the clamp, increase the diameter of the wire harness with tape:
 - (a) Remove the saddle bars.
 - (b) Make a selection of tape from Table 9.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

- (c) Wind a sufficient number of layers of tape on the wire harness where the saddle bars hold the wire harness to increase the wire harness diameter.

Make sure that the layers of tape make a 100 percent overlap.

- (6) If the ends of the saddle bars are not against the legs, or the wire harness is too tight in the clamp, decrease the diameter of the wire harness:
 - (a) Remove the saddle bars.
 - (b) Remove a sufficient number of layers of tape to decrease the diameter of the wire harness.
- (7) Fully tighten the saddle bar screws.

Make sure that:

- The saddle bar screws are tight
- The saddle bars are against the legs of the strain relief backshell
- The saddle bars do not crush or pinch the wire harness
- The wire harness cannot be moved in the cable clamp
- Tape is not between the saddle bars and the legs of the strain relief backshell.

- (8) If the fit of the wire harness in the clamp is not correct, do Step (5) through Step (7) again.

4. ASSEMBLY OF BACKSHELLS FOR CA66279-106 CONNECTORS

A. Assembly of Backshells for CA66279-106 Connectors

**Table 11
NECESSARY MATERIALS**

Material	Part Number	Approved Supplier
Thread Lock Compound	222	Locktite

**Table 12
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

**Table 13
BACKSHELL INSTALLATION TORQUE VALUES**

Connector Shell Size	Torque (inch-pounds)		Torque (newton-meters)	
	Minimum	Maximum	Minimum	Maximum
28	115	120	1.33	1.38

- (1) Put the necessary backshell components on the wire harness in this sequence:
 - The ESC53-37 support bushing
 - The strain relief backshell

Make sure that the strain relief end of the backshell is pointed rearward away from the end of the wire harness.

- (2) Install the contacts in the connector. Refer to Subject 20-23-37.

20-23-39

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

- (3) Make a selection of thread lock compound from Table 11.
- (4) Put one drop of thread lock compound on the threads at the rear of the connector on one side of the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (5) Put one drop of thread lock compound on the threads at the rear of the connector on the other side of the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (6) Engage the threads of the backshell and the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (7) Torque the backshell 115 inch-pounds (1.33 newton-meters) to 120 inch-pounds (1.38 newton-meters).

- (8) Assemble the strain relief. Refer to Paragraph 4.B.

B. Standard Strain Relief Assembly

**Table 14
NECESSARY MATERIALS**

Material	Part Number	Approved Supplier
Thread Lock Compound	222	Loctite

**Table 15
NECESSARY TOOLS**

Tool	Type	Supplier
Screwdriver	Flat Blade	An available source

**Table 16
TERMINAL LUG PART NUMBERS**

Crimp Barrel Size	Part Number	Supplier
16-14	322334	AMP

- (1) Make a selection of a terminal lug from Table 16.

NOTE: An equivalent terminal lug is a satisfactory alternative.

STANDARD WIRING PRACTICES MANUAL

RB 211 TRENT 800 POWER PLANT: ASSEMBLY OF BACKSHELLS

Make sure that:

- The type of terminal lug is applicable for the type of the shield ground wire
- The type of terminal lug is applicable for the location of the installation of the connector
- The stud size hole of the terminal lug is applicable for the cable clamp screw.

- (2) Assemble the terminal lug. Refer to Subject 20-23-32.
- (3) Make a selection of a screwdriver from Table 15.
- (4) Make a selection of thread lock compound from Table 14.
- (5) Align the center of the support bushing with the saddle bar installation screw holes in the legs of the strain relief backshell.
- (6) Put a lockwasher on each cable clamp screw.
- (7) Put the terminal lug in its position on the saddle clamp screw.

POSITION OF THE TERMINAL LUG
Figure 13

- (8) Align the screw holes of a saddle bar of the cable clamp and the screw holes in the legs of the backshell.
- (9) Put the other saddle bar on the wire harness and the backshell.
- (10) Push the saddle bars of the cable clamp together.
- (11) Engage the threads of each cable clamp screw and the applicable screw hole.
- (12) Put a thin layer of the compound on one or two threads of the cable clamp screws around the circumference of the threads.

Make sure that the thread lock compound is applied to screw threads that engage the threads in the saddle bar.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (13) Tighten the screws until the ends of the saddle bars are against the legs of the backshell.

Make sure that:

- The saddle bars do not crush or pinch the wire harness
- The wire harness is tight in the cable clamp
- The cable clamp screws are tight.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: WIRING REPAIR

This Subject gives the applicable PW4000/777 power plant part numbers and the related repair Subjects.

1. GENERAL DATA

A. Applicable Conditions for the PW4000/777 Power Plant Wiring Repair Data

The data and procedures that are given in Subject 20-24-00 through Subject 20-24-27 are applicable only for the PW4000/777 power plant wire harnesses that have Pratt & Whitney part numbers. Refer to Table 2.

CAUTION: THE DATA AND PROCEDURES IN Subject 20-24-00 THROUGH Subject 20-24-27 ARE NOT APPLICABLE FOR THE REPAIR OF THE WIRING OF OTHER POWER PLANTS, OF OTHER POWER PLANT MANUFACTURERS, OR OF PW4000/777 WIRING THAT HAS A BOEING PART NUMBER. REPAIRS THAT ARE NOT APPROVED CAN CAUSE UNSATISFACTORY PERFORMANCE OR RELIABILITY OF THE WIRING.

Refer to:

- The remainder of the SWPM for a PW4000/777 power plant wire harness that has a Boeing part number
- Pratt & Whitney for problems with the PW4000/777 power plant wiring repair data and procedures.

B. PW4000/777 Power Plant Wiring Repair Data and Procedures

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: GENERAL DATA FOR WIRING REPAIR

This Subject gives the general data for the repair of the PW4000/777 power plant wiring.

1. GENERAL DATA

A. Applicable Conditions

For the conditions that are applicable to the data of this Subject, refer to Subject 20-24-00.

B. Equipment Identification Numbers

All of the wire harnesses, components, and connectors of the power plant have an Equipment Identification Number.

C. Cable Identification

Each cable has an identification label.

NOTE: 2953 is an example of a cable circuit identification.

D. Cable Jacket Colors

The jackets of the cables in the harnesses have specified colors to show the related system. Refer to Table 1.

**Table 1
COLORS OF POWER PLANT CABLES**

Color	System
Blue	Electronic Engine Control (EEC) Channel A
Gray	Circuits that are not related to the EEC
Green	Electronic Engine Control (EEC) Channel B
Yellow	Thermocouple Circuits

E. Primary Wire Color Codes

**Table 2
COLOR CODES OF POWER PLANT PRIMARY WIRES**

Color Code	Color	Description
B	Blue	General power plant wire
O	Orange	General power plant wire
R	Red	Alumel Thermocouple wire
W	White	General power plant wire
Y	Yellow	Chromel Thermocouple wire

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: GENERAL DATA FOR WIRING REPAIR****2. REPAIR AND REPLACEMENT OF WIRING COMPONENTS****A. Necessary Repair Conditions**

A wire harness must be repaired when one or more of these conditions occur:

- The insulation of a cable or a wire has damage
- The conductor of a wire has damage
- The shield of a cable or a wire has damage
- A terminal lug is broken
- A connector has contacts that are bent, broken, or recessed
- A connector has threads that are worn or stripped
- A backshell threads that are broken, worn, or stripped.

A wiring component must be replaced if the amount of damage makes it unserviceable.

Refer to:

- Paragraph 2.B. for the conditions that are applicable for the replacement of a wire or a cable
- Paragraph 2.C. for the conditions that are applicable for the replacement of a terminal lug, a connector, a contact, or a backshell
- Subject 20-24-00 for the applicable repair procedure.

B. Necessary Conditions for the Replacement of a Wire or a Cable

If replacement is necessary, a wire or a cable must be replaced with a new wire that has the same part number.

Refer to the Wiring Diagram Manual (WDM) Chapter 91 Wire List for:

- The wire identification number
- The correct part number of the wire
- The size of the wire
- The length of the wire.

Refer to Subject 20-24-00 for the applicable replacement procedure.

C. Necessary Conditions for the Replacement of a Terminal Lug, a Connector, a Contact, or a Backshell

If replacement is necessary, a terminal lug, a connector, a contact, or a backshell must be replaced with a new component that has the same part number or a specified alternative.

CAUTION: IF A TERMINAL LUG, A CONNECTOR, A CONTACT, OR A BACKSHELL IS REPLACED WITH A COMPONENT THAT DOES NOT HAVE THE SAME PART NUMBER OR A COMPONENT THAT IS NOT A SPECIFIED ALTERNATIVE, DAMAGE TO THE COMPONENT OR THE SYSTEM CAN OCCUR.

Make sure that:

- The location of the connection is correct
- The Equipment Identification Number of the component is correct.

Refer to:

- The WDM Equipment List for the correct part number of the terminal lug, the connector, the contact, or the backshell
- The Airplane Illustrated Parts Catalog (AIPC) for the specified alternative part numbers
- Subject 20-24-00 for the applicable replacement procedure.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR INSERT CONFIGURATIONS AND POLARIZATION

CAUTION: A CONNECTOR FROM ONE SERIES MUST NOT BE CONNECTED TO A CONNECTOR FROM DIFFERENT SERIES. DAMAGE TO THE CONNECTORS CAN OCCUR.

Make sure that:

- An ESC10 connector is only connected to an ESC10 connector
- A modified MIL-C-26500 connector is only connected to modified MIL-C-26500 connector
- A MIL-C-38999 Series III connector is only connected to a MIL-C-38999 Series III connector
- A MIL-C-5015 connector is only connected to MIL-C-5015 connector
- A MIL-C-83723 Series III connector is only connected to MIL-C-83723 Series III connector.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR INSERT CONFIGURATIONS AND POLARIZATION

C. MIL-C-5015 Connectors

Front Face of the Pin Insert

In the normal position, the insert vertical, the key, and the keyway are the same: $L = 0$ degrees.

In the alternative positions W, X, Y, and Z, the insert is turned in relation to the centerline of the master key or keyway of the shell:

- The pin insert is turned clockwise in the shell; the position is the angle between the index radius and the centerline of the master key or keyway
- The socket insert is turned counterclockwise in the shell; the position is the angle between the index radius and the centerline of the master key or keyway.

20-24-14 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: ASSEMBLY OF WIRE HARNESS TIES**

This Subject gives the procedures to assemble wire harness ties.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Wire Routing

These conditions are applicable:

- The twists of cable in a wire harness must be kept to a minimum
- The routing of the wire harness must be as straight as possible.

D. Necessary Materials

NOTE: Alternatives to the materials in Table 2 must be equivalent materials. Refer to Subject 20-00-11.

Table 2
NECESSARY MATERIALS

Material	Part Number	Supplier Code
Tape, Lacing, White	718Z	82110

2. CONFIGURATION OF WIRE HARNESS TIES**A. Types of Knots**

A wire harness tie has two knots:

- A clove hitch knot; refer to Figure 1
- A square knot or a surgical knot; refer to Figure 1.

A square knot or a surgical knot is used to prevent the unwanted movement of a clove hitch on the harness.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: ASSEMBLY OF WIRE HARNESS TIES

TYPES OF KNOTS FOR WIRE HARNESS TIES

Figure 1

B. Location and Position of Wire Harness Ties

These general conditions are applicable:

- A wire harness must have wire harness ties if the harness has two or more cables
- If it is necessary to disassemble a wire harness tie or replace a damaged wire harness tie, a new tie must be put in the same location
- The maximum interval between two wire harness ties is 2 inches (50.8 mm); refer to Figure 2.
- If the diameter of the wire harness is larger than 1.5 inches (38.1 mm), two wire harness ties must be put at the same location; refer to Figure 3.

These conditions are applicable for wire harnesses with wire harness branches:

- The wire harness must have a wire harness tie on each side of a branch
- The branch must have a wire harness tie at the wire harness.

STANDARD INTERVAL FOR WIRE HARNESS TIES

Figure 2

TWO WIRE HARNESS TIES AT THE SAME LOCATION

Figure 3

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: ASSEMBLY OF WIRE HARNESS TIES****3. ASSEMBLY OF WIRE HARNESS TIES****A. Assembly of a Standard Wire Harness Tie**

- (1) Make a clove hitch on the harness. Refer to Figure 4 and Figure 5.

Make sure that the knot is tight.

CAUTION: DO NOT MAKE THE FIRST LOOP ON:

- A THERMOCOUPLE CABLE (YELLOW JACKET)
- A THERMOCOUPLE WIRE (RED OR YELLOW INSULATION)

CLOVE HITCH KNOT
Figure 4

STEPS TO MAKE A CLOVE HITCH KNOT
Figure 5

- (2) Make a square knot or surgical knot on top of the clove hitch knot. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: ASSEMBLY OF WIRE HARNESS TIES

STEPS TO MAKE A SQUARE KNOT
Figure 6

- (3) Cut the two ends of the tie material to make the distance between each end and the knot equal to:
- A minimum of 0.25 inch (6.35 mm)
 - A maximum of 0.50 inch (12.7 mm).

B. Assembly of a Wire Harness Tie That Supports a Wire Harness Branch

- (1) Assemble a wire harness tie on the wire harness on both sides of the branch.
- (2) Make a loose clove hitch on the wire harness and the branch. Refer to Figure 7.
 Make sure that the clove hitch is not tight.

CLOVE HITCH AROUND THE WIRE HARNESS AND THE BRANCH
Figure 7

- (3) Put each end of the tie material across the other and between the wire harness and the lengths of the clove hitch that are against wire harness. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: ASSEMBLY OF WIRE HARNESS TIES

SQUARE KNOT ON TOP OF THE CLOVE HITCH
Figure 8

- (4) Tighten the clove hitch.
- (5) Make a square knot or surgical knot on top of the clove hitch knot. Refer to Figure 8.
- (6) Cut the two ends of the tie material to make the distance between each end and the knot equal to:
 - A minimum of 0.25 inch (6.35 mm)
 - A maximum of 0.50 inch (12.7 mm).

C. Assembly of a Wire Harness Tie on Spiral Wrap

POSTION OF THE WIRE HARNESS TIE ON THE SPIRAL WRAP
Figure 9

Refer to Figure 9.

- (1) Make a 0.075 inch to 0.175 inch (1.9 mm to 4.4 mm) diameter hole in the spiral wrap at the end.
- (2) Put one end of the tie material through the hole.
- (3) Assemble a wire harness tie on the spiral wrap. Refer to Paragraph 3.A.

20-24-20 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT**

This Subject gives the procedures to replace a connector or a backshell on a wire harness or cable assembly.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it
Stubwire Assembly	A 4 inch wire that is sealed with a cap on one end and has a contact crimped to the other end

C. Disconnect Identification Number

Refer to the Equipment List of the Wiring Diagram Manual (WDM) to find the Disconnect Identification Number for the correct connector and backshell part numbers.

D. Alternative Part Numbers

To identify alternative part numbers, refer to the Airplane Illustrated Parts Catalog (AIPC).

E. Wire Data

Refer to the WDM Wire List (Chapter 91) for detailed pin to pin and wire color data.

F. More References

Refer to:

- Subject 20-24-12 for the insert configurations of the connectors
- Subject 20-24-14 for the assembly of the wire harness ties
- Subject 20-24-25 for the adapter plate assembly.

G. Connector or Backshell Replacement

These conditions are applicable when a connector or backshell must be replaced:

- The connector or backshell must be replaced with a connector or backshell that has the same part number; refer to the WDM Equipment list
- The part number must be correct for the Disconnect Identification Number location
- If a contact cavity of the old connector has a stub wire assembly, the same contact cavity of the new connector must have a stub wire assembly
- If a contact cavity of the old connector has an unwired contact and a seal plug, the same contact cavity of the new connector must have an unwired contact and a seal plug.

20-24-20

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

2. STANDARD EQUIPMENT

A. Tools

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

NOTE: Alternatives to the tools specified in Table 2 must be equivalent tools.

3. CONNECTOR DISASSEMBLY

A. Connector Separation

- (1) Disconnect the plug from the receptacle with the TG-69 pliers or the TG-70 strap wrench. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

CONNECTOR SEPARATION TOOLS
Figure 1

- (2) If it is necessary, remove the adapter plate assembly and the receptacle from the engine bracket. Refer to Subject 20-24-25.

B. Backshell Removal

BACKSHELL REMOVAL
Figure 2

Refer to Figure 2.

- (1) Make a mark on the connector backshell in relation to the master key or keyway on the front of the connector.

NOTE: The backshell is installed at an angular or the straight position in relation to the master key on the connector. The position must be the same after the backshell is removed and attached to the connector again.

- (2) If it is necessary to replace the backshell, make a mark on a new backshell in the same position as the mark on the old backshell.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

- (3) Make a record of the direction and position of the hose clamp screw in relation to the master key on the front of the connector.
- (4) Move the hose clamp away from the repair area. Refer to Figure 3.

POSITION OF THE HOSE CLAMP ON THE BACKSHELL
Figure 3

- (a) Loosen the hose clamp screw.
NOTE: If it is necessary, the tab of the hose clamp can be bent to make it straight.
- (b) Push the hose clamp rearward away from the backshell.
NOTE: If the saddle bars of the strain relief clamp stop the hose clamp, the hose clamp can be fully removed.
- (5) Loosen the strain relief clamp screws sufficiently.
NOTE: To make the removal of the backshell easier, the saddle bars of the strain relief clamp can be fully removed.
- (6) If it is necessary to remove the saddle bars:
 - (a) Make a record of the direction and position of the saddle bars and screws of the strain relief clamp in relation to the master key on the front of the connector.
NOTE: The position of the saddle bars and the screws must be the same after the backshell is assembled again.
 - (b) Remove the strain relief clamp screws.
- (7) Fold the ends of the shields rearward against the wire harness.
 Make sure that the shields are flat and symmetrical around the circumference of the wire harness.
- (8) For the plug connector:
 - (a) Make a selection of a connector adapter kit from Table 2.
 - (b) Align the master key on the engaging end of the connector and the master keyway of the adapter. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

ALIGNMENT OF THE ADAPTER AND THE PLUG CONNECTOR
Figure 4

- (c) Engage the adapter and the plug.
- (9) Hold the plug connector and the adaptor or the flange of the receptacle connector with a standard wrench or a small vise.
- (10) Put the TG-69 pliers or the TG-70 strap wrench on the backshell.
NOTE: A standard crowsfoot wrench is a satisfactory alternative.
- (11) Turn the backshell in a counterclockwise direction until it is disengaged from the connector.
- (12) Push the black rubber tape rearward away from the backshell.
NOTE: If it is necessary, the tape can be fully removed from the wire harness.
- (13) Push the backshell rearward away from the rear of the connector.

CAUTION: DO NOT CAUSE DAMAGE TO THE CABLES, THE WIRES, OR THE SHIELDS. DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE OR RELIABILITY OF THE SYSTEM.

C. Contact Removal

Table 4
CONTACT REMOVAL PROCEDURES

Connector Series	Contact Retention	Procedure
D38999	Rear Release	Paragraph 3.E.
ESC10	Rear Release	Paragraph 3.E.
MIL-C-26500	Front Release	Paragraph 3.D.
MIL-C-5015	Rear Release	Paragraph 3.E.
MIL-C-83723	Rear Release	Paragraph 3.E.

- (1) If it is necessary, remove the tie material to permit the removal of the contacts.
- (2) Make a selection of a contact removal procedure. Refer to Table 4.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

D. Front Release Contact Contact Removal

FRONT RELEASE CONTACT REMOVAL
Figure 5

Refer to Figure 5.

- (1) Make a selection of a contact removal tool from Table 2.
- (2) Put the removal tool on the contact from the front face of the connector.
- (3) Axially align the removal tool and the contact.
- (4) Push the removal tool into the grommet until it stops.

CAUTION: IF TOO MUCH PRESSURE IS APPLIED, DAMAGE TO THE COLLET, THE CONTACT, OR THE GROMMET CAN OCCUR.

NOTE: When the tool is fully inserted, it:

- Expands the collet
 - Releases the contact
 - Starts to push the contact out of the contact cavity.
- (5) From the rear of the connector, pull the contact out of the contact cavity.
 - (6) Remove the tool from the grommet.
 - (7) For a contact that is assembled with a wire:
 - (a) Make a label that identifies the contact number
 - (b) Put the label on the wire.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

E. Rear Release Contact Contact Removal

REAR RELEASE CONTACT REMOVAL
Figure 6

Refer to Figure 6.

- (1) Make a selection of a contact removal tool from Table 2.
- (2) At the rear of the connector, put the removal tool on the wire. Refer to Figure 7.

POSITION OF THE WIRE IN THE CONTACT REMOVAL TOOL
Figure 7

- (3) Hold the wire tight and move the tool on the wire in the direction away from the contact to make the wire go into the slot of the tool.
- (4) Axially align the removal tool and the contact.
- (5) Push the tool forward into the connector grommet until it stops.

CAUTION: IF TOO MUCH PRESSURE IS APPLIED, DAMAGE TO THE COLLET, THE CONTACT, OR THE GROMMET CAN OCCUR.

NOTE: When the tool is fully inserted, it:

- Expands the collet
- Releases the contact.

- (6) Hold the wire against the serrated shoulder of the tool.
- (7) Pull the tool and the contact assembly from the connector.
- (8) Remove the wire from the tool.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

- (9) Make a label that identifies the contact number.
- (10) Put the label on the wire.

4. CONNECTOR ASSEMBLY

A. Contact Assembly

Refer to Subject 20-24-21.

B. Contact Insertion

NOTE: If more than one contact must be installed, it is easier to start in the center of the connector insert.

- (1) Put the backshell on the wire harness.
- (2) Push the backshell away from the end of the wire harness. Refer to Figure 8.

POSITION OF THE BACKSHELL FOR CONTACT INSERTION
Figure 8

- (3) Make a selection of a contact insertion tool from Table 2.
- (4) Examine the label on the wire.
 Make sure that the contact cavity is correct for the contact. Refer to the WDM Chapter 91 Wire List for the detailed wire data.
- (5) Put the insertion tool on the wire. Refer to Figure 9.

POSITION OF THE WIRE IN THE CONTACT INSERTION TOOL
Figure 9

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

- (6) Hold the wire tight and move the tool on the wire in the direction away from the contact to make the wire go into the slot of the tool.
- (7) Push the tool forward until the tip of the tool is against the rear shoulder of the contact.
- (8) Carefully push the contact into the contact cavity. Refer to Figure 10.

CAUTION: IF TOO MUCH PRESSURE IS APPLIED, DAMAGE TO THE COLLET, THE CONTACT, OR THE GROMMET CAN OCCUR.

CONTACT INSERTION
Figure 10

- (9) Remove the tool.
- (10) Lightly pull the wire.
Make sure that the contact is locked in the collet.
- (11) Do the contact retention test. Refer to Paragraph 4.C.

C. Contact Retention Test

NOTE: The contact retention force that is necessary to make sure that the contact is locked in the connector is 10 pounds to 15 pounds (44.5 Newtons to 66.7 Newtons).

- (1) Make a selection of a contact retention test tool and tool tip from Table 2. Refer to Figure 11.

CONTACT RETENTION TEST TOOL
Figure 11

- (2) Put the tool tip in the retention test tool.
- (3) Axially align the tip and the engaging end of the contact.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

- (4) Put the tip on the engaging end of the contact.

NOTE: For the most accurate measurement, the test tool must stay axially aligned with the contact.

- (5) Carefully apply pressure on the tool handle forward until the indicator band on the tip is aligned with the end of the body of the tool.

Make sure to keep the tip and the engaging end of the contact axially aligned.

CAUTION: IF THE CONTACT RETENTION TEST TOOL TIP AND THE CONTACT ARE NOT AXIALLY ALIGNED, DAMAGE TO THE CONTACT, THE CONNECTOR, OR THE TOOL CAN OCCUR.

NOTE: At this point, the pressure is 13 pounds (57.8 Newtons). If the contact stays in position, the contact retention is satisfactory.

D. Seal of an Empty Contact Cavity

All unused contact cavities must be sealed with the specified:

- Stub wire assembly
- An unwired contact and a seal plug.

Refer to the applicable conditions for connector replacement in Paragraph 1.G.

- (1) If a stubwire assembly is specified, install the stubwire. Refer to Paragraph 4.B.
- (2) If an unwired contact and seal plug are specified:
 - (a) Make a selection of a contact insertion tool from Table 2.
 - (b) Put the contact in the contact cavity.
 - (c) Put the end of the insertion tool on the rear shoulder of the contact.
 - (d) Carefully push the contact into the contact cavity.

CAUTION: IF TOO MUCH PRESSURE IS APPLIED, DAMAGE TO THE COLLET, THE CONTACT, OR THE GROMMET CAN OCCUR.

- (e) Remove the tool.
- (f) Do the contact retention test. Refer to Paragraph 4.C.
- (g) Install a seal plug in the contact cavity.

Make sure that the large end of the seal plug in put the contact cavity first.

E. Backshell Assembly

BACKSHELL ASSEMBLY
Figure 12

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

Refer to Figure 12.

- (1) Assemble the necessary wire harness ties. Refer to Subject 20-24-14.
- (2) Fold the ends of the shields rearward against the wire harness.
Make sure that the shields are flat and symmetrical around the circumference of the wire harness.
NOTE: If it is necessary, tape can be used to temporarily hold the shields on the harness.
- (3) Move the backshell forward until the backshell nut is against the rear of the connector. Refer to Figure 13.

POSITION OF THE BACKSHELL AGAINST THE REAR OF THE CONNECTOR

Figure 13

- (4) Align the mark on the backshell, from the removal of the backshell in Paragraph 3.B., with the master key on the front face of the connector. Refer to Figure 14.

CAUTION: IF THE MARK ON THE BACKSHELL IS NOT ALIGNED WITH THE MASTER KEY ON THE CONNECTOR:

- THE CONNECTOR AND THE BACKSHELL DO NOT ENGAGE CORRECTLY
- DAMAGE TO THE ANTI-ROTATION TEETH OF THE CONNECTOR OR THE BACKSHELL CAN OCCUR.

ALIGNMENT OF THE BACKSHELL AND THE MASTER KEY OF THE CONNECTOR

Figure 14

- (5) Engage the threads of the backshell nut and the connector.
- (6) Tighten the nut and, at the same time, lightly twist the backshell clockwise and counterclockwise to engage the anti-rotation teeth.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT**

Make sure that:

- The mark on the backshell stays aligned with the master key on the connector
- The anti-rotation teeth of the connector and the backshell engage correctly.

NOTE: The anti-rotation teeth can be examined through the inspection hole on the coupling nut of the backshell.

- (7) For the plug connector:
- (a) Make a selection of a connector adapter kit from Table 2.
 - (b) Align the master key on the engaging end of the connector and the master keyway of the adaptor. Refer to Figure 15.

ALIGNMENT OF THE ADAPTER AND THE PLUG CONNECTOR

Figure 15

- (c) Engage the adapter and the plug.
- (8) Hold the plug connector and the adaptor or the flange of the receptacle connector with a standard wrench or a small vise.
- (9) Put the TG-69 pliers or the TG-70 strap wrench on the backshell. Refer to Figure 16.

NOTE: As an alternative, a standard crowsfoot wrench can be used.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

BACKSHELL INSTALLATION ON A PLUG CONNECTOR

Figure 16

- (10) To make sure that the anti-rotation teeth in the connector and the backshell are engaged correctly:
 - (a) Move the backshell from one side of the longitudinal axis of the wire harness to the other side.
 - (b) Twist the backshell in a clockwise and counterclockwise direction.
- (11) Torque the backshell nut 115 inch-pounds to 125 inch-pounds (511.5 Newton-meters to 556 Newton-meters).
- (12) Remove the temporary layer of tape that holds the shields to the harness.

F. Strain Relief Clamp Assembly

POSITION OF THE CABLE SHIELDS

Figure 17

Refer to Figure 17.

- (1) Put the wire harness in the correct position.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT**

Make sure that the end of the outer jacket of each cable extends 0.25 inch to 0.50 inch (6.35 mm to 12.7 mm) forward from the rear end of the primary backshell body.

NOTE: The strain relief clamp part of the backshell is not part of the primary backshell body.

- (2) Fold the shields forward on top of the backshell.
Make sure that the shields are flat and symmetrical around the circumference of the backshell.
- (3) Remove the necessary length from the end of each shield to make the distance from the forward rib of the backshell to the end of the shield equal to 0.24 inch to 0.5 inch.
- (4) If the black rubber tape is on the wire harness:
 - (a) Hold the cables tight from the rear.
 - (b) Carefully push the tape forward until the center of the tape is aligned with the screw holes in the ears of the strain relief clamp.
- (5) If the black rubber tape is not on the wire harness:
 - (a) Make a selection of a black rubber tape from Table 3.
 - (b) Put the necessary layers of the tape on the harness between the ears of the strain relief clamp.
Make sure that:
 - The layers of tape make a 100 percent overlap
 - The number of layers of the tape is sufficient for the saddle bars to hold the wire harness tightly.
 - (c) Hold the cables tight from the rear.
 - (d) Carefully push the tape forward until the center of the tape is aligned with the screw holes in the ears of the strain relief clamp.
- (6) Install the saddle bars on the strain relief clamp:
 - (a) Align the screw holes of the saddle bars with the holes in the strain relief clamp ears.
Make sure that the position of the saddle bars is the same as the position of the saddle bars before the backshell was disassembled.
 - (b) Engage the first two or three threads of the clamp screws with the threads of the clamp ears.
Make sure that the direction that the screws are pointed is the same as the direction that the screws pointed before the backshell was disassembled.
- (7) Fold each shield forward between the layer of tape and the saddle bars.
Make sure that:
 - The shields are flat and symmetrical around the circumference of the backshell
 - A shield does not make an overlap with the other shields
 - The rear end of the shield is 0.125 inch to 0.25 inch (3.2 mm to 6.4 mm) from the rear end of the saddle bar of the strain relief clamp.
- (8) Tighten each screw two turns at a time until the saddle bars are against the clamp ears.
Make sure that:
 - The wire harness does not move in the clamp
 - The tape is not between the clamp ears and the saddle bars.
- (9) If the saddle bars are not against the clamp ears:
 - (a) Remove the saddle bars.
 - (b) Remove the necessary layers of the tape.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

- (c) Do Step (4) through Step (8) again.
- (10) If the clamp does not hold the wire harness tightly:
 - (a) Remove the saddle bars.
 - (b) Add the necessary layers of the tape.
 - (c) Do Step (4) through Step (8) again.

G. Hose Clamp Installation

POSITION OF THE HOSE CLAMP ON THE BACKSHELL
Figure 18

Refer to Figure 18.

- (1) Fold the end of each shield rearward and down against the body of the backshell.
 Make sure that:
 - The shields are flat and symmetrical around the circumference of the backshell
 - A shield does not make an overlap with the other shields.
 - (2) Put the hose clamp on the shields in the area between the backshell ribs.
 Make sure that the position of the hose clamp is the same as the initial position before the removal of the backshell.
 - (3) Carefully align each shield under the clamp.
 Make sure that:
 - The folded edge of each shield extends a small distance farther the edge of the clamp
 - A shield is not put between the backshell and the hose clamp screw.
- CAUTION:** IF A SHIELD IS PUT THE BACKSHELL AND THE HOSE CLAMP SCREW, DAMAGE TO THE SHIELD CAN OCCUR.
- (4) Tighten the screw.
 - (5) Bend the end of the hose clamp down until it is against the part of the hose clamp that is against the backshell. Refer to Figure 19.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT****POSITION OF THE END OF THE HOSE CLAMP****Figure 19**

(6) Do the necessary electrical checks. Refer to Paragraph 5.

5. ELECTRICAL CHECKS

Electrical checks must be done for all circuits. Refer to the WDM Chapter 91 Wire List for the detailed pin to pin and the wire color data.

A. Wire Continuity

- (1) Disconnect the wire harness connectors from the ends of the circuit with the TG-69 pliers or the TG-70 strap wrench.
- (2) Make a selection of a multimeter or an ohmmeter from Table 2.
- (3) Do the wire continuity check from the contact on one end of the wire to the contact on the other end of the wire.

Make sure that each circuit has continuity from the contact on one end of the wire to the contact on the other end of the wire.

CAUTION: DO NOT PUT STRESS ON OR BEND THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

B. Insulation Resistance

WARNING: A MEGOHMMETER MUST NOT BE USED FOR THE INSULATION RESISTANCE TEST OF THE ON-WING WIRE REPAIR. A MEGOHMMETER CAN CAUSE:

- PERSONAL INJURY
- DAMAGE TO THE AIRPLANE.

CAUTION: DO NOT PUT STRESS ON OR BEND THE CONTACTS. DAMAGE TO THE CONNECTOR OR THE CONTACTS CAN OCCUR.

- (1) Make a selection of a multimeter or an ohmmeter from Table 2.
- (2) Set the ohmmeter scale to 100K ohms.
- (3) Disconnect all of the connectors on the circuit before the insulation resistance check.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR AND BACKSHELL REPLACEMENT

CAUTION: IF ALL OF THE CONNECTORS ARE NOT DISCONNECTED:

- UNSATISFACTORY RESISTANCE INDICATION CAN OCCUR
- POSSIBLE DAMAGE TO THE CIRCUITS CAN OCCUR.

(4) Measure the insulation resistance:

- Attach one lead of the ohmmeter to a contact.
- With the other lead of the ohmmeter, touch the contacts of a different circuit one at a time.

NOTE: The minimum resistance is 100K ohms.

- Attach one lead of the ohmmeter to the connector backshell.
- With the other lead of the ohmmeter, touch the contacts of a different circuit one at a time.

NOTE: The minimum resistance is 100K ohms.

(5) Install and connect the plugs and receptacles again. Refer to Subject 20-24-25.

C. Engine

Refer to the test reference table in the Aircraft Maintenance Manual 71-00-00/501.

20-24-20

20-24-21 CONTENTS

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONTACT REPLACEMENT

This Subject gives the procedure to replace a pin or a socket contact in a connector.

1. GENERAL DATA

A. Applicable Conditions

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

**Table 1
DEFINITIONS**

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Conditions for Contact Replacement

Before the first replacement of a contact, each wire is a minimum of 0.250 inch (6.35 mm) longer than the minimum length that is necessary for insertion of the contact and the assembly of the backshell.

These conditions are applicable:

- A contact on a wire can be replaced twice before the wire is too short for insertion of the contact into the connector
- If it is necessary to replace a contact on a wire in a cable more than 2 times, the cable must be replaced; refer to Subject 20-24-24.

D. Contact Part Numbers

Refer to:

- The Wiring Diagram Manual (WDM) Equipment List for the connector Disconnect Identification Number for the correct contact part numbers
- The Aircraft Illustrated Parts Catalog (AIPC) for alternate part numbers.

E. References

Refer to:

- The WDM Chapter 91 Wire List for the contact to contact hookup and wire color data
- Subject 20-24-12 for the insert configurations of the connectors
- Subject 20-24-14 for the assembly of the wire harness ties
- Subject 20-24-20 for the procedures to replace the connector and the connector backshell
- Subject 20-24-24 for the procedures to replace the wire harness cables
- Subject 20-24-25 for the adapter plate assembly.

2. STANDARD EQUIPMENT

A. Tools

NOTE: Alternatives to the tools specified in Table 2 must be equivalent tools.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONTACT REPLACEMENT

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

**Table 2
TOOLS**

Tool	Procedure	Part Number	Supplier Code
Contact Crimp Tool Basic Unit	Contact assembly	M22520/7-01	11851
Contact Crimp Tool Locator	Size 20 contact assembly for MIL-C-38999 connectors	M22520/7-08	11851
	Size 20 contact assembly except for MIL-C-38999 connectors	M22520/7-02	11851
	Size 16 contact assembly	M22520/7-03	11851
Pliers, Soft Jaw	Connector and backshell removal and installation	BT-SJ-468	11851
		TG-69	06324
		TG-69	11851
Wire Insulation Removal Tool	Removal of the wire insulation	45-092	11851
Wrench, Strap	Connector and backshell removal and installation	BT-BS-6()	11851
		TG-70	06324
		TG-70	11851

B. Necessary Materials

No materials are necessary for the replacement of a contact.

3. CONTACT REPLACEMENT

A. Connector Disassembly

Refer to Paragraph 1.C. for the conditions that are applicable for contact replacement.

- (1) Disconnect the plug from the receptacle with the TG-69 pliers or the TG-70 strap wrench. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONTACT REPLACEMENT

CONNECTOR SEPARATION TOOLS

Figure 1

- (2) If it is necessary, remove the adapter plate assembly and the receptacle from the engine bracket. Refer to Subject 20-24-25.
- (3) If the connector has a backshell, remove it. Refer to Subject 20-24-20.
- (4) Remove the contact from the connector. Refer to Subject 20-24-20.
- (5) Cut the contact in the middle of the crimp area on the contact barrel. Refer to Figure 2.

LOCATION TO CUT THE CONTACT

Figure 2

- (6) Carefully remove the remaining part of the crimp barrel that is on the conductor.

B. Connector Assembly

- (1) Assemble the contact. Refer to Paragraph 4.
- (2) Assemble the connector. Refer to Subject 20-24-20.
Make sure to do all the necessary electrical checks.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONTACT REPLACEMENT

4. CONTACT ASSEMBLY

A. Contact Selection

- (1) Find the contact part number that is related to Connector Disconnect Identification Number. Refer to the WDM Equipment List.

NOTE: For the part numbers of the alternative contacts, refer to the AIPC.

B. Crimp Tool Preparation

- (1) Make a selection of a crimp tool from Table 2.
Make sure to use the correct locator for each contact size.
- (2) Assemble the crimp tool. Refer to Figure 3.

CAUTION: TO AVOID DAMAGE TO THE CRIMP TOOL, THE HANDLE OF THE BASIC UNIT MUST BE IN THE OPEN POSITION WHEN THE LOCATOR IS:

- INSTALLED
- REMOVED
- RELEASED.

**CONTACT CRIMP TOOL
Figure 3**

- (a) Remove the lock clip from the lock ring on the locator.
 - (b) Put the locator in the lock plate of the basic unit.
 - (c) Align the locator pins with the ring slots on the lock plate.
 - (d) Push the locator into the basic unit.
 - (e) Turn the locator in a clockwise direction until it locks in position, approximately 90 degrees.
 - (f) Put the lock clip in the lock ring.
- (3) Adjust the crimp tool.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONTACT REPLACEMENT**

CAUTION: IF THE SELECTOR KNOB OF THE BASIC UNIT IS IN AN INCORRECT POSITION WHEN THE CONTACT IS CRIMPED:

- DAMAGE TO THE CONTACT CAN OCCUR
- UNSATISFACTORY RELIABILITY AND PERFORMANCE OF THE CONTACT ASSEMBLY CAN OCCUR.

- Remove the lock clip from the lock ring hole in the selector knob.
- Raise and turn the selector knob of the basic unit until the number on the knob is the same as the number on the locator data plate for the wire size.
- Put the lock clip in the lock ring hole.
- Align the number on the knob to the index mark on the basic unit and release the knob.

C. Contact Assembly

- Make a selection of a wire insulation removal tool from Table 2.
- Remove the necessary length of the insulation from the end of the wire to make the distance from the end of the insulation to the end of the conductor equal to 0.250 inch (6.35 mm). Refer to Figure 4.

CAUTION: IF LESS THAN THE SPECIFIED LENGTH OF INSULATION IS REMOVED, THE END OF THE CONDUCTOR DOES NOT TOUCH THE FORWARD END OF THE CRIMP BARREL OF THE CONTACT.

CAUTION: IF MORE THAN THE SPECIFIED LENGTH OF INSULATION IS REMOVED, TOO MUCH BARE CONDUCTOR IS OUTSIDE THE REAR END OF CRIMP BARREL OF THE CONTACT.

INSULATION REMOVAL LENGTH
Figure 4

- If it is necessary, carefully twist the strands of the conductor together.
Make sure that the strands are twisted in the same direction as the strands are twisted before the removal of the insulation.
- Put the end of the wire in the crimp barrel of the contact.
Make sure that:
 - The end of the wire is against the forward end of the crimp barrel
 - The strands of the conductor can be seen in the inspection hole.
- Put the wire and the contact in the locator of the crimp tool. Refer to Figure 5.
Make sure that the forward end of the contact is against the bottom of the locator.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONTACT REPLACEMENT

ALIGNMENT OF THE WIRE, THE CONTACT, AND THE CRIMP TOOL
Figure 5

- (6) Close the handles of the basic unit until the ratchet is released.

CAUTION: DO NOT RELEASE THE LATCH FOR THE LOCATOR WHEN THE BASIC UNIT HANDLE IS IN THE CLOSED POSITION.

- (7) Remove the contact assembly from the tool.
(8) Hold the wire and lightly pull the contact to make sure that the contact is crimped on the conductor.

20-24-22 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CABLE JACKET REPAIR**

This Subject gives the procedure to repair the damaged outer jacket of a cable.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Conditions for the Replacement of a Cable

Refer to Paragraph 1.D. for the conditions that are applicable for the repair of a cable.

A cable must be replaced if one or more of these conditions occur:

- The shield of a shielded cable has damage
- The cable jacket has damage that is more than 50 percent of the circumference of the cable
- The cable jacket has damage that is more than 2.0 inches (50.8 mm) in length parallel to the length of the cable.

For the procedures to replace a shielded cable, refer to Subject 20-24-24.

D. Conditions for the Repair of a Cable

The jacket of a cable can be repaired when these conditions occur:

- If the cable has a shield, the shield of the cable does not have damage
- The wires of the cable do not have damage
- The cable jacket has damage that is less than or equal to 50 percent the circumference of the cable
- The cable jacket has damage that is less than or equal to 2.0 inches (50.8 mm) in length parallel to the length of the cable.

Refer to Paragraph 3.

E. References

Refer to Subject 20-24-14 for the procedures to assemble a wire harness tie.

2. STANDARD EQUIPMENT**A. Tools**

No special tools are necessary for the repair of a cable jacket.

20-24-22

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CABLE JACKET REPAIR

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

B. Necessary Materials

NOTE: Alternatives to the materials specified in Table 2 must be equivalent materials.

**Table 2
NECESSARY MATERIALS**

Material	Part Number	Supplier Code
Alcohol, Isopropyl	TT-I-735	Local
Cloth, Clean, Lint Free	-	Local
Tape, Electrical Silicone, Inner Layer	Scotch No. 92	04963
Tape, Electrical Silicone, Outer Layer	Scotch No. 62	04963
Tape, Lacing, White	718Z	82110

3. REPAIR OF A CABLE JACKET

A. Cable Preparation

- (1) If it necessary to get sufficient access to the area where the jacket of the cable has damage, remove the wire harness.
- (2) If it not necessary to remove the wire harness:
 - (a) Remove the necessary wire harness ties.
 - (b) Loosen the necessary hinged clamp bolts.
- (3) Put a small amount of isopropyl alcohol on a clean cloth. Refer to Table 2.
Make sure to use the necessary skin and eye protection.

WARNING: ISOPROPYL ALCOHOL:

- IS FLAMMABLE
- IS DANGEROUS TO THE SKIN, THE EYES, AND THE RESPIRATORY SYSTEM
- MUST BE USED IN A WORK AREA THAT HAS A GOOD FLOW OF AIR
- MUST NOT BE HANDLED FOR LONG PERIODS OF TIME.

- (4) With the moist cloth, clean:
 - The area of the damaged jacket
 - 3.0 inches (76.2 mm) of the cable on both sides of the damaged area.

B. Installation of the Tape

- (1) Make a selection of a tape for the inner layer from Table 2.
- (2) Put a layer of the tape on the cable. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CABLE JACKET REPAIR

Make sure that:

- Each end of the layer of tape is 1.0 inch (25.4 mm) minimum farther than the ends of the damaged area
- The layer of tape makes a 20 percent overlap.

INNER LAYER OF TAPE

Figure 1

- (3) Make a selection of a tape for the outer layer from Table 2.
- (4) Put one more layer of the tape on the cable. Refer to Figure 2.

Make sure that:

- Each end of the layer of tape is 0.5 inch (12.7 mm) minimum farther than the ends of the inner layer
- The layer of tape is wound in the opposite direction of the inner layer
- The layer of tape makes a 20 percent overlap.

OUTER LAYER OF TAPE LAYER

Figure 2

- (5) Assemble a wire harness tie on the cable at each end of the tape.

Refer to:

- Figure 2
- Figure 3
- Subject 20-24-14.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CABLE JACKET REPAIR

TIE ON THE END OF THE TAPE

Figure 3

C. Installation of the Wire Harness

- (1) If the wire harness is removed from the hinged clamps:
 - (a) Put the harness back into the clamps.
Make sure that the tracer cord stays on the outboard side of the harness.
 - (b) Torque the bolts 36 inch-pounds to 40 inch-pounds (4.067 Newton-meters to 4.519 Newton-meters).
- (2) If wire harness ties are removed, assemble new ties on the harness in the same location. Refer to Subject 20-24-14.
- (3) If the bolts of a hinged clamp are loosened, torque the bolts 36 inch-pounds to 40 inch-pounds (4.067 Newton-meters to 4.519 Newton-meters).

20-24-24 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE**

This Subject gives the procedure to replace a damaged or open circuit shielded cable with a new shielded cable.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Conditions for the Replacement of a Shielded Cable

Refer to Paragraph 1.D. for the conditions that are applicable for the repair of a shielded cable.

A shielded cable must be replaced if one or more of these conditions occur:

- The shield of the cable has damage
- The cable jacket has damage that is more than 50 percent of the circumference of the cable
- The cable jacket has damage that is more than 2.0 inches (50.8 mm) in length parallel to the length of the cable.

The replacement cable must be:

- The same type of cable as the damaged cable
- Installed on the outer surface of the wire harness
- Installed in the harness clamps.

D. Conditions for the Repair of a Shielded Cable

The jacket of a cable can be repaired when these conditions occur:

- The shield of the cable does not have damage
- The cable jacket has damage that is less than or equal to 50 percent the circumference of the cable
- The cable jacket has damage that is less than or equal to 2.0 inches (50.8 mm) in length parallel to the length of the cable.

Refer to Subject 20-24-22.

E. Removal of the Damaged Cable

The damaged cable can be removed from the wire harness when one of these conditions occur:

- The wire harness is removed from the engine
- The next maintenance of the power plant is done.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE

F. Disconnect Identification Number

Refer to the Equipment List of the Wiring Diagram Manual (WDM) to find the Disconnect Identification Number for the correct contact part numbers.

G. Alternative Part Numbers

To identify alternative part numbers, refer to the Airplane Illustrated Parts Catalog (AIPC).

H. Wire Data

Refer to the WDM Wire List (Chapter 91) for wire type, size, pin to pin, and wire color data.

I. References

Refer to:

- Subject 20-24-12 for the insert configurations of the connectors
- Subject 20-24-14 for the assembly of wire harness ties
- Subject 20-24-20 for the replacement of the backshell and the connector
- Subject 20-24-21 for the replacement of the contacts
- Subject 20-24-25 for the replacement of the adapter plates.

2. STANDARD EQUIPMENT

A. Tools

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

NOTE: Alternatives to the tools specified in must Table 2 be equivalent tools.

**Table 2
TOOLS**

Tool	Procedure	Part Number	Supplier Code
Pliers, Soft Jaw	Connector and backshell removal and installation	BT-SJ-468	11851
		TG-69	06324
		TG-69	11851
Wrench, Strap	Connector and backshell removal and installation	BT-BS-6()	11851
		TG-70	06324
		TG-70	11851
Wire Insulation Removal Tool	Removal of wire insulation	45-092	11851

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE

CONNECTOR SEPARATION AND ASSEMBLY TOOLS
Figure 1

B. Necessary Materials

NOTE: Alternatives to the materials specified in Table 3 must be equivalent materials.

Table 3
NECESSARY MATERIALS

Material	Part Number	Supplier Code
Tape, Lacing, White	718Z	82110
Tape, Silicone Rubber, Self-bonding, Black	Moxness 620-1	07099

3. REPLACEMENT OF A SHIELDED CABLE

A. Installation of the New Cable on the Wire Harness

- (1) Identify the connectors that are attached to the ends of the damaged cable.
- (2) Make a selection of a replacement cable. Refer to the WDM Chapter 91 Wire List.
Make sure that the replacement cable type is the same type as the damaged cable.
- (3) Make a selection of silicone rubber tape from Table 3.
- (4) Temporarily attach the end of the replacement cable to one end of the wire harness with tape.
Make sure that:
 - The end of the replacement cable extends 6 inches (150 mm) farther than the connector of the damaged cable
 - The replacement cable is on the outer surface of the harness
 - The tape is in a location where it can be removed.
- (5) Temporarily attach the replacement cable to the other end of the harness.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE**

- (6) Cut the replacement cable at the location that is 6 inches (150 mm) farther than the connector on the end of the damaged cable.
- (7) Put the replacement cable in the same hinged clamps that hold the harness.

Make sure:

- To do one clamp at a time
- To start with the clamp that is the nearest the connector on one end of the harness
- That the routing of the harness tracer cord is outboard along the full length of the harness.

CAUTION: DO NOT ALLOW THE FULL WEIGHT OF THE HARNESS TO HANG ON AN ELECTRICAL CONNECTOR WITHOUT OTHER SUPPORT. DAMAGE TO THE CONNECTOR OR THE HARNESS CAN OCCUR.

- (a) Open the hinged clamp.
 - (b) Put the cable in the hinged clamp.
 - (c) Pull the cable to make it:
 - Tight
 - Flat against the harness
 - Parallel to the harness.
 - (d) Close the hinged clamp.
- (8) Assemble the necessary wire harness ties on the harness and the replacement cable. Refer to Subject 20-24-14.

Make sure that each tie is assembled:

 - Between each of the hinged clamps
 - At the center point between the two clamps.
 - (9) Torque the hinged clamp bolts 36 inch-pounds to 40 inch-pounds (4.067 Newton-meters to 4.519 Newton-meters).
 - (10) If it is necessary, cut the other end of the replacement cable again at the location that 6 inches (155 mm) farther than the connector of the damaged cable.
 - (11) Disassemble each connector on the damaged cable. Refer to Subject 20-24-20.

Make sure that each wired contact that is removed from each connector is identified with a label.

B. Preparation of the New Cable

- (1) Remove the necessary length of the jacket from the end of the new cable.

CAUTION: DO NOT CUT OR NICK THE WIRES OR THE SHIELD OF THE NEW CABLE. DAMAGE TO THE CABLE CAN OCCUR.

Make sure that:

- The end of the jacket is in the same location in relation to the end of the jacket on the damaged cable
 - The colors of the wire insulation of the new cable are the same as the colors of the wire insulation of the damaged cable.
- (2) Push the end of the shield rearward to the end of the jacket.
 - (3) Near the end of the jacket, move the strands of the shield apart to make a hole in the shield. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE

CAUTION: DO NOT CUT THE STRANDS OF THE SHIELD. THE SHIELD MUST NOT HAVE DAMAGE. Make sure that the hole is sufficiently large to pull the wires the wires of the cable through.

SHIELD PREPARATION
Figure 2

(4) Fold the wires and the shield back. Refer to Figure 3.

POSITION OF THE WIRES AND THE SHIELD
Figure 3

- (5) Pull the wires through the hole in the shield one at a time.
- (6) Pull the shield tight to make a flat and symmetrical conductor. Refer to Figure 4.

CONFIGURATION OF THE SHIELD CONDUCTOR
Figure 4

- (7) Cut the wires of the new cable to make the lengths the same as the wires of the damaged cable.
- (8) Move the contact number labels from the wires of the damaged cable to the wires of the new cable.

Make sure that:

- One label at a time is done
- That the color of the insulation of the new wire is the same as the color of the insulation of the wire of the damaged cable.

C. Insulation of the Damaged Cable

(1) Cut each end of the damaged cable at the end of the cable jacket. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF A SHIELDED CABLE

LOCATION TO CUT THE DAMAGED CABLE
Figure 5

- (2) Install the necessary insulation on each end of the damaged cable. Refer to Figure 6.

INSULATION ON THE END OF THE DAMAGED CABLE
Figure 6

- (a) Make a selection of a black rubber tape from Table 3.
- (b) Put a layer of the tape on the cable.
 Make sure that:
 - The rear end of the tape is 0.5 inch (12.7 mm) minimum from the end of the cable
 - The forward end of the tape extends 0.5 inch (12.7 mm) minimum farther than the end of the cable.
- (c) Put a second layer of tape on the first layer.
- (d) Assemble a wire harness tie on the cable 0.25 inch (6.35 mm) from the rear end of the tape.
 Refer to Subject 20-24-14.

D. Connector Assembly

- (1) Assemble each contact. Refer to Subject 20-24-21.
- (2) Assemble the connector. Refer to Subject 20-24-20.

E. Electrical Checks

- (1) Do the necessary electrical checks. Refer to Subject 20-24-20.

20-24-25 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR ADAPTER PLATE REPLACEMENT**

This Subject gives the procedures to remove and install a connector adapter plate on an engine bracket.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Identification of the Adapter Assembly Part Number

(1) Identify the number on the wire harness.

These are the PW4000/777 power plant wire harness numbers:

- W0621
- W0628
- W0629
- W0604
- W0605.

(2) Refer to the wire harness located in the Airplane Illustrated Parts Catalog (AIPC) for the correct adapter assembly part number.

D. Additional References

Refer to:

- Subject 20-24-02 for supplier codes, names, and addresses
- Subject 20-00-11 for alternative materials
- The Aircraft Maintenance Manual (AMM).

2. STANDARD EQUIPMENT**A. Tools**

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

NOTE: Alternatives to the tools specified in must Table 2 be equivalent tools.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR ADAPTER PLATE REPLACEMENT

**Table 2
TOOLS**

Tool	Procedure	Part Number	Supplier Code
Pliers, Soft Jaw	Connector and backshell removal and installation	BT-SJ-468	11851
		TG-69	06324
		TG-69	11851
Wrench, Strap	Connector and backshell removal and installation	BT-BS-6()	11851
		TG-70	06324

B. Necessary Materials

NOTE: Alternatives to the materials specified in Table 3 must be equivalent materials.

**Table 3
NECESSARY MATERIALS**

Material	Part Number	Supplier Code
Oil, Lubricating, Turbine Engine	PWA 521B Type II	77445

3. ADAPTER PLATE REPLACEMENT

A. Connector Separation

- (1) Make a selection of a connector separation tool from Table 2.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: CONNECTOR ADAPTER PLATE REPLACEMENT

Refer to Figure 1.

- (2) Put the pliers or the strap wrench on the coupling nut of the plug.
- (3) Turn the coupling nut until the threads are fully disengaged.
- (4) Pull the plug from the receptacle.

B. Adapter Plate Removal

ADAPTER PLATE CONFIGURATION
Figure 2

Refer to Figure 2.

- (1) Remove the adapter plate and receptacle from the engine bracket:
 - (a) Remove the bolts that attach the adapter plate to the engine bracket.
NOTE: Adapter plates that have different shapes can have a different quantity of bolt holes.
 - (b) Make a mark on the adapter plate to show the position of the master keyway of the receptacle.
- (2) Remove the nuts and screws that attach the adapter plate to the receptacle.
- (3) Remove the adapter plate from the receptacle.

C. Adapter Plate Installation

Table 4
MAXIMUM TORQUE FOR RECEPTACLE INSTALLATION NUTS

Nut Size	Maximum Torque	
	Standard (inch-pound)	Metric (Newton-meter)
4-40	5	0.565
6-32	10	1.130

- (1) Make a mark on the new adapter plate in the same location as the mark on the old adapter plate.
- (2) Align the master keyway of the receptacle with mark on the adapter plate.

20-24-25

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: CONNECTOR ADAPTER PLATE REPLACEMENT**

- (3) Put the screws through the holes of the adapter plate and the receptacle.
- (4) Engage the threads of an installation nut and each installation screw.
- (5) Torque the nuts. Refer to Table 4.
- (6) Install the adapter plate on the engine bracket:
 - (a) Make a selection of a lubricating oil from Table 3.
 - (b) Put a light layer of the oil on each bolt.
 - (c) Align the adapter plate with the engine bracket.
 - (d) Put the bolts through the engine bracket bolt holes.
 - (e) Torque the bolts 36 inch-pounds to 40 inch-pounds (4.067 Newton-meters to 4.519 Newton-meters).

D. Plug and Receptacle Connection

- (1) Align the master key of the plug with the master keyway of the receptacle.
- (2) Engage the plug and the receptacle.
- (3) Engage the threads of the coupling nut and the receptacle.
- (4) Move the backshell from one side to the other side to fully engage the contacts.
- (5) Turn the coupling nut again with light pressure until it is tight.
- (6) Make a selection of a connector installation tool from Table 2. Refer to Figure 1.

CAUTION: DO NOT USE A TOOL THAT HAS METAL JAWS TO TIGHTEN THE CONNECTOR. DAMAGE TO THE CONNECTOR CAN OCCUR.

- (7) Put the pliers or the strap wrench on the coupling nut.
- (8) Tighten the coupling nut until the pliers or strap wrench move on the surface of the nut.

Make sure that:

- The forward edge of the knurled nut on the plug goes farther than the top of the color indicator band
- No part of the color indicator band can be seen.

CAUTION: THE FULL ENGAGEMENT INDICATOR BAND ON THE RECEPTACLE, THE COLORED BAND NEAREST THE THREADS OF THE RECEPTACLE, IS NOT A STOP LINE.

- (9) Do the necessary engine tests.
Refer to the test reference table in the AMM 71-00-00-700/501.

707, 727-787

20-24-26 CONTENTS

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS

This Subject gives the procedures to replace:

- The ground wire terminal lug on a thermocouple termination assembly
- A fan overheat terminal lug.

1. GENERAL DATA

A. Applicable Conditions

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

**Table 1
DEFINITIONS**

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Ground Wire Terminal Lug on a Thermocouple Termination Assembly

The part numbers of the PW4000/777 power plant wire harnesses that have ground wire terminations are:

- W0602
- W0603
- W0623
- W0629.

D. Fan Overheat Terminal Lug

The part numbers of the PW4000/777 power plant wire harnesses that have ground wire terminations are:

- W0602
- W0603.

E. References

Refer to:

- Subject 20-24-02 for the supplier codes, names, and addresses
- The Aircraft Maintenance Manual (AMM) for the engine test reference table.

2. STANDARD EQUIPMENT

A. Terminal Lug Part Numbers

**Table 2
TERMINAL LUG PART NUMBERS**

Description	Part Number	Size	Supplier Code
Terminal Lug, Fan Overheat	79208	8	83311
Terminal Lug, Ground Wire, Thermocouple Termination Assembly	158376	10	83311

20-24-26

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS

B. Tools

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

NOTE: Alternatives to the tools specified in Table 3 must be equivalent tools.

**Table 3
STANDARD EQUIPMENT**

Tool	Procedure	Part number	Supplier Code
Crimp Tool	Assembly of the ground wire terminal	49935	00779
Digital Multimeter	Continuity measurement	Model 177	80164
Ohmmeter	Continuity measurement	Model 260	16902
Wire Insulation Removal Tool	Removal of the wire insulation	45-092	11851

C. Necessary Materials

NOTE: Alternatives to the materials specified in Table 4 must be equivalent materials.

**Table 4
NECESSARY MATERIALS**

Description	Part Number	Code
Oil, Lubricating, Turbine Engine	PWA 521B Type II	77445

3. REPLACEMENT OF A GROUND WIRE TERMINAL LUG ON A THERMOCOUPLE TERMINATION ASSEMBLY

A. Terminal Lug Removal

- (1) Remove the bolt that attaches the ground wire terminal lug to the engine.
- (2) Cut the terminal lug from the ground wire.

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS

B. Terminal Lug Assembly

GROUND WIRE TERMINAL LUG ASSEMBLY
Figure 1

Refer to Figure 1.

- (1) Make a selection of an insulation removal tool from Table 3.
- (2) Remove the necessary length of the insulation from the end of the wire to make the distance from the end of the insulation to the end of the wire equal to 0.375 inch (9.525mm).

Refer to Figure 2.

INSULATION REMOVAL LENGTH
Figure 2

- (3) Make a selection of a ground wire terminal lug from Table 2.
- (4) Make a selection of a crimp tool from Table 3.
- (5) Put the wire in the crimp barrel of the terminal lug.
Make sure that the strands of the conductor can be seen at the forward end of the crimp barrel.
- (6) Put the terminal lug and the wire in the crimp tool.

Make sure that:

- The terminal lug is in the correct set of crimp dies for the size
- The center of the crimp barrel is aligned with the center crimp dies.

- (7) Crimp the terminal lug.

Make sure that the wire cannot be pulled out of the crimp barrel.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS****C. Continuity Check**

- (1) Make a selection of a multimeter or an ohmmeter from Table 3.
- (2) Set the resistance scale to 100 ohms.
- (3) Attach one test lead to the backshell on the end of the harness.
- (4) Attach the other lead to the terminal lug.
- (5) Measure the resistance.
Make sure that the resistance is less than 1 ohm.
- (6) Remove the test leads.

D. Terminal Lug Installation

- (1) Make a selection of a lubricating oil from Table 4.
- (2) Put a light layer of the oil on the bolt.
- (3) Put the bolt through the terminal lug and into the engine bracket.
- (4) Torque the bolt 36 inch-pounds to 40-inch pounds (4.067 Newton-meters to 4.519 Newton-meters).

E. Power Plant Tests

- (1) Do the necessary engine tests.
Refer to the test reference table in the AMM 71-00-00-700/501.

4. REPLACEMENT OF A FAN OVERHEAT TERMINAL LUG**A. Terminal Lug Removal**

- (1) Remove the bolt that attaches the fan overheat terminal lug to the engine.
- (2) Cut the terminal lug from the wire. Refer to Figure 2.

REMOVAL OF THE FAN OVERHEAT TERMINAL LUG
Figure 3

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS

B. Terminal Lug Assembly

OVERHEAT FAN TERMINAL LUG ASSEMBLY

Figure 4

- (1) Move the paper marker away from the end of the wire approximately 0.500 inch (12.7 mm).
- (2) Move the heat shrinkable sleeve away from the end of the wire approximately 0.500 inch (12.7 mm).
- (3) Make a selection of an insulation removal tool from Table 3.
- (4) Remove the necessary length of the insulation from the end of the wire to make the distance from the end of the insulation to the end of the wire equal to 0.375 inch (9.525mm).

Refer to Figure 5.

INSULATION REMOVAL LENGTH

Figure 5

- (5) Make a selection of a fan overheat terminal lug from Table 2.
- (6) Make a selection of a crimp tool from Table 3.
- (7) Put the wire in the crimp barrel of the terminal lug. Refer to Figure 4.
Make sure that the strands of the conductor can be seen at the forward end of the crimp barrel.
- (8) Put the terminal lug and wire in the crimp tool.
Make sure that:
 - The terminal lug is in the correct set of crimp dies for the size
 - The center of the crimp barrel is aligned with the center crimp dies.
- (9) Crimp the terminal lug.
Make sure that the wire cannot be pulled out of the crimp barrel.
- (10) Push the paper marker forward until the forward end of the marker is against the rear end of the crimp barrel.
- (11) Push the heat shrinkable forward until the forward end of the sleeve is against the rear end of the crimp barrel.

C. Continuity Check

- (1) Check the continuity of the terminal lug assembly. Refer to Subject 20-24-20.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

PW4000/777 POWER PLANT: REPLACEMENT OF TERMINAL LUGS

D. Terminal Lug Installation

- (1) Make a selection of a lubricating oil from Table 4.
- (2) Put a light layer of the oil on the stud.
- (3) Put the terminal lug on the stud.
- (4) Install the nut.
- (5) Torque the nut:
 - 30 inch-pounds to 35 inch-pounds (3.39 Newton-meters to 3.95 Newton-meters) for a size 10 nut
 - 20 inch-pounds to 25 inch-pounds (2.6 Newton-meters to 2.82 Newton-meters) for a size 8 nut.

E. Power Plant Tests

- (1) Do the necessary engine tests.
Refer to the test reference table in the AMM 71-00-00-700/501.

B. Identification Marker Assembly	2

20-24-27 CONTENTS

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: REPAIR OF WIRING IDENTIFICATION MARKERS**

This Subject gives the procedure to repair an identification marker on a wire harness.

1. GENERAL DATA**A. Applicable Conditions**

For the conditions that are applicable to the data and procedures of this Subject, refer to Subject 20-24-00.

B. Wire Harness Components

Table 1
DEFINITIONS

Term	Definition
Cable	A group of wires in a metal shield and an insulated jacket
Harness	One or more cables with connectors or terminal lugs attached to the ends of the cables
Wire	A single electrical conductor with insulation around it

C. Identification Markers

Each harness has one harness identification marker.

The disconnect identification markers are:

- Near each end of the harness
- Near each connector and each backshell assembly.

D. References

Refer to:

- Subject 20-24-02 for the supplier codes, names, and addresses
- Subject 20-24-14 for the assembly of wire harness ties.

2. STANDARD EQUIPMENT**A. Tools**

No special tools are necessary for this procedure.

WARNING: TO AVOID INJURY TO PERSONS OR DAMAGE TO EQUIPMENT WHILE AN ON-WING REPAIR IS MADE, DO NOT USE THESE TOOLS:

- A HEAT GUN
- A SOLDERING GUN
- A SOLDERING IRON.

B. Necessary Materials

NOTE: Alternatives to the materials specified in Table 2 must be equivalent materials.

STANDARD WIRING PRACTICES MANUAL**PW4000/777 POWER PLANT: REPAIR OF WIRING IDENTIFICATION MARKERS**

Table 2
NECESSARY MATERIALS

Description	Part Number	Supplier Code
Ink, Permanent, Black	-	Local
Tape, Fiberglass	Scotch 69	04963

3. IDENTIFICATION MARKER REPAIR**A. Identification Marker Removal**

- (1) Remove the wire harness ties.
- (2) Remove the chafe guard sleeve that covers the identification marker.
- (3) Remove the tape.

NOTE: This tape can be used again.

- (4) Remove the marker from the harness.

B. Identification Marker Assembly

- (1) Make a selection of a permanent ink from Table 2.
- (2) Make a line through the old identification number with the ink.
- (3) Write the new identification number on the marker with the ink.
- (4) Put the new marker in the same location as the old marker on the harness.
- (5) Make a selection of a fiberglass tape from Table 2.

NOTE: As an alternative, the tape that was removed can be used again.

- (6) Put two layers of tape around each edge of the marker.
Make sure that the tape does not make an overlap with the marker label.
- (7) Install the chafe guard sleeve over the marker.
- (8) Assemble a wire harness tie on the chafe guard sleeve. Refer to Subject 20-24-14.

20-25-00 CONTENTS

STANDARD WIRING PRACTICES MANUAL**SHIELDED CABLES**

This Subject gives the general data about:

- The functions of a shielded cable in the aircraft
- The configurations of a shielded cable
- The procedures to attach a shield to an electrical connector
- Related data in other subjects of the Standard Wiring Practices Manual (SWPM).

1. GENERAL DATA**A. High Energy Impulses**

It is necessary to keep a high energy impulse out of a wire on the aircraft because:

- It can be read, in error, as data by the electronic equipment on the aircraft
- It can cause damage to the electronic equipment that is connected to the wires.

B. Functions of a Shield

A shield supplies the necessary protection for the wires and the equipment when it transmits the unwanted energy from the conductors in the shield to the electrical ground through these routings:

- From the shield to the plug connector strain relief to the plug connector backshell
- From the plug connector backshell to the plug connector
- From the plug connector to the receptacle connector
- From the receptacle connector to the ground of the aircraft structure.

The shield on a shielded cable only does its function correctly when these conditions occur:

- There is a low electrical impedance at each interface in the routing
- The length of the connection between the interfaces is short; the more sensitive the electrical circuit is, the shorter the connection between the shield and the backshell must be
- The shield coverage is in proportion to the sensitivity of the electrical circuits that the shield protects; very sensitive electrical circuits must have 100 percent coverage and less sensitive electrical circuits can have less than 100 percent coverage.

C. Functions of a Shielded Cable

A shielded cable does not let:

- The high energy, electrical impulses, that are caused by lightning, go into the wires in the shield
- The high intensity radio frequency (HIRF) energy from the different radio sources that are external to the aircraft go into the wires in the shield
- The radio frequency energy from the different electrical and electronic sources in the aircraft go into the wires in the shield
- The radio frequency energy from the wires in the shield come out and cause the incorrect performance of other equipment or systems on the aircraft.

D. Configurations of Shielded Cable

A shielded cable is an electrical cable that has a conductive shield around the wires in the cable. Usually, the conductive shield is metal.

20-25-00

STANDARD WIRING PRACTICES MANUAL

SHIELDED CABLES

Different shielded cables have shields that are made with:

- Braided, round conductors
- Braided, flat conductors
- Wrapped, round conductors
- Wrapped, flat conductors
- Wrapped, foil conductor
- A mixture of the braided or wrapped conductors.

Some shielded cables:

- Have one layer of shield material
- Have more than one layer of shield material
- Have insulation on top of the shield
- Do not have insulation on top of the shield
- Have insulation between the shields.

2. PROCEDURES TO ATTACH A SHIELDED CABLE TO AN ELECTRICAL CONNECTOR

There are 2 usual procedures.

A. Connection of a Shield to the Connector Strain Relief

Refer to Figure 1.

Either of these connections is satisfactory:

- The shield is attached directly to a terminal and the terminal is attached to the connector strain relief.
- One end of a shield ground wire is attached to the shield and the other end is attached to a terminal that is subsequently attached to the connector strain relief.

SHIELD CONNECTED TO THE CONNECTOR STRAIN RELIEF
Figure 1

B. Connection of a Shield to the Connector Backshell through a Faying Surface Bond

NOTE: This procedure is recommended to connect the shields of the electrical circuits that are sensitive.

Refer to Figure 2 and Figure 3.

20-25-00

STANDARD WIRING PRACTICES MANUAL

SHIELDED CABLES

To keep the faying surface bond in position, either of these connections is satisfactory:

- A shield retainer strip is used to press the shield against the surface of the backshell
- The internal components in the backshell and the position of the shield in relation to these components make the bond.

SHIELD CONNECTION WITH A SHIELD RETAINER STRIP
Figure 2

SHIELD CONNECTION WITH A PERIPHERAL BACKSHELL
Figure 3

3. RELATED DATA IN OTHER SWPM SUBJECTS

A. Bonding and Grounding of Electrical Connectors

For the procedure to make low impedance bond between the receptacle connector and the aircraft structure, refer to Subject 20-20-00.

B. Faying Surface Bond

For the procedures to install a faying surface bond, refer to Subject 20-20-00.

C. Overall Shield Termination

For the procedures to install overall shield braid on wire bundles, refer to Subject 20-25-11.

D. Strain Relief Shield Termination

For the procedures to assemble and maintain connections from the shield to the connector strain relief, refer to Subject 20-25-12.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

SHIELDED CABLES

E. Peripheral Shield Termination

For the procedures to assemble and maintain connections from the shield to the internal components in the backshell, refer to Subject 20-25-13.

F. Shield Braid Retainer Strip Termination

For the procedures to assemble and maintain connections that use a shield retainer strip to connect the shield to the backshell, refer to Subject 20-25-14.

G. Connector Assembly

For the procedures to connect the connector plug to the connector receptacle so that a low impedance interface occurs, refer to the Subject for the assembly of the connector.

20-25-11 CONTENTS

STANDARD WIRING PRACTICES MANUAL**OVERBRAID SHIELDS ON WIRE BUNDLES**

Critical system wiring has shielded wires and overbraid shields for protection. This Subject gives these procedures for overbraid shields:

- Installation
- Repair
- Rework.

1. GENERAL DATA**A. Lightning Strike Energy**

Lightning strike energy:

- Can be transferred or coupled through non-metallic skin panels to electrical wiring and equipment
- Can have a sufficient magnitude to cause a system failure if it is not attenuated.

As a result of extensive studies, the aircraft have lightning protection which include:

- Transient suppression filters
- Metallic shields over the wire bundles.

B. Susceptible Areas

Refer to Figure 1 for the usual areas where electrical wiring is susceptible to interference or damage from lightning; the areas of the wheel wells are included.

NOTE: Almost all wire bundles in the susceptible areas have braided, metallic overbraid shields for protection.

AREAS SUSCEPTIBLE TO DAMAGE OR INTERFERENCE FROM LIGHTNING

Figure 1

C. Bonds or Grounds of Connectors

When it is necessary to bond or ground connectors, circuits, or backshell hardware to maintain lightning protection, refer to Subject 20-20-00.

20-25-11

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

2. GENERAL CONDITIONS FOR OVERBRAID SHIELDS

A. Identification

A wire bundle that has an overbraid shield installed must be identified with a W number at these locations:

- Within 18 inches of all connectors
- Within 18 inches of all shield terminations
- At branches
- Every six feet.

An example is W3108.

B. Selection of an Overbraid Shield

For the selection of a shield material for an overbraid shield, the shield must have the same or higher temperature grade as the wire bundle.

**Table 1
SHIELD MATERIALS**

Description	Temperature Grade	Boeing Standard	Assembly Procedure
Overbraid Shield, Tin Coated	B	BAC3108-()	Paragraph 3.
			Paragraph 4.
Overbraid Shield, Nickel Coated	D	BAC3106-()	Paragraph 3.

NOTE: The BAC3106-() overbraid shield is nickel coated and must be assembled without solder.

NOTE: For sizes and suppliers of shield materials, refer to Subject 20-00-11.

C. Conditions for the Installation of an Overbraid Shield

Overbraid shields must be:

- A tight fit on the wire bundle
- Attached to ground at both ends.
- Terminated within 4 inches of the center of a seal fitting.

The overbraid shields of the wire bundle and the individual shield ground wires of the cables must not be installed so that they are connected from shield to shield. Refer to Figure 2.

CONFIGURATION OF SHIELD GROUND WIRES AND OVERBRAID SHIELDS
Figure 2

STANDARD WIRING PRACTICES MANUAL**OVERBRAID SHIELDS ON WIRE BUNDLES****D. Shield Ground Wires, Short Wire Bundle Branches, and Adjacent Wires**

It is not necessary to install an overbraid shield on these wires when they are 6 inches or less in length:

- Shield ground wires of each shielded cable of the wire bundle
- Short branches of a wire bundle.

NOTE: The length of an unshielded wire must be kept as short as possible.

Shield ground wires and short wire bundle branches must have either of these type of protection from the abrasive overbraid shield:

- A heat shrinkable sleeve; refer to Subject 20-10-14
- The necessary layers of TFE Teflon tape.

Refer to Figure 3.

Adjacent wires must have protection from the abrasive overbraid shield. The protection is given by the installation of an expando sleeve. Refer to Subject 20-00-11.

NOTE: If the separation of the adjacent wires and the overbraid shield is not possible with an expando sleeve, the satisfactory alternatives are:

- A heat shrinkable sleeve; refer to Subject 20-10-14
- The necessary layers of TFE Teflon tape.

These conditions are applicable:

- It is not necessary for the sleeve of a shielded wire to obey the conditions for color code separation
- A layer of TFE Teflon tape must be installed on each end of an expando sleeve
- If the overbraid shield is soldered, a layer of TFE Teflon tape must be installed on the wire bundle or cable directly under the soldered area of the shield.

PROTECTION OF A SHORT WIRE BUNDLE BRANCH

Figure 3

E. Wire Bundle Ties

Refer to Subject 20-10-11.

STANDARD WIRING PRACTICES MANUAL**OVERBRAID SHIELDS ON WIRE BUNDLES**

Wire bundle ties:

- Must be installed on the overbraid shield every 4 inches, unless it is specified that the bundle must be tied every 2 inches
- Must be used to hold the end of a layer of tape
- Must be used to support a branch of a wire bundle
- Are not necessary under the overbraid shield.

3. ASSEMBLY OF AN OVERBRAID SHIELD WITHOUT SOLDER**A. Overbraid Shield Installation**

- (1) Make a selection of a shield material from Table 1.

Make sure that the shield is the correct size for a tight fit on the wire bundle.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Cut the necessary length of the shield so that a 4 inch to 6 inch shield ground wire can be made at both ends.
- (3) Make a hole in the shield 4 inches 6 inches from each end. Refer to Figure 4.
Make sure that the location of the hole is correct in relation to the configuration of the wire bundle.

INSTALLATION OF THE OVERBRAID SHIELD ON THE WIRE BUNDLE
Figure 4

- (4) Put the necessary length of an expando sleeve on the wire bundle.
- (5) Put a layer of TFE Teflon tape or a heat shrinkable sleeve on the ends of the expand sleeve so that either the tape or the heat shrinkable sleeve:
- Makes an overlap with the expando sleeve
 - Extend 1 inch to 2 inches beyond the end of the overbraid shield.
- (6) Pull the shield over the wires or cables so that the hole is the correct position on the wire bundle.

CAUTION: DO NOT INSTALL THE SHIELD OVER A WIRE BUNDLE TIE.

- (7) If it is possible, pull the wires or cable through the hole. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

WIRES PULLED THROUGH THE HOLE IN THE SHIELD

Figure 5

- (8) If the wires or cables cannot be pulled through the hole in the shield because of the configuration of the wire bundle, a shield can be installed on each wire or cable. Refer to Figure 6.

NOTE: To make the installation easier, more than one shield can be installed on the wire bundle; refer to Figure 7. These conditions are applicable:

- Each shield is installed on the wires or cable that are attached to the same connector
- A larger wire bundle diameter is permitted.

OVERBRAID SHIELD INSTALLED ON EACH WIRE OR CABLE

Figure 6

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

MORE THAN ONE OVERBRAID SHIELD INSTALLED ON A WIRE BUNDLE
Figure 7

- (9) Install an expando sleeve on each shield. Refer to Paragraph 2.D.
- (10) Assemble the necessary quantity of wire bundle ties in the applicable positions on the wire bundle. Refer to Paragraph 2.E. and Subject 20-10-11.

CAUTION: DO NOT INSTALL AN EXPANDO SLEEVE OVER A WIRE BUNDLE TIE.

B. Connection of Overbraid Shields

- (1) On the end of the shield ground wires at the 2 adjacent ends of the overbraid shields on the wire bundle, move the strands of the shield ground wires apart.
- (2) Twist the two ends of the shield ground wires together.
- (3) Find the equivalent wire size of the attached shield ground wires at approximately one inch from the wire bundle.
- (4) Install an uninsulated splice on the attached shield ground wires so that the end of the splice is 1 inch maximum from the wire bundle.

Refer to Subject 20-30-12 and Figure 8.

CONNECTION OF TWO OVERBRAID SHIELDS
Figure 8

- (5) Make the spliced shield ground wire flat against the overbraid shield on the wire bundle. Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

POSITION OF THE SPLICE AGAINST THE OVERBRAID SHIELD
Figure 9

- (6) Put a layer of TFE Teflon tape wrap over the connection of the overbraid shields on the wire bundle. Refer to Figure 10.

TAPE ON THE CONNECTION OF THE OVERBRAID SHIELDS
Figure 10

C. Overbraid Shield Termination

Table 2
SHIELD GROUND WIRE TERMINALS

Overbraid Shield			Boeing Standard
Inside Diameter (inch)	Number of Conductors	Number of Ends	
0.109	24	96	BACT12AC3
0.172	24	168	BACT12AC8
0.203	24	384	BACT12AC12
0.375	48	384	BACT12AC12
0.500	48	528	BACT12AC15
0.781	48	864	BACT12AC19
0.875	48	336	BACT12AC15
1.00	48	864	BACT12AC19

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

- (1) On each end of the overbraid shield, cut the shield ground wire so that it is a maximum length of:
 - 2.0 inches for termination at a connector strain relief
 - 6 inches for other terminations.
- (2) Move the strands of the shield apart on the last 1/2 inch of each shield ground wire.
- (3) Twist the strands of the shield to make a wire.
- (4) Make a selection of a terminal from Table 2.
- (5) Assemble a terminal on each shield ground wire. Refer to Subject 20-30-11 and Figure 11.

NOTE: To make it easier to put the terminal on the shield ground wire, the terminal can be twisted in the same direction as the twisted strands of the shield.

TERMINATION OF A SHIELD GROUND WIRE

Figure 11

- (6) Install the necessary length of a heat shrinkable sleeve on the end of the overbraid shield. Refer to Figure 12.

Make sure that the end of the sleeve extends 1/2 inch to 3/4 inch beyond the location where the shield ground wire comes out of the shield.

TERMINATION OF THE OVERBRAID SHIELD

Figure 12

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

4. ASSEMBLY OF AN OVERBRAID SHIELD WITH SOLDER

A. Overbraid Shield Installation

Refer to Paragraph 3.A. for the procedure to install the shield.

NOTE: When it is necessary to terminate the overbraid shield on a connector with a Sunbank S2408-XX-XX cable clamp, make sure that the ends of the expando sleeve and the TFE tape are:

- Under the clamp
- A minimum of 1/2 inch from the connector grommet.

B. Connection of Overbraid Shields with a Shield Ground Wire Soldered to the Shield

CONNECTION OF A BRANCH SHIELD TO THE WIRE BUNDLE SHIELD
Figure 13

NOTE: This procedure cannot be used for nickel coated overbraid shield. For nickel coated overbraid shield, refer to Paragraph 3.

- (1) Make a selection of the location on the overbraid shield of the wire bundle where the shield ground wire at the end of the overbraid shield of the wire bundle branch can be soldered.

Make sure that the distance from the end of the branch shield to the bundle shield is not greater than 0.25 inch.

NOTE: The assembly of the necessary number of wire bundle ties at the ends of adjacent shields can make the solder procedure easier.

- (2) At the location of the connection, put the end of the shield ground wire under 3 to 12 strands of the overbraid shield on the wire bundle. Refer to Figure 13.
- (3) Apply solder to the shield ground wire and the surface of the shield so that the length of the soldered area is:
 - At least equal to the diameter of the wire bundle
 - Not less than 0.25 inch.
- (4) Remove the length of the unwanted shield ground wire from the end of the soldered area.

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

- (5) Put a heat shrinkable sleeve over the soldered area. Refer to Figure 13.

NOTE: If it is necessary, the sleeve can be installed over the wire bundle ties from Step (1).

- (6) Shrink the sleeve into position. Refer to Subject 20-10-14.

C. Connection of Overbraid Shields with the Shield Ground Wires Soldered Together

CONNECTION OF A BRANCH SHIELD TO THE WIRE BUNDLE SHIELD
Figure 14

- (1) Make the shield ground wires of the adjacent overbraid shields flat.
- (2) Cut both of the shield ground wires so that the distance from the end of the wires to the shield on the wire bundle is 2-1/2 inches maximum.
Refer to Figure 14.
- (3) Solder the shield ground wires together.
Make sure that the solder is applied from the end of the wires to 1 inch from the ends.
- (4) Fold the soldered wires so that they are against the overbraid shield.
- (5) Put a heat shrinkable sleeve over the soldered area.
- (6) Shrink the sleeve into position. Refer to Figure 15 and Subject 20-10-14.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 15

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

D. Overbraid Shield Termination

OVERBRAID SHIELD TERMINATION AT THE CONNECTOR STRAIN RELIEF

Figure 16

- (1) Prepare the shield ground wire:
 - (a) Make a selection of a shield ground wire. Refer to Subject 20-10-15.
 - (b) Cut a length of the wire so that it is a maximum of:
 - 2.0 inches for termination at a connector strain relief
 - 6 inches for other terminations.
 - (c) Assemble one of these terminals on end of the shield ground wire:
 - A general purpose terminal
 - A high temperature terminal.
 Refer to Subject 20-30-11.
 - (d) Remove 3/4 inch to 1 inch of insulation from the other end of the wire.
- (2) Prepare the overbraid shield. Refer Figure 16.
 - (a) Fold the shield back so that the distance from the location where the shield is folded to:
 - The end of the shield is, at the minimum, equal to the diameter of the wire bundle
 - The end of the TFE tape is 1-1/2 inches maximum.

NOTE: A white wire bundle tie can be assembled to hold the shield in position so it can be folded back.
 - (b) Make a small hole in the shield at the location where the shield is folded.
- (3) Put the end of the shield ground wire without any solder through the hold in the shield.

20-25-11

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

- (4) At the location for the connection of the shield ground wire to the shield, put the end of the wire under 3 to 6 strands of the overbraid shield on the wire bundle.

Refer to Figure 16.

- (5) Apply solder to the shield ground wire and the surface of the shield so that all of the strands of the shield that touch the shield ground wire are soldered.
- (6) Put the necessary length of a heat shrinkable sleeve on the connection of the shield ground wire and the overbraid shield so that the sleeve is over the free end of the shield. Refer to Figure 17.

Make sure that the rearward end of the sleeve is is 1/2 inch minimum beyond either of these locations:

- The rearward end of the shield
- The rearward end of the soldered area.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 17

5. ASSEMBLY OF A SHIELD GROUND WIRE WITH SHIELDED WIRE

NOTE: Shield ground wires that are assembled with shielded wire are only necessary when the specified length of the shield ground wire is greater than 6 inches.

A. General Conditions

When a ground wire that is assembled with a shielded wire terminates the shield at a dual termination ground, the unshielded distance between the end of the shield and the end of the ground wire terminal must be:

- 3 inches minimum
- 3-1/2 inches maximum.

- (1) Make a selection of a shielded wire or cable for the shield ground wire from Table 3 and Table 4.
- (2) Find the total CAU of the wire or wires and the shield.

NOTE: CAU is Circular Area Units. Refer to Subject 20-30-22.

- (a) Find the CAU of the shield in Table 4.
 - (b) Find the CAU of the conductor in Table 5.
 - (c) Add the CAU of the conductor multiplied by the number of conductors to the CAU of the shield .
- (3) With the total CAU, make a selection of a terminal. Refer to Subject 20-30-11.
 - (4) Prepare the shielded wire for the assembly of the terminal:
 - (a) Remove the necessary length of the outer insulation of the wire or cable plus:
 - 1/8 inch more for a cable with 1 conductor
 - 1 inch to 1-1/4 inches more for a cable with more than 1 conductor.
 Refer to Subject 20-30-11 for the necessary length.
 - (b) Fold the shield back over the outer insulation.
 - (c) Remove the necessary length of the inner insulation from the each conductor. Refer to Subject 20-30-11.
 - (d) Fold the shield back over the conductor or conductors.

STANDARD WIRING PRACTICES MANUAL

OVERBRAID SHIELDS ON WIRE BUNDLES

- (e) For cables with more than 1 conductor, install a 1-1/2 inch to 1-3/4 inch length of heat shrinkable sleeve on the cable.

Refer to Subject 20-10-11.

- (5) Assemble the terminal. Refer to Subject 20-30-11.

NOTE: If the insulation build-up of the wire combination is too large for the terminal, one of the conductors may be doubled back.

6. MODIFICATION OF A WIRE BUNDLE WITH AN OVERBRAID SHIELD

This paragraph gives the procedure to add a wire or wires to a wire bundle when it is not possible to open the overbraid shield.

A. Installation of a New Wire

INSTALLATION OF A NEW WIRE OR WIRE BUNDLE

Figure 18

- (1) Install the overbraid shield on the new wire as if it were a different wire bundle. Refer to Paragraph 3. for nickel or tin coated over braid shield or Paragraph 4. for tin coated overbraid shield.

NOTE: TFE tape wrap can be used as the alternative to a heat shrinkable sleeve at the branches or shield terminations. Make sure to assemble wire bundle ties to hold the ends of tape.

- (2) Align the locations of termination of the new bundle with the terminations of the main wire bundle. Refer to Figure 18.

NOTE: It is not necessary to assemble wire bundle ties on tape or sleeves of the new bundle.

- (3) Terminate the shield ground wire of the new bundle in the same terminal as the main bundle:
 - (a) Remove the terminal from the shield ground wire of the main bundle.
 - (b) Assemble a new terminal on the shield ground wires of the new bundle and the main bundle. Refer to Paragraph 3. for nickel or tin coated overbraid shield or Paragraph 4. for tin coated overbraid shield.

- (4) Remove the wire bundle ties from the overbraid shield of the main bundle that is adjacent to the shield of the new bundle.

NOTE: Do not remove ties that hold the TFE tape or heat shrinkable sleeve over a soldered area.

- (5) Assemble new wire bundle ties every 4 inches to hold the new bundle to the main bundle. Refer to Figure 18.

3. BACKSHELL DISASSEMBLY

A. Backshell Disassembly

- (1) If the backshell has safety wire, remove the safety wire from the cable clamp screws and the backshell coupling ring.
- (2) Remove the strain relief clamp screws.
- (3) Put the saddle bars, the screws, and the washers in a safe place.
- (4) Make a selection of a strap wrench from Table 7.
- (5) Disengage the threads of the backshell and the connector.

4. BACKSHELL ASSEMBLY

For the procedure to assemble a backshell without a shield ground wire termination, refer to Subject 20-60-09.

Figure 8

B. Applicable Conditions for Backshell Assembly

These conditions are applicable for a wire harness in a backshell with a cable clamp:

- Strain must not be put on the wires
- The wires must not have tension that pulls the seal webs of the grommet out of their shape
- The crimp barrel of a contact cannot be seen in the rear grommet of an environmental connector
- When a wire makes an exit from the rear of the connector grommet at an angle that is less than 60 degrees, the distance from the rear of the grommet to the bend must be 0.10 inch minimum
- Safety wire must be installed on the coupling ring of the backshell if the applicable conditions occur; refer to Subject 20-60-07.

BEND OF THE WIRE IN A STRAIGHT BACKSHELL
Figure 9

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

BEND OF THE WIRE IN A 90 DEGREE BACKSHELL

Figure 10

C. Applicable Conditions for Strain Relief Assembly

These conditions are applicable for the assembly of the strain relief:

- The wires must not go across each other in the cable clamp
- The wire harness must have a minimum of two layers of tape for protection
- The tape must not be between the saddle bar and the backshell leg
- The wire harness must be held tightly in the cable clamp
- The cable clamp must not crush the wire harness
- The cable clamp screws must be tight.

The diameter of a wire harness must be increased when these conditions occur:

- The cable clamp does not hold the wire harness tightly
- The wire harness has a small number of wires
- The contact assemblies are installed only near the outer edge of the connector grommet

These conditions are applicable for the layers of tape:

- The forward and rear edges of the tape must extend a minimum of 0.06 inch farther than the edges of the saddle bar
- The edge of one layer is a maximum of 0.05 inch from the edge of a different layer
- For U shaped tape, each layer makes a 100 percent overlap.

Spacers must be installed between the saddle bar and the backshell leg when these conditions occur:

- The diameter of the wire harness is much larger than the diameter of the clamp
- The clamp crushes the wire harness before the screws are fully tightened.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

D. Necessary Materials

**Table 9
NECESSARY MATERIALS**

Material	Temperature Grade	Description	Part Number or Specification	Supplier
Filler Rod	C	Silicone	69B47691-()	Boeing
			BMS1-52	Boeing
	D	PTFE	AMS 3656	QPL
Tape	D	Silicone	912-10X12	Arlon
			Scotch 70	3M
		PTFE	P-212HD	Permacel
			P-421	Permacel
			P-440	Permacel
Tape, U Shaped	C	Silicone, 0.5 inch width	10-62034-1	Boeing
		Silicone, 0.4 inch width	10-62034-2	Boeing

E. Assembly of the Terminal Lug on the Shield Ground Wire

**Table 10
EQUIVALENT STUD SIZE**

Screw Diameter (inch)	Equivalent Stud Size
0.1120	4
0.1380	6
0.1640	8

**Table 11
RECOMMENDED TERMINAL LUGS**

Maximum Temperature Grade	Boeing Standard Terminal Lug
B	BACT12AC()
D	BACT12M()

- (1) Measure the diameter of the cable clamp screw.
- (2) Find the equivalent size of the stud for the terminal lug. Refer to Table 10.
- (3) Make a selection of a terminal lug. Refer to Table 11 and Subject 20-30-11.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

Make sure that:

- The type of terminal lug is applicable for the type of the shield ground wire
- The type of the terminal lug is applicable for the location of the installation of the connector
- The stud size hole of the terminal lug is applicable for the cable clamp screw.

(4) Assemble the terminal lug. Refer to Subject 20-30-11.

F. Backshell Assembly

(1) Make a selection of a strap wrench from Table 7.

(2) Put the necessary backshell components on the wire harness.

Make sure that the cable clamp of the backshell is pointed away from the end of the wire harness.

(3) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.

(4) Put the wires into their positions.

Make sure that:

- The wires do not go across each other
- The wires do not have tension that pulls the seal web out of its shape
- Strain is not put on the wires.

(5) If the backshell has anti-rotation teeth, examine the teeth of the backshell through the inspection hole. Refer to Figure 11.

Make sure that the backshell teeth are engaged with the connector teeth. Refer to Figure 12.

BACKSHELL WITH ANTI-ROTATION TEETH

Figure 11

ENGAGEMENT OF THE CONNECTOR TEETH AND THE BACKSHELL TEETH

Figure 12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

(6) Tighten the backshell on the connector with the strap wrench.

Make sure that:

- The backshell does not make more than 1/8 turn with the strap wrench
- The backshell is in the correct clock position.

CAUTION: DO NOT TIGHTEN THE BACKSHELL MORE THAN NECESSARY. DAMAGE TO THE BACKSHELL CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR OR THE BACKSHELL.

(7) If the backshell has set screws, tighten one of the set screws.

(8) Try to loosen the backshell manually.

NOTE: The backshell is installed correctly when the backshell does not move in relation to the connector.

(9) If the backshell is loose, do Step (6) through Step (8) again.

(10) Assemble the strain relief.

Refer to:

- Paragraph 4.G. for the assembly of the strain relief of a straight backshell
- Paragraph 4.H. for assembly of the strain relief of a 45 degree or a 90 degree backshell.

G. Strain Relief Assembly - Straight Backshell

**Table 12
CABLE CLAMP SCREW TORQUE VALUES**

Screw Size	Torque (inch-pounds)	
	Minimum	Maximum
4	10	12
6	15	23
8	25	30

(1) Make a selection of a torque driver from Table 7.

(2) Make a selection of a tape from Table 9.

Make sure that the tape is a minimum of 0.12 inch wider than the saddle bar.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

NOTE: A thicker tape is recommended when the difference between the initial diameter of the wire harness and the inner diameter of the strain relief is large.

(3) Align the screw holes in a saddle bar with the screw holes in the legs of the backshell.

(4) Make a mark on the wire harness at the center of the width of the saddle bar.

(5) If the assembled contacts are installed only near the outer edge of the connector grommet:

(a) Make a selection of a filler rod from Table 9.

(b) Put the filler rod in the center of the group of wires where the saddle bars go across the wire harness. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

POSITION OF THE FILLER ROD
Figure 13

(6) Put a minimum of two layers of tape on the wires or cables at the location of the mark.

Make sure that:

- The outer diameter of the wire harness with the layers of tape is larger than the inner diameter of the strain relief
- The center of the layers of tape is aligned with the center of the saddle bar
- The edge of the tape extends a minimum of 0.06 inch farther than each edge of the saddle bar
- The edge of one layer of the tape is a maximum of 0.05 inch from the edge of a different layer of tape
- For U shaped tape, each layer of tape makes a 100 percent overlap.

CONFIGURATION OF THE LAYERS OF U SHAPED TAPE
Figure 14

(a) Wind the tape around one wire to hold it in its position. Refer to Figure 15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

FIRST CONFIGURATION SECOND CONFIGURATION

CONFIGURATIONS OF THE LAYERS OF TAPE

Figure 15

- (b) Continue to wind the tape around the wire harness until the tape is fully installed.
- (7) If spacers are necessary, specified, or installed on the initial backshell assembly, make a selection of a spacer from Table 5.

Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the strain relief.

NOTE: A minimum of two spacers are necessary, one for each screw.

NOTE: The initial spacers can be installed again if they do not have damage.

- (8) If lockwashers are supplied, put a lockwasher on each screw.
- (9) If 1 to 4 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 16.

CABLE CLAMP CONFIGURATION WITH 1 TO 4 TERMINAL LUGS

Figure 16

- (a) Put a screw through a hole in a saddle bar.
- (b) Put a terminal lug on the screw.
- (c) If spacers are necessary, put a spacer on the screw.
- (d) Put the saddle bar with the screw against the backshell legs.
- (e) Put the screw through the hole in the backshell leg.

From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.

- (f) If the wire harness has more terminal lugs, put a terminal lug on the screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

- (g) Put the other saddle bar against the backshell legs.
 - (h) Engage the threads of the screw and the threads of the nut.
 - (i) Put a screw through the empty hole in the saddle bar.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.
 - (j) If the wire harness has more terminal lugs, put a terminal lug on the screw.
 - (k) Push the screw through the hole in the backshell leg.
 - (l) If the wire harness has more terminal lugs, put a terminal lug on the screw.
 - (m) If spacers are necessary, put a spacer on the screw.
 - (n) Engage the threads of the screw and the threads of the nut.
- (10) If 5 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 17.

CABLE CLAMP CONFIGURATION WITH 5 TERMINAL LUGS
Figure 17

- (a) Put a screw through a hole in a saddle bar.
- (b) Put a terminal lug on the screw.
- (c) Put a different terminal lug on the screw.
- (d) If spacers are necessary, put a spacer on the screw.
- (e) Put the saddle bar with the screw against the backshell legs.
- (f) Put the screw through the hole in the backshell leg.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.
- (g) Put a terminal lug on the screw.
- (h) Put the other saddle bar against the backshell legs.
- (i) Engage the threads of the screw and the threads of the nut.
- (j) Put a screw through the empty hole in the saddle bar.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

- (k) Put a terminal lug on the screw.
 - (l) Put the screw through the hole in the backshell leg.
 - (m) If spacers are necessary, put a spacer on the screw.
 - (n) Put the remaining terminal lug on the screw.
 - (o) Engage the threads of the screw and the threads of the nut.
- (11) If the 6 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 18.

CABLE CLAMP CONFIGURATION WITH 6 TERMINAL LUGS

Figure 18

- (a) Put a screw through a hole in a saddle bar.
- (b) Put a terminal lug on the screw.
- (c) Put a different terminal lug on the screw.
- (d) If spacers are necessary, put a spacer on the screw.
- (e) Put the saddle bar with the screw against the backshell legs.
- (f) Put the screw through the hole in the backshell leg.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.
- (g) Put a terminal lug on the screw.
- (h) Put the other saddle bar against the backshell legs.
- (i) Engage the threads of the screw and the threads of the nut.
- (j) Put a screw through the empty hole in the saddle bar.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head on the screw on the left is pointed down.
- (k) Put a terminal lug on the screw.
- (l) Put a different terminal lug on the screw.
- (m) Put the screw through the hole in the backshell leg.
- (n) If spacers are necessary, put a spacer on the screw.
- (o) Put the remaining terminal lug on the screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

- (p) Engage the threads of the screw and the threads of the nut.
- (12) Tighten the cable clamp screws.

Make sure that:

- The cable clamp does not crush or pinch the wire harness
- If the saddle bar and the backshell leg do not touch, the distance between the saddle bar and the backshell leg is approximately equal on each side of the cable clamp
- The layers of tape are not pinched between the saddle bars and the backshell leg
- The screws do not cause an interference with a wire harness or a component.

NOTE: It is not necessary for the saddle bars to touch the legs of the backshell.

- (13) If the wire harness is not held tightly:
 - (a) Remove the cable clamp screws.
 - (b) Wind two layers of tape on the wire harness on the existing layers of tape.
 - (c) Do Step (9), Step (10), or Step (11) again.
 - (d) Do Step (12) again.

- (14) Torque the screws to the specified value in Table 12.

Make sure that:

- The saddle bars are tight against the shield ground wire terminal lug
- The shield ground wire terminal lug is tight against the backshell leg
- The clamp does not crush or pinch the wire harness
- The layers of tape are not pinched between the saddle bars and the backshell leg
- The screws do not cause an interference with a wire harness or a component.

H. Strain Relief Assembly - 45 Degree or 90 Degree Backshell

**Table 13
CABLE CLAMP SCREW TORQUE VALUES**

Screw Size	Torque (inch-pounds)	
	Minimum	Maximum
4	10	12
6	15	23
8	25	30

**Table 14
FLAT WASHER PART NUMBERS**

Part Number	Supplier
NAS620()	Available source

- (1) Make a selection of a torque driver from Table 7.
- (2) Make a selection of a tape from Table 9.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

Make sure that the tape is a minimum of 0.12 inch wider than the saddle bar.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

NOTE: A thicker tape is recommended when the difference between the initial diameter of the wire harness and the inner diameter of the strain relief is large.

- (3) Align the screw holes in a saddle bar with the screw holes in the legs of the backshell.
- (4) Make a mark on the wire harness at the center of the width of the saddle bar.
- (5) If the assembled contacts are installed only near the outer edge of the connector grommet:
 - (a) Make a selection of a filler rod from Table 9.
 - (b) Put the filler rod in the center of the group of wires where the saddle bar goes across the wire harness. Refer to Figure 19.

POSITION OF THE FILLER ROD
Figure 19

- (6) Put a minimum of two layers of tape on the wires or cables at the location of the mark.

Make sure that:

- The outer diameter of the wire harness with the layers of tape is larger than the inner diameter of the saddle bars
- The center of the layers of tape is aligned with the center of the saddle bar
- The edge of the tape extends a minimum of 0.06 inch farther than each edge of the saddle bar
- The edge of one layer of the tape is a maximum of 0.05 inch from the edge of a different layer of tape
- For U shaped tape, each layer of tape makes a 100 percent overlap.

CONFIGURATION OF THE LAYERS OF U SHAPED TAPE
Figure 20

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

- (a) Wind the tape around one wire to hold it in its position. Refer to Figure 21.

CONFIGURATIONS OF THE LAYERS OF TAPE
Figure 21

- (b) Continue to wind the tape around the wire harness until the tape is fully installed.
- (7) If spacers are necessary, specified, or installed on the initial backshell assembly, make a selection of a spacer from Table 5.

Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the strain relief.

NOTE: A minimum of two spacers are necessary, one for each screw.

NOTE: The initial spacers can be installed again if they do not have damage.

- (8) If 1 to 4 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 22.

CABLE CLAMP CONFIGURATION WITH 1 TO 4 TERMINAL LUGS
Figure 22

- (a) If lockwashers are supplied, put a lockwasher on each screw.
- (b) Put a screw through a hole in the saddle bar.
- (c) Put a terminal lug on the screw.
- (d) If the wire harness has more terminal lugs, put a terminal lug on the screw.
- (e) If spacers are necessary, put a spacer on the screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

- (f) Put the saddle bar against the backshell legs.
 - (g) Engage the threads of the screw and the threads of the nut.
 - (h) Put the remaining screw through the hole in the other end of the saddle bar.
 - (i) If the wire harness has more terminal lugs, put the remaining terminal lugs on the screw.
 - (j) If spacers are necessary, put a spacer on the screw.
 - (k) Engage the threads of the screw and the threads of the nut.
- (9) If 5 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 23.

CABLE CLAMP CONFIGURATION WITH 5 TERMINAL LUGS

Figure 23

- (a) Make a selection of the applicable size of flat washer from Table 14.
 - (b) If lockwashers are supplied, put a lockwasher on each screw.
 - (c) Put the flat washer on the one of the screws.
 - (d) Put a terminal lug on the screw against the flat washer.
 - (e) Put the screw through the hole in the saddle bar.
 - (f) Put a terminal lug on the screw.
 - (g) Put a different terminal lug on the screw.
 - (h) If spacers are necessary, put a spacer on the screw.
 - (i) Put the saddle bar against the backshell legs.
 - (j) Engage the threads of the screw and the threads of the nut.
 - (k) Put the other screw through the hole on the other end of the saddle bar.
 - (l) Put a terminal lug on the screw.
 - (m) If spacers are necessary, put a spacer on the screw.
 - (n) Put the remaining terminal lug on the screw.
 - (o) Engage the threads of the screw and the threads of the nut.
- (10) If 6 terminal lugs must be installed, put each terminal lug in its position. Refer to Figure 24.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION

CABLE CLAMP CONFIGURATION WITH 6 TERMINAL LUGS

Figure 24

- (a) Make a selection of the applicable size of flat washer from Table 14.
 - (b) If lockwashers are supplied, put a lockwasher on each screw.
 - (c) Put a flat washer on each screw.
 - (d) Put a terminal lug on the screw against the flat washer.
 - (e) Put the screw through the hole in the saddle bar.
 - (f) Put a terminal lug on the screw.
 - (g) Put a different terminal lug on the screw.
 - (h) If spacers are necessary, put a spacer on the screw.
 - (i) Put the saddle bar against the backshell legs.
 - (j) Engage the threads of the screw and the threads of the nut.
 - (k) Put a terminal lug on the remaining screw.
 - (l) Put the screw through the hole on the other end of the saddle bar.
 - (m) Put a terminal lug on the screw.
 - (n) Put a different terminal lug on the screw.
 - (o) If spacers are necessary, put a spacer on the screw.
 - (p) Engage the threads of the screw and the threads of the nut.
- (11) Tighten the cable clamp screws.

Make sure that:

- The cable clamp does not crush or pinch the wire harness
- If the saddle bar and the backshell leg do not touch, the distance between the saddle bar and the backshell leg is approximately equal on each side of the cable clamp
- The layers of tape are not pinched between the saddle bars and the backshell leg
- The screws do not cause an interference with a wire harness or a component.

NOTE: It is not necessary for the saddle bars to touch the legs of the backshell.

- (12) If the wire harness is not held tightly:

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITH A SHIELD TERMINATION**

- (a) Remove the cable clamp screws.
 - (b) Wind two layers of tape on the wire harness on the existing layers of tape.
 - (c) Do Step (8), Step (9), or Step (10) again.
 - (d) Do Step (11) again.
- (13) Torque the screws to the specified value in Table 13.
Make sure that:
- The saddle bars are tight against the shield ground wire terminal lug
 - The shield ground wire terminal lug is tight against the backshell leg
 - The clamp does not crush or pinch the wire harness
 - The layers of tape are not pinched between the saddle bars and the backshell leg
 - The screws do not cause an interference with a wire harness or a component.
- (14) If screws are too long and screws with a shorter length are not available, cut off the unwanted length.
Make sure that the end of the screw is smooth and has no rough edges.
- CAUTION:** DO NOT LET METAL SAWDUST OR THE UNWANTED LENGTH OF THE SCREW FALL ON OR INTO THE WIRE HARNESS OR ON THE REAR GROMMET OF THE CONNECTOR. SHARP METAL PIECES CAN CAUSE DAMAGE TO THE WIRES AND THE CONNECTOR.
- (15) If safety wire is necessary, install safety wire on each screw.
Refer to Subject 20-60-07 for:
- The applicable conditions that make the installation of the safety wire on the cable clamp screw necessary
 - The procedures to install the safety wire.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

This subject gives the procedures to attach a shield of a cable or wire to a peripheral backshell to get a low resistance electrical bond.

1. PART NUMBERS AND DESCRIPTION

A. Connector Backshell Part Numbers

**Table 1
PERIPHERAL BACKSHELL PART NUMBERS**

Boeing Specification	Configuration	Part Number	Supplier
-	-	380()001()	Glenair
-	-	380()003	Glenair
-	-	387()	Glenair
S280W605()-1	Straight Cable	467AS009LF10FR	Glenair
S280W605()-2	45 Degree Cable	467AH009LF10FR	Glenair
S280W605()-3	90 Degree Cable	467AJ009LF10FR	Glenair
-	-	G387()	Glenair
-	-	G4993	Glenair
-	-	G9034()	Glenair
-	-	G9166()	Glenair

B. Connector Backshell Description

The peripheral backshell has these technical features:

- It is conductive
- It gives a low impedance connection from the connector to the cable shield
- It can be repaired.

NOTE: Many components of the different peripheral backshells have the same configuration. The primary difference between the backshells are the design and configuration of the ground rings.

**S280W605() PERIPHERAL BACKSHELL ASSEMBLY

2. BACKSHELL DISASSEMBLY

A. Disassembly of a Peripheral Backshell with 1 Ground Ring

This paragraph gives the procedure to disassemble these Glenair peripheral backshells:

- 380()003
- 387()
- G387()
- G4993
- G9034()
- G9166().

NOTE: Figure 6 and Figure 5 show straight backshells. The procedure to disassemble the 45 degree configuration and 90 degree configuration is the same as the procedure for the straight configuration.

DISASSEMBLY OF THE GLENAIR 380()003, 387(), G9034(), AND G9166() BACKSHELLS
Figure 5

DISASSEMBLY OF THE GLENAIR G387() AND G4993 BACKSHELLS
Figure 6

- (1) Loosen the cable clamp screws of the strain relief adapter.
- (2) Remove any insulation tape on the cable that was the saddle bars of the clamp.
- (3) Loosen the strain relief adapter until it is free from the body of the backshell.
- (4) Push the adapter away from the body of the backshell.
- (5) Push the ground ring away from the body of the backshell.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

- (6) Push the strands of the outer shield of the primary cable against the surface of the cable so that the end of the shield is flat against the wires in the cable.
- (7) Loosen the body of the backshell from the connector.
- (8) Carefully push the body of the backshell away from the connector.

Make sure that:

- The end of the shield goes into the cable exit at the rear of the backshell
 - The backshell moves smoothly on the surface of the shield
 - The shield stays symmetrical around the wires in the cable.
- (9) Disassemble the connector. Refer to the applicable Subject.
 - (10) Remove these components from the cable:
 - The body of the backshell
 - The ground ring
 - The strain relief adapter.

B. Disassembly of a Peripheral Backshell with 2 Ground Rings

This paragraph gives the procedure to disassemble the Glenair 380()001() peripheral backshell.

NOTE: Figure 7 shows a straight backshell. The procedure to disassemble the 45 degree configuration and 90 degree configuration is the same as the procedure for the straight configuration.

DISASSEMBLY OF THE GLENAIR 380()001() BACKSHELL
Figure 7

- (1) Loosen the cable clamp screws of the strain relief adapter.
- (2) Remove any insulation tape on the cable that was the saddle bars of the clamp.
- (3) Loosen the strain relief adapter until it is free from the body of the backshell.
- (4) Push the adapter away from the body of the backshell.
- (5) Push the outer ground ring away from the body of the backshell.
- (6) Push the strands of the outer shield of the primary cable under the end of the inner ground ring with a plastic awl or an equivalent tool.

Make sure that the end of the shield is flat against the wires in the cable.

- (7) Move the inner ground ring away from the body of the backshell.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

Make sure that:

- The ground ring moves smoothly on the surface of the shield
- The shield stays symmetrical around the wires in the cable.

(8) Loosen the body of the backshell from the connector.

(9) Carefully push the body of the backshell away from the connector.

Make sure that:

- The end of the shield goes into the cable exit at the rear of the backshell
- The backshell moves smoothly on the surface of the shield
- The shield stays symmetrical around the wires in the cable.

(10) Disassemble the connector. Refer to the applicable Subject.

(11) Remove these components from the cable:

- The body of the backshell
- The inner ground ring
- The outer ground ring
- The strain relief adapter.

3. TORQUE VALUES FOR BACKSHELL ASSEMBLY

A. Backshell to Connector Torque

**Table 2
BACKSHELL TO CONNECTOR TORQUE VALUES**

Connector Shell Size	Coupling Ring Torque (inch-pound)		Torque Wrench Setting (inch-pound)	
	Minimum	Maximum	Minimum	Maximum
10	45	50	39	44
12	65	70	56	61
14	85	90	73	78
16	105	110	91	96
18	135	140	117	122
20	145	150	125	130
22	145	150	125	130
24	145	150	125	130
28	155	160	134	139

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

B. Strain Relief Adapter to Backshell Torque

**Table 3
STRAIN RELIEF ADAPTER TO BACKSHELL TORQUE VALUES**

Connector Shell Size	Strain Relief Torque (inch-pound)		Torque Wrench Setting (inch-pound)	
	Minimum	Maximum	Minimum	Maximum
10	45	50	39	44
12	45	50	39	44
14	45	50	39	44
16	45	50	39	44
18	55	60	48	53
20	75	80	65	70
22	85	90	73	78
24	95	100	81	86
28	105	110	91	96

4. ASSEMBLY OF THE GLENAIR G387() AND G4993 PERIPHERAL BACKSHELLS

This paragraph gives the procedures to attach the end of the one shield of the primary cable to a backshell.

A. Cable Preparation

(1) In order, put these components on the end of the cable:

- The strain relief adapter
- The ground ring.

Refer to Figure 8.

POSITION OF THE GROUND RING AND THE STRAIN RELIEF ADAPTER ON THE CABLE

Figure 8

- (2) Temporarily attach the backshell to the connector.
- (3) Push the end of the cable into the backshell until the end of the cable touches the rear grommet of the connector.
- (4) If the cable has an outer jacket:
 - (a) Make a mark on the jacket 0.5 inches away from the rear end of the backshell.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS**

- (b) Remove the length of jacket between the mark and the end of the cable. Refer to Subject 20-00-15.
- (5) If the cable does not have a jacket, make a mark on the shield of the cable at the rear end of the backshell.
- (6) Remove the backshell from the connector.
- (7) Put the backshell on the end of the cable so that the front end of the backshell is beyond the end of the cable.
- (8) If the cable does not have a jacket, remove the length of shield between the end of the cable and the mark from Step (5). Refer to Subject 20-00-15.
- (9) If the cable has a jacket remove the necessary length of the shield so that the distance from the end of the shield to the end of the jacket is 0.5 inch. Refer to Subject 20-00-15.
- (10) Assemble the connector. Refer to the applicable Subject for the connector.

B. Backshell Installation

- (1) Push the backshell along the cable until the front of the backshell touches the back of the connector.
- (2) Engage the threads of the backshell and the connector.
- (3) Torque the backshell to the value specified in Table 2 with a strap wrench that has a 0.375 inch drive.

C. Strain Relief Adapter Installation

- (1) Move the strands at the end of the shield apart with a plastic awl or an equivalent tool.
- (2) Put the strands of the shield in sequence on the outer surface of the slope at the rear end of the backshell body.
Make sure that the strands of the shield do not make an overlap with each other.
- (3) Push the ground ring against the rear surface of the backshell so that the strands of the shield are between the ring and the slope of the backshell.
- (4) If the strands of the shield extend beyond the outer edge of the ground ring, cut the strands so that the end of the strands is aligned with the edge of the ground ring.
- (5) If it is necessary, put the sufficient layers of Scotch 70 insulation tape on the cable so that:
 - The layers of tape will be under the cable clamp
 - The quantity of the tape is sufficient for the cable clamp to hold the cable firmly in position.
- (6) Push the strain relief adapter against the rear of the backshell.
- (7) Engage the threads of the adapter and the backshell.
- (8) Torque the adapter to the value specified in Table 3 with a strap wrench that has a 0.375 inch drive.
- (9) Tighten the screws of the cable clamp.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

5. ASSEMBLY OF THE GLENAIR 380()003, 387(), G9034(), AND G9166() PERIPHERAL BACKSHELLS

This paragraph gives the procedures to assemble and attach the shield ground wires of these shields to a backshell:

- The shield of the primary cable
- The adjacent shields of a primary cable
- The shield of each wire or cable in the primary cable.
- The adjacent shields of each wire or cable in the primary cable.

A. Cable Preparation

(1) In order, put these components on the end of the cable:

- The strain relief adapter
- The ground ring

Refer to Figure 9.

POSITION OF THE GROUND RING AND THE STRAIN RELIEF ADAPTER ON THE CABLE

Figure 9

- (2) Temporarily attach the backshell to the connector.
- (3) Push the end of the cable into the backshell until the end of the cable touches the rear grommet of the connector.
- (4) If the cable has an outer jacket:
 - (a) Make a mark on the jacket at the rear end of the backshell.
 - (b) Remove the length of jacket between the mark and the end of the cable. Refer to Subject 20-00-15.
- (5) If the cable does not have a jacket, make a mark on the shield of the cable at the rear end of the backshell.
- (6) Remove the backshell from the connector.
- (7) Put the backshell on the cable.
- (8) Assemble an uninsulated shield ground wire on the end of the shield of the primary cable. Refer to Subject 20-10-15.

Make sure that the shield ground wire configuration is applicable for the shielded cable.

- (9) Assemble an uninsulated shield ground wire on the shield of each shielded wire or shielded cable in the primary cable. Refer to Subject 20-10-15.

Make sure that the shield ground wire configuration is applicable for each shielded cable or shielded wire.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS**

- (10) Assemble the connector. Refer to the applicable Subject for the connector.

B. Backshell Installation

- (1) Push the backshell along the cable until the front of the backshell touches the back of the connector.
- (2) Engage the threads of the backshell and the connector.
- (3) Torque the backshell to the value specified in Table 2 with a strap wrench that has a 0.375 inch drive.

C. Strain Relief Adapter Installation

- (1) Put the shield ground wire or wires in sequence around the body of the backshell.
Make sure that each shield ground wire does not make an overlap with another shield ground wire.
- (2) Push the ground ring against the rear surface of the backshell so that the shield ground wires are between the ring and the rear end of the backshell.
- (3) If it is necessary, put the sufficient layers of Scotch 70 insulation tape on the cable so that:
 - The layers of tape will be under the cable clamp
 - The quantity of the tape is sufficient for the cable clamp to hold the cable firmly in position.
- (4) Make a selection of the location of the end of the shield ground wires for the completed assembly.
- (5) If the ends of the shield ground wires are at the rear end of the backshell:
 - (a) Cut each shield ground wire so that the end of each wire is aligned with the forward edge of the ground ring.
 - (b) Push the strain relief adapter against the rear of the backshell.
- (6) If the ends of the shield ground wires are at the rear end of the strain relief:
 - (a) Fold each shield ground wire back over the ground ring the wires are flat against the outer surface of the primary cable.
 - (b) Push the strain relief adapter over the shield ground wires until the adapter is against the rear of the backshell.
Make sure that each shield ground wire is inside the adapter.
- (7) Engage the threads of the adapter and the backshell.
- (8) Torque the adapter to the value specified in Table 3 with a strap wrench that has a 0.375 inch drive.
- (9) Tighten the screws of the cable clamp.

6. ASSEMBLY OF THE GLENAIR 380(001) PERIPHERAL BACKSHELL

This paragraph gives the procedures to assemble and attach the shield ground wires of these shields to a backshell:

- The shield of each wire or cable in the primary cable.
- The adjacent shields of each wire or cable in the primary cable.

A. Cable Preparation

- (1) In order, put these components on the end of the cable:
 - The strain relief adapter
 - The outer ground ring
 - The inner ground ring.
- (2) Temporarily attach the backshell to the connector.
- (3) Push the end of the cable into the backshell until the end of the cable touches the rear grommet of the connector.

20-25-13

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

- (4) If the cable has an outer jacket:
 - (a) Make a mark on the jacket 0.5 inches away from the rear end of the backshell.
 - (b) Remove the length of jacket between the mark and the end of the cable. Refer to Subject 20-00-15.
- (5) If the cable does not have a jacket, make a mark on the shield at the rear end of the backshell.
- (6) Remove the backshell from the connector.
- (7) Put the backshell on the cable.
- (8) If the cable has a jacket remove the necessary length of the shield so that the distance from the end of the shield to the end of the jacket is 0.5 inch. Refer to Subject 20-00-15.
- (9) If the cable does not have a jacket, remove the length of shield between the end of the cable and the mark from Step (5). Refer to Subject 20-00-15.
- (10) Assemble an uninsulated shield ground wire on the shield of each shielded wire or shielded cable. Refer to Subject 20-10-15.

Make sure that:

- The shield ground wire configuration is applicable for each shielded cable or shielded wire
- The start of each shield ground wire is approximately 0.5 inch from the end of the shield of the primary cable; refer to Figure 10.

CONFIGURATION OF A COMPONENT SHIELD GROUND WIRE AND THE SHIELD OF THE PRIMARY CABLE
Figure 10

- (11) Assemble the connector. Refer to the applicable Subject for the connector.

B. Backshell Installation

- (1) Push the backshell along the cable until the front of the backshell touches the back of the connector.
- (2) Engage the threads of the backshell and the connector.
- (3) Torque the backshell to the value specified in Table 2 with a strap wrench that has a 0.375 inch drive.

C. Strain Relief Adapter Installation

- (1) Put each shield ground wire of the cable or wires of the primary cable in sequence against the rear end of the backshell.

Make sure that each shield ground wire does not make an overlap with another shield ground wire.

- (2) Push the inner ground ring against the rear surface of the backshell so that the shield ground wires are between the ring and the rear end of the backshell.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

- (3) At the end of the shield of the primary cable, move the strands of the shield apart with a plastic awl or an equivalent tool.
- (4) Put the strands of the shield of the primary cable in sequence on the outer surface of the inner ground ring.
Make sure that the strands of the shield do not make an overlap with each other.
- (5) Fold each shield ground wire back over the outer surface of the inner ground ring so that each shield ground wire:
 - Does not make an overlap with another shield ground wire
 - Makes an overlap with the strands of the shield of the primary cable
 - Is flat against the outer surface of the primary cable.
- (6) Make a selection of the location of the end of the shield ground wires for the completed assembly.
- (7) If the ends of the shield ground wires are at the rear end of the backshell:
 - (a) Cut each shield ground wire so that the end of each wire is aligned with the rear edge of the inner ground ring.
 - (b) Push the outer ground ring over each shield ground wire until it is against the inner ground ring.
 - (c) Push the strain relief adapter against the rear of the backshell.
- (8) If the ends of the shield ground wires are at the rear end of the strain relief:
 - (a) Push the outer ground ring over the shield ground wires until it is against the inner ground ring.
 - (b) Push the strain relief adapter over the shield ground wires until the adapter is against the inner ground ring.
Make sure that each shield ground wire is inside the adapter.
- (9) Engage the threads of the adapter and the backshell.
- (10) Torque the adapter to the value specified in Table 3 with a strap wrench that has a 0.375 inch drive.
- (11) Tighten the screws of the cable clamp.

7. ASSEMBLY OF THE S280W605-() PERIPHERAL BACKSHELL

NOTE: The assembly procedures for the 45 degree backshell and the 90 degree backshell are the same the procedures for the straight backshell.

A. Cable Preparation

**Table 4
OUTER JACKET REMOVAL LENGTH**

Cable Exit Configuration	Removal Length L (inch)		
	Minimum	Target	Maximum
Straight	1.55	1.60	1.60
45 Degrees	2.35	2.40	2.40
90 Degrees	2.55	2.60	2.60

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

POSITION OF THE STRAIN RELIEF ADAPTER AND THE BACKSHELL ADAPTER
Figure 11

- (1) Look at the circular compression spring inside the strain relief adapter. Make sure that the spring is in the correct position.
- (2) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (3) In order, put these components on the cable:
 - The strain relief adapter
 - The backshell adapter
 - A 0.45 inch \pm 0.03 inch length of the heat shrinkable sleeve.

Refer to Figure 11.

- (4) Remove the length L of the outer jacket from the end of the cable. Refer to Table 4 and Figure 12.

OUTER JACKET REMOVAL
Figure 12

- (5) Remove the necessary length of the shields so that the distance from the end of the cable jacket to the end of the shields is 0.75 inch \pm 0.03 inch.

Refer to:

- Figure 13 for the straight configuration
- Figure 14 for the 45 degree configuration
- Figure 15 for the 90 degree configuration.

SHIELD REMOVAL LENGTH FOR A STRAIGHT CONFIGURATION BACKSHELL
Figure 13

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

SHIELD REMOVAL LENGTH FOR A 45 DEGREE CONFIGURATION BACKSHELL
Figure 14

SHIELD REMOVAL LENGTH FOR A 90 DEGREE CONFIGURATION BACKSHELL
Figure 15

- (6) Put the ferrule on the cable. Refer to Figure 16.
 Make sure that all the wires and the fillers are in the ferrule.

POSITION OF THE FERRULE OVER THE WIRES AND FILLERS OF THE CABLE
Figure 16

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

- (7) Carefully push the shields back away from the end the cable so that the shields become loose.
- (8) Push the ferrule under both shields. Refer to Figure 17.

Make sure that:

- The end of the ferrule is against the end of the cable jacket
- The distance from the end of the cable jacket to the rear end of the ferrule is not greater than 0.05 inch.

POSITION OF THE FERRULE UNDER THE SHIELDS

Figure 17

- (9) Cut the cable fillers so that the ends of the fillers are aligned with the forward end of the ferrule.
- (10) To make the shields smooth, carefully push the shields toward end of the cable.

Make sure that:

- The ferrule does not move
- The distance from the end of the cable jacket to the rear end of the ferrule is not greater than 0.05 inch.

- (11) Cut the shields so that the distance from the ends of the shields to the end of the cable jacket 0.70 inch +0 inch, -0.03 inch. Refer to Figure 18.

Make sure that the ends round conductors of the outer shield are aligned with the ends of the flat conductors of the inner shield.

DISTANCE FROM THE END OF THE CABLE JACKET TO THE END OF THE SHIELDS

Figure 18

- (12) Put the wires in a sequence that agrees with the contact configuration of the connector.
- (13) Push the heat shrinkable sleeve over the shields and the ferrule until the distance from the end of the cable jacket to the rear end of the sleeve is 0.45 inch ±0.03 inch

Refer to Figure 19.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE SHIELD

Figure 19

- (14) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (15) Examine the cable to make sure that the distance from the end of the cable jacket to the end of the wires agrees with the specified distance in Table 4.
- (16) If distance from the end of the jacket to the end of any wire is longer than the specified distance, cut the necessary length from the end of the wire.
- (17) Assemble the connector. Refer to the applicable Subject for the connector.

B. Backshell Installation

- (1) To hold the connector in position, attach the connector to a plug board.

NOTE: A satisfactory alternative is to use some other tool that:

- Can hold the connector stable
- Does not cause damage to the connector.

- (2) Push the backshell adapter toward the connector until the teeth in the adapter are against the teeth at the rear of the connector.
- (3) Carefully turn the coupling nut of the adapter until the teeth are fully engaged with the teeth in the back of the connector.

Refer to Figure 20.

POSITION OF THE BACKSHELL ADAPTER ON THE CONNECTOR

Figure 20

- (4) Torque the adapter to 75 inch-pounds \pm 5 inch-pounds.
- (5) Examine the position of the heat shrinkable sleeve in relation to the chamfer of the backshell adapter.

Make sure that the rear edge of the heat shrinkable sleeve is aligned with or inside the forward edge of the chamfer.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

Refer to:

- Figure 21 for the incorrect position of the sleeve
- Figure 22 for the correct position of the sleeve.

INCORRECT POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 21

CORRECT POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 22

- (6) If the position of the sleeve is not correct:
- (a) Disconnect the backshell adapter from the connector.
 - (b) Disassemble the connector. Refer to the applicable Subject for the connector.
 - (c) Remove the heat shrinkable sleeve sleeve.
 - (d) Do the cable preparation and the backshell installation again.
- Refer to Paragraph 7.A. and Paragraph 7.B.

C. Strain Relief Adapter Installation

- (1) Push the strain relief adapter until it is against the backshell adapter. Refer to Figure 23.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR PERIPHERAL BACKSHELLS

POSITION OF THE STRAIN RELIEF ADAPTER
Figure 23

- (2) Engage the threads of the strain relief adapter and the backshell adapter.
- (3) Torque the strain relief adapter to 25 inch-pound \pm 5 inch-pounds.
- (4) Install the saddle clamps. Refer to Figure 24.

INSTALLATION OF THE SADDLE CLAMPS
Figure 24

- (5) Tighten the cable clamp screws so that the clamp holds the cable tightly. Make sure that the surfaces of the saddle clamps are against the surfaces of the strain relief adapter.

NOTE: It is not necessary to put tape on the cable for protection.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

This Subject gives the procedures to assemble a connector backshell with a shield terminator band that holds the shield of a cable on the backshell to get the specified low impedance electrical bond.

1. PART NUMBERS AND DESCRIPTION

A. Applicable Backshells

Table 1 gives the part numbers of the connector backshells that can be assembled with the Glenair 687-062-0() and the BACB42F() shield terminator bands.

NOTE: When the shield or the shield ground wire must make a specified electrical bond with the outer surface of the backshell, either terminator band assembly gives a satisfactory performance.

NOTE: When only a small area to make the bond is available, the backshell assembly with a BACB42F() shield terminator band gives a better result.

Refer to:

- Figure 1 for the Glenair 387()020 backshell
- Figure 2 for the S280W603-() backshell
- Figure 3 and Figure 4 for the Glenair 557-() backshell
- Figure 5 for the Glenair 440()031 and 440()069 backshells.

				24	
				28	
	687-062-06	1.06	2.00	-	Glenair

Refer to Figure 6.

The Glenair 687-062-() shield terminator band has these technical properties:

- It is easy to assemble and disassemble
- It is reusable
- It accepts many shield ground leads
- It is applicable for Zero Length grounds
- It gives a low impedance electrical bond.

CONFIGURATION OF THE GLENAIR 687-062-() SHIELD TERMINATOR BAND
Figure 6

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

C. BACB42F() Shield Terminator Bands

The BACB42F() shield terminator band can be installed on these backshells:

- Boeing S280W603, and S280W604 backshells for circular connectors
- Glenair 440()031 and 440()069 backshells for circular connectors
- Glenair 527-187() backshell for ARINC 600 shell size 1 plug connectors
- Glenair 527-212() backshell for ARINC 600 shell size 2 plug connectors
- Glenair 557-() backshell for M24308/() D-subminiature connectors.

**Table 3
BACB42F() SHIELD TERMINATOR BAND PART NUMBERS**

Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

The BACB42F() shield terminator band has these technical properties:

- It is easy to assemble and disassemble
- It is not reusable
- It accepts many shield ground leads
- It is applicable for Zero Length grounds
- It gives a low impedance electrical bond.

CONFIGURATION OF THE BACB42F() SHIELD TERMINATOR BAND
Figure 8

D. Necessary Materials for Backshell Assembly

Table 5
NECESSARY MATERIALS

Part or Material	Part Number	Supplier
Adhesive Sealant, Gray	DC 3145 RTV	Dow
Insulation Tape, Gray	Scotch 70	3M
Sleeve, Heat Shrinkable	AMS-DTL-23053/5 Class 1	Available source
	MIL-LT	Raychem

2. SHIELD TERMINATOR BAND REMOVAL

A. Removal of the Glenair 687-062-0() Shield Terminator Band

- (1) Loosen the screw until:
 - The end of the band goes through the screw head
 - The band disengages from the screw head.
- (2) Remove the band from the assembly.

B. Removal of the BACB42F() Shield Terminator Band

- (1) Hold the free end of the buckle on the band with a pair of needle nose pliers.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (2) To release the buckle, pull the free end of the buckle:
 - In a direction that is up and away from the band
 - Until the end of the band is free from the buckle.

Refer to Figure 9.

BUCKLE RELEASE OF THE SHIELD TERMINATOR BAND
Figure 9

- (3) Remove the band from the assembly.
- (4) Discard the BACB42F() shield terminator band.

3. ASSEMBLY OF THE GLENAIR 387()020 BACKSHELL

This paragraph gives the procedure to assemble and attach the shield ground wires of these shields to a backshell:

- The shield of a wire or cable
- The adjacent shields of a wire or cable.

A. Backshell Part Numbers

Table 6
BACKSHELL PART NUMBERS

Part Number	Supplier
387AA020	Glenair
387AB020	Glenair
387AS020	Glenair
387HA020	Glenair
387HB020	Glenair
387HS020	Glenair

B. Preparation of Cable with a Tin Plated or a Silver Plated Shield

NOTE: If the cable has one round conductor shield or two adjacent round conductor shields, the procedure to prepare a cable that has a nickel plated shield is a satisfactory alternative. Refer to Paragraph 3.C.

- (1) Remove 1.5 inches ± 0.1 inch of the outer jacket from the end of the cable.
- (2) Remove 1.25 inches ± 0.01 inch of the shield from the end of the cable.

20-25-14

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (3) Assemble a shield ground wire with a solder sleeve that has an uninsulated integral wire. Refer to Subject 20-10-15.

Make sure that the shield ground wire is pointed back away from the end of the cable.

C. Preparation of a Cable with a Nickel Plated Shield

CABLE PREPARATION
Figure 10

Refer to Figure 10.

- (1) Remove approximately 1.75 inches of the outer jacket from the end of the cable.
- (2) Cut the wires of the cable to make the distance from the end of the wires to the end of the cable jacket equal to 1.50 inches ± 0.15 inch.
- (3) Assemble a shield ground wire with a shield pull through. Refer to Subject 20-10-15.

CAUTION: A SHIELD GROUND WIRE ASSEMBLY WITH A SOLDER SLEEVE IS NOT APPLICABLE FOR A SHIELD THAT HAS NICKEL PLATED CONDUCTORS. THE SOLDER DOES NOT MAKE A SATISFACTORY CONNECTION TO THE SHIELD.

Make sure that:

- The shield ground wire is pointed back away from the end of the cable
- The forward end of the tape or heat shrinkable sleeve extends 0.25 inch ± 0.10 inch farther than the end of the outer jacket
- The rear end of the tape or heat shrinkable sleeve extends 0.5 inch ± 0.1 inch farther than the end of the outer jacket.

D. Connector Assembly

- (1) Put the all the applicable cables through backshell.
- (2) Assemble the connector. Refer to the applicable Subject for the connector.

E. Backshell Installation

- (1) Push the backshell over the wires of the cables until the backshell is against the rear of the connector.

Make sure that the shield ground wires of all the cables come out of the rear end of the backshell.

- (2) Carefully, push and turn the backshell until the teeth of the backshell are fully engaged with the teeth of the connector.
- (3) Look in the inspection hole of the backshell adapter. Refer to Figure 11.

Make sure that the teeth of the backshell adapter are fully engaged with the teeth of the MIL-C-26500 connector.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE MIL-C-26500 TEETH AND THE BACKSHELL TEETH
Figure 11

- (4) Torque the backshell to the specified value in Table 7 with a torque wrench.

Table 7
BACKSHELL INSTALLATION TORQUE VALUES

Shell Size	Torque (inch-pound)	
	Minimum	Maximum
28	180	200
24	180	200
22	180	200
20	180	200
18	150	170
16	150	170
14	150	170
12	90	110
10	90	110
8	90	110

F. Installation of the Glenair 687-062-0() Shield Terminator Band

- (1) Make a selection of a shield terminator band from Table 2.
- (2) Put the band on the cable.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (3) Put each shield ground wire on the outer surface of the backshell so that the shield ground wires:
 - Are parallel to the longitudinal axis of the connector backshell
 - Are even and symmetrical around the circumference of the backshell
 - Do not make an overlap with another shield ground wire.
- (4) Push the shield terminator band toward the connector until:
 - The band is on the ribbed area on the rear of the backshell
 - There are no shield ground wires under the clamp components.

Refer to Figure 12.

POSITION OF THE SHIELD TERMINATOR BAND ON THE BACKSHELL

Figure 12

- (5) Torque the shield terminator band to the applicable torque in Table 8.

**Table 8
SHIELD TERMINATOR BAND INSTALLATION TORQUE VALUES**

Shell Size	Torque (inch-pound)	
	Minimum	Maximum
28	45	55
24	45	55
22	45	55
20	45	55
18	45	55
16	45	55
14	15	25
12	15	25
10	15	25
08	15	25

- (6) If the free end of the shield terminator band is more than 0.4 inch from the end of the screw head, bend the free end of the band so that the distance from the end of the band to the body of the clamp is 0.02 inch or less.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (7) Cut each shield ground wire so that the end of each wire is 0.1 inch \pm 0.05 inch from the edge of the band. Refer to Figure 13.

POSITION OF THE END OF THE SHIELD GROUND WIRES
Figure 13

- (8) Put the necessary layers of insulation tape on the cable so that the outer diameter of the cable is increased. Refer to Figure 14.

Make sure that:

- The tape is in the location where the saddle clamp holds the cable
- The outer diameter of the cable is equal to the inner diameter of the cable clamps
- The clamp will hold the cable satisfactorily.

POSITION OF THE INSULATION TAPE ON THE CABLE
Figure 14

- (9) Tighten the cable clamps.

Make sure that:

- The inner surface of the cable clamps is against the outer surface of the strain relief posts on the backshell
- The cable clamps hold the cable tightly, but does not cut into the cable jacket.

4. ASSEMBLY OF THE S280W603 BACKSHELL

This paragraph gives the procedure to assemble and attach the shield ground wires of these shields to a backshell:

- The shield of a wire or a cable
- The adjacent shields of a wire or a cable.

A. Cable Preparation

- (1) Remove a 1.5 inches \pm 0.1 inch of the outer jacket from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (2) Remove 1.25 inches \pm 0.10 inch of the shield.
- (3) Assemble shield ground wire with a solder sleeve that has an uninsulated integral wire. Refer to Subject 20-10-15.

Make sure that the shield ground wire is pointed back away from the end of the cable.

B. Connector Assembly

- (1) Put the all the applicable cables through backshell.
- (2) Assemble the connector. Refer to the applicable Subject for the connector.

C. Backshell Installation

- (1) Put the shield ground wires against each cable so that the wires are:
 - Flat and symmetrical around the circumference of each cable
 - Aligned with the longitudinal axis of each cable.

- (2) Push the backshell over the wires of the cables and the shield ground wires until the backshell is against the rear of the connector.

Make sure that each shield ground wire comes out of the end of the backshell that has the cable retention clamps.

- (3) Carefully, push and turn the backshell until the teeth of the backshell are fully engaged with the teeth of the connector.

- (4) Look in the inspection hole of the backshell adapter. Refer to Figure 15.

Make sure that the teeth of the backshell adapter are fully engaged with the teeth of the MIL-C-26500 connector.

POSITION OF THE MIL-C-26500 TEETH AND THE BACKSHELL TEETH
Figure 15

- (5) Torque the backshell to the specified value in Table 9 with a torque wrench.

Table 9
BACKSHELL INSTALLATION TORQUE VALUES

12	90	110
10	90	110
8	90	110

D. Installation of the BACB42F() Shield Terminator Band

- (1) Pull the shield ground wires through the slots in the backshell with a plastic awl or an equivalent tool.
- (2) Carefully, pull the free ends of the shield ground wires tightly so that the wires are not loose inside the backshell.
- (3) Put the shield ground wires around on the outer surface of the backshell so that the wires:
 - Are even and symmetrical around the outer surface of the backshell
 - Do not make an overlap with another shield ground wire.
- (4) Make a selection of a shield terminator band from Table 3.
- (5) Attach the shield terminator band to the backshell.

Refer to:

- Figure 16 for the location of the installation
- Paragraph 10. for the installation procedure.

Make sure that:

- The band does not move the position of the shield ground wires
- The buckle of the band is not over a shield ground wire on the backshell
- The buckle of the band is not over a slot in the backshell.

POSITION OF THE SHIELD TERMINATOR BAND ON THE BACKSHELL

Figure 16

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (6) Fold the shield ground wires back across the shield terminator band.
- (7) Cut the ends of the shield ground wires so that end of each wire is aligned with the edge of the band that is adjacent to the connector.
- (8) To prevent the abrasive movement of the cable under the clamp, install either of these types of protection at the location of the clamp on the cable or cables:
 - A BACI12Z insert
 - The sufficient layers of insulation tape.

If the protection is insulation tape, make sure that the outer diameter of the cable and the insulation tape is sufficient for the clamp to hold the cable tightly.

Refer to Figure 17.

POSITION OF THE INSULATION TAPE OR INSERT UNDER THE CABLE CLAMP

Figure 17

- (9) Tighten the cable clamps.
Make sure that the inner surface of the clamp is against the outer surface of the strain relief posts on the backshell.

E. Insulation of the Shield Terminator Band

- (1) Clean the area of the electrical connection of the shield terminator band and the backshell with isopropyl alcohol. Refer to Figure 16.
- (2) Cut the sufficient length Scotch 70 insulation tape to put two layers of tape around the circumference of the backshell and shield terminator band.
- (3) Cut the length of tape again so that the width is 0.4 inch \pm 0.1 inch.
- (4) Put the two layers of tape around the circumference of the shield terminator band and the backshell so that:
 - Each layer of tape makes a small overlap
 - The tape is on the band termination area
 - The tape is on the body of the backshell on the both sides of the shield terminator band termination.

Refer to Figure 18.

CAUTION: DO NOT PUT THE TAPE OVER THE DRAIN HOLES IN THE BACKSHELL. DAMAGE TO THE CONNECTOR CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE INSULATION TAPE ON THE BACKSHELL

Figure 18

- (5) Apply a 0.02 inch thick, continuous layer of DC 3145 RTV adhesive sealant on the electrical connection with a clean spatula.

Refer to Figure 19.

Make sure that the layer of adhesive sealant:

- Is over the surface and the edges of the tape
- Is over the surface of the backshell from the edge of the tape that is adjacent to the connector to the forward edge of the strain relief of the backshell
- Has no cracks or openings to the surface of the insulation tape or the surface of the backshell.

CAUTION: DO NOT PUT THE ADHESIVE SEALANT IN OR ON THE DRAIN HOLES IN THE BACKSHELL. DAMAGE TO THE CONNECTOR CAN OCCUR.

NOTE: It is acceptable if the layer of sealant is not smooth or symmetrical.

LOCATION OF THE ADHESIVE SEALANT

Figure 19

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

5. ASSEMBLY OF THE S280W604 BACKSHELL

This paragraph gives the procedure to:

- Attach the shield of a primary cable to a backshell
- Attach the adjacent shields of a primary cable to a backshell
- Assemble the shield ground wires of each shielded wire or cable in the primary cable and attach them to a backshell
- Assemble the shield ground wires of each shielded wire or cable with adjacent shields in the primary cable and attach them to a backshell.

A. Cable Preparation

**Table 10
S280W501-() CABLE JACKET REMOVAL LENGTH**

Shell Size	Backshell Configuration	Removal Length (inch)	
		Target	Tolerance
22	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.2	
20	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.2	
18	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.2	
16	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.0	
14	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.0	
12	Straight	2.0	± 0.05
	45 Degrees	2.3	
	90 Degrees	3.0	

- (1) Put the strain relief adapter on the cable.
- (2) Remove the necessary length of the outer jacket from the end of the primary cable. Refer to Table 10.
- (3) Fold the shield or shields of the primary cable back on the outer jacket. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE SHIELD

Figure 20

- (4) Remove 1.5 inches ± 0.1 inch of the outer jacket of each inner cable in the S280W501-() cable.

NOTE: The S280W501-4 cable does not have shielded wire or cable.

- (5) Remove the necessary length of the shield from each inner cable to make the distance from the end of the outer jacket to the end of the shield equal to 0.25 inch ± 0.10 inch. Refer to Figure 21.

PREPARATION OF THE INNER CABLES

Figure 21

- (6) Assemble a shield ground wire with a solder sleeve that has an uninsulated integral wire on each inner cable. Refer to Figure 22 and Subject 20-10-15.

Make sure the shield ground wire is pointed back away from the end of the cable.

POSITION OF THE SOLDER SLEEVE AND SHIELD GROUND WIRE

Figure 22

- (7) Put the backshell adapter on the cable. Refer to Figure 23.

Make sure that the forward end of the adapter is against the shield of the primary cable.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE BACKSHELL ADAPTER
Figure 23

B. Connector Assembly

- (1) Assemble the connector. Refer to the applicable Subject for the connector.

C. Backshell Installation

- (1) Push the backshell adapter over the wires of the cables and the shield ground wires until the adapter is against the rear of the connector. Refer to Figure 24.

Make sure that the end of each shield ground wire is through the backshell adapter.

BACKSHELL ADAPTER AND SHIELD GROUND WIRES
Figure 24

- (2) Carefully, push and turn the backshell adapter until the teeth of the adapter are fully engaged with the teeth of the connector.
- (3) Look in the inspection hole of the backshell adapter. Refer to Figure 25.

Make sure that the teeth of the backshell adapter are fully engaged with the teeth of the MIL-C-26500 connector.

POSITION OF THE MIL-C-26500 TEETH AND THE BACKSHELL TEETH
Figure 25

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (4) Torque the backshell to the specified value in Table 11 with a torque wrench.

NOTE: Do not install lockwire to hold the backshell adapter in position on the connector.

**Table 11
BACKSHELL INSTALLATION TORQUE VALUES**

Shell Size	Torque (inch-pound)	
	Minimum	Maximum
28	120	130
24	115	125
22	115	125
20	115	125
18	105	115
16	80	90
14	70	80
12	55	65
10	40	50
8	32	42

D. Installation of the BACB42F() Shield Terminator Band

- (1) Fold each shield ground wire back over the termination platform of the backshell adapter.

Make sure that the shield ground wires:

- Are even and symmetrical around the platform
- Do not make an overlap with another shield ground wire.

- (2) Push the end of the shield or shields of the primary cable onto the termination platform.

Make sure that the end of the shield is:

- Aligned with the forward edge of the termination platform
- Over the shield ground wires
- Smooth.

- (3) Make a selection of a shield terminator band from Table 3.

- (4) Attach the shield terminator band to the backshell.

Refer to:

- Figure 26 for the location of the installation
- Paragraph 10. for the installation procedure.

Make sure that:

- The band is on the knurled or ribbed area of the termination platform
- The buckle of the band is not over a shield ground wire on the backshell.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE TERMINATOR BAND ON THE BACKSHELL ADAPTER

Figure 26

- (5) Cut the unwanted length of the shield or shields of the primary cable and the shield ground wires to make the distance from the forward edge of the band and the end of the shield and wires equal to 0.10 inch \pm 0.03 inch.

Refer to Figure 27.

POSITION OF THE SHIELD AND THE SHIELD GROUND WIRES

Figure 27

E. Insulation of the Shield Terminator Band

- (1) Clean these areas of the electrical connection of the shield terminator band with isopropyl alcohol:
 - The shoulder of the backshell adapter
 - The shield terminator band
 - The shield of the primary cable
 - The outer jacket of the primary cable.
- (2) Cut the sufficient length of Scotch 70 insulation tape to put a layer of the tape around the circumference of the area of the electrical connection.
- (3) Cut the length of tape again so that the width is 0.75 inch \pm 0.10 inch.
- (4) Put the layer of tape on the backshell so that the tape:
 - Makes a small overlap
 - Is on the band termination area
 - Extends 1.0 inch \pm 0.1 inch from the shoulder of the backshell adapter to the outer jacket of the primary cable.

Refer to Figure 28.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE INSULATION TAPE ON THE BACKSHELL

Figure 28

- (5) Apply a 0.02 inch thick, continuous layer of DC 3145 RTV adhesive sealant on the electrical connection with a clean spatula.

Refer to Figure 29.

Make sure that layer of adhesive sealant:

- Is on the surface and the edges of the insulation tape
- Increases the outside diameter of the cable to a size that is less than the inside diameter of the backshell
- Has no cracks or openings to the surface of the insulation tape or the surface of the backshell.

CAUTION: ADHESIVE SEALANT MUST NOT BE APPLIED ON THE THREADS OF THE BACKSHELL ADAPTER. THE THREADS OF STRAIN RELIEF ADAPTER WILL NOT ENGAGE THE THREADS OF THE BACKSHELL ADAPTER.

NOTE: It is acceptable if the layer of sealant is not smooth or symmetrical.

LOCATION OF THE ADHESIVE SEALANT

Figure 29

- (6) Cure the sealant at room temperature for 3 hours minimum.

NOTE: If the relative humidity is lower than 30 percent, the time for the sealant to fully cure will be longer than normal.

Until the sealant is fully cured, do not:

- Do any other work on the assembly
- Put the assembly in a package.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

F. Installation of the Strain Relief Adapter

- (1) Push the strain relief adapter until it is against the backshell adapter.
- (2) Engage the threads of the strain relief adapter and the threads of the backshell adapter.
- (3) Turn the strain relief adapter until it stops.
- (4) To prevent the abrasive movement of the cable under the clamp, install either of these types of protection at the location of the clamp on the cable or cables:
 - A BACI12Z insert
 - The sufficient layers of insulation tape.

If the protection is insulation tape, make sure that the outer diameter of the cable and the insulation tape is sufficient for the clamp to hold the cable tightly.

Refer to Figure 30.

POSITION OF THE INSULATION TAPE OR INSERT UNDER THE CABLE CLAMP

Figure 30

- (5) Tighten the cable clamps.

Make sure that the inner surface of the clamp is against the outer surface of the strain relief posts on the backshell.

6. ASSEMBLY OF THE S280W604 BACKSHELL WITH POTTING COMPOUND

This paragraph gives the procedure to assemble and seal each connector and backshell on both ends of the wire harness.

A. Necessary Materials

**Table 12
NECESSARY MATERIALS**

Material	Part Number or Specification
Potting Compound	MIL-PRF-8516 Type II Class 2
Shield Material	BAC3108
Sleeve, Insulation	DWP-125
Sleeve, Protection	TFE 4X
Sleeve, Fuel Resistant	DR-25

NOTE: For sizes and suppliers of shield materials and sleeves, refer to Subject 20-00-11.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

B. Assembly of the First Connector

CONNECTOR ASSEMBLY
Figure 31

- (1) Prepare the cable. Refer to Paragraph 5.A..
- (2) Make a selection of an insulation sleeve from Table 12.
NOTE: For alternative insulation sleeves, refer to Subject 20-00-11.
- (3) Put the backshell on the cable.
- (4) Put a 1.25 inch \pm 0.06 inch length of 1 inch diameter insulation sleeve on the cable. Refer to Figure 31.
- (5) Assemble the connector. Refer to the applicable Subject for the connector.

C. Assembly of the First Backshell

- (1) Push the backshell adapter over the wires of the cable and each shield ground wire until the adapter is against the rear of the connector. Refer to Figure 24.
Make sure that the end of each shield ground wire is through the backshell adapter.
- (2) Carefully, push and turn the backshell adapter until the teeth of the adapter are fully engaged with the teeth of the connector.
- (3) Look in the inspection hole of the backshell adapter. Refer to Figure 25.
Make sure that the teeth of the backshell adapter are fully engaged with the teeth of the connector.
- (4) Torque the backshell to the specified value in Table 11 with a torque wrench.
NOTE: Do not install lockwire to hold the backshell adapter in position on the connector.

D. Installation of the Wire Harness Protection

- (1) Install a protective sleeve on the cable. Refer to Figure 32.

POSITION OF THE PROTECTIVE SLEEVE ON THE WIRE HARNESS
Figure 32

- (a) Make a selection of a protective sleeve from Table 12.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

Make sure that the protective sleeve has a diameter that is sufficiently large to move over the wire harness.

NOTE: For alternative protective sleeves, refer to Subject 20-00-11.

- (b) Cut the necessary length of the protective sleeve. Refer to Figure 36.

Make sure that the length of the protective sleeve is equal to the distance:

- From the edge of the shield termination platform of the backshell adapter at one end of the wire harness
- To the edge of the shield termination platform of the backshell adapter at the other end of the wire harness.

- (c) Put the protective sleeve on the wire harness through the strain relief adapter and the insulation sleeve.

Make sure that the distance between the edge of the shield termination platform and the protective sleeve is 0.06 inch maximum.

- (d) Assemble a temporary wire harness tie on each end of the protective sleeve.

- (2) Install a shield on the wire harness. Refer to Figure 33.

POSITION OF THE SHIELD MATERIAL ON THE WIRE HARNESS
Figure 33

- (a) Make a selection of a shield material from Table 12.

Make sure that the shield material has a diameter that is sufficiently large to move over the sleeve on the wire harness.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (b) Cut the necessary length of the shield material. Refer to Figure 36.

Make sure that the length of the shield material is 10 percent longer than the distance:

- From the shoulder of the backshell adapter on one end of the wire harness
- To the shoulder of the backshell adapter on the other end of the wire harness.

- (c) Put the shield material on the wire harness through the strain relief adapter and the adhesive sleeve.

Make sure that the shield termination platform is between the shield and the wire harness.

- (3) Install a fuel resistant sleeve on the wire harness. Refer to Figure 34.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE FUEL RESISTANT SLEEVE ON THE WIRE HARNESS
Figure 34

- (a) Make a selection of a fuel resistant sleeve from Table 12. Make sure that the fuel resistant sleeve has a diameter that is sufficiently large to move over the shield.
- (b) Cut the necessary length of the fuel resistant sleeve. Refer to Figure 36.
 Make sure that the length of the fuel resistant sleeve is 10 percent longer than the distance:
 - From the shield termination platform of the backshell adapter at one end of the wire harness
 - To the shield termination platform of the backshell adapter at the other end of the wire harness.
- (c) Put the fuel resistant sleeve on the wire harness through the strain relief adapter and adhesive sleeve.
- (4) If the shield material is longer than the fuel resistant sleeve, fold the shield material back over the ends of the sleeve at both ends of the wire harness.

E. Assembly of the Second Connector

POSITION OF THE STRAIN RELIEF ADAPTERS ON THE WIRE HARNESS
Figure 35

- (1) Prepare the cable. Refer to Paragraph 5.A.
- (2) Make a selection of an insulation sleeve from Table 12.
NOTE: For alternative insulation sleeves, refer to Subject 20-00-11.
- (3) Put the backshell on the cable.
- (4) Put a 1.25 inch \pm 0.06 inch length of 1 inch diameter insulation sleeve on the cable. Refer to Figure 35.
- (5) Assemble the connector. Refer to the applicable Subject for the connector.

F. Assembly of the Second Backshell

- (1) Push both ends of the fuel resistant sleeve back approximately 2 inches from each end of the wire harness.
- (2) Remove the temporary wire harness ties at each end of the protective sleeve. Refer to Figure 32.
- (3) Assemble the backshell. Refer to Paragraph 6.C.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

G. Installation of the Shield Terminator Bands

POSITION OF THE SHIELD TERMINATOR BANDS

Figure 36

- (1) Install the terminator band on the shield at each end of the wire harness.
Refer to Figure 36 and Paragraph 5.D.
- (2) Shrink the fuel resistant sleeve into its position. Refer to Subject 20-10-14.
Make sure that the heat is applied from the center of the wire harness toward the ends.
- (3) Remove the length of the fuel resistant sleeve that makes an overlap with the shield termination platform of the backshell adapters at each end of the wire harness.
Refer to Figure 37.

REMOVAL OF THE UNWANTED LENGTH OF THE FUEL RESISTANT SLEEVE

Figure 37

H. Seal of the Connector Assembly with Potting Compound

- (1) Put the connector and the wire harness in the vertical position with the forward end of the connector pointed down. Refer to Figure 38.

POSITION OF THE CONNECTOR AND THE WIRE HARNESS

Figure 38

20-25-14

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (2) Push the insulation sleeve over the shield termination platform until the edge of the sleeve is against the shoulder of the backshell adapter.

Refer to Figure 39.

POSITION OF THE INSULATION SLEEVE BEFORE THE HEAT IS APPLIED

Figure 39

- (3) Shrink the insulation sleeve into its position. Refer to Subject 20-10-14 and Figure 40.

Make sure that:

- A downward force is lightly applied on the insulation sleeve as the heat is applied to keep the edge of the sleeve against the shoulder of the backshell adapter.
- The distance between the shoulder of the backshell adapter and the edge of the insulation sleeve is not greater than 0.06 inch.

POSITION OF THE INSULATION SLEEVE AFTER THE HEAT IS APPLIED

Figure 40

- (4) Put the connector and the wire harness in the vertical position with the forward end of the connector pointed up. Refer to Figure 41.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE CONNECTOR AND THE WIRE HARNESS

Figure 41

- (5) Put a temporary layer of tape over one of the 3 drain holes in the side of the backshell adapter.
- (6) Make a selection of a potting compound from Table 12.
- (7) Put the potting compound into one of the remaining drain holes until the potting compound comes out the other remaining drain hole.
- (8) Remove the tape from the first drain hole.
- (9) Put more potting compound into the drain hole until the compound comes out all 3 drain holes.
- (10) Remove any unwanted potting compound from the assembly.
- (11) Let the potting compound cure for 24 hours.
Make sure that the connector assembly stays in the vertical position.
- (12) Do Step (1) through Step (11) again for the connector assembly at the other end of the wire harness.

I. Installation of the Strain Relief Adapter

- (1) Install the strain relief adapter on the backshell adapter at each end of the wire harness. Refer to Figure 42 and Paragraph 5.F.

POTTED S280W604 BACKSHELL ASSEMBLY

Figure 42

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

7. ASSEMBLY OF THE GLENAIR 527-187() BACKSHELL ON A SHELL SIZE 1 ARINC 600 PLUG CONNECTOR

A. Preparation of Shielded Cables

This procedure is applicable for cables with shields that must be attached to the backshell.

- (1) Remove 2.25 inches minimum, to 3.75 inches maximum, of the jacket from the end of a shielded cable. Refer to Figure 43.

Make sure that the jacket removal length is different for each cable in the group of cables that have routing to each connector insert. Refer to Figure 44.

CABLE PREPARATION
Figure 43

- (2) Assemble a solder sleeve with an integral uninsulated shield ground wire on the shielded cable. Make sure that the rear end of the solder sleeve is on the end of the cable jacket. Refer to Subject 20-10-15 for the procedure to assemble the solder sleeves.
- (3) Do Step (1) and Step (2) again for each shielded cable.

B. Backshell Assembly

Table 13
NECESSARY MATERIALS

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	An available source
	RT850	Raychem
	RW175	Raychem
	TFE 4X	Chemplast
Zeus		
Tape, Insulation	Scotch 70	3M

- (1) Make a selection of a shield terminator band from Table 3 for each backshell wire entrance that has shielded wires.
Use the outside diameter of the wire entrance of the backshell to make the selection.
- (2) Make a selection of an insulation tape from Table 13.
- (3) Make a selection of a heat shrinkable sleeve from Table 13.
NOTE: A satisfactory alternative to a heat shrinkable sleeve is a layer of insulation tape.
- (4) Put a 2.0 inch ±0.25 inch length of heat shrinkable sleeve on each group of wires at each backshell wire entrance.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS**

Make sure that the sleeve has the smallest diameter that can easily move on the backshell wire entrance after the terminator band, and the insulation tape are installed.

NOTE: The diameter of the backshell entrance will be increased by the terminator band, and the layers of insulation tape.

- (5) Prepare the ends of the specified shielded cables. Refer to Paragraph 7.A.
- (6) Assemble the contacts on the ends of the wires. Refer to Subject 20-71-14.
- (7) Install the contacts in the connector. Refer to Subject 20-71-14.
- (8) Remove the ten screws on the rear of the connector shell that hold the insert retainer plates on the shell.

NOTE: Do not remove the insert retainer plates or the connector inserts.

- (9) Discard the screws.

NOTE: These screws do not have the sufficient length.

- (10) Install one half of the backshell on the rear of the connector with the screws and lockwashers supplied with the backshell.

Make sure that the retainer plate is between the connector shell and the backshell.

- (a) Align a screw and lockwasher with the applicable backshell installation hole in the backshell.
 - (b) Tighten the screw.
 - (c) Do Step (a) and Step (b) again for each remaining backshell installation screw.
- (11) Wind a sufficient number of layers of tape around the wire harness at each backshell wire entrance to increase the harness diameter to the diameter of the backshell wire entrance hole.
 - (12) Install the other half of the backshell on the rear of the connector; Do Step (10) again.
 - (13) Put the shield ground wires against the backshell around the circumference of the band termination platform. Refer to Figure 44.

Make sure that:

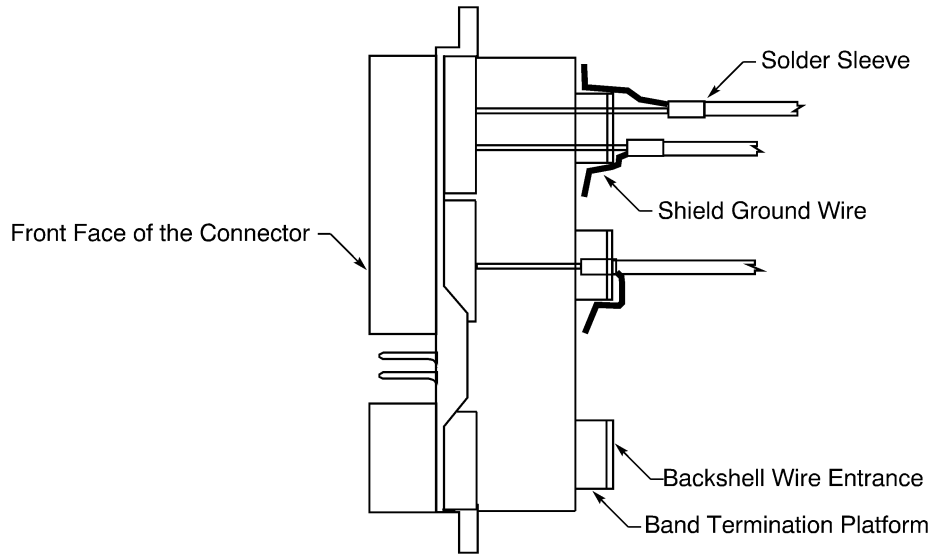

- The distance between each of the shield ground wires is equal around the band termination platform
- The shield ground wires do not make an overlap with each other.

NOTE: Tape can be used on the connector shell to temporarily hold the shield ground wires in their positions until the band is installed.

CAUTION: DO NOT PUT TAPE ON THE BAND TERMINATION PLATFORMS OF THE BACKSHELL.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

CONFIGURATION OF THE SHIELD GROUND WIRES ON THE BAND TERMINATION PLATFORMS OF THE BACKSHELL

Figure 44

- (14) If the wire harness has an overall shield:
 - (a) If the wire harness has a protective sleeve below the overall shield, assemble a wire harness tie on the protective sleeve approximately 2 inches from the rear end of the shield terminations.
 - (b) Pull the end of the overall shield forward on the band termination platform.
 - (c) If the band termination platform has shield ground wires on it, put the end of the overall shield braid on the shield ground wires against the band termination platform.
- (15) Install a shield terminator band on the band termination platform. Refer to Paragraph 10.
Make sure that no tape is under the shield terminator band.
- (16) Remove the tape used to hold the shield ground wires in their positions.
- (17) Remove the unwanted length of the overall shield. Refer to Figure 45.
Make sure that the length of the remaining shield braid is 0.10 inch \pm 0.05 inch.

POSITION OF THE OVERALL SHIELD

Figure 45

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (18) If the band termination platform has shield ground wires installed, fold the shield ground wires back on the band and on the wire harness.
- (19) Cut the ends of the shield ground wires. Refer to Figure 46.
Make sure that the remaining length of the shield ground wires is approximately 2.5 inches from the rear edge of the band.

POSITION OF THE SHIELD GROUND WIRES
Figure 46

- (20) Wind a sufficient number of layers of insulation tape on the wire harness to hold the ends of the shield ground wires to the harness. Refer to Figure 47.
Make sure that the ends of the shield ground wires are between the layers of tape.

POSITION OF THE INSULATION TAPE
Figure 47

- (21) Wind a minimum of 3 layers of insulation tape on the shield terminator band. Refer to Figure 47.
- (22) If the wire harness has a protective sleeve on the overall shield:
 - (a) Pull the end of the protective sleeve forward on the band termination platform.
 - (b) Assemble a wire harness tie on the protective sleeve and the band termination platform. Refer to Subject 20-10-11.
- (23) If a length of heat shrinkable sleeve is on the harness:
 - (a) Push the length of heat shrinkable sleeve forward until it is against the rear of the backshell.
Make sure that the forward edge of the sleeve is against the rear surface of the backshell.
 - (b) Shrink the sleeve into its position.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

Refer to:

- Figure 48 for the location of the sleeve
- Subject 20-10-14 for the procedure to shrink a heat shrinkable sleeve.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 48

(24) If a length of heat shrinkable sleeve is not on the harness, wind another layer of insulation tape on the harness.

Make sure that:

- The insulation tape wrap has a 50 percent overlap
- The insulation tape layers extend a minimum of 0.5 inch farther rearward than the ends of the shield ground wires.

(25) Do Step (13) through Step (24) again for each backshell wire entrance.

8. ASSEMBLY OF THE GLENAIR 527-212() BACKSHELL ON A SHELL SIZE 2 ARINC 600 PLUG CONNECTOR

A. Preparation of Wires and Cables

This procedure is applicable for specified wires, and cables with shields that must be attached to the backshell.

(1) Prepare the ends of the specified shielded cables:

Refer to Figure 49.

SHIELDED CABLE PREPARATION
Figure 49

- At a distance of 2.87 inches ± 0.13 inch from the end of the cable, remove a 1.13 inch ± 0.13 inch length of the jacket from the shielded cable.
- Remove a 1.63 inches ± 0.13 inch length of the jacket and the shield from the end of the cable.
- Put a 0.5 inch ± 0.1 inch length of heat shrinkable sleeve on the forward end of the jacket. Refer to Figure 50.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

Make sure that:

- The sleeve has the smallest diameter that can easily move on the cable
- The distance from the end of the jacket to the rear end of the sleeve is not more than 0.25 inch.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE SHIELDED CABLE

Figure 50

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (2) Prepare the specified single conductor wires:
- (a) At a distance of 2.87 inches \pm 0.13 inch from the end of the wire, remove a 1.13 inch \pm 0.13 inch length of the insulation from the wire. Refer to Figure 51.

SINGLE CONDUCTOR WIRE PREPARATION

Figure 51

- (3) Prepare the ends of the specified coax cables that have a protective sleeve, and an overall shield:
- (a) Remove the necessary length of the overall shield to make the distance from the end of the cable to the end of the overall shield equal to 2.87 inches \pm 0.13 inch. Refer to Figure 52.

PREPARATION OF COAX CABLE THAT HAS A PROTECTIVE SLEEVE AND AN OVERALL SHIELD

Figure 52

- (b) Remove the necessary length of the protective sleeve to make the distance from the end of the cable to the end of the protective sleeve equal to 1.13 inches \pm 0.13 inch. Refer to Figure 52.
- (c) Assemble a lacing tape wire harness tie near the end of the protective sleeve.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

Refer to:

- Figure 52 for the location of the wire harness tie
 - Refer to Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.
- (d) Put a 0.5 inch \pm 0.1 inch length of heat shrinkable sleeve on the forward end of the shield. Refer to Figure 53.

Make sure that:

- The sleeve has the smallest diameter that can easily move on the cable
- The distance from the end of the shield to the forward end of the sleeve is not more than 0.25 inch.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE COAX CABLE
Figure 53

- (e) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (4) Prepare the ends of the specified coax cables that do not have a protective sleeve, or an overall shield:
- (a) At a distance of 2.87 inches \pm 0.13 inch from the end of the cable, remove a 1.13 inch \pm 0.13 inch length of the jacket from the cable. Refer to Figure 54.

BACW10EC()	Anillo
	Mellowes

- (1) Make a selection of a shield terminator band from Table 3 for each backshell wire entrance.
Use the outside diameter of the wire entrance of the backshell to make the selection.
- (2) Make a selection of a insulation tape from Table 14.
- (3) Make a selection of a shield tape from Table 14.
- (4) Make a selection of a heat shrinkable sleeve from Table 14.
NOTE: A satisfactory alternative to a heat shrinkable sleeve is a layer of insulation tape.
- (5) Put a 3.00 inch ± 0.25 inch length of heat shrinkable sleeve on each group of wires at each backshell wire entrance.
Make sure that the sleeve has the smallest diameter that can easily move on the backshell wire entrance after the shield tape, the terminator band, and the insulation tape are installed.
NOTE: The diameter of the backshell entrance will be increased by the layers of shield tape, the terminator band, and the layers of insulation tape.
- (6) Prepare the ends of the specified wires and cables. Refer to Paragraph 8.A.
- (7) Assemble the contacts on the ends of the wires. Refer to Subject 20-71-14.
- (8) Install the contacts in the connector. Refer to Subject 20-71-14.
- (9) Wind a sufficient number of layers of insulation tape around the wire harness at each backshell wire entrance until the harness diameter is equal to the diameter of the backshell wire entrance hole. Refer to Figure 55.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

Make sure that:

- The distance from the rear edge of the layers of the insulation tape to the forward end of the shield windows is 0.25 inch \pm 0.05 inch.
- The width of the layers of tape is 0.70 inch to 1.00 inch.

POSITION OF THE LAYERS OF INSULATION TAPE

Figure 55

- (10) Put the end of the shield tape on the shield window of one cable. Refer to Figure 56.

Make sure that the center of the shield tape is aligned with the center of the shield window.

POSITION OF THE SHIELD TAPE ON ONE CABLE

Figure 56

- (11) Wind a layer of shield tape on the shield window of one wire. Refer to Figure 56.
- (12) Continue to wind the shield tape on the shield window of each wire. Refer to Figure 57.
- Make sure that the surface of the shield tape is against the shield of each cable.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE SHIELD TAPE IN THE HARNESS
Figure 57

- (13) Wind two full layers of shield tape on all of the cables at the location of the shield windows.
- (14) Assemble a lacing tape wire harness tie on the shield tape.

Refer to:

- Figure 58 for the location of the wire harness tie
- Subject 20-10-11 for the procedure to assemble a wire harness tie.

Make sure that the shield tape that comes out from below the wire harness tie:

- Points to the connector.
- Has sufficient length to do Step (22) through Step (25).

CONFIGURATION OF THE SHIELD TAPE ON THE SHIELD WINDOWS
Figure 58

- (15) Do Step (9) through Step (14) again for the harnesses that have routing to each connector insert.
- (16) Remove the ten screws on the rear of the connector shell that hold the insert retainer plates on the shell.

NOTE: Do not remove the insert retainer plates or the connector inserts.

- (17) Discard the screws.

NOTE: These screws do not have the sufficient length.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

- (18) Discard the backshell gaskets supplied with the backshell.
- (19) Install one half of the backshell on the rear of the connector with the screws and lockwashers supplied with the backshell.

NOTE: The screws and lockwashers in Table 15 are a satisfactory alternative to the screws supplied with the backshell.

Make sure that the retainer plate is between the connector shell and the backshell.

- (a) Align a screw and lockwasher with the applicable backshell installation hole in the backshell.
 - (b) Tighten the screw.
 - (c) Do Step (a) and Step (b) again for each remaining backshell installation screw.
- (20) Install the other half of the backshell on the rear of the connector; Do Step (19) again.
 - (21) Wind more layers of shield tape on the harness until the diameter of the shield tape layers is the same as the diameter of the insulation tape layers.
 - (22) Continue to wind the shield tape on the harness forward to the backshell. Refer to Figure 59.

Make sure that:

- The shield tape wrap has a 50 percent overlap
- The shield tape tension is kept moderate and constant.

POSITION OF THE SHIELD TAPE LAYERS
Figure 59

- (23) At the backshell, wind two layers of shield tape on the band termination platform. Make sure that the forward edge of the shield tape layers is aligned with the rear surface of the backshell.
- (24) Continue to wind the shield tape rearward to the location of the shield windows. Refer to Figure 60. Make sure that:
 - The shield tape wrap has a 50 percent overlap
 - The shield tape tension is kept moderate and constant.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE LAST LAYER OF SHIELD TAPE
Figure 60

- (25) At the location of the shield windows, wind one full layer of shield tape on the harness.
- (26) Assemble a lacing tape wire harness tie on the shield tape at the center of the shield window area.

Refer to:

- Figure 60 for the location of the wire harness tie
- Refer to Subject 20-10-11 for the procedure to assemble a lacing tape wire harness tie.

- (27) Install a shield terminator band on the band termination platform.

Refer to:

- Figure 61
- Paragraph 10. for the procedure to install the shield terminator band.

LOCATION OF THE WIRE HARNESS TIE AND THE SHIELD TERMINATOR BAND ON THE SHIELD TAPE
Figure 61

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS**

(28) Wind layers of insulation tape on the shield tape. Refer to Figure 62.

Make sure that:

- The insulation tape wrap has a 50 percent overlap
- The insulation tape layers extend a minimum of 0.5 inch farther rearward than the rear edge of the shield window.

CONFIGURATION OF THE INSULATION TAPE LAYERS

Figure 62

(29) Continue to wind layers of insulation tape until the diameter of the harness is approximately the same as the inside diameter of the heat shrinkable sleeve.

(30) If a length of heat shrinkable sleeve is on the harness:

- (a) Push the length of heat shrinkable sleeve forward until it is against the rear of the backshell. Make sure that the forward edge of the sleeve is against the rear surface of the backshell.
- (b) Shrink the sleeve into its position.

Refer to:

- Figure 63 for the position of the sleeve
- Subject 20-10-14 for the procedure to shrink a heat shrinkable sleeve.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 63

- (31) If a length of heat shrinkable sleeve is not on the harness, wind another layer of insulation tape on the harness.

Make sure that:

- The insulation tape wrap has a 50 percent overlap
- The insulation tape layers extend a minimum of 0.5 inch farther rearward than the shield window area.

- (32) If a coax cable has a protective sleeve, push the protective sleeve forward to the rear edge of the heat shrinkable sleeve. Refer to Figure 64.

Make sure that the forward edge of the protective sleeve is not more than 0.06 inch from the rear edge of the heat shrinkable sleeve.

POSITION OF THE PROTECTIVE SLEEVE OF THE COAX CABLE

Figure 64

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

(33) Assemble a wire harness tie near on each protective sleeve near the end of the sleeve.

Refer to:

- Figure 64 for the location of the wire harness tie
- Subject 20-10-11 for the procedure to assemble the tie.

(34) Do Step (21) through Step (33) again for each backshell wire entrance.

9. ASSEMBLY OF THE GLENAIR 557-() BACKSHELL

This paragraph gives the procedure to assemble and attach the shield ground wires of these shields to a backshell:

- The shield of a wire or a cable
- The adjacent shields of a wire or a cable.

Refer to Table 17 for the applicable connector part numbers.

A. Connector Part Numbers

**Table 17
APPLICABLE M24308 CONNECTOR PART NUMBERS**

Part Number	Supplier
DBMA()	ITT Cannon
CAMA()	ITT Cannon
CBMA()	ITT Cannon
CCMA()	ITT Cannon

B. Wire Harness Preparation

NOTE: If the wire or the cable has two adjacent shields, the shields are prepared as one shield.

- (1) Make a selection of a solder sleeve with an uninsulated integral wire. Refer to Subject 20-10-15.
- (2) If it is necessary, remove the C-clips on the 2 jack screws of the backshell with a C-clip removal tool.
- (3) Remove the 2 jack screws from the backshell.
- (4) Put the jack screws and the C-clips, if any, in a safe place.

The screws and the clips are necessary to attach the backshell to the connector.

- (5) Make a selection of a heat shrinkable sleeve from Table 5.

Make sure that the diameter of the sleeve is greater than the outer diameter of the backshell cable exit.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Put an approximate 4 inch length of the heat shrinkable sleeve on the wire harness.
- (7) For each shielded cable in the wire harness, put an uninsulated integral wire of a solder sleeve into the front of the backshell and through the slot in the cable exit.

Refer to Figure 65.

Make sure that approximately 0.5 inch of each uninsulated wire extends out of the slot.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE UNINSULATED INTEGRAL WIRES
Figure 65

- (8) Put the backshell on the wire harness.
 Make sure that the uninsulated wires stay in the slot in the cable exit.
- (9) Remove 1.25 inches ± 0.10 inch of the outer jacket from the end one of the shielded cables.
- (10) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the outer jacket equal to 0.25 inch ± 0.10 inch.

Refer to Figure 66.

CABLE PREPARATION
Figure 66

- (11) Put the solder sleeve on the cable. Refer to Figure 67.
 Make sure that:
 - The end of the solder sleeve that has the integral wire is put on the cable first
 - The inner edge of the seal ring is aligned with the end of the outer jacket.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE SOLDER SLEEVE ON THE CABLE
Figure 67

(12) Shrink the solder sleeve into position. Refer to Subject 20-10-14.

Make sure that:

- The solder sleeve stays in the correct position
- A minimum of seventy-five percent of the indicator ring on top of the solder ring is melted.

(13) Do Step (9) through Step (12) for the remaining shielded cables in the wire harness.

C. Connector Assembly

(1) Assemble the connector. Refer to the applicable Subject for the connector.

D. Backshell Installation

- (1) Carefully pull the end of each shield ground wire until the slack in the wires is removed.
- (2) Turn the backshell to the specified clock position for the connector.

Refer to Table 18 and Figure 68.

Table 18
CLOCK POSITIONS OF THE GLENAIR 557-() BACKSHELL

Backshell	Clock Position (degree)	Cable Exit
557B()	90	End
	270	45 Degree
557E()	90	End
	270	45 Degree
557T()	0	Side
	180	

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

CLOCK POSITIONS OF THE GLENAIR 557(-) BACKSHELL

Figure 68

- (3) At the same time, carefully push the backshell until it is against the rear of the connector and pull the end of shield ground wires away from the backshell.
- (4) Align the screw holes in the backshell with the screw holes in the connector.
- (5) For a backshell with jack screws:
 - (a) Push the jack screws through the screw holes in the backshell and the screw holes in the connector.
 - (b) Install a C-clip on each jack screw where there are no threads.
- (6) For a backshell without jack screws:
 - (a) Put two 0.088 inch 4-40 screws into the two screw holes on the front of the connector.
 - (b) Tighten the screws with a screwdriver.
- (7) Carefully, pull each shield ground wire so that any unwanted length of the wire is removed from the backshell.

Refer to Figure 69.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE BACKSHELL ON THE CONNECTOR
Figure 69

E. Installation of the BACB42F() Shield Terminator Band

- (1) Put each shield ground wire against band termination platform on the cable exit of the backshell so that the shield ground wires:
 - Are tight, even, and symmetrical around the termination platform
 - Do not make an overlap with another shield ground wire.

Refer to Figure 70.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS****POSITION OF THE SHIELD GROUND WIRES****Figure 70**

- (2) Make a selection of a shield terminator band from Table 3.
- (3) Attach the shield terminator band to the backshell.

Refer to:

- Figure 71 for the location of the installation
- Paragraph 10. for the installation procedure.

Make sure that:

- The band is on the knurled or ribbed area of the band termination platform of the backshell
- There is no unwanted length of shield ground wire between the slot and the shield terminator band
- The buckle of the band is not over a shield ground wire on the backshell
- The buckle of the band is not over a slot in the backshell.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE SHIELD TERMINATOR BAND ON THE BACKSHELL
Figure 71

F. Insulation of the Shield Terminator Band

- (1) Cut each shield ground wire so that the distance from the end of the wire to the shield terminator band is approximately 2.5 inches.
- (2) Make a selection of a 0.19 inch diameter heat shrinkable sleeve from Table 5.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (3) Put a 3.0 inch ± 0.10 inch length of the heat shrinkable sleeve on each shield ground wire.
- (4) Shrink each sleeve in position. Refer to Subject 20-10-14.
- (5) Align the shield ground wires with the longitudinal axis of the wire harness.

Make sure that the shield ground wire do not make any overlaps that are not necessary.

NOTE: An overlap is acceptable when these conditions occur:

- The diameter of the wire harness is so small that the shield ground wires automatically make an overlap
- A large number of shield ground wires does not permit them to lie along the wire harness without an overlap.

- (6) Cut a length of Scotch 70 insulation tape that is approximately 2.5 times the distance around the outer surface of the band termination platform.
- (7) Cut the length of tape again so that the width is 0.25 inch ± 0.03 inch.
- (8) Put one end of the tape on the end of the shield terminator band that was cut.
- (9) Apply the remaining tape around the band until all the tape is on the band.

Refer to Figure 72 and Figure 73.

20-25-14

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS****SCOTCH 70 INSULATION TAPE IN POSITION ON THE BAND****Figure 72****POSITION OF THE INSULATION TAPE ON THE BAND TERMINATION PLATFORM****Figure 73**

- (10) Push the 4 inch length of the heat shrinkable sleeve until the end of the sleeve is against the rear surface of the backshell.

Make sure that the all the wires that will be subsequently connected with a splice are in the harness.

NOTE: If it is necessary to install splice on any of the wires from the connector, put the splice approximately 1 inch from the rear end of the heat shrinkable sleeve.

- (11) Shrink the sleeve in position. Refer to Subject 20-10-14 and Figure 74.

Make sure that the sleeve does not have any cracks.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS****POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE HARNESS****Figure 74**

- (12) If the diameter of the heat shrinkable sleeve does not decrease to the diameter of the wire harness, assemble the necessary number of wire harness ties on the sleeve.
Refer to Subject 20-10-15 and Subject 20-10-11.
- (13) If the heat shrinkable sleeve is removed from the wire harness, replace the sleeve after the necessary work is done:
- Make a selection of a heat shrinkable sleeve from Table 5.
Make sure that the diameter of the sleeve is greater than the outer diameter of the backshell cable exit.
NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
 - Cut an approximate 4 inch length of the heat shrinkable sleeve.
 - Cut the sleeve again along the longitudinal axis.
 - Put the sleeve on the cable exit of the backshell and the wire harness.
Make sure that the longitudinal axis of the sleeve is aligned with the longitudinal axis of the wire harness.
 - Assemble the necessary number of wire harness ties on the sleeve to hold it in position. Refer to Subject 20-10-15.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

10. INSTALLATION OF THE BACB42F() SHIELD TERMINATOR BAND

A. Installation Tools

**Table 19
BACB42F() SHIELD TERMINATOR BAND INSTALLATION TOOLS**

Shield Terminator Band	Installation Tool		
	Type	Part Number	Supplier
BACB42F3()	Manual	600-058	Glenair
		A40199	Band-It Idex
	Power	600-051	Glenair
		A75099	Band-It Idex
BACB42F4()	Manual	600-061	Glenair
		A30199	Band-It Idex

B. Shield Terminator Band Installation

- (1) Make a selection of an installation tool from Table 19.
- (2) If the shield terminator band is flat, make the band into a coil. Refer to Figure 75.

**INSTALLATION CONFIGURATION OF THE BACB42F() SHIELD TERMINATOR BAND
Figure 75**

- (a) Put the free end of the band through the thin slot in the buckle.
 - (b) Pull the free end through the buckle until the diameter of the loop is approximately the same size as the diameter of the backshell.
 - (c) Put the free end of the BACB42F() shield terminator band through the thin slot in the buckle again.
 - (d) Pull the free end through the buckle until the inner surface of the second loop touches the surface of the first loop.
- (3) Pull the release trigger of the tool in the direction of the pull-up handle.
 - (4) Put the free end of the terminator band into the tool. Refer to Figure 76.
Make sure that the loop is away from the tool.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

POSITION OF THE BACB42F() SHIELD TERMINATOR BAND IN THE TOOL
Figure 76

- (5) Pull the pull-up handle toward the tool frame to complete one cycle so that the terminator band is held in the internal grip mechanism of the tool. Refer to Figure 77.

POSITION OF THE PULL-UP HANDLE AT THE END OF A CYCLE
Figure 77

- (6) Put the shield terminator band on the backshell at the location of the installation.
- (7) Align the edges of the two loops of the terminator band so that the edge of either loop is not more than 0.03 inch beyond the edge of the other. Refer to Figure 78.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF SHIELDED CABLES AND CONNECTOR BACKSHELLS WITH SHIELD TERMINATOR BANDS

ALIGNMENT OF THE LOOPS OF THE SHIELD TERMINATOR BAND

Figure 78

- (8) Pull the pull-up handle through the necessary cycles until the terminator band is tight around the backshell.
Make sure that the position of pull-up handle is the position of the handle at the end of the last cycle.
- (9) If it is necessary to loosen or remove the terminator band after the band has been tightened:
 - (a) Hold the pull-up handle tightly.
 - (b) Push the tension release lever forward.
 - (c) Release the pull-up handle.
NOTE: The pull-up handle will open automatically.
 - (d) Pull the release trigger toward the tool frame.
 - (e) Loosen the band and do the installation again from Step (3).
 - (f) If it is necessary, remove the band and do the installation again from Step (3).
- (10) Pull the cut-off handle toward the tool frame.
- (11) Pull the release trigger of the tool to cut the band.
- (12) Remove the unwanted length of the band from the tool.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

1. GENERAL DATA

A. Phase Identification of Three Phase Power Wires

The phase potential of the three phase power wires that are attached to a single equipment item must be identified. Refer to Table 1 and Table 2.

These conditions are applicable:

- Each end of the wire must have a phase identification sleeve
- The wire can have one phase identification sleeve if the length of the wire between the connections is not sufficient for two sleeves.
- It is necessary to install a phase identification sleeve on preinsulated terminals where the identification sleeve fully includes the terminal insulation.
- On AWG 10 and smaller wire, the end of the phase identification sleeve must extend a maximum of 1/16 inch past the end of the terminal insulation.
- On AWG 8 and larger wire, the phase identification sleeve must be installed and tied over the PTFE insulation sleeve of the terminal.
- It is satisfactory to use one piece of heat shrink sleeve on uninsulated terminals for both the terminal insulation sleeve, and the phase identification sleeve.
- If a cold shrink sleeve is on a terminal or splice, the forward end of the phase identification sleeve must be against the rearward end of the cold shrink sleeve.

2. NECESSARY CONDITIONS FOR THE INSTALLATION OF TERMINALS

A. General Data

Insulation of these wires is necessary before any system is energized:

- The end of a wire that has no termination
- The end of a wire that has a terminal, but is not connected.

Refer to Subject 20-30-11.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

These conditions are applicable:

- A minimum of 1-1/2 threads of the stud or the screw must go through the end of the nut
- The size of the stud hole in the terminal lug must be the same as the size of the stud.

If a terminal lug that has the same size hole as the stud is not available, these configurations of terminals lugs and studs are satisfactory alternatives:

- A terminal lug that has a size 10 hole on a size 8 stud
- A terminal lug that has a size 8 hole on a size 6 stud
- A terminal lug that has a size 6 hole on a size 4 stud
- A terminal lug that has a size 4 hole on a size 2 stud.

These conditions are applicable for studs that have more than one terminal lug:

- The maximum number of terminal lugs that can be attached to a stud is 4
- The largest terminal lug must be installed first at the base of the stud
- The remaining terminal lugs must be installed in order of decreasing size.

All electrical connections that are open to the air in the flammable leakage zones must be sealed. Refer to Paragraph 4.

NOTE: It is not necessary to seal insulated splices.

B. Permitted Bends of a Terminal

Uninsulated and preinsulated terminals can be bent:

- A maximum of 90 degrees for installation in restricted spaces
- A maximum of 30 degrees for installation on a terminal block.

Refer to Figure 1.

CAUTION: A TERMINAL CAN BE BENT ONLY ONCE AND ONLY IN EITHER DIRECTION THAT IS SHOWN IN FIGURE 1. DO NOT USE TERMINALS THAT HAVE BEEN BENT BEFORE.

Make sure that:

- The bend radius is not greater than 5/32 inch ± 1/32 inch
- There are no cracks in the bend area.

PERMITTED DIRECTION AND ANGLE OF THE BEND OF A TERMINAL
Figure 1

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

C. Insulation of AWG 8 or Larger Terminals

**Table 3
HEAT SHRINKABLE SLEEVES FOR SINGLE PHASE AND DC WIRES**

Area Temperature Range (degrees F)	Heat Shrinkable Sleeve	
	Part Number or Description	Supplier
Less than or equal to 275	Grade B, Class 1 Heat Shrinkable Sleeve	Refer to Subject 20-00-11.
Greater than 275	Thermofit TFE	Raychem (Tyco)
	Thermofit TFE-R	Raychem (Tyco)
	Ben-Har 1151-FRB	Bentley-Harris (Federal-Mogul)

**INSULATION OF AWG 8 AND LARGER WIRE WITH A TERMINAL
Figure 2**

It is necessary to install a heat shrinkable sleeve on AWG 8 and larger wires that have a terminal attached. The sleeve:

- Must not be in between the different components of the terminal hardware
- Can extend over the pressure washer, but must not touch the terminal stud.
- Must be yellow for single phase and DC wires; refer to Table 3
- Must be installed on the terminal after the terminal is attached to the wire
- Must have the smallest possible diameter that can be installed over the wire barrel of the terminal
- Must be 1-1/2 inches to 2 inches in length.

NOTE: When two wires from a single terminal start to go in different directions within 1/2 inch of the terminal, the permitted length of the sleeve is 1 inch minimum.

When a Thermofit TFE heat shrinkable sleeve is used:

- The phase identification sleeve is installed over the Thermofit TFE sleeve
- The sleeve is held in position with a wire bundle tie on the wire barrel of the terminal or on the wire beyond the terminal.

NOTE: In fuel vapor areas, the sleeve can be held in position with a wire bundle tie.

When the terminal is attached to the equipment, these conditions are applicable:

- If it is necessary, the sleeve can be cut so that it is clear of the hardware
- If there is a barrier between phases or components, the sleeves of adjacent terminals must not touch each other.

STANDARD WIRING PRACTICES MANUAL**ELECTRICAL CONNECTION OF EQUIPMENT****D. Configuration of Terminals on an MS27212 Terminal Block**

When a terminal lug is installed on the terminal block, make sure that the terminal lug cannot be moved in the direction that loosens it.

For the MS27212-2 terminal block:

- The size of the stud hole in the terminal lug must be the same as the size of the stud
- The maximum number of terminal lugs that can be attached to a stud is 4
- A maximum of 2 terminal lugs that have 8 AWG or larger wire can be installed on one stud on each side of the terminal block
- The largest terminal lug must be installed first at the base of the stud
- The remaining terminal lugs must be installed in order of decreasing size.

Refer to:

- Figure 3 for more than one terminal on a stud
- Figure 4 for the different configurations of one or more terminals on a stud
- Figure 5 for the bus configuration.

NOTE: To make the installation of one or more terminals easier, the top of the terminal can be turned toward the bottom of the stud.

For terminal block hardware that is not used, these conditions are applicable:

- A plain nut must be tightened sufficiently with a steel lock washer under the nut
- A plain nut must be held in position with a self-locking nut
- A self-locking nut must be tightened so that a minimum of one thread of the stud goes through the nut
- A terminal screw must be tightened sufficiently with a steel lock washer under the head of the screw.

NOTE: It is not necessary to install a self-lock nut at the bottom of a stud on the MS27212 terminal block.

NOTE: If it is necessary, the legs of an MS18029 terminal block cover can be cut to make a hole for the wire barrel of a terminal.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

CONFIGURATION OF TERMINALS ON AN MS27212 TERMINAL BLOCK
Figure 4

BUS CONFIGURATION OF A TERMINAL BOARD
Figure 5

E. Installation of a Terminal on a Circuit Breaker

Refer to Figure 6.

NOTE: When a terminal, with a hole that is larger than the hole of the circuit breaker terminal, is attached to a circuit breaker:

- An AN960 pressure washer is installed between the terminal and the lock washer
- The AN960 pressure washer has a hole that is the same size as the hole of the circuit breaker terminal; for example, an AN960-8 pressure washer is used when a size 10 terminal is attached to size 8 circuit breaker terminal.

3. TERMINAL INSTALLATION

A. Installation of Copper Terminals

CAUTION: DO NOT USE ANODIZED WASHERS OR STEEL WASHERS TO INSTALL A TERMINAL.

NOTE: Copper terminals are attached to:

- Either brass studs or brass screws with tin plated brass nuts
- Either steel studs or steel screws with self-locking steel nuts.

(1) To install a single terminal on a stud, refer to Figure 8 and Table 4.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

A Single Terminal and a Plain Nut

A Single Terminal and a Self-Locking Nut

INSTALLATION OF A SINGLE TERMINAL

Figure 8

- (a) Put the terminal on the stud.
- (b) Put these washers on the stud in this order:
 - An NAS1149F ()P flat washer
 - An MS35338- () lock washer for a plain nut
 - An BACW10EC () lock washer for a self locking nut.
- (2) To install more than one terminal on the same stud, refer to Figure 9 and Table 4.
Put these washers on the stud in this order:
 - An NAS1149F ()P flat washer
 - An MS35338- () lock washer for a plain nut
 - An BACW10EC () lock washer for a self locking nut.

Two or More Terminals and a Plain Nut

Two or More Terminals and a Self-Locking Nut

INSTALLATION OF TWO OR MORE TERMINALS

Figure 9

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

- (a) Put the terminals on the stud so that the terminals with the larger holes are nearer to the bottom of the stud.

Make sure that the bottom face and the top face of the adjacent terminals are parallel.

- (b) Put AN961-() spacer washers between adjacent terminals when more than one terminal is installed. Refer to Figure 9.

NOTE: A MAXIMUM OF 4 TERMINALS CAN BE INSTALLED ON 1 STUD.

CAUTION: DO NOT USE ANODIZED WASHERS, DYED WASHERS, OR STEEL WASHERS BETWEEN ADJACENT TERMINALS.

- (c) Put these washers on the stud in this order:
 - An NAS1149F()P flat washer
 - An MS35338-() lock washer for a plain nut
 - An BACW10EC() lock washer for a self locking nut.

- (3) Put the nut on the stud.

- (4) Torque the nut. Refer to Table 5.

If the torque value is not specified in Table 7 for the terminal hardware, make sure that:

- The lock washer is fully compressed
- The terminal does not move on the stud.

B. Installation of Aluminum Terminals

CAUTION: DO NOT USE ANODIZED WASHERS OR STEEL WASHERS TO INSTALL A TERMINAL.

(1) Make a selection of a flat washer from Table 6.

NOTE: 2 washers are necessary.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

(2) Install one or more terminals. Refer to Figure 10.

POSITION OF THE WASHERS WITH ALUMINUM TERMINALS
Figure 10

- (a) Put a flat washer on the stud against the terminal board or equipment.
- (b) Put the terminal or terminals on the stud.
- (c) Put the other flat washer on the stud against the top terminal.
- (d) If a plain nut is used, put a lock washer on the stud against the last flat washer.
- (e) Put the nut on the stud.
- (f) Torque the nut. Refer to Table 7.

If the torque value is not specified in Table 7 for the terminal hardware, make sure that:

- The lock washer is fully compressed
- The terminal does not move on the stud.

Table 16
PRESSURE WASHER FOR JAY-EL TIME DELAY TERMINALS

Description	Material	Plating	Part Number	Supplier
Pressure washer	Steel	Cadmium	AN960-6I	An available source

The terminal stud hardware buildup on the 10167-(-)(-) time delays includes a flat, cadmium plated steel pressure washer between the lock washer and the bottom nut.

- (1) Make a selection of a pressure washer from Table 16.
- (2) Put the pressure washer on the terminal between the lock washer and the bottom nut.
- (3) Do Step (1) through Step (2) for the remaining terminals of the Jay-El 10167 Time Delay.
- (4) Torque the terminals. Refer to Table 5.

4. PROTECTION OF ELECTRICAL CONNECTIONS IN A FLAMMABLE LEAKAGE ZONE

This paragraph gives the applicable conditions for and the procedure to seal an electrical connection that is open to the air in a flammable leakage zone. Refer to Paragraph 4.B.

A. General Conditions for Electrical Connections in a Flammable Leakage Zone

CAUTION: THE SEAL OF AN ELECTRICAL CONNECTION IN A FUEL TANK IS NOT A STANDARD PROCEDURE. FOR FUEL SYSTEM WIRING REPAIRS THAT ARE PERMITTED, REFER TO SUBJECT 20-10-13.

The seal of these electrical connections in a flammable leakage zone is not necessary:

- A dual ground assembly
- A terminal lug on the engine
- A terminal lug on the APU
- A bond jumper
- A ground assembly that is not sealed initially

All other electrical connections in a flammable leakage zone must be sealed.

For the procedure to seal:

- A ground stud ground assembly that is in a flammable leakage zone, refer to Subject 20-20-00
- All other electrical connections, refer to Paragraph 4.C.

STANDARD WIRING PRACTICES MANUAL

ELECTRICAL CONNECTION OF EQUIPMENT

B. Location of the Flammable Leakage Zones

For the locations of the flammable leakage zones, refer to Subject 20-02-10.

C. Seal of an Electrical Connection in a Flammable Leakage Zone

For the conditions that are applicable for this procedure, refer to Paragraph 4.A.

NOTE: The cure times and tack-free times that are specified in Table 19 are applicable for 77 degrees F \pm 5 degrees F and 50 percent relative humidity.

NOTE: The cure time and the tack free time:

- Increase at lower temperature and lower humidity
- Decrease at higher temperature and higher humidity.

**Table 19
RECOMMENDED SEALANTS FOR A FUEL VAPOR AREA**

BMS5-95 B-2	Yokohama Rubber

- (1) Make a selection of a sealant from Table 19.
- (2) With a clean cloth and naphtha or an equivalent solvent, remove all contamination from:
 - The connection
 - The 1 inch minimum area around the connection.
- (3) Let the area dry for a minimum of 15 minutes.
- (4) For a lamp terminal, with or without a sleeve, apply one continuous layer of sealant with a brush on:
 - The end of the terminal
 - The hardware that is attached to the lamp.

Make sure that the sealant is not applied on:

- The shank of the terminal
- A soldered filament connection.

CAUTION: ANY SEALANT ON THE SHANK CAN PREVENT THE MOTION OF THE LAMP CONTACT. THE LAMP CAN BECOME TOO HOT WHICH CAN CAUSE THE FAILURE OF THE LIGHT ASSEMBLY.

- (5) For a switch terminal that is not connected, apply one continuous layer of sealant on the terminal with a brush.
- (6) For a switch lead wire that is not connected, assemble a crimp type end cap on the wire. Refer to Subject 20-30-16.
- (7) For all other connections, apply a layer of sealant on the connection with a brush.
Make sure that the sealant is fully applied on the outer surface of the connection.
- (8) Let the sealant cure.

NOTE: The full cure of a sealant is recommended, but the sealant is serviceable when:

- It is tack free
- It is in an area where wind shear does not occur.

20-30-11 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

1. PART NUMBERS AND DESCRIPTION

A. General Data

Refer to Subject 20-30-14 for the assembly of Copalum and aluminum terminals.

Refer to Subject 20-30-00 for the:

- The procedures to attach terminal lugs to equipment
- The configuration of the terminal lugs attached to equipment
- The installation of colored identification sleeves on terminals on three phase power wires.

Refer to Subject 20-30-22 for the:

- Assembly of a terminal lug with more than one conductor
- Assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug
- Assembly of a terminal lug with a wire size that is not given in this Subject
- Assembly of a terminal lug with a wire that has an insulation O.D. that is smaller than the insulation grip of the terminal lug.

If a terminal lug that has the same size hole as the stud is not available, these configurations of terminals lugs and studs are satisfactory alternatives:

- A terminal lug that has a size 10 hole on a size 8 stud
- A terminal lug that has a size 8 hole on a size 6 stud
- A terminal lug that has a size 6 hole on a size 4 stud
- A terminal lug that has a size 4 hole on a size 2 stud.

For the Circular Area Units (CAU) of a conductor, refer to Table 1.

CAU can be calculated if the Circular Mil Area (CMA) of a conductor is known. Refer to Figure 1.

NOTE: The circular mils of a conductor can be found in all wire tables. If the tables are not available, the CMA can be calculated. Refer to Figure 1.

$$CAU = \frac{CMA}{100} = \frac{(1000 \times \text{Strand Diameter})^2}{100} \times \text{Number of Strands}$$

CIRCULAR AREA UNITS OF A CONDUCTOR
Figure 1

Table 1 gives the CAU of conductors of wire.

Refer to Paragraph 2.C. for the CAU of the shield of different shielded wires and cables.

Table 1
CAU OF CONDUCTORS OF WIRE

Wire Size (AWG)	Conductor

B. BACT12AC General Purpose Terminal Lugs

Refer to Paragraph 2.D. for the procedure to assemble these terminals.

Some BACT12AC terminal lugs have an insulation grip. Some of the larger size BACT12AC terminal lugs do not have an insulation grip.

BACT12AC insulated terminal lugs must be used:

- To terminate BMS 13-51 Grade B AWG 8 and larger wire
- To terminate BMS 13-48 AWG 8 and larger wire
- To terminate BMS 13-31 wire in Temperature Grade Zone A and Zone B.

C. BACT12AL General Purpose Terminal Lugs

Refer to Paragraph 2.E. for the procedure to assemble these terminals.

BACT12AL terminal lugs:

- Are insulated
- Have no wire insulation grip.

D. BACT12AR Restrictive Entry Terminal Lugs

Refer to Paragraph 2.F. for the procedure to assemble these terminals.

BACT12AR terminal lugs have a wire insulation grip.

One BACT12AR terminal lug can be used to terminate only one wire.

An AWG 26 through AWG 10 wire can be terminated with a BACT12AR terminal lug.

NOTE: A BACT12AC terminal lug is a satisfactory alternative to a BACT12AR terminal lug for AWG 12 and smaller wire. Refer also to Table 9.

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

F. BACT12G and Burndy YBM Series Flag Terminal Lugs

Refer to Paragraph 2.H. for the procedure to assemble these terminals.

BACT12G and Burndy YBM Series flag terminal lugs:

- Are not insulated
- Have no wire insulation grip.

G. BACT12M and 280U0010-1 Nickel Plated High Temperature Terminal Lugs

Refer to Paragraph 2.i. for the procedure to assemble these terminals.

These terminal lugs do not have a wire insulation grip.

The 280U0010-1 terminal lug has the same configuration as BACT12M28-2 but has additional nickel plating.

These conditions are applicable:

- For AWG 14 and smaller wire, a BACT12M terminal lug with a hole that is one size larger than the specified stud size can be used
- When high temperature terminal lugs are used as ground lugs, it is not necessary to put insulation on the post
- When a terminal lug is specified for a high temperature area or a high vibration area or both, the terminal lug must be a BACT12M, 280U0010-1, or an AMP solid nickel terminal lug.

NOTE: A solid nickel terminal lug from Table 18 is a satisfactory alternative to a BACT12M terminal lug.

J. MS20659 Terminal Lugs

Refer to Paragraph 2.L. for the procedure to assemble these terminals.

Some of the small MS20659 terminal lugs have a wire insulation grip. Most of the MS10659 terminal lugs do not have a wire insulation grip.

MS20659 terminal lugs are available from these suppliers:

- Burndy
- Thomas & Betts.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

K. Burndy Dual Hole, Upright, and Heavy Duty YAV Terminal Lugs

Refer to Paragraph 2.M. for the procedure to assemble these terminals.

These terminal lugs do not have a wire insulation grip.

**Table 21

Thomas & Betts	13642	9500	10000
	13642M	9500	10000
	TBM12	9500	10000

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS LESS THAN THE MINIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, THE CRIMP CONNECTION OF THE TERMINAL LUG AND THE WIRE IS NOT SATISFACTORY.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

B. Crimp Tools with an Insulation Crimp Adjustment

The insulation crimp part of the hand crimp tool has three positions:

- 1 for a tight crimp
- 2 for a medium crimp
- 3 for a loose crimp.

It is necessary to test each combination of a tool, a terminal lug, and a wire to find the correct adjustment:

- (1) Set the adjustment to the loose position.
- (2) Put a terminal lug in the crimp jaw of the crimp tool.
- (3) Push the end of the wire into the insulation grip of the terminal lug until it stops.

Make sure that:

- The insulation is not removed from the end of the wire
- The end of the wire insulation is against the forward end of the insulation grip of the terminal lug
- The wire insulation does not go into the crimp barrel of the terminal lug.

- (4) Crimp the terminal lug.
- (5) Examine the insulation support.
- (6) Bend the wire back and forward once to make sure that the wire does not come out of the terminal lug.
- (7) If the wire comes out of the terminal lug:
 - (a) Set the insulation adjustment to the subsequent position that is more tight.
 - (b) Use a new terminal lug to do Step (2) through Step (6) again.

Make sure that:

- The insulation adjustment pins are in the same position
- The adjustment is not more tight than is sufficient.

- (1) Make shield ground wire from the end of the shield of the cable or shielded wire.
Refer to Subject 20-10-15 for the assembly of a shield ground wire with a shield pull-through.
- (2) Find the CAU of the shield.
Refer to:
 - Table 40 for the table that has the CAU data for the shielded wire or cable
 - Table 50 for the CAU data for the different BAC3108 shields.
- (3) Make a selection of a terminal lug.
Use the CAU of the shield and the stud hole size to make the selection.
- (4) Assemble the terminal lug. Refer to the paragraph applicable to the assembly of the terminal lug.

D. Assembly of BACT12AC Terminal Lugs

Refer to Paragraph 1.B. for the description of the BACT12AC terminal lugs.

2/0	Yellow	Power Pump	-	58422-1	47825
			-	69066	47825
			-	PPFC-1H	47825
4/0	Blue	Power Pump	-	58422-1	47918
			-	69066	47918

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from Table 3.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from Table 51 or Table 52.
- (3) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (4) Remove the necessary length of the insulation from the end of the wire.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

Refer to Subject 20-00-15 for the insulation removal procedures.

To attach one AWG 24 wire to a terminal lug with a 22-18 size crimp barrel, remove twice the length of insulation and fold back the conductor.

Make sure that:

- When the wire is in the terminal lug, and the end of the wire insulation is in the insulation grip of the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

- (5) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

- (6) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug has an insulation grip, the crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

E. Assembly of BACT12AL Terminal Lugs

Refer to Paragraph 1.C. for the description of the BACT12AL terminal lugs.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

**Table 53
CRIMP TOOLS FOR BACT12AL TERMINAL LUGS**

Crimp Barrel Size	Insulation Color	Crimp Tool		
		Basic Unit	Head	Die Set
8	Red	59974-1	-	47820
		69010	68285-1	-
		Power Pump	69051	47820
			69061	47820
			ST970-12	47820
6	Blue	59974-1	-	47821
		Power Pump	69051	47821
			69061	47821
			ST970-12	47821
4	Yellow	59974-1	-	47822
		Power Pump	69051	47822
			69061	47822
			ST970-12	47822

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from Table 5.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from Table 77.
- (3) Remove the necessary length of the insulation from the end of the wire.
Refer to Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

Make sure that:

- When the wire is in the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
 - The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
 - The conductor does not have nicked or cut strands
 - If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
 - If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
 - The remaining insulation is not frayed.
- (4) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (5) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
 - The end of the conductor extends farther than the end of the crimp barrel
 - The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.
- (6) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

F. Assembly of BACT12AR and Other Restrictive Entry Terminal Lugs

Refer to Paragraph 1.D. for the description of the BACT12AR terminal lugs.

69875	-	-	69874 Model C				

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from Table 7.

Make sure that the crimp barrel size of the terminal lug is the same as the wire size.

NOTE: BACT12AR terminal lugs are intended to be terminated to only one wire. If more than one wire is to be terminated, refer to Subject 20-30-22.

- (2) Remove the necessary length of the insulation from the end of the wire.

Refer to Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

Make sure that:

- When the wire is in the terminal lug, and the end of the wire insulation is in the insulation grip of the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
 - The conductor does not have nicked or cut strands
 - If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
 - If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
 - The remaining insulation is not frayed.
- (3) If a BACT12AR terminal lug for AWG 12 wire and smaller is not available, and a heat gun can be used:
- (a) Make a selection of a BACT12AC terminal lug from Table 3.
 - (b) Put a 0.5 inch to 0.75 inch length of heat shrinkable sleeve on the wire.
Make sure that:
 - The sleeve has the smallest diameter that will let the sleeve move easily on the wire
 - The end of the sleeve is aligned with the end of the wire insulation.
 - (c) Shrink the sleeve into its position.
- (4) If a BACT12AR terminal lug for AWG 12 wire and smaller is not available, and a heat gun cannot be used:
- (a) Make a selection of a BACT12AC terminal lug from Table 3.
 - (b) Make a selection of a Grade D TFE tape. Refer to Subject 20-00-11.
 - (c) Wind a sufficient number of layers of tape around the end of the wire insulation.
Make sure that:
 - The end of the tape layers is aligned with the end of the wire insulation
 - The outer diameter of the layers of tape and the inside diameter of the insulation grip of the terminal make a fit.
 - The tape layers make a 50 percent minimum overlap
 - The length of the tape layers on the wire insulation is approximately 1.0 inch.
 - (d) Assemble a wire harness tie near each end of the tape layers to hold the layers in their position.
- (5) Make a selection of a crimp tool from:
- Table 54 for a BACT12AR terminal lug
 - Table 51 for a BACT12AC terminal lug.
- (6) Put the conductor of the wire in the crimp barrel of the terminal lug.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The end of the wire insulation is in the insulation grip of the terminal lug
- If a sleeve or tape is on the wire, the end the sleeve or tape is in the insulation grip of the terminal lug
- If a sleeve or tape is on the wire, the sleeve or tape does not go into the crimp barrel of the terminal lug
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(7) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The end of the wire insulation is in the insulation grip of the terminal lug
- The crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- If a sleeve or tape is on the wire, the end the sleeve or tape is in the insulation grip of the terminal lug
- If a sleeve or tape is on the wire, the sleeve or tape does not go into the crimp barrel of the terminal lug
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

G. Assembly of BACT12E 90 Degree Upright Terminal Lugs

Refer to Paragraph 1.E. for the description of the BACT12E upright terminal lugs.

		1/2
2/0	0.81	3/8
3/0	0.88	3/8
4/0	0.88	3/8
		1/2

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a BACT12E upright terminal lug from Table 10.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from Table 55.
- (3) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (4) Remove the necessary length of the insulation from the end of the wire.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

Refer to:

- Table 56 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- When the wire is in the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

- (5) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger.

- (6) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger.

- (7) If the crimp tool is a hex type tool and Table 10 gives a secondary die, crimp the terminal lug again with the secondary die:

NOTE: The second crimp removes the flash that is made by the first crimp.

NOTE: The removal of the plating from the terminal lug caused by the second crimp is permitted.

- (a) Put the secondary die in the crimp tool.
- (b) Turn the terminal lug one flat, approximately 60 degrees.
- (c) Crimp the terminal lug again.

Make sure that the second crimp is in the same location along crimp barrel as the first crimp.

H. Assembly of BACT12G and Burndy YBM Series Flag Terminal Lugs

Refer to Paragraph 1.F. for the description of these terminal lugs.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

	3/8	0.75	0.06
2/0	3/8	0.81	0.06

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

NOTE: Refer to Subject 20-20-12 for:

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

- Information on the operation of the Burndy MY28 crimp tool
- The assembly of a dual ground that has two flag terminals.

(1) Make a selection of a BACT12G flag terminal lug from Table 12.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

(2) Make a selection of a crimp tool from Table 57.

(3) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

(4) Remove the necessary length of the insulation from the end of the wire.

Refer to:

- Table 59 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

(5) If the wire has a braid jacket, put a 1.0 ± 0.06 length of heat shrinkable sleeve on the jacket.

(6) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger.

(7) If two flag terminals are to be attached to the end of a wire, put the conductor through the crimp barrels of both flag terminal lugs.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

Make sure that:

- All of the strands of the conductor go through both crimp barrels
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The distance between the terminal lugs is correct for the installation
- The end of the conductor extends farther than the end of the crimp barrel of the terminal lug nearest to the end of the wire.

(8) Crimp the terminal lug or lugs.

Make sure that:

- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- If two flag terminals are on the wire, the crimp of the flag terminal nearest to the end of the wire is made first
- If two flag terminals are on the wire, the distance between the terminal lugs is correct for the installation.

NOTE: If two flag terminals are on the wire, the crimp of the flag terminal at the end of the wire completed first, keeps the strands of the conductor together until the crimp of both flag terminals is completed.

(9) If a length of heat shrinkable sleeve is on the wire, shrink it into its position.

Make sure that the end of the heat shrinkable sleeve is aligned with the end of the wire insulation.

NOTE: This keeps the strands of the insulation braid together.

I. Assembly of BACT12M, and 280U0010-1 Terminal Lugs

Refer to Paragraph 1.G. for the description of the BACT12M, and the 280U0010-1 terminal lugs.

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

(1) Make a selection of a terminal lug from Table 15.

NOTE: An AMP solid nickel terminal lug is a satisfactory alternative to a BACT12M terminal lug.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

- (2) Make a selection of a crimp tool from:
 - Table 60 for small BACT12M terminal lugs
 - Table 61 or Table 62 for large BACT12M terminal lugs
- (3) If the tool has an insulation crimp adjustment, set the position of the adjustment. Refer to Paragraph 2.B.

Make sure to set the adjustment at position 2 for these wires:

- Champlain 24-00034 wire
 - Champlain 24-00523 wire
 - Filotex 85842 wire.
- (4) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (5) Remove the necessary length of the insulation from the end of the wire.

Refer to:

- Figure 2
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- When the wire is in the terminal lug, the end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

INSULATION REMOVAL LENGTH
Figure 2

20-30-11

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

- (6) For a terminal lug in a high temperature area or in a high vibration area, if a heat gun can be used, put a 1.00 inch \pm 0.06 inch length of TFE 2X heat shrinkable sleeve on the wire.
- Make sure that the sleeve has the smallest diameter that will let the sleeve move easily on the wire and on the crimp barrel of the terminal.
- (7) Put the conductor of the wire in the crimp barrel of the terminal lug. Refer to Figure 2.
- Make sure that:
- All of the strands of the conductor are in the crimp barrel
 - The end of the conductor extends 0.06 \pm 0.03 inch farther than the end of the crimp barrel
 - If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
 - If a sleeve is on the wire, the sleeve does not go into the insulation grip or the crimp barrel of the terminal
 - If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.
- (8) Crimp the terminal lug.
- Make sure that:
- All of the strands of the conductor are in the crimp barrel
 - The end of the conductor extends 0.06 \pm 0.03 inch farther than the end of the crimp barrel
 - If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
 - If the terminal lug has an insulation grip, the crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
 - If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.
- (9) If the crimp tool is a hex type tool from Table 62, crimp the terminal lug again with the secondary die.
- NOTE:** The second crimp removes the flash that is made by the first crimp.
- NOTE:** The removal of the plating from the terminal lug caused by the second crimp is permitted.
- (a) Put the secondary die in the crimp tool.
- (b) Turn the terminal lug one flat, approximately 60 degrees.
- (c) Crimp the terminal lug again.
- Make sure that the second crimp is in the same location along crimp barrel as the first crimp.
- (10) If a heat shrinkable sleeve is on the wire:
- (a) For terminal lugs on AWG 10 or smaller wire, push the sleeve over the terminal lug until the end of the sleeve is 1/16 inch \pm 1/16 inch from the forward end of the crimp barrel. Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

POSITION OF THE SLEEVE FOR SIZE AWG 10 OR SMALLER WIRE
Figure 3

- (b) For terminal lugs on AWG 8 or larger wire, push the sleeve over the terminal lug until the end of the sleeve is 1/4 inch \pm 1/16 inch from the rear edge of the stud hole. Refer to Figure 4.

POSITION OF THE SLEEVE FOR SIZE AWG 8 OR LARGER WIRE
Figure 4

- (c) Shrink the sleeve into its position.
- (11) For a terminal lug in a high temperature area or in a high vibration area, if a heat gun cannot be used:
- Make a selection of a Grade D TFE tape. Refer to Subject 20-00-11.
 - Wind a sufficient number of layers of tape around the crimp barrel of the terminal and around the end of the wire insulation.
 Make sure that:
 - The tape layers include the crimp barrel of the terminal
 - The tape layers make a 50 percent minimum overlap
 - The length of the tape layers on the wire insulation is approximately 1.0 inch.
 - Assemble a wire harness tie near each end of the tape layers to hold the layers in their position.

J. Assembly of AMP Solid Nickel Terminal Lugs

Refer to Paragraph 1.H. for the description of the AMP solid nickel, high temperature terminal lugs.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

**Table 63

		59461	-	-	-
		PHRPU2	-	PHST-59461	-

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from Table 18.

NOTE: An AMP solid nickel terminal lug is a satisfactory alternative to a BACT12M terminal lug.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from Table 63.
- (3) If the tool has an insulation crimp adjustment, set the position of the adjustment. Refer to Paragraph 2.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

Make sure to set the adjustment at position 2 for these wires:

- Champlain 24-00034 wire
- Champlain 24-00523 wire
- Filotex 85842 wire.

(4) Remove the necessary length of the insulation from the end of the wire.

Refer to:

- Figure 5
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- When the wire is in the terminal lug, the end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

INSULATION REMOVAL LENGTH

Figure 5

(5) For a terminal lug in a high temperature area or in a high vibration area, if a heat gun can be used, put a 1.00 inch ±0.06 inch length of TFE 2X heat shrinkable sleeve on the wire.

Make sure that the sleeve has the smallest diameter that will let the sleeve move easily on the wire and on the crimp barrel of the terminal.

(6) Put the conductor of the wire in the crimp barrel of the terminal lug. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- If a sleeve is on the wire, the sleeve does not go into the crimp barrel of the terminal lug
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(7) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug has an insulation grip, the crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(8) If a heat shrinkable sleeve is on the wire:

(a) For terminal lugs on AWG 10 or smaller wire, push the sleeve over the terminal lug until the end of the sleeve is 1/16 inch ± 1/16 inch from the forward end of the crimp barrel. Refer to Figure 6.

POSITION OF THE SLEEVE FOR SIZE AWG 10 OR SMALLER WIRE

Figure 6

(b) For terminal lugs on AWG 8 or larger wire, push the sleeve over the terminal lug until the end of the sleeve is 1/4 inch ± 1/16 inch from the rear edge of the stud hole. Refer to Figure 7.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

POSITION OF THE SLEEVE FOR SIZE AWG 8 OR LARGER WIRE
Figure 7

- (c) Shrink the sleeve into its position.
- (9) For a terminal lug in a high temperature area or in a high vibration area, if a heat gun cannot be used:
 - (a) Make a selection of a Grade D TFE tape. Refer to Subject 20-00-11.
 - (b) Wind a sufficient number of layers of tape around the crimp barrel of the terminal and around the end of the wire insulation.
 - Make sure that:
 - The tape layers include the crimp barrel of the terminal
 - The tape layers make a 50 percent minimum overlap
 - The length of the tape layers on the wire insulation is approximately 1.0 inch.
 - (c) Assemble a wire harness tie near each end of the tape layers to hold the layers in their position.

K. Assembly of M7928/1 Terminal Lugs

Refer to Paragraph 1.i. for the description of the M7928/1 terminal lugs.

	69365-()	-	47807-1

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from Table 19.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from Table 64.
- (3) Remove the necessary length of the insulation from the end of the wire.

Refer to Subject 20-00-15 for the insulation removal procedures.

Make sure that:

- When the wire is in the terminal lug, and the end of the wire insulation is in the insulation grip of the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
 - The conductor does not have nicked or cut strands
 - If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
 - If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
 - The remaining insulation is not frayed.
- (4) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

(5) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The end of the wire insulation is in the insulation grip of the terminal lug
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(6) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The end of the wire insulation is in the insulation grip of the terminal lug
- The crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

L. Assembly of MS20659 Terminal Lugs

Refer to Paragraph 1.J. for the description of the MS20659 terminal lugs.

		Y29B	-	ST2354B-3	-

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

- (1) Make a selection of a terminal lug from Table 20.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from:
- Table 65 for small MS20659 terminal lugs
 - Table 66 or Table 67 for large MS20659 terminal lugs.
- (3) If the tool has an insulation crimp adjustment, set the adjustment of the tool. Refer to Paragraph 2.B.
- (4) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (5) Remove the necessary length of the insulation from the end of the wire.

Refer to:

- Figure 8
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- When the wire is in the terminal lug, and the end of the wire insulation is in the insulation grip of the terminal lug, the end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

INSULATION REMOVAL LENGTH

Figure 8

(6) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(7) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends 0.06 ± 0.03 inch farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug has an insulation grip, the crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(8) If the crimp tool is a hex type tool from Table 67, crimp the terminal lug again with the secondary die.

NOTE: The second crimp removes the flash that is made by the first crimp.

NOTE: The removal of the plating from the terminal lug caused by the second crimp is permitted.

- (a) Put the secondary die in the crimp tool.
- (b) Turn the terminal lug one flat, approximately 60 degrees.
- (c) Crimp the terminal lug again.

Make sure that the second crimp is in the same location along crimp barrel as the first crimp.

M. Assembly of Burndy Dual Hole, Upright, and Heavy Duty Terminal Lugs

Refer to Paragraph 1.K. for the description of the Burndy dual hole, upright, and heavy duty terminal lugs.

		YAV26-2L38-30-NK
3/0	0.81 ± 0.03	YAV27-2L38-NK
		YAV27-2L38-30-NK

NOTE: For the assembly of the Burndy heavy duty YAV terminal lugs with AWG 20 or AWG 18 wire, refer to Subject 20-30-22.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

- (1) Make a selection of a terminal lug from:
- Table 21 for dual hole YAV terminal lugs
 - Table 22 for upright YAV terminal lugs
 - Table 23 for heavy duty YAV terminal lugs.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

- (2) Make a selection of a crimp tool from:
- Table 68 or Table 69 for dual hole YAV terminal lugs
 - Table 70 for upright YAV terminal lugs
 - Table 71 for heavy duty YAV terminal lugs.
- (3) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (4) Remove the necessary length of the insulation from the end of the wire.

20-30-11

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

Refer to:

- Table 72 for the insulation removal length for YAV14G82 and YAV14G88 terminal lugs
- Table 73 for the insulation removal length for the other terminal lug part numbers
- Subject 20-00-15 for the insulation removal procedures

Make sure that:

- The conductor does not have nicked or cut strands
- If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
- If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
- The remaining insulation is not frayed.

- (5) If it is specified, fold the conductor back.
- (6) Put the conductor of the wire in the crimp barrel of the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

- (7) Crimp the terminal lug.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

- (8) If the crimp tool is a hex type tool and a secondary die is specified, crimp the terminal lug again with the secondary die.

NOTE: The second crimp removes the flash that is made by the first crimp.

NOTE: The removal of the plating from the terminal lug caused by the second crimp is permitted.

- (a) Put the secondary die in the crimp tool.
- (b) Turn the terminal lug one flat, approximately 60 degrees.
- (c) Crimp the terminal lug again.

Make sure that the second crimp is in the same location along crimp barrel as the first crimp.

N. Assembly of BACT12AB, BACT12AM, BACT12S, Rolls-Royce, Thermocouple, 69B40570, and Other Terminal Lugs

Refer to Paragraph 1.L. for the description of the terminal lugs applicable to this procedure.

**Table 74
CRIMP TOOLS FOR BACT12AB TERMINAL LUGS**

54746-1	6	59974-1	-	-	-	-	47822
		Power Pump	-	-	69061	-	47821

NOTE: Refer to Table 38 for the part numbers of the recommended Power Pumps.

NOTE: Refer to Subject 20-30-22 for the assembly of a terminal lug with a conductor that is smaller than the crimp barrel size of the terminal lug.

(1) Make a selection of:

- A BACT12AB terminal lug from Table 25
- A BACT12AM terminal lug from Table 27
- A BACT12S terminal lug from Table 29
- A Rolls-Royce terminal lug from Table 31
- A thermocouple terminal lug from Table 34
- A 69B40570 terminal lug from Table 35.
- Another terminal lug from Table 36.

NOTE: For the selection of the terminal, use:

- The crimp barrel size, if one wire is to be terminated
- The CAU range, if more than one wire is to be terminated.

NOTE: Refer to Subject 20-30-22 if more than one wire is to be terminated.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

- (2) Make a selection of a crimp tool from:
- Table 74 for BACT12AB terminal lugs
 - Table 75 for BACT12AM terminal lugs
 - Table 76 for BACT12S terminal lugs
 - Table 77 for Rolls-Royce terminal lugs
 - Table 78 for thermocouple terminal lugs
 - Table 79 for a 69B40570(-) terminal lug
 - Table 81 for other terminal lugs.
- (3) If the crimp tool basic unit is a power pump, adjust the pressure to make it satisfactory for the crimp tool head. Refer to Table 39.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP TOOL HEAD CAN OCCUR.

- (4) Remove the necessary length of the insulation from the end of the wire.

Refer to:

- Table 80 for the insulation removal length for thermocouple or 69B40570 terminal lugs
- Subject 20-00-15 for the insulation removal procedures.

Make sure that:

- When the wire is in the terminal lug, and the end of the wire insulation is in the insulation grip of the terminal lug, the end of the conductor extends farther than the end of the crimp barrel
 - The clearance from the end of the conductor is sufficient for the installation of the washer and the nut
 - If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
 - The conductor does not have nicked or cut strands
 - If the insulation is removed by the application of heat, the conductor has not moved from the center of the wire
 - If the insulation is removed by the application of heat, the remaining insulation does not have blisters or evidence of overheating
 - The remaining insulation is not frayed.
- (5) If the wire has a braid jacket, put a 1.0 ± 0.06 length of heat shrinkable sleeve on the jacket.
- (6) If two flag terminals are to be attached to the end of a wire, put the conductor through the crimp barrels of both flag terminal lugs.

Make sure that:

- All of the strands of the conductor go through both crimp barrels
 - The end of the conductor extends farther than the end of the crimp barrel of the terminal lug nearest to the end of the wire
 - The distance between the terminal lugs is correct for the installation.
- (7) Put the conductor of the wire in the crimp barrel of the terminal lug.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS**

If the terminal lug is a thermocouple terminal lug, make sure that:

- The Alumel wire that has green insulation attaches to the Alumel terminal lug
- The Chromel wire that has white insulation attaches to the Chromel terminal lug.

If the terminal is a flag terminal or an upright terminal, make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- The maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger

If the terminal is not a flag terminal or an upright terminal, make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- The clearance from the end of the conductor is sufficient for the installation of the washer and the nut.

(8) Crimp the terminal lug or lugs.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor extends farther than the end of the crimp barrel
- If the terminal lug has an insulation grip, the end of the wire insulation is in the insulation grip of the terminal lug
- If the terminal lug has an insulation grip, the crimp tool is adjusted to give the correct insulation support. Refer to Paragraph 2.B.
- If the terminal lug does not have an insulation grip, the maximum distance from the end of the wire insulation of a single wire to the end of the crimp barrel is 0.12 inch for AWG 10 and smaller, and 0.25 inch for AWG 8 and larger
- If the terminal lug is not a flag or an upright terminal, the clearance from the end of the conductor is sufficient for the installation of the washer and the nut
- If two flag terminals are assembled on the wire, the crimp of the flag terminal nearest to the end of the wire is made first
- If two flag terminals are assembled on the wire, the distance between the terminal lugs is correct for the installation.

NOTE: If two flag terminals are on the wire, the crimp of the flag terminal at the end of the wire first, keeps the strands of the conductor together until the crimp of both flag terminals is completed.

(9) If a secondary die is specified, crimp the terminal lug again with the secondary die.

NOTE: The second crimp removes the flash that is made by the first crimp.

NOTE: The removal of the plating from the terminal lug caused by the second crimp is permitted.

- (a) Put the secondary die in the crimp tool.
- (b) Turn the terminal lug one flat, approximately 60 degrees.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF INSULATED AND UNINSULATED TERMINAL LUGS

- (c) Crimp the terminal lug again.
Make sure that the second crimp is in the same location along crimp barrel as the first crimp.
- (10) If the terminal is a Thermo-Electric thermocouple terminal lug part number 1387-3 or 1387-4:
 - (a) Make a selection of a flux and a high temperature silver/lead solder. Refer to Subject 20-00-11.
 - (b) Solder the terminal lug to the conductor.
- (11) If a length of heat shrinkable sleeve is on the wire, shrink it into its position on the end of the wire insulation.

NOTE: The heat shrinkable sleeve keeps the strands of the insulation braid together.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

1. GENERAL DATA

A. Applicable Conditions for the Assembly of Splices

For the conditions that are applicable for:

- The repair of a wire or cable, refer to Subject 20-10-13
- The repair of a splice assembly, refer to Subject 20-10-13
- The assembly of a wire harness that has a splice, refer to Subject 20-10-11
- The installation of a wire harness that has a splice, refer to Subject 20-10-11.

For the assembly of:

- A splice that connects aluminum wires or an aluminum wire to a copper wire, refer to Subject 20-30-13
- A specified splice, refer to Paragraph 1.B.
- A closed end splice, refer to Paragraph 5.A.
- An unsealed butt splice, refer to Paragraph 6.A.
- A sealed splice, refer to Paragraph 1.C.

B. Assembly of Specified Splices

Table 1 gives the location of the assembly procedure or the selection of the assembly procedure for the applicable splice assembly configuration of a specified splice.

**Table 1
ASSEMBLY PROCEDURES FOR SPECIFIED SPLICES**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

D. Conductor CAU

This paragraph gives the procedure to find the CAU of the conductor or conductors.

Table 4
AWG TO CAU CONVERSION

Wire Size (AWG)	Circular Area Units (CAU)
32	0.6
30	1
28	1.6
26	3
24	5
22	8
20	12
18	19
16	24
14	38
12	59
10	99
8	170
6	268
4	426
2	665
1	837
1/0	1045
2/0	1330
3/0	1665
4/0	2109

- Find the CAU of each conductor. Refer to Table 4.
- For more than one conductor, add the CAU of each conductor for the total CAU of the conductors.

2. INCREASE OF CONDUCTOR CAU

A. Applicable Conditions

If the total CAU of the conductors is less than the minimum CAU of the conductor splice, increase the CAU of the conductor.

20-30-12

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

For example, an AWG 20 wire can be assembled in a size 12-10 NAS1388 butt splice, but the CAU of the AWG 20 conductor must be increased by a minimum of 31 CAU and a maximum of 126 CAU because:

- The CAU of the AWG 20 conductor is 12
- The minimum CAU of the size 12-10 splice is 43
- The maximum CAU of the size 12-10 splice is 138.

Refer to:

- Paragraph 2.B. for the assembly of a conductor splice with a conductor that is folded back
- Paragraph 2.C. for the assembly of a conductor splice with a filler wire.

B. Assembly of a Conductor Splice with a Conductor that is Folded Back

- (1) Find the correct insulation removal length L for the conductor splice.
- (2) Remove two times the removal length L of the insulation from the end of the wire.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

CAUTION: MAKE SURE THAT THE END OF THE INSULATION IS EQUAL AND SYMMETRICAL AROUND THE CIRCUMFERENCE OF THE CONDUCTOR. UNWANTED INSULATION IN THE CRIMP CAN INCREASE THE ELECTRICAL RESISTANCE.

CAUTION: MAKE SURE THAT THE BASE METAL OF THE CONDUCTOR CANNOT BE SEEN. CORROSION OF THE CONDUCTOR CAN OCCUR.

- (3) Fold the conductor back.

Make sure that the distance from the end of the insulation to the end of the conductor is the removal length L.

- (4) Assemble the conductor splice.

Refer to the applicable paragraph for the procedure to assemble the specified splice.

C. Assembly of a Conductor Splice with a Filler Wire

- (1) Make a selection of a filler wire.
- (2) Remove the necessary length of insulation from the end of the filler wire.
- (3) Put the filler wire and the primary wire in the conductor splice at the same time.
- (4) Assemble the conductor splice.

Refer to the applicable paragraph for the procedure to assemble the specified splice.

- (5) After the conductor splice is crimped, remove the unwanted length of the filler wire as near as possible to the end of the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

3. PART NUMBERS AND DESCRIPTION

5. CLOSED END SPLICE CONFIGURATIONS

A. Splice Assembly Configurations

For the conditions that are applicable for a closed end splice, refer to Paragraph 1.A.

Table 54

CLOSED END SPLICE CONFIGURATIONS

Seal	Splice Assembly	
	Configuration	Procedure
Sealed	Splice Kit	Paragraph 5.B.
	Parallel Splice and a Sleeve	Paragraph 5.C.
Unsealed	Insulated Closed End Splice	Paragraph 5.D.
	Parallel Splice and a Sleeve	Paragraph 5.E.

B. Sealed Closed End Splice - Splice Kit

NOTE: A satisfactory alternative for a sealed closed end splice kit is a sealed closed end splice with a parallel splice and a sleeve. Refer to Paragraph 5.C.

- (1) Make a selection of a sealed closed end splice kit from Table 5.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the splice kit has:

- The smallest CAU range that can accept the total CAU of the conductors
- The correct maximum number of wires.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductors.

- (2) Find the part number of the parallel splice in the splice kit from Table 6.
- (3) Find the crimp barrel size of the splice from Table 6.
- (4) Make a selection of a crimp tool from Table 37.
- (5) For a sleeve with a 1 hole wire seal, put the sleeve on the wires. Refer to Figure 1.
Make sure to put the end of the sleeve with the wire seal on the wires first.
- (6) For a sleeve with a 5 hole wire seal, put the sleeve on the wires. Refer to Figure 2.

Make sure to:

- Put the end of the sleeve with the wire seal on the wires first
- Put one wire in each hole of the wire seal.

- (7) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 8
- Table 55 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 8

Table 55
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-04	0.28	± 0.03
D-609-05	0.28	± 0.03

- (8) Put the splice in the crimp tool.
- (9) Hold the splice in position with light pressure.
- (10) Put each wire in the same end of the splice. Refer to Figure 9.

Make sure that the distance from the end of the wire insulation to the rear end of the splice is:

- 0.12 inch ± 0.12 inch for wires AWG 10 and smaller
- 0.18 inch ± 0.18 inch for wires AWG 8 and larger.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF EACH WIRE IN THE PARALLEL SPLICE

Figure 9

- (11) Crimp the splice.
- (12) Align the center of the sleeve with the center of the splice.
- (13) Shrink the sleeve into position. Refer to Figure 10 and Subject 20-10-14.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 10

C. Sealed Closed End Splice - Parallel Splice, Sleeve

- (1) Make a selection of a parallel splice from Table 8.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductors.
- (2) Make a selection of a sleeve from Table 9.
Make sure the sleeve is for:
 - The applicable parallel splice
 - The maximum number of wires.
- (3) Find the crimp barrel size of the splice from Table 8.
- (4) Make a selection of a crimp tool from:
 - Table 36 for AMP 3413() parallel splices
 - Table 37 for Raychem D-609-0() parallel splices.
- (5) For a sleeve with a 5 hole wire seal, put the sleeve on the wires. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure to:

- Put the end of the sleeve with the wire seal on the wires first
- Put one wire in each hole of the wire seal.

(6) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 11
- Table 57 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 11

Table 56
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-04	0.28	± 0.03
D-609-05	0.28	± 0.03
34137	0.34	± 0.03
34138	0.34	± 0.03

(7) Put the splice in the crimp tool.

(8) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 12.

POSITION OF THE PARALLEL SPLICE IN THE CRIMP TOOL
Figure 12

(9) Hold the splice in position with light pressure.

(10) Put each wire in the same end of the splice. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the distance from the end of the wire insulation to the rear end of the splice is:

- 0.12 inch \pm 0.12 inch for wires AWG 10 and smaller
- 0.18 inch \pm 0.18 inch for wires AWG 8 and larger.

POSITION OF EACH WIRE IN THE PARALLEL SPLICE

Figure 13

- (11) Crimp the splice.
- (12) Put the sleeve on the splice assembly.
Make sure to align the center of the sleeve with the center of the splice.
- (13) Shrink the sleeve into position. Refer to Figure 14 and Subject 20-10-14.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 14

D. Unsealed Insulated Closed End Splice

NOTE: A satisfactory alternative for an unsealed closed end splice is a sealed closed end splice. Refer to Paragraph 5.B. or Paragraph 5.C.

- (1) Make a selection of an insulated closed end splice from Table 7.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductors.
- (2) Find the crimp barrel size of the splice from Table 7.
- (3) Make a selection of a crimp tool from Table 35.
- (4) Remove the necessary length of insulation from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 15
- Subject 20-00-15 for the insulation removal procedures.

POSITION OF EACH WIRE IN THE SPLICE
Figure 15

- (5) Put the wire in the splice. Refer to Figure 15.

Make sure that when the wire is in the splice:

- The insulation of the splice makes a 0.1 inch minimum overlap with the wire insulation
- The wire insulation is not in the crimp barrel of the splice
- The distance from the end of the conductor to the end of the crimp barrel of the splice is 0.06 inch \pm 0.03 inch.

NOTE: The wire insulation, the crimp barrel, and the conductor can be seen through the insulation of the closed end splice.

- (6) If it is necessary, remove more insulation from the end of the wire to make a correct fit of the wire in the splice.
- (7) Put the splice in the crimp tool.
- (8) Hold the splice in position with light pressure.
- (9) Put each wire in the splice. Refer to Figure 15.
Make sure that each wire is in the correct position.
- (10) Crimp the splice. Refer to Figure 16.
Make sure that the shoulder of the insulation on the splice is against the locator of the crimp tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SPLICE IN THE CRIMP TOOL

Figure 16

(11) After the wire harness assembly is installed, examine the splice assembly.

Make sure that:

- The start of each branch is near the top side of the harness
- The end of each closed end splice is pointed up
- Each closed end splice is in the position that is ± 45 degrees from the vertical.

Refer to Figure 17.

NOTE: This configuration is not necessary for splices that are in a module.

CONFIGURATION OF THE CLOSED END SPLICES

Figure 17

E. Unsealed Closed End Splice - Parallel Splice, Sleeve

NOTE: A satisfactory alternative for an unsealed closed end splice is a sealed closed end splice. Refer to Paragraph 5.B. or Paragraph 5.C.

(1) Make a selection of an uninsulated parallel splice from Table 8.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductors.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (2) Find the crimp barrel size of the splice from Table 8.
- (3) Make a selection of a crimp tool from:
 - Table 36 for AMP 3413() parallel splices
 - Table 37 for Raychem D-609-0() parallel splices.
- (4) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 18
- Table 57 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 18

Table 57
INSULATION REMOVAL LENGTH

Parallel Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-04	0.28	± 0.03
D-609-05	0.28	± 0.03
34137	0.34	± 0.03
34138	0.34	± 0.03

- (5) Put the splice in the crimp tool.
- (6) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 19.

POSITION OF THE PARALLEL SPLICE IN THE CRIMP TOOL
Figure 19

- (7) Hold the splice in position with light pressure.
- (8) Put each wire in the same end of the splice. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the distance from the end of the wire insulation to the forward end of the splice is:

- 0.12 inch \pm 0.12 inch for wires AWG 10 and smaller
- 0.18 inch \pm 0.18 inch for wires AWG 8 and larger.

POSITION OF EACH WIRE IN THE PARALLEL SPLICE

Figure 20

- (9) Crimp the splice.
- (10) Make a selection of a Temperature Grade B heat shrinkable sleeve from Table 48. Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (11) Cut the necessary length of the sleeve. Refer to Figure 21.

NOTE: The necessary length is a minimum of 2.0 inches plus the length of the splice.

POSITION OF THE SLEEVE ON THE SPLICE ASSEMBLY

Figure 21

- (12) Put the sleeve on the splice assembly. Refer to Figure 21. Make sure that:
 - The distance from the forward end of the sleeve to the forward end of the splice is 0.40 inch \pm 0.15 inch
 - The distance from the rear end of the sleeve to the rear end of the splice is 1.00 inch \pm 0.25 inch.
- (13) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (14) After the wire harness assembly is installed, examine the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- The start of each branch is near the top side of the harness
- The end of each splice is pointed up
- Each splice is in the position that is ± 45 degrees from the vertical.

Refer to Figure 22.

NOTE: This configuration is not necessary for splices that are in a module.

CONFIGURATION OF THE CLOSED END SPLICES

Figure 22

6. UNSEALED BUTT SPLICE CONFIGURATIONS

A. Splice Assembly Configurations

For the conditions that are applicable for an unsealed butt splice, refer to Paragraph 1.A.

**Table 58
UNSEALED BUTT SPLICE CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Splice Assembly	
		Configuration	Procedure
One Wire	One Wire	Insulated Butt Splice	Paragraph 6.B.
		Uninsulated Butt Splice with Sleeve	Paragraph 6.D.
More Than One Wire	More Than One Wire	Insulated Butt Splice	Paragraph 6.C.
		Uninsulated Butt Splice with Sleeves	Paragraph 6.E.

B. One Wire to One Wire - Insulated Butt Splice

NOTE: A satisfactory alternative for an insulated butt splice on one wire is an uninsulated butt splice and sleeves on one wire. Refer to Paragraph 6.D.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (1) Make a selection of an insulated butt splice from Table 10.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the crimp barrel size of the splice from Table 10.
- (3) Make a selection of a crimp tool from Table 38.
- (4) Remove the necessary length of insulation from the end of each wire. Refer to Subject 20-00-15.
- (5) For butt splices with an insulation grip, put the wire in the splice.

Refer to:

- Figure 23 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 24 for the position of the wire in the splice with the wire insulation out of the insulation grip

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- If the wire insulation can go into the insulation grip, the insulation grip makes an overlap with the wire insulation
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The splice insulation makes an overlap with the wire insulation.

NOTE: The wire insulation, the crimp barrel, and the conductor can be seen through the insulation of the butt splice.

POSITION OF THE WIRE IN THE SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 23

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE WIRE IN THE SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 24

(6) For butt splices without an insulation grip, put the wire in the splice. Refer to Figure 25.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel
- The splice insulation makes an overlap with the wire insulation.

NOTE: The wire insulation, the crimp barrel, and the conductor can be seen through the insulation of the butt splice.

POSITION OF THE WIRE IN THE INSULATED BUTT SPLICE

Figure 25

(7) If it is necessary, remove more insulation from the wire to make a correct fit of the wire in the splice.

(8) Assemble one end of the splice.

- (a) Put the splice in the crimp tool.
- (b) Hold the splice in position with light pressure.
- (c) Put the wire in the end of the splice.
Make sure that the wire is in the correct position.
- (d) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(9) Do Step (8) again to assemble the other end of the splice.

C. More Than One Wire to More Than One Wire - Insulated Butt Splice

NOTE: A satisfactory alternative for an insulated butt splice on more than one wire is an uninsulated butt splice and sleeves on more than one wire. Refer to Paragraph 6.E.

(1) Make a selection of an insulated butt splice from Table 10.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

(2) Find the crimp barrel size of the splice from Table 10.

(3) Make a selection of a crimp tool from Table 38.

(4) Remove the necessary length of insulation from the end of each wire. Refer to Subject 20-00-15.

(5) For butt splices with an insulation grip, put the wires in the splice. Refer to Figure 26.

Make sure that for each wire:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- If the wire insulation can go into the insulation grip, the insulation grip makes an overlap with the wire insulation
- If the wire insulation can go into the splice insulation, the splice insulation makes an overlap with the wire insulation
- If the wire insulation of a AWG 10 and smaller wire cannot go into the splice insulation, the end of the wire insulation is a maximum of 0.25 inch from the end of the splice insulation
- If the wire insulation of a AWG 8 and larger wire cannot go into the splice insulation, the end of the wire insulation is a maximum of 0.37 inch from the end of the splice insulation.

NOTE: The wire insulation, the crimp barrel, and the conductor can be seen through the insulation of the butt splice.

POSITION OF THE WIRES IN THE INSULATED BUTT SPLICE WITH AN INSULATION GRIP

Figure 26

(6) For butt splices without an insulation grip, put the wires in the splice. Refer to Figure 27.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that for each wire:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- If the wire insulation can go into the splice insulation, the splice insulation makes an overlap with the wire insulation
- If the wire insulation of a AWG 10 and smaller wire cannot go into the splice insulation, the end of the wire insulation is a maximum of 0.25 inch from the end of the splice insulation
- If the wire insulation of a AWG 8 and larger wire cannot go into the splice insulation, the end of the wire insulation is a maximum of 0.37 inch from the end of the splice insulation.

NOTE: The wire insulation, the crimp barrel, and the conductor can be seen through the insulation of the butt splice.

POSITION OF THE WIRE IN THE INSULATED BUTT SPLICE
Figure 27

- (7) If it is necessary, remove more insulation from the wire to make a correct fit of the wire in the splice.
- (8) If the end of a wire insulation is not in the splice insulation, put a sleeve on the splice assembly.
 - (a) Make a selection of a Temperature Grade B sleeve. Refer to Table 48.
 Make sure that the sleeve has the smallest diameter that can be put on the wires and the splice.
 - (b) Cut a length of the sleeve.
 Make sure that the sleeve makes a 0.8 inch minimum overlap with the wire insulation on each wire on each end of the splice assembly.
 - (c) Put the sleeve on the wires on one side of the splice assembly.
- (9) Assemble one end of the splice.
 - (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wires in the end of the splice.
 Make sure that the wires are in the correct position.
 - (d) Crimp the splice.
- (10) Do Step (9) again to assemble the other end of the splice.
- (11) If a sleeve is on the wires, install the sleeve on the splice assembly.
 - (a) Align the center of the sleeve with the center of the splice.
 - (b) Shrink the sleeve into position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

D. One Wire to One Wire - Butt Splice, Sleeves

NOTE: A satisfactory alternative for an uninsulated butt splice and sleeves on one wire is an insulated butt splice on one wire. Refer to Paragraph 6.B.

- (1) Make a selection of an uninsulated butt splice from Table 12 or Table 14.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from Table 41.
- (4) Make a selection of a Temperature Grade B heat shrinkable sleeve from Table 48.
Make sure that the sleeve has the smallest diameter that can be put on the wire and the splice.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (5) Cut a 4.0 inch ± 0.2 inch length of the sleeve.
- (6) For an AWG 8 and larger wire, cut one more piece of the sleeve that is 2.4 inches ± 0.2 inch in length.
- (7) Put the sleeves on the end of one of the wires.
- (8) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 28
- Table 59 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 28

Table 59
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C12	0.35	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 59 (continued)

Splice	Removal Length L (inch)	
	Target	Tolerance
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (9) Assemble one end of the butt splice:
 - (a) Put the splice in the crimp tool.
 - (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 29.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 29

- (c) Hold the splice in position with light pressure.
- (d) Put the wire in the end of the splice. Refer to Figure 30.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRE IN THE SPLICE
Figure 30

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (e) Crimp the splice.
- (10) Do Step (9) again to assemble the other end of the butt splice.
- (11) For an AWG 10 and smaller wire:
 - (a) Align the center of the sleeve with the center of the splice. Refer to Figure 31.
Make sure that the sleeve makes a 0.88 inch minimum overlap with the wire insulation on each end of the splice assembly.

POSITION OF THE SLEEVE ON THE SPLICE ASSEMBLY WITH AWG 10 AND SMALLER WIRE
Figure 31

- (b) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (12) For an AWG 8 and larger wire:
 - (a) Align the center of the short sleeve with the center of the splice. Refer to Figure 32.
Make sure that the short sleeve makes a 0.13 inch minimum overlap with the wire insulation on each end of the splice assembly.

POSITION OF THE SLEEVES ON THE SPLICE ASSEMBLY WITH AWG 8 AND LARGER WIRE
Figure 32

- (b) Shrink the short sleeve in position. Refer to Subject 20-10-14.
 - (c) Align the center of the long sleeve with the center of the splice. Refer to Figure 32.
Make sure that the long sleeve makes a 0.88 inch minimum overlap with the wire insulation on each end of the splice assembly.
 - (d) Shrink the long sleeve into position. Refer to Subject 20-10-14.
- E. More Than One Wire to More Than One Wire - Butt Splice, Sleeves**

NOTE: A satisfactory alternative for an uninsulated butt splice and sleeves on more than one wire is an insulated butt splice on more than one wire. Refer to Paragraph 6.C.

- (1) Make a selection of an uninsulated butt splice from Table 12 or Table 14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the splice has the smallest CAU size that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductors.

- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from Table 41.
- (4) Make a selection of a Temperature Grade B heat shrinkable sleeve from Table 48.

Make sure that the sleeve has the smallest diameter that can be put on the wires and the splice.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (5) Cut a 4.0 inch ± 0.2 inch length of the sleeve.
- (6) Cut one more piece of sleeve that is 2.4 inches ± 0.2 inch in length.
- (7) Put the sleeves on the end of one of the wires.
- (8) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 33
- Table 60 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 33

Table 60
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C12	0.47	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (9) Assemble one end of the butt splice:

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 34.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 34

- (c) Hold the splice in position with light pressure.
- (d) Put the wires in the end of the splice. Refer to Figure 35.

Make sure that:

- The end of the each conductor can be seen in the inspection hole
- The end of the each conductor does not make an overlap with the wire stop
- The wire insulation is not in the crimp barrel
- For AWG 10 and smaller wires, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel
- For AWG 8 and larger wires, the end of the wire insulation is a maximum of 0.37 inch from the end of the crimp barrel.

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 35

- (e) Crimp the splice.
- (10) Do Step (9) again to assemble the other end of the butt splice.
- (11) Align the center of the short sleeve with the center of the splice. Refer to Figure 36.

Make sure that the short sleeve makes a 0.13 inch minimum overlap with each wire insulation on each end of the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SLEEVES ON THE SPLICE ASSEMBLY

Figure 36

- (12) Shrink the short sleeve into position. Refer to Subject 20-10-14.
- (13) Align the center of the long sleeve with the center of the splice. Refer to Figure 36.
Make sure that the long sleeve makes a 0.88 inch minimum overlap with the wire insulation on each end of the splice assembly.
- (14) Shrink the long sleeve into position. Refer to Subject 20-10-14.

7. SEALED SPLICE CONFIGURATIONS FOR UNSHIELDED WIRES AND UNSHIELDED CABLES

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

To calculate the CAU of the conductor, refer to Table 4.

**Table 61
SEALED SPLICE ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	CAU Range		Applicable Condition	Splice Assembly	
		Minimum	Maximum		Configuration	Procedure
One Wire	One Wire	3	457	Fuel Vapor	Tape, Ties	Paragraph 7.B.
				No Fuel Vapor	Tape, Ties	Paragraph 7.B.
				Fuel Vapor	Sealant, Sleeve, Ties	Paragraph 7.C.
				No Fuel Vapor	Sealant, Sleeve, Ties	Paragraph 7.C.
One Wire	Two Wires	3	457	Fuel Vapor	Tape, Ties	Paragraph 7.D.
				No Fuel Vapor	Tape, Ties	Paragraph 7.D.
Two Wires	Two Wires	3	457	Fuel Vapor	Tape, Ties	Paragraph 7.E.
				No Fuel Vapor	Tape, Ties	Paragraph 7.E.
One or Two Wires	One or Two Wires	3	67	No Fuel Vapor	Splice Kit	Paragraph 7.F.
		3	457	No Fuel Vapor	Sleeve	Paragraph 7.G.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 61 (continued)

One End of Splice Assembly	Other End of Splice Assembly	CAU Range		Applicable Condition	Splice Assembly	
		Minimum	Maximum		Configuration	Procedure
One to Five Wires	One to Five Wires	3	457	No Fuel Vapor	Sleeve - 3 to 5 Hole Wire Seal	Paragraph 7.I.
		19	67	No Fuel Vapor	Splice Kit - 3 Hole Wire Seal	Paragraph 7.H.
One Cable	One Cable	3	457	Fuel Vapor	Tape, Ties	Paragraph 7.J.
				No Fuel Vapor	Tape, Ties	Paragraph 7.J.
					Tape, Sleeve	Paragraph 7.K.

B. One Wire to One Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 37

Refer to Figure 37.

- (1) Make a selection of a butt splice from Table 12 or Table 14.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 38
- Table 62 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 38

Table 62
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

(6) Assemble one end of the butt splice.

- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 39.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL

Figure 39

- (c) Hold the splice in position with light pressure.
- (d) Put the wire in the splice. Refer to Figure 40.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For an AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For an AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRE IN THE BUTT SPLICE

Figure 40

- (e) Crimp the splice.
- (7) Do Step (6) again to assemble the other end of the butt splice.
- (8) Put three layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

NOTE: An alternative to the first layer of tape is two layers of Temperature Grade D insulation film strip from Table 50.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- The layer of tape or each layer of film strip starts 0.5 inch minimum farther than the end of the wire insulation
- The layer of tape or each layer of film strip stops 0.5 inch minimum farther than the end of the wire insulation at the other end of the splice assembly
- The layer of tape or each layer of film strip makes a 50 percent overlap
- The second layer of film strip is wound in the opposite direction of the first layer.

(b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than the end of the first layer of tape
- Stops 1 inch minimum farther than the end of the first layer of tape at the other end of the splice assembly
- Makes a minimum 50 percent overlap.

(c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.

Make sure that the layer:

- Starts where the second layer stops
- Stops where the second layer starts
- Makes a 50 percent overlap.

(9) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

C. One Wire to One Wire - Sealant, Sleeve, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**Table 63
NECESSARY MATERIALS**

Material	Part Number	Diameter (inch)	Color	Supplier
Sleeve	Versafit	1/4	Yellow	Raychem
		5/16	Yellow	Raychem
Sealant	BMS 5-63, Type II, Class B-1/2, Form A	-	-	Boeing
	BMS 5-95, Type II, Class B-1/2	-	-	Boeing
	BMS 5-95, Type II, Class B-2	-	-	Boeing

(1) Make a selection of a sleeve from Table 63.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

(2) Make a selection of a sealant from Table 63.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (3) Make a selection of a butt splice from Table 12 or Table 14.
 Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
 Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (4) Cut a length of sleeve a minimum of 3.00 inches longer than the splice.
- (5) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (6) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (7) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 41
- Table 64 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 41

Table 64
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 64 (continued)

Splice	Removal Length L (inch)	
	Target	Tolerance
NAS1387-6	0.28	± 0.03

- (8) Put the length of sleeve on one of the two wires that are to be spliced together.
- (9) Assemble one end of the butt splice.
 - (a) Put the splice in the crimp tool.
 - (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 42.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 42

- (c) Hold the splice in position with light pressure.
- (d) Put the wire in the splice. Refer to Figure 43.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For an AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For an AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRE IN THE BUTT SPLICE
Figure 43

- (e) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (10) Do Step (9) again to assemble the other end of the butt splice.
- (11) Apply a continuous layer of the sealant on the area of the splice. Refer to Figure 44.

Make sure that:

- The splice has a full layer of sealant on the length and the circumference of the splice surface
- The sealant extends a minimum of 1.5 inches farther than each end of the splice.

CONFIGURATION OF THE SEALANT ON THE SPLICE

Figure 44

- (12) Slowly push the sleeve until the center of the sleeve is aligned with the center of the butt splice.

POSITION OF THE SLEEVE ON THE SEALANT

Figure 45

- (13) Apply pressure with the fingers to the sleeve to push the air bubbles out.
- (14) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the sleeve.

Refer to:

- Subject 20-10-11 for the procedure to assemble a wire harness tie
- Figure 46 for the position of the wire harness ties.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

POSITION OF THE WIRE HARNESS TIES ON THE SLEEVE

Figure 46

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

D. One Wire to Two Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 47

Refer to Figure 47.

- (1) Make a selection of a butt splice from Table 12 or Table 14.
 Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
 Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
 - (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
 - (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
 - (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
 Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
 - (5) Remove the necessary length of insulation from the end of each wire.
- Refer to:
- Figure 48
 - Table 65 for the insulation removal length
 - Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

INSULATION REMOVAL LENGTH
Figure 48

Table 65
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03

NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (6) Wind a layer of the insulation tape on each of the two wires for the side of the splice with two wires. Make sure that:
 - The edge of the tape is aligned with the end of the wire insulation
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (7) Assemble one end of the butt splice.
 - (a) Put the splice in the crimp tool.
 - (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 49.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL

Figure 49

- (c) Hold the splice in position with light pressure.
- (d) Put the wire or wires in the splice. Refer to Figure 50.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRES IN THE BUTT SPLICE

Figure 50

- (e) Crimp the splice.
- (8) Do Step (7) again to assemble the other end side of the butt splice.
- (9) Put three layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts 0.5 inch minimum farther than the end of the wire insulation on the side of the splice with one wire
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- The layer of tape makes a 50 percent overlap.

- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts 1 inch minimum farther than the end of the first layer
- Stops 1 inch minimum farther than the end of the first layer at the other end of the splice assembly
- Makes a minimum 50 percent overlap.

- (c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.

Make sure that the layer:

- Starts where the second layer stops
- Stops where the second layer starts
- Makes a 50 percent overlap.

- (10) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

E. Two Wires to Two Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 51

Refer to Figure 51.

- (1) Make a selection of a butt splice from Table 12 or Table 14.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 52
- Table 66 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 52

Table 66
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(6) Wind a layer of the insulation tape on each wire.

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(7) Assemble one end of the butt splice.

(a) Put the splice in the crimp tool.

(b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 53.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL

Figure 53

(c) Hold the splice in position with light pressure.

(d) Put the wire or wires in the splice. Refer to Figure 54.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRES IN THE BUTT SPLICE

Figure 54

(e) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (8) Do Step (7) again to assemble the other end side of the butt splice.
- (9) Put three layers of insulation tape on the splice assembly.
- (a) Tightly wind the first layer of tape on the splice assembly.
- Make sure that the layer:
- Starts at the rear end of the layers of tape on the two wires on one end of the splice assembly
 - Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
 - Makes a 50 percent overlap.
- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.
- Make sure that the layer:
- Starts 1 inch minimum farther than where the first layer stops
 - Stops 1 inch minimum farther than where the first layer starts
 - Makes a 50 percent overlap.
- (c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.
- Make sure that the layer:
- Starts where the second layer stops
 - Stops where the second layer starts
 - Makes a 50 percent overlap.
- (10) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
- Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

F. One or Two Wires to One or Two Wires - Splice Kit

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
 - The selection of the correct sealed splice configuration, refer to Paragraph 1.C.
- (1) Make a selection of a sealed splice kit with 1 hole in the wire seal from Table 19.
- Make sure that:
- The sleeve can make a seal on the number of wires in one end of the splice
 - The splice kit has the smallest CAU range that can accept the total CAU of the conductor.
- Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the part number of the butt splice in the splice kit from Table 20.
- (3) Find the crimp barrel size of the splice from Table 20.
- (4) Make a selection of a crimp tool from Table 43.
- (5) Put the sleeve on the one or two wires of one end of the splice assembly.
- (6) Remove the necessary length of insulation from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 55
- Table 67 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 55

Table 67
INSULATION REMOVAL LENGTH

Butt Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03

- (7) Assemble one end of the butt splice.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put all of the wires for one end of the splice in the crimp barrel. Refer to Figure 56 and Figure 57.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The insulation of each wire is not in the crimp barrel
- For one wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For two wires, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF ONE WIRE IN THE BUTT SPLICE
Figure 56

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF TWO WIRES IN THE BUTT SPLICE
Figure 57

- (d) Crimp the splice.
- (8) Do Step (7) again to assemble the other end of the butt splice.
- (9) Align the center of the sleeve with the center of the butt splice. Refer to Figure 58 and Figure 59.

POSITION OF THE SLEEVE ON ONE WIRE
Figure 58

POSITION OF THE SLEEVE ON TWO WIRES
Figure 59

- (10) Shrink the sleeve into position. Refer to Subject 20-10-14.
 Make sure that the seal material that comes out of the ends of the sleeve does not have rough edges.

G. One or Two Wires to One or Two Wires - Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

- (1) Make a selection of a butt splice from Table 12 or Table 14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a sleeve with 1 hole in the wire seal from Table 18.

Make sure that:

- The sleeve can make a seal on the number of wires in one end of the splice
 - The sleeve has the smallest diameter that can be moved easily on the wires, if the sleeve is a DWP-125 sleeve.
- (5) If the sleeve is a DWP-125 sleeve, cut the sleeve to the necessary length.
Make sure that the sleeve extends a minimum of 0.8 inch farther than each end of the splice.
 - (6) Put the sleeve on all the wires of one end of the splice assembly.
 - (7) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 60
- Table 68 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 60

Table 68
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 68 (continued)

Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (8) Assemble one end of the butt splice.
- (a) Put the splice in the crimp tool.
 - (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 61.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL

Figure 61

- (c) Hold the splice in position with light pressure.
- (d) Put the wire or wires for one end of the splice in the crimp barrel. Refer to Figure 62 and Figure 63.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The insulation of each wire is not in the crimp barrel
- For one AWG 10 or smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For one AWG 8 or larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel
- For two wires, the end of the insulation of each AWG 10 or smaller wire is a maximum of 0.25 inch from the end of the crimp barrel
- For two wires, the end of the insulation of each AWG 8 or larger wire is a maximum of 0.37 inch from the end of the crimp barrel.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF ONE WIRE IN THE BUTT SPLICE
Figure 62

POSITION OF TWO WIRES IN THE BUTT SPLICE
Figure 63

- (e) Crimp the splice.
- (9) Do Step (8) again to assemble the other end of the butt splice.
- (10) Align the center of the sleeve with the center of the butt splice. Refer to Figure 64 and Figure 65.

POSITION OF THE SLEEVE ON ONE WIRE
Figure 64

POSITION OF THE SLEEVE ON TWO WIRES
Figure 65

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (11) Shrink the sleeve into position. Refer to Subject 20-10-14.

Make sure that the seal material that comes out of the ends of the sleeve does not have rough edges.

H. One to Five Wires to One to Five Wires - Splice Kit

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

- (1) Make a selection of a sealed splice kit with 3 holes in the wire seal from Table 19.

Make sure that the splice kit has the smallest CAU range that can accept the total CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) Find the part number of the butt splice in the splice kit from Table 20.
- (3) Find the crimp barrel size of the splice from Table 20.
- (4) Make a selection of a crimp tool from Table 43.
- (5) Put the sleeve on all the wires of one end of the splice assembly. Refer to Figure 5 and Figure 66.

Make sure that:

- The end of the sleeve with the integral wire seal goes on the wires first
- No more than two wires are in one hole of the wire seal.

**SLEEVE ON THE WIRES****Figure 66**

- (6) Put the separate 3 hole wire seal on all the wires of the other end of the splice assembly. Refer to Figure 5 and Figure 67.

Make sure that no more than two wires are in one hole of the wire seal.

**SEPARATE WIRE SEAL ON THE WIRES****Figure 67**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(7) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 68
- Table 69 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 68

Table 69
INSULATION REMOVAL LENGTH

Butt Splice	Removal Length L (inch)	
	Target	Tolerance
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03

(8) Assemble one end of the butt splice.

- (a) Put the splice in the crimp tool.
- (b) Hold the splice in position with light pressure.
- (c) Put all of the wires for one end of the splice in the crimp barrel. Refer to Figure 69 and Figure 70.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The insulation of each wire is not in the crimp barrel
- For one wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For more than one wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF ONE WIRE IN THE BUTT SPLICE

ASSEMBLY OF SPLICES

POSITION OF MORE THAN ONE WIRE IN THE BUTT SPLICE
Figure 70

- (d) Crimp the splice.
- (9) Do Step (8) again to assemble the other end of the butt splice. Refer to Figure 71.

CRIMPED SPLICE ASSEMBLY
Figure 71

- (10) Align the center of the sleeve with the center of the butt splice.
- (11) Push the separate 3 hole wire seal fully into the sleeve until it is as near the splice as possible. Refer to Figure 72.

POSITION OF THE SLEEVE AND THE WIRE SEAL
Figure 72

- (12) Shrink the sleeve into position. Refer to Subject 20-10-14.
 Make sure that the seal material that comes out of the ends of the sleeve does not have rough edges.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES****I. One to Five Wires to One to Five Wires - Sleeve**

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

(1) Make a selection of a butt splice from Table 12 or Table 14.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

(2) Find the crimp barrel size of the splice from Table 12 or Table 14.

(3) Make a selection of a crimp tool from:

- Table 41 for BACT12C() splices
- Table 42 for NAS1387-() splices
- Table 43 for BACS52K() splices
- Table 43 for Raychem D-609-0() splices.

(4) Make a selection of a sleeve with 3 to 5 holes in the wire seal from Table 18.

Make sure that the selection is for:

- The applicable splice
- The maximum number of wires in each end of the splice assembly.

(5) Put the sleeve on all the wires of one end of the splice assembly. Refer to Figure 3 and Figure 73.

Make sure that:

- The end of the sleeve with the integral wire seal goes on the wires first
- No more than two wires are in one hole of the wire seal.

**SLEEVE ON THE WIRES****Figure 73**

(6) Put the separate wire seal with 3 to 5 holes on all the wires of the other end of the splice assembly. Refer to Figure 3 and Figure 74.

Make sure that no more than two wires are in one hole of the wire seal.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SEPARATE WIRE SEAL ON THE WIRES

Figure 74

(7) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 75
- Table 70 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

Figure 75

**Table 70
INSULATION REMOVAL LENGTH**

NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

(8) Assemble one end of the butt splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 76.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 76

- (c) Hold the splice in position with light pressure.
- (d) Put all of the wires for one end of the splice in the crimp barrel. Refer to Figure 77 and Figure 78.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The insulation of each wire is not in the crimp barrel
- For one AWG 10 or smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For one AWG 8 or larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel
- For two wires, the end of the insulation of each AWG 10 or smaller wire is a maximum of 0.25 inch from the end of the crimp barrel
- For two wires, the end of the insulation of each AWG 8 or larger wire is a maximum of 0.37 inch from the end of the crimp barrel.

Figure 77

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF MORE THAN ONE WIRE IN THE BUTT SPLICE
Figure 78

- (e) Crimp the splice.
- (9) Do Step (8) again to assemble the other end of the butt splice.

CRIMPED SPLICE
Figure 79

- (10) Align the center of the sleeve with the center of the butt splice.
- (11) Push the wire seal with 3 to 5 holes fully into the sleeve until it is as near the splice as possible.

POSITION OF THE SLEEVE AND THE WIRE SEAL
Figure 80

- (12) Shrink the sleeve into position. Refer to Subject 20-10-14.
 Make sure that the seal material that comes out of the ends of the sleeve does not have rough edges.

J. One Cable to One Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE CABLE SPLICE ASSEMBLY

Figure 81

Refer to Figure 81.

(1) Prepare the cable.

Refer to:

- Figure 82
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on a different wire is 2.38 inches \pm 0.25 inch.

CABLE PREPARATION

Figure 82

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Assemble the sealed splices on the wires in the cable. Refer to Paragraph 7.B.
- (4) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts 1 inch minimum farther than the end of the outer jacket
- Stops 1 inch minimum farther than the end of the outer jacket at the other end of the splice assembly
- Makes a minimum 50 percent overlap.

(b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

(5) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

K. One Cable to One Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE CABLE SPLICE ASSEMBLY

Figure 83

Refer to Figure 83.

(1) Prepare the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 84
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

CABLE PREPARATION
Figure 84

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Make a selection of a Temperature Grade B heat shrinkable sleeve from Table 48.

Make sure that the sleeve has the smallest diameter that can move easily on the cable splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Cut the necessary length of the sleeve.
Make sure that the sleeve can make a minimum overlap of 1 inch on each end of the outer jacket.
- (5) Put the sleeve on the cable of one end of the splice assembly.
- (6) Calculate the CAU of the conductors. Refer to Paragraph 1.D.
- (7) Assemble the sealed splices on the wires in the cable.
Refer to Table 61 for an applicable sealed splice configuration on wire.
- (8) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.
Make sure that the layer:
 - Makes an overlap between 0.50 inch and 0.75 inch on each end of the outer jacket
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

(9) Align the center of the sleeve with the center of the splice assembly.

Make sure that on each end of the splice assembly, the distance from the end of the layer of tape to the end of the sleeve is 0.25 inch minimum.

(10) Shrink the sleeve into position. Refer to Subject 20-10-14.

8. SEALED SPLICE CONFIGURATIONS FOR UNSHIELDED WIRES AND UNSHIELDED CABLES FOR HIGH TEMPERATURE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

To calculate the CAU of the conductor, refer to Table 4.

**Table 71
SEALED SPLICE ASSEMBLY CONFIGURATIONS FOR HIGH TEMPERATURE**

One End of Splice Assembly	Other End of Splice Assembly	CAU Range		Applicable Condition	Splice Assembly	
		Minimum	Maximum		Configuration	Procedure
One Wire	One Wire	5	138	Fuel Vapor	Tape, Ties	Paragraph 8.B.
				No Fuel Vapor	Tape, Sleeve	Paragraph 8.C.
					Tape, Ties	Paragraph 8.B.
One Wire	Two Wires	5	138	Fuel Vapor	Tape, Ties	Paragraph 8.D.
				No Fuel Vapor	Tape, Sleeve	Paragraph 8.E.
					Tape, Ties	Paragraph 8.D.
Two Wires	Two Wires	5	138	Fuel Vapor	Tape, Ties	Paragraph 8.F.
				No Fuel Vapor	Tape, Sleeve	Paragraph 8.G.
					Tape, Ties	Paragraph 8.F.
One Cable	One Cable	5	138	Fuel Vapor	Tape, Ties	Paragraph 8.H.
				No Fuel Vapor	Tape, Sleeve	Paragraph 8.I.
					Tape, Ties	Paragraph 8.H.

B. One Wire to One Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 85

Refer to Figure 85.

- (1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

Refer to:

- Table 15 for the minimum CAU of the butt splice
- Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.

- (3) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

- (4) Find the crimp barrel size of the splice from Table 15.
- (5) Make a selection of a crimp tool from Table 44.
- (6) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (7) Remove the necessary length of insulation from the end of the wires.

Refer to:

- Figure 86
- Table 72 for the insulation removal length for a wire that can go into the insulation grip
- Table 73 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 86

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 72
INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

**Table 73
INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

- (8) Assemble one end of the butt splice.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wire in the splice.

Refer to:

- Figure 87 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 88 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 87

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 88

- (d) Crimp the splice.
- (9) Do Step (8) again to assemble the other end of the butt splice.
- (10) Put three layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

NOTE: An alternative to the first layer of tape is two layers of Temperature Grade D insulation film strip from Table 50.

Make sure that:

- The layer of tape or each layer of film strip starts 0.6 inch minimum farther than the end of the splice
 - The layer of tape or each layer of film strip stops 0.6 inch minimum farther than the end of the splice at the other end of the splice assembly
 - The layer of tape or each layer of film strip makes a 50 percent overlap
 - The second layer of film strip is wound in the opposite direction of the first layer.
- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 1 inch minimum farther than the end of the first layer of tape
- Stops 1 inch minimum farther than the end of the first layer of tape at the other end of the splice assembly
- Makes a minimum 50 percent overlap.

- (c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.

Make sure that the layer of tape:

- Starts where the second layer of tape stops
- Stops where the second layer of tape starts
- Makes a 50 percent overlap.

- (11) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

C. One Wire to One Wire - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 89

Refer to Figure 89.

- (1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

Refer to:

- Table 15 for the minimum CAU of the butt splice
- Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.

- (3) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

- (4) Find the crimp barrel size of the splice from Table 15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (5) Make a selection of a crimp tool from Table 44.
- (6) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (7) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.
Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (8) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1.1 inches farther than each end of the splice.
- (9) Put the sleeve on the wire of one end of the splice assembly.
- (10) Remove the necessary length of insulation from the end of the wires.

Refer to:

- Figure 90
- Table 74 for the insulation removal length for a wire that can go into the insulation grip
- Table 75 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 90

Table 74
INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

Table 75
INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

- (11) Assemble one end of the butt splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (a) Put the splice in the crimp tool.
- (b) Hold the splice in position with light pressure.
- (c) Put the wire in the splice.

Refer to:

- Figure 91 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 92 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- The end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 91

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 92

- (d) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (12) Do Step (11) again to assemble the other end of the butt splice.
- (13) Put two layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

 - Starts 0.6 inch minimum to 0.85 inch maximum farther than the end of the splice
 - Stops 0.6 inch minimum to 0.85 inch maximum farther than the other end of the splice
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

 - Starts where the first layer stops
 - Stops where the first layer starts
 - Makes a 50 percent overlap.
- (14) Align the center of the sleeve with the center of the butt splice.
- (15) Shrink the sleeve into position. Refer to Subject 20-10-14.

D. One Wire to Two Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 93

Refer to Figure 93.

- (1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Table 15 for the minimum CAU of the butt splice
 - Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.
- (3) Make a selection of a butt splice from Table 15.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
 - (4) Find the crimp barrel size of the splice from Table 15.
 - (5) Make a selection of a crimp tool from Table 44.
 - (6) Make a selection of a Temperature Grade D insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
 - (7) Prepare each wire for the side of the splice assembly with two wires.

INSULATION REMOVAL LENGTH
Figure 94

Table 76
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 95

- (a) Remove the necessary length of insulation from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 94
- Table 76 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

(b) Put the wires in the splice. Refer to Figure 95.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

(c) If it is necessary, remove more insulation from the end of the wire to make the wire fit correctly in the splice.

(d) Wind a layer of the insulation tape on each wire. Refer to Figure 95.

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(8) Remove the necessary length of insulation from the end of the wire for the side of the splice assembly with one wire.

Refer to:

- Figure 94
- Table 77 for the insulation removal length for a wire that can go into the insulation grip
- Table 78 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

**Table 77
INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

**Table 78
INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 78 (continued)

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C20	0.30	± 0.02

- (9) Assemble the end of the butt splice with two wires.
 - (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wires in the splice. Refer to Figure 95.
Make sure that the wires are in the correct position.
 - (d) Crimp the splice.
- (10) Assemble the end of the butt splice with one wire.
 - (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wire in the splice.

Refer to:

- Figure 96 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 97 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 96

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 97

- (d) Crimp the splice.
- (11) Put three layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

 - Starts 0.6 inch minimum farther than the end of the splice on the side with one wire
 - Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

 - Starts 1 inch minimum farther than where the first layer stops on the side with two wires
 - Stops 1 inch minimum farther than where the first layer starts on the side with one wire
 - Makes a 50 percent overlap.
 - (c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.

Make sure that the layer:

 - Starts where the second layer stops
 - Stops where the second layer starts
 - Makes a 50 percent overlap.
- (12) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

E. One Wire to Two Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 98

Refer to Figure 98.

- (1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

Refer to:

- Table 15 for the minimum CAU of the butt splice
- Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.

- (3) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

- (4) Find the crimp barrel size of the splice from Table 15.

- (5) Make a selection of a crimp tool from Table 44.

- (6) Make a selection of a Temperature Grade D insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

- (7) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (8) Cut the necessary length of the sleeve.

Make sure that the sleeve extends a minimum of 1.5 inches farther than each end of the splice.

- (9) Put the sleeve on the wires of one end of the splice assembly.

- (10) Prepare each wire for the side of the splice assembly with two wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

INSULATION REMOVAL LENGTH
Figure 99

Table 79
INSULATION REMOVAL LENGTH

BACT12C20	0.30	± 0.02

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 100

- (a) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 99
- Table 79 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

- (b) Put the wires in the splice. Refer to Figure 100.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

- (c) If it is necessary, remove more insulation from the end of the wire to make the wire fit correctly in the splice.

- (d) Wind a layer of the insulation tape on each wire. Refer to Figure 100.

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

- (11) Remove the necessary length of insulation from the end of the wire for the side of the splice assembly with one wire.

Refer to:

- Figure 99
- Table 80 for the insulation removal length for a wire that can go into the insulation grip
- Table 81 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

Table 80

INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

Table 81

INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)

BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

- (12) Assemble the end of the butt splice with two wires.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wires in the splice. Refer to Figure 100.
Make sure that the wires are in the correct position.
 - (d) Crimp the splice.
- (13) Assemble the end of the butt splice with one wire.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wire in the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 101 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 102 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 101

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 102

- (d) Crimp the splice.
- (14) Put two layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts 0.6 inch minimum farther than the end of the splice on the side with one wire
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- Makes a 50 percent overlap.

(b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

(15) Align the center of the sleeve with the center of the butt splice.

(16) Shrink the sleeve into position. Refer to Subject 20-10-14.

F. Two Wires to Two Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 103

Refer to Figure 103.

(1) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

(2) Find the crimp barrel size of the splice from Table 15.

(3) Make a selection of a crimp tool from Table 44.

(4) Make a selection of a Temperature Grade D insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

(5) Remove the necessary length of insulation from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 104
- Table 82 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 104

Table 82
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

(6) Put the wires in the splice. Refer to Figure 105.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 105

- (7) If it is necessary, remove more insulation from the end of the wire to make the wire fit correctly in the splice.
- (8) Wind a layer of the insulation tape on each wire. Refer to Figure 105.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(9) Assemble one end of the butt splice.

- (a) Put the splice in the crimp tool.
- (b) Hold the splice in position with light pressure.
- (c) Put the wires in the splice. Refer to Figure 105.

Make sure that the wires are in the correct position.

(d) Crimp the splice.

(10) Do Step (9) again to assemble the other end of the butt splice.

(11) Put three layers of insulation tape on the splice assembly.

(a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

- Starts at the rear end of the layers of tape on the two wires on one end of the splice assembly
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- Makes a 50 percent overlap.

(b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts 1 inch minimum farther than where the first layer stops
- Stops 1 inch minimum farther than where the first layer starts
- Makes a 50 percent overlap.

(c) Tightly wind the third layer of tape on the splice assembly in the opposite direction of the second layer.

Make sure that the layer:

- Starts where the second layer stops
- Stops where the second layer starts
- Makes a 50 percent overlap.

(12) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

G. Two Wires to Two Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 106

Refer to Figure 106.

- (1) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) Find the crimp barrel size of the splice from Table 15.

- (3) Make a selection of a crimp tool from Table 44.

- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

- (5) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

Make sure that the sleeve has the smallest diameter that can be put on the splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Cut the necessary length of the sleeve.

Make sure that the sleeve extends a minimum of 1.5 inches farther than each end of the splice.

- (7) Put the sleeve on the wires of one end of the splice assembly.

- (8) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 107
- Table 83 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

Figure 107

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 83
INSULATION REMOVAL LENGTH**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

(9) Put the wires in the splice. Refer to Figure 108.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

**POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 108**

(10) If it is necessary, remove more insulation from the end of the wire to make the wire fit correctly in the splice.

(11) Wind a layer of the insulation tape on each wire. Refer to Figure 108.

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(12) Assemble one end of the butt splice.

- Put the splice in the crimp tool.
- Hold the splice in position with light pressure.
- Put the wires in the splice. Refer to Figure 108.

Make sure that the wires are in the correct position.

(d) Crimp the splice.

(13) Do Step (12) again to assemble the other end of the butt splice.

(14) Put two layers of insulation tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

- Starts at the rear end of the layers of tape on the two wires on one end of the splice assembly
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- Makes a 50 percent overlap.

- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

- (15) Align the center of the sleeve with the center of the butt splice.

- (16) Shrink the sleeve in position. Refer to Subject 20-10-14.

H. One Cable to One Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE CABLE SPLICE ASSEMBLY
Figure 109

Refer to Figure 109.

- (1) Prepare the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 110
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

CABLE PREPARATION
Figure 110

- (2) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (3) Assemble the sealed splices on the wires in the cable. Refer to Paragraph 8.B.
- (4) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

 - Starts 1 inch minimum farther than the end of the outer jacket
 - Stops 1 inch minimum farther than the end of the outer jacket at the other end of the splice assembly
 - Makes a minimum 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

 - Starts where the first layer stops
 - Stops where the first layer starts
 - Makes a 50 percent overlap.
- (5) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

I. One Cable to One Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE CABLE SPLICE ASSEMBLY
Figure 111

Refer to Figure 111.

(1) Prepare the cable.

Refer to:

- Figure 112
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

CABLE PREPARATION
Figure 112

(2) Make a selection of a Temperature Grade D insulation tape from Table 49.

(3) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that the sleeve has the smallest diameter that can be put on the cable splice assembly.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Cut the necessary length of the sleeve.

Make sure that the sleeve has a minimum overlap of 1 inch on each end of the outer jacket.

- (5) Put the sleeve on the cable of one end of the splice assembly.

- (6) Assemble the sealed splices on the wires in the cable.

Refer to Table 71 for an applicable sealed splice configuration on wire.

- (7) Put two layers of insulation tape on the splice assembly.

- (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

- Makes an overlap of 0.50 inch minimum to 0.75 inch maximum on each end of the outer jacket
- Makes a 50 percent overlap.

- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

- (8) Align the center of the sleeve with the center of the splice assembly.

Make sure that on each end of the splice assembly, the distance from the end of the layer of tape to the end of the sleeve is 0.25 inch minimum.

- (9) Shrink the sleeve in position. Refer to Subject 20-10-14.

9. CONDUCTOR SPLICE CONFIGURATIONS FOR SHIELDED WIRES AND SHIELDED CABLES**A. Splice Assembly Configurations**

The splice assembly configurations in Table 84 are for the conductor splice of a sealed splice assembly for shielded wire and shielded cable.

To calculate the CAU of the conductor, refer to Table 4.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 84
CONDUCTOR SPLICE ASSEMBLY CONFIGURATIONS**

Maximum Temperature Grade	One End of Splice Assembly	Other End of Splice Assembly	CAU Range		Applicable Condition	Splice Assembly	
			Minimum	Maximum		Components	Procedure
B	One Wire	One Wire	3	457	Fuel Vapor	Tape	Paragraph 9.B.
					No Fuel Vapor	Tape	Paragraph 9.B.
	One Wire	Two Wires	3	457	Fuel Vapor	Tape	Paragraph 9.C.
					No Fuel Vapor	Tape	Paragraph 9.C.

					No Fuel Vapor	Tape	Paragraph 9.G.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

B. One Wire to One Wire - Tape

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 113

Refer to Figure 113.

- (1) Make a selection of a butt splice from Table 12 or Table 14.
Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 114
- Table 85 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (6) Assemble one end of the butt splice.
- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 115.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 115

- (c) Hold the splice in position with light pressure.
- (d) Put the wire in the splice. Refer to Figure 116.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For an AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For an AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE WIRE IN THE BUTT SPLICE
Figure 116

- (e) Crimp the splice.
- (7) Do Step (6) again to assemble the other end of the butt splice.
- (8) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

 - Starts 0.5 inch minimum farther than the end of the wire insulation
 - Stops 0.5 inch minimum farther than the end of the wire insulation at the other end of the splice assembly
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

 - Starts where the first layer stops
 - Stops where the first layer starts
 - Makes a minimum 50 percent overlap.

C. One Wire to Two Wires - Tape

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 117

Refer to Figure 117.

- (1) Make a selection of a butt splice from Table 12 or Table 14.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 118
- Table 86 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 118

Table 86
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03
D-609-08	0.28	± 0.03
NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

- (6) Wind a layer of the insulation tape on each of the two wires for the side of the splice with two wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(7) Assemble one end of the butt splice.

- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 119.

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 119

- (c) Hold the splice in position with light pressure.
- (d) Put the wire or wires in the splice. Refer to Figure 120.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 120

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (e) Crimp the splice.
- (8) Do Step (7) again to assemble the other end side of the butt splice.
- (9) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

Make sure that the layer:

 - Starts 0.5 inch minimum farther than the end of the wire insulation on the side of the splice with one wire
 - Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

 - Starts where the first layer stops
 - Stops where the first layer starts
 - Makes a minimum 50 percent overlap.

D. Two Wires to Two Wires - Tape

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 121

Refer to Figure 121.

- (1) Make a selection of a butt splice from Table 12 or Table 14.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.
 Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.
- (2) Find the crimp barrel size of the splice from Table 12 or Table 14.
- (3) Make a selection of a crimp tool from:
 - Table 41 for BACT12C() splices
 - Table 42 for NAS1387-() splices
 - Table 43 for BACS52K() splices
 - Table 43 for Raychem D-609-0() splices.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Remove the necessary length of insulation from the end of each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 122
- Table 87 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 122

Table 87
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C101	0.72	± 0.03
BACT12C12	0.34	± 0.03
BACT12C21	0.65	± 0.03
BACT12C4	0.53	± 0.03
BACT12C6	0.53	± 0.03
BACT12C8	0.47	± 0.03
D-609-06	0.28	± 0.03
D-609-07	0.28	± 0.03

NAS1387-4	0.28	± 0.03
NAS1387-5	0.28	± 0.03
NAS1387-6	0.28	± 0.03

(6) Wind a layer of the insulation tape on each wire.

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(7) Assemble one end of the butt splice.

- (a) Put the splice in the crimp tool.
- (b) If the splice has a seam, align the seam opposite the indenter. Refer to Figure 123.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE BUTT SPLICE IN THE CRIMP TOOL
Figure 123

- (c) Hold the splice in position with light pressure.
- (d) Put the wire or wires in the splice. Refer to Figure 124.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- The insulation of the wire is not in the crimp barrel
- For AWG 10 and smaller wire, the end of the wire insulation is a maximum of 0.13 inch from the end of the crimp barrel
- For AWG 8 and larger wire, the end of the wire insulation is a maximum of 0.25 inch from the end of the crimp barrel.

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 124

- (e) Crimp the splice.
- (8) Do Step (7) again to assemble the other end side of the butt splice.
- (9) Put two layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts at the rear end of the layers of tape on the two wires on one end of the splice assembly
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- Makes a 50 percent overlap.

- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a 50 percent overlap.

E. One Wire to One Wire for High Temperature - Tape

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 125

Refer to Figure 125.

- (1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

Refer to:

- Table 15 for the minimum CAU of the butt splice
- Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.

- (3) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

- (4) Find the crimp barrel size of the splice from Table 15.

- (5) Make a selection of a crimp tool from Table 44.

- (6) Make a selection of a Temperature Grade D insulation tape from Table 49.

- (7) Remove the necessary length of insulation from the end of the wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 126
- Table 88 for the insulation removal length for a wire that can go into the insulation grip
- Table 89 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

Figure 126

Table 88

INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

Table 89

INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

- (8) Assemble one end of the butt splice.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wire in the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 127 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 128 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 127

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 128

- (d) Crimp the splice.
- (9) Do Step (8) again to assemble the other end of the butt splice.
- (10) Put two layers of the insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts 0.6 inch minimum farther than the end of the splice
- Stops 0.6 inch minimum farther than the end of the splice at the other end of the splice assembly
- Makes a 50 percent overlap.

(b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a minimum 50 percent overlap.

F. One Wire to Two Wires for High Temperature - Tape

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 129

Refer to Figure 129.

(1) Find the CAU of the conductor.

Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

(2) If the CAU of the conductor is less than the minimum CAU for the butt splice, increase the CAU of the conductor.

Refer to:

- Table 15 for the minimum CAU of the butt splice
- Paragraph 2. for the applicable conditions and procedures for the increase of the CAU.

(3) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductor.

(4) Find the crimp barrel size of the splice from Table 15.

(5) Make a selection of a crimp tool from Table 44.

(6) Make a selection of a Temperature Grade D insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

(7) Prepare each wire for the side of the splice assembly with two wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

INSULATION REMOVAL LENGTH
Figure 130

Table 90
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 131

(a) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 130
- Table 90 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

(b) Put the wires in the splice. Refer to Figure 131.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

(c) If it is necessary, remove more insulation from the end of the wire.

(d) Wind a layer of the insulation tape on each wire. Refer to Figure 131.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (8) Remove the necessary length of insulation from the end of the wire for the side of the splice assembly with one wire.

Refer to:

- Figure 130
- Table 91 for the insulation removal length for a wire that can go into the insulation grip
- Table 92 for the insulation removal length for a wire that cannot go into the insulation grip
- Subject 20-00-15 for the insulation removal procedures.

**Table 91
INSULATION REMOVAL LENGTH FOR A WIRE THAT CAN GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.37	± 0.02
BACT12C15	0.23	± 0.02
BACT12C20	0.23	± 0.02

**Table 92
INSULATION REMOVAL LENGTH FOR A WIRE THAT CANNOT GO INTO THE INSULATION GRIP**

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

- (9) Assemble the end of the butt splice with two wires.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wires in the splice. Refer to Figure 131.
Make sure that the wires are in the correct position.
 - (d) Crimp the splice.
- (10) Assemble the end of the butt splice with one wire.
- (a) Put the splice in the crimp tool.
 - (b) Hold the splice in position with light pressure.
 - (c) Put the wire in the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 132 for the position of the wire in the splice with the wire insulation in the insulation grip
- Figure 133 for the position of the wire in the splice with the wire insulation out of the insulation grip.

Make sure that:

- The end of the conductor can be seen in the inspection hole
- The end of the conductor does not make an overlap with the wire stop
- If the wire insulation can go into the insulation grip, the end of the wire insulation is in the insulation grip
- If the wire insulation cannot go into the insulation grip, the end of the wire insulation is a maximum of 0.13 inch from the end of the insulation grip
- The wire insulation is not in the crimp barrel.

NOTE: The insulation removal length can be changed to make these conditions satisfactory.

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION IN THE INSULATION GRIP

Figure 132

POSITION OF THE WIRE IN THE BUTT SPLICE WITH THE WIRE INSULATION OUT OF THE INSULATION GRIP

Figure 133

- (d) Crimp the splice.
- (11) Put two layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer:

- Starts 0.6 inch minimum farther than the end of the splice on the side with one wire
- Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
- Makes a 50 percent overlap.

- (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.

Make sure that the layer:

- Starts where the first layer stops
- Stops where the first layer starts
- Makes a minimum 50 percent overlap.

G. Two Wires to Two Wires for High Temperature - Tape

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 134

Refer to Figure 134.

- (1) Make a selection of a butt splice from Table 15.

Make sure that the splice has the smallest CAU range that can accept the total CAU of the conductors. Refer to Paragraph 1.D. for the procedure to calculate the CAU of the conductor.

- (2) Find the crimp barrel size of the splice from Table 15.
 (3) Make a selection of a crimp tool from Table 44.
 (4) Make a selection of a Temperature Grade D insulation tape from Table 49.

Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 135
- Table 93 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

INSULATION REMOVAL LENGTH
Figure 135

Table 93
INSULATION REMOVAL LENGTH

Splice	Removal Length L (inch)	
	Target	Tolerance
BACT12C11	0.46	± 0.02
BACT12C15	0.30	± 0.02
BACT12C20	0.30	± 0.02

(6) Put the wires in the splice. Refer to Figure 136.

Make sure that:

- The end of each conductor can be seen in the inspection hole
- The end of each conductor does not make an overlap with the wire stop
- The end of each wire insulation is a maximum of 0.19 inch from the end of the insulation grip.

POSITION OF THE WIRES IN THE BUTT SPLICE
Figure 136

(7) If it is necessary, remove more insulation from the end of the wire.

(8) Wind a layer of the insulation tape on each wire. Refer to Figure 136.

Make sure that:

- The edge of the tape is aligned with the end of the wire insulation
- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

(9) Assemble one end of the butt splice.

- Put the splice in the crimp tool.
- Hold the splice in position with light pressure.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (c) Put the wires in the splice. Refer to Figure 136.
Make sure that the wires are in the correct position.
- (d) Crimp the splice.
- (10) Do Step (9) again to assemble the other end of the butt splice.
- (11) Put two layers of insulation tape on the splice assembly.
 - (a) Tightly wind the first layer of tape on the splice assembly.
Make sure that the layer:
 - Starts at the rear end of the layers of tape on the two wires on one end of the splice assembly
 - Stops at the rear end of the layers of tape on the two wires on the other end of the splice assembly
 - Makes a 50 percent overlap.
 - (b) Tightly wind the second layer of tape on the splice assembly in the opposite direction of the first layer.
Make sure that the layer:
 - Starts where the first layer stops
 - Stops where the first layer starts
 - Makes a minimum 50 percent overlap.

10. SEALED SPlice CONFIGURATIONS WITH MECHANICAL FERRULES FOR SHIELDED WIRE AND SHIELDED CABLE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**Table 94
SPlice ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Applicable Condition	Splice Assembly	
				Configuration	Procedure
One Shielded Wire	One Shielded Wire	1	Fuel Vapor	Tape, Ties	Paragraph 10.B.
			No Fuel Vapor	Tape, Sleeve	Paragraph 10.C.
				Tape, Ties	Paragraph 10.B.
Shielded Wire	Two Shielded Wires	1	Fuel Vapor	Tape, Ties	Paragraph 10.D.
			No Fuel Vapor	Tape, Sleeve	Paragraph 10.E.
				Tape, Ties	Paragraph 10.D.
Two Shielded Wires	Two Shielded Wires	1	Fuel Vapor	Tape, Ties	Paragraph 10.F.
			No Fuel Vapor	Tape, Sleeve	Paragraph 10.G.
				Tape, Ties	Paragraph 10.F.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Table 94 (continued)

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Applicable Condition	Splice Assembly	
				Configuration	Procedure
One Shielded Cable	One Shielded Cable	-	Fuel Vapor	Tape, Ties	Paragraph 10.H.
			No Fuel Vapor	Tape, Sleeve	Paragraph 10.I.
				Tape, Ties	Paragraph 10.H.

B. One Shielded Wire to One Shielded Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 137

Refer to Figure 137.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (5) Prepare each end of the shielded wire.

Refer to:

- Figure 138
- Subject 20-00-15 for the outer jacket removal procedures.

**SHIELDED WIRE PREPARATION****Figure 138**

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch \pm 0.06 inch.
- (6) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
 - (7) Put these components on the end of one wire:
 - The outer ferrule
 - The inner ferrule.
 - (8) Put these components on the end of the other wire:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (9) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (10) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.

20-30-12

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (11) Assemble the end of the shield splice opposite the end with the shield material.
- Move the outer ferrule on the shield material.
 - Move the strands of the shield apart and make them straight.
 - Align the forward end of the inner ferrule with the end of the outer jacket.
 - Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
 - Align the end of the shield material with the end of the strands of the shield that are folded back.
 - Align the rear end of the outer ferrule with the rear end of the inner ferrule.
- Make sure that:
- The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (g) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tight before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
- Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

C. One Shielded Wire to One Shielded Wire - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 139

Refer to Figure 139.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.
Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (5) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each end of the shielded wire.

Refer to:

- Figure 140
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION

Figure 140

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch ±0.06 inch.
 - (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the ferrules on each end of the shield splice.
 - (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
 - (9) Put these components on the end of one wire:
 - The sleeve
 - The outer ferrule
 - The inner ferrule.
 - (10) Put these components on the end of the other wire:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (13) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.
 - (c) Align the forward end of the inner ferrule with the end of the outer jacket.
 - (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
 - (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(g) Crimp the ferrules.

(14) Do Step (13) again to assemble the other end of the shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

(15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

(16) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
- Makes a 50 percent overlap.

(17) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(18) Align the center of the sleeve with the center of the splice assembly.

(19) Shrink the sleeve into position. Refer to Subject 20-10-14.

D. One Shielded Wire to Two Shielded Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 141

Refer to Figure 141.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jackets
- The outer ferrule is the smallest ferrule that can move freely on the shields, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Prepare each shielded wire for the side of the splice assembly with two shielded wires.

Refer to:

- Figure 142
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION
Figure 142

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is $0.31 \text{ inch} \pm 0.06 \text{ inch}$.
- (c) Wind a layer of the insulation tape on the outer jacket of each wire $0.50 \text{ inch} \pm 0.06 \text{ inch}$ farther than the end of the outer jackets.

Make sure that:

- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

- (6) Prepare the end of the shielded wire for the side of the splice assembly with one shielded wire.

Refer to:

- Figure 143
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

SHIELDED WIRE PREPARATION
Figure 143

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is $0.31 \text{ inch} \pm 0.06 \text{ inch}$.
- (7) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (8) Put these components on the side of the splice assembly with one shielded wire:
 - The outer ferrule
 - The inner ferrule.
- (9) Put these components on the side of the splice assembly with two shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (10) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to two wires. Refer to Paragraph 9.A.
- (11) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (12) Assemble the side of the shield splice with two shielded wires.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shields apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 144.

POSITION OF THE SHIELDS
Figure 144

- (d) Align the forward end of the inner ferrule with each end of the outer jackets.
- (e) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (13) Assemble the side of the shield splice with one shielded wire.
 - (a) Move the outer ferrule on the shield material.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (b) Move the strands of the shields apart and make them straight.
- (c) Align the forward end of the inner ferrule with each end of the outer jackets.
- (d) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shields that are folded back.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (g) Crimp the ferrules.

- (14) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (15) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts at the rear end of the layer of tape on the outer jacket on the side with two shielded wires
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule on the side with one shielded wire
- Makes a 50 percent overlap.

- (16) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

- (17) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

E. One Shielded Wire to Two Shielded Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 145

Refer to Figure 145.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jackets
- The outer ferrule is the smallest ferrule that can move freely on the shields, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each shielded wire for the side of the splice assembly with two shielded wires.

Refer to:

- Figure 146
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION
Figure 146

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch \pm 0.06 inch.
- (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch \pm 0.06 inch farther than the end of the outer jackets.

Make sure that:

- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

- (7) Prepare the end of the shielded wire for the side of the splice assembly with one shielded wire.

Refer to:

- Figure 147
- Subject 20-00-15 for the outer jacket and insulation removal procedures.

SHIELDED WIRE PREPARATION
Figure 147

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch \pm 0.06 inch.
- (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
- (9) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1.5 inch farther than the rear end of the ferrules on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (10) Put these components on the side of the splice assembly with one shielded wire:
- The sleeve
 - The outer ferrule
 - The inner ferrule.

- (11) Put these components on the side of the splice assembly with two shielded wires:
- The outer ferrule
 - The inner ferrule
 - The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (12) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to two wires. Refer to Paragraph 9.A.
- (13) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (14) Assemble the side of the shield splice with two shielded wires.
- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shields apart and make them straight.
- (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 148.

POSITION OF THE SHIELDS
Figure 148

- (d) Align the forward end of the inner ferrule with each end of the outer jackets.
- (e) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
- Make sure that:
- The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (15) Assemble the side of the shield splice with one shielded wire.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shields apart and make them straight.
- (c) Align the forward end of the inner ferrule with each end of the outer jackets.
- (d) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shields that are folded back.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (g) Crimp the ferrules.

- (16) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (17) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts at the rear end of the layer of tape on the outer jacket on the side with two shielded wires
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule on the side with one shielded wire
- Makes a 50 percent overlap.

- (18) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

- (19) Align the center of the sleeve with the center of the splice assembly.

- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.

F. Two Shielded Wires to Two Shielded Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 149

Refer to Figure 149.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the two outer jackets
- The outer ferrule is the smallest ferrule that can move freely on the shields, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
 Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Prepare each end of the shielded wires.

Refer to:

- Figure 150
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION

Figure 150

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch ±0.06 inch.
 - (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch ±0.06 inch farther than the end of the outer jackets.
Make sure that:
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (6) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
 - (7) Put these components on the end of one pair of shielded wires:
 - The outer ferrule
 - The inner ferrule.
 - (8) Put these components on the end of the other pair of shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (9) Make a selection of an applicable Temperature Grade B conductor splice configuration for two wires to two wires. Refer to Paragraph 9.A.
 - (10) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (11) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shields apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 151.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SHIELDS

Figure 151

- (d) Align the forward end of the inner ferrule with each end of the outer jackets.
- (e) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
 Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
 Make sure that the shield material is pulled tightly before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly.
 Make sure that the layer of tape:
 - Starts at the rear end of the layer of tape on the outer jacket
 - Stops at the rear end of the layer of tape on the outer jacket at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
 Make sure that the layer of tape:
 - Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
 Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

G. Two Shielded Wires to Two Shielded Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 152

Refer to Figure 152.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the two outer jackets
- The outer ferrule is the smallest ferrule that can move freely on the shields, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each end of the shielded wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 153
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 153

- (a) Remove a 1.25 inch minimum length of the outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure that the remaining shield is 0.31 inch ±0.06 inch.
 - (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch ±0.06 inch farther than the end of the outer jackets.
Make sure that:
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1.5 inches farther than the rear end of the ferrules on each end of the shield splice.
 - (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
 - (9) Put these components on the end of one pair of shielded wires:
 - The sleeve
 - The outer ferrule
 - The inner ferrule.
 - (10) Put these components on the end of the other pair of shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for two wires to two wires. Refer to Paragraph 9.A.
 - (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (13) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shields apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 154.

POSITION OF THE SHIELDS
Figure 154

- (d) Align the forward end of the inner ferrule with each end of the outer jackets.
- (e) Fold the strands of the shields back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (14) Do Step (13) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tightly before the ferrules are crimped.
- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (16) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts at the rear end of the layer of tape on the outer jacket
 - Stops at the rear end of the layer of tape on the outer jacket at the other end of the splice
 - Makes a 50 percent overlap.
- (17) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(18) Align the center of the sleeve with the center of the splice assembly.

(19) Shrink the sleeve into position. Refer to Subject 20-10-14.

H. One Shielded Cable to One Shielded Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 155

Refer to Figure 155.

(1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

(2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

(3) Make a selection of a ferrule crimp tool from Table 45.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (5) Prepare the shielded cable.

Refer to:

- Figure 156
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 156

- (6) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.
 - (7) Put these components on the end of one cable:
 - The outer ferrule
 - The inner ferrule.
 - (8) Put these components on the end of the other cable:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.
- (9) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (10) Assemble each conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (11) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
 - (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
 - (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (g) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tightly before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly that:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly that:
 - Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

I. One Shielded Cable to One Shielded Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 157

Refer to Figure 157.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade B or higher inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (5) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare the shielded cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 158
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 158

- (7) Cut the necessary length of the sleeve.

Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the ferrules on each end of the shield splice.

- (8) Cut the necessary length of the shield material.

Make sure that the ends of the shield material extend farther than the rear end of the ferrules on each end of the shield splice.

- (9) Put these components on the end of one cable:

- The sleeve
- The outer ferrule
- The inner ferrule.

- (10) Put these components on the end of the other cable:

- The outer ferrule
- The inner ferrule
- The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble each conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Assemble the end of the shield splice opposite the end with the shield material.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(g) Crimp the ferrules.

- (14) Do Step (13) again to assemble the other end of the shield splice.

Make sure that the shield material is pulled tightly before the ferrules are crimped.

- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (16) Tightly wind a layer of the tape on the splice assembly that:
- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the ferrule at the other end of the splice
 - Makes a 50 percent overlap.
- (17) Tightly wind a second layer of the tape on the splice assembly that:
- Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (18) Align the center of the sleeve with the center of the splice assembly.
- (19) Shrink the sleeve into position. Refer to Subject 20-10-14.

11. SEALED SPLICE CONFIGURATIONS WITH MECHANICAL FERRULES FOR SHIELDED WIRE AND SHIELDED CABLE FOR HIGH TEMPERATURE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 95
SPLICE ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Applicable Condition	Splice Assembly	
				Configuration	Procedure
One Shielded Wire	One Shielded Wire	1	Fuel Vapor	Tape, Ties	Paragraph 11.B.
			No Fuel Vapor	Tape, Sleeve	Paragraph 11.C.
				Tape, Ties	Paragraph 11.B.
Shielded Wire	Two Shielded Wires	1	Fuel Vapor	Tape, Ties	Paragraph 11.D.
			No Fuel Vapor	Tape, Sleeve	Paragraph 11.E.
				Tape, Ties	Paragraph 11.D.
Two Shielded Wires	Two Shielded Wires	1	Fuel Vapor	Tape, Ties	Paragraph 11.F.
			No Fuel Vapor	Tape, Sleeve	Paragraph 11.G.
				Tape, Ties	Paragraph 11.F.
One Shielded Cable	One Shielded Cable	-	Fuel Vapor	Tape, Ties	Paragraph 11.H.
			No Fuel Vapor	Tape, Sleeve	Paragraph 11.I.
				Tape, Ties	Paragraph 11.H.

B. One Shielded Wire to One Shielded Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 159**

Refer to Figure 159.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.

- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.

- (5) Prepare each end of the shielded wire.

Refer to:

- Figure 160
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION

Figure 160

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.

- (b) Remove the necessary length of the shield from the end of the wire.

Make sure the remaining shield is 0.31 inch \pm 0.06 inch.

- (6) Cut the necessary length of the shield material.

Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (7) Put these components on the end of one wire:
- The outer ferrule
 - The inner ferrule.
- (8) Put these components on the other end of the shielded wire:
- The outer ferrule
 - The inner ferrule
 - The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (9) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (10) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (11) Assemble the end of the shield splice opposite the end with the shield material.
- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
- Make sure that:
- The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (g) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
- Make sure that the shield material is pulled tight before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly.
- Make sure that the layer of tape:
- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

C. One Shielded Wire to One Shielded Wire - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 161

Refer to Figure 161.

(1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

(2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

(3) Make a selection of a ferrule crimp tool from Table 45.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (5) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each end of the shielded wire.

Refer to:

- Figure 162
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 162

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.31 inch ±0.06 inch.
- (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the inner ferrule on each end of the shield splice.
 - (8) Cut the necessary length of the shield material.
Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.
 - (9) Put these components on the end of one wire:
 - The sleeve
 - The outer ferrule
 - The inner ferrule.
 - (10) Put these components on the other end of the shielded wire:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (11) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (13) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

(g) Crimp the ferrules.

- (14) Do Step (13) again to assemble the other end of the shield splice.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (16) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at the other end of the splice
- Makes a 50 percent overlap.

- (17) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

- (18) Align the center of the sleeve with the center of the splice assembly.

- (19) Shrink the sleeve into position. Refer to Subject 20-10-14.

D. One Shielded Wire to Two Shielded Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

FINAL CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 163

Refer to Figure 163.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.

- (5) Prepare each shielded wire for the side of the splice assembly with two shielded wires.

Refer to:

- Figure 164
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION
Figure 164

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.31 inch \pm 0.06 inch.
- (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch \pm 0.06 inch farther than the end of the outer jackets.

Make sure that:

- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

- (6) Prepare the shielded wire for the side of the splice assembly with one shielded wire.

Refer to:

- Figure 165
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 165

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.31 inch \pm 0.06 inch.
- (7) Cut the necessary length of the shield material.
Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (8) Put these components on the side of the splice assembly with one shielded wire:
 - The outer ferrule
 - The inner ferrule.
- (9) Put these components on the side of the splice assembly with two shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wires.

- (10) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to two wires. Refer to Paragraph 9.A.
- (11) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (12) Assemble the sealed splice of the wires. Refer to Paragraph 8.D.
- (13) Assemble the end of the shield splice with two shielded wires.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 166.

POSITION OF THE SHIELDS
Figure 166

- (d) Align the forward end of the inner ferrule with the end of the outer jackets.
- (e) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (14) Assemble the end of the shield splice with one shielded wire.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jackets.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shields that are folded back.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (g) Crimp the ferrules.

- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (16) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts at the rear end of the layer of tape on the outer jacket on the side with two shielded wires
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule on the side with one shielded wire
- Makes a 50 percent overlap.

- (17) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

- (18) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

E. One Shielded Wire to Two Shielded Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

FINAL CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 167

Refer to Figure 167.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each shielded wire for the side of the splice assembly with two shielded wires.

Refer to:

- Figure 168
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION
Figure 168

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is $0.31 \text{ inch} \pm 0.06 \text{ inch}$.
- (c) Wind a layer of the insulation tape on the outer jacket of each wire $0.50 \text{ inch} \pm 0.06 \text{ inch}$ farther than the end of the outer jackets.

Make sure that:

- The tape goes around the circumference of the wire a minimum of two times
- The tape makes a 100 percent overlap.

- (7) Prepare the shielded wire for the side of the splice assembly with one shielded wire.

Refer to:

- Figure 169
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 169

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is $0.31 \text{ inch} \pm 0.06 \text{ inch}$.
- (8) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1.5 inch farther than the rear end of the inner ferrule on each end of the shield splice.
 - (9) Cut the necessary length of the shield material.
Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (10) Put these components on the side of the splice assembly with one shielded wire:
- The sleeve
 - The outer ferrule
 - The inner ferrule.

- (11) Put these components on the side of the splice assembly with two shielded wires:
- The outer ferrule
 - The inner ferrule
 - The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wires.

- (12) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to two wires. Refer to Paragraph 9.A.
- (13) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (14) Assemble the end of the shield splice with two shielded wires.
- (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 170.

POSITION OF THE SHIELDS
Figure 170

- (d) Align the forward end of the inner ferrule with the end of the outer jackets.
 - (e) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
 - (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
 - (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (h) Crimp the ferrules.
- (15) Assemble the end of the shield splice with one shielded wire.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jackets.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shields that are folded back.

Make sure that the shield material is pulled tight before the ferrules are crimped.

- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (g) Crimp the ferrules.

- (16) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (17) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts at the rear end of the layer of tape on the outer jacket on the side with two shielded wires
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule on the side with one shielded wire
- Makes a 50 percent overlap.

- (18) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

- (19) Align the center of the sleeve with the center of the splice assembly.

- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.

F. Two Shielded Wires to Two Shielded Wires - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

FINAL CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 171

Refer to Figure 171.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Prepare each end of the shielded wires.

Refer to:

- Figure 172
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION
Figure 172

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
 Make sure the remaining shield is 0.31 inch ± 0.06 inch.
 - (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch ± 0.06 inch farther than the end of the outer jackets.
 Make sure that:
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (6) Cut the necessary length of the shield material.
 Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.
 - (7) Put these components on one pair of the shielded wires:
 - The outer ferrule
 - The inner ferrule.
 - (8) Put these components on the end of the other pair of shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wires.
- (9) Make a selection of an applicable Temperature Grade D conductor splice configuration for two wires to two wires. Refer to Paragraph 9.A.
 - (10) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (11) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 173.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SHIELDS

Figure 173

- (d) Align the forward end of the inner ferrule with the end of the outer jackets.
- (e) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tight before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts at the rear end of the layer of tape on the outer jacket.
 - Stops at the rear end of the layer of tape on the outer jacket at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

G. Two Shielded Wires to Two Shielded Wires - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

FINAL CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 174

Refer to Figure 174.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shields of the two wires.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
Make sure that the tape has a width of 0.5 inch minimum to 1.0 inch maximum.
- (5) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare each end of the shielded wires.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 175
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 175

- (a) Remove 1.1 inch minimum length of outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.31 inch ±0.06 inch.
 - (c) Wind a layer of the insulation tape on the outer jacket of each wire 0.50 inch ±0.06 inch farther than the end of the outer jackets.
Make sure that:
 - The tape goes around the circumference of the wire a minimum of two times
 - The tape makes a 100 percent overlap.
- (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1.5 inch farther than the rear end of the inner ferrule on each end of the shield splice.
 - (8) Cut the necessary length of the shield material.
Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.
 - (9) Put these components on one pair of the shielded wires:
 - The sleeve
 - The outer ferrule
 - The inner ferrule.
 - (10) Put these components on the end of the other pair of shielded wires:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wires.
- (11) Make a selection of an applicable Temperature Grade D conductor splice configuration for two wires to two wires. Refer to Paragraph 9.A.
 - (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (13) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.
 - (c) Move the strands of each shield away from the adjacent wire. Refer to Figure 176.

POSITION OF THE SHIELDS
Figure 176

- (d) Align the forward end of the inner ferrule with the end of the outer jackets.
- (e) Fold the strands of the shield back over the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (f) Align the end of the shield material with the end of the strands of the shields that are folded back.
- (g) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
- (h) Crimp the ferrules.
- (14) Do Step (13) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tight before the ferrules are crimped.
- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (16) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts at the rear end of the layer of tape on the outer jacket.
 - Stops at the rear end of the layer of tape on the outer jacket at the other end of the splice
 - Makes a 50 percent overlap.
- (17) Tightly wind a second layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(18) Align the center of the sleeve with the center of the splice assembly.

(19) Shrink the sleeve into position. Refer to Subject 20-10-14.

H. One Shielded Cable to One Shielded Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 177

Refer to Figure 177.

(1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

(2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

(3) Make a selection of a ferrule crimp tool from Table 45.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (5) Prepare the shielded cable.

Refer to:

- Figure 178
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 178

- (6) Cut the necessary length of the shield material.
Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.
 - (7) Put these components on the end of one cable:
 - The outer ferrule
 - The inner ferrule.
 - (8) Put these components on the end of the other cable:
 - The outer ferrule
 - The inner ferrule
 - The shield material.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.
- (9) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (10) Assemble the conductor splices. Refer to the applicable procedure given in Paragraph 9.A.
 - (11) Assemble the end of the shield splice opposite the end with the shield material.
 - (a) Move the outer ferrule on the shield material.
 - (b) Move the strands of the shield apart and make them straight.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
 - (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
 - (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
 - (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.
Make sure that:
 - The outer ferrule goes around the shield material
 - The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
 - The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.
 - (g) Crimp the ferrules.
- (12) Do Step (11) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tightly before the ferrules are crimped.
- (13) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.
- (14) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

I. One Shielded Cable to One Shielded Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 179

Refer to Figure 179.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of two sets of Temperature Grade D inner ferrules and outer ferrules.

Refer to:

- Figure 6 for the ferrule size
- Table 31 for the Temperature Grade
- Table 32 for the ferrule part numbers.

Make sure that:

- The inner ferrule is the smallest ferrule that can move freely on the outer jacket
- The outer ferrule is the smallest ferrule that can move freely on the shield, the shield material, and the inner ferrule.

- (3) Make a selection of a ferrule crimp tool from Table 45.
- (4) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (5) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (6) Prepare the shielded cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 180
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 180

- (7) Cut the necessary length of the sleeve.

Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the inner ferrule on each end of the shield splice.

- (8) Cut the necessary length of the shield material.

Make sure that the end of the shield material extends farther than the rear end of the inner ferrule on each end of the shield splice.

- (9) Put these components on the end of one cable:

- The sleeve
- The outer ferrule
- The inner ferrule.

- (10) Put these components on the end of the other cable:

- The outer ferrule
- The inner ferrule
- The shield material.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

- (11) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble the conductor splices. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Assemble the end of the shield splice opposite the end with the shield material.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Move the outer ferrule on the shield material.
- (b) Move the strands of the shield apart and make them straight.
- (c) Align the forward end of the inner ferrule with the end of the outer jacket.
- (d) Fold the strands of the shield back on the inner ferrule to make the strands of the shield symmetrical around the circumference of the ferrule.
- (e) Align the end of the shield material with the end of the strands of the shield that are folded back.
- (f) Align the rear end of the outer ferrule with the rear end of the inner ferrule.

Make sure that:

- The outer ferrule goes around the shield material
- The rear end of the outer ferrule does not extend farther than the rear end of the inner ferrule
- The rear end of the outer ferrule is a maximum of 0.06 inch from the rear end of the inner ferrule.

- (g) Crimp the ferrules.

- (14) Do Step (13) again to assemble the other end of the shield splice.

Make sure that the shield material is pulled tightly before the ferrules are crimped.

- (15) Remove the shield and the shield material that extend farther than the rear end of the inner ferrule on each end of the shield splice.

- (16) Tightly wind a layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the inner ferrule at the other end of the splice
- Makes a 50 percent overlap.

- (17) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

- (18) Align the center of the sleeve with the center of the splice assembly.

- (19) Shrink the sleeve into position. Refer to Subject 20-10-14.

12. SEALED SPLICE CONFIGURATIONS WITH SHIELD-KONS FOR SHIELDED WIRE AND SHIELDED CABLE**A. Splice Assembly Configurations**

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 96
SPLICE ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Applicable Condition	Splice Assembly	
				Configuration	Procedure
One Shielded Wire	One Shielded Wire	1	Fuel Vapor	Tape, Ties	Paragraph 12.B.
			No Fuel Vapor	Tape, Sleeves	Paragraph 12.C.
				Tape, Ties	Paragraph 12.B.
One Shielded Cable	One Shielded Cable	-	Fuel Vapor	Tape, Ties	Paragraph 12.D.
			No Fuel Vapor	Tape, Sleeves	Paragraph 12.E.
				Tape, Ties	Paragraph 12.D.

B. One Shielded Wire to One Shielded Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 181**

Refer to Figure 181.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Prepare each end of the shielded wire.

Refer to:

- Figure 182
- Subject 20-00-15 for the outer jacket removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELDED WIRE PREPARATION

Figure 182

- (a) Remove 1.45 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.50 inch ±0.06 inch.
- (4) Fold the end of the shield against the outer jacket.
- (5) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (6) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
- (7) Put the shield material on the end of the other wire.
NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (8) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (9) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (10) Align one end of the shield material with the end of the folded back shield. Refer to Figure 183.

POSITION OF THE SHIELD MATERIAL ON THE WIRE

Figure 183

- (11) Measure the outer diameter of the shield assembly. Refer to Figure 184.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 184

- (12) Make a selection of the correct size of two Temperature Grade B or higher Shield-Kons from Table 34.
- (13) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 183.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.
 - (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 185.

SHIELD SPLICE ASSEMBLY
Figure 185

- (14) Tightly wind a layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
- Makes a 50 percent overlap.

(15) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

C. One Shielded Wire to One Shielded Wire - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 186

Refer to Figure 186.

(1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

(2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.

(3) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

(4) Prepare each end of the shielded wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 187
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION
Figure 187

- (a) Remove 1.45 inch minimum length of outer jacket from the end of the wire.
 - (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.50 inch ±0.06 inch.
 - (5) Fold the end of the shield against the outer jacket.
 - (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
 - (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the Shield-Kons on each end of the shield splice.
 - (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
 - (9) Put the sleeve on one end of the wire.
 - (10) Put the shield material on the end of the other wire.
- NOTE:** If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
 - (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
 - (13) Align one end of the shield material with the end of the folded back shield. Refer to Figure 188.

POSITION OF THE SHIELD MATERIAL ON THE WIRE
Figure 188

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (14) Measure the outer diameter of the shield assembly. Refer to Figure 189.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 189

- (15) Make a selection of the correct size of two Temperature Grade B or higher Shield-Kons from Table 34.
- (16) Assemble the splice of the shield:
- (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 188.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.
 - (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 190.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELD SPLICE ASSEMBLY
Figure 190

- (17) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (18) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (19) Align the center of the sleeve with the center of the splice assembly.
- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.

D. One Shielded Cable to One Shielded Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 191

Refer to Figure 191.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Prepare the shielded cable.

Refer to:

- Figure 192
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 192

- (4) Fold the end of the shield against the outer jacket.
- (5) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (6) Cut the necessary length of the shield material.

Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.

- (7) Put the shield material on the end of the other cable.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.

- (8) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (9) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (10) Align one end of the shield material with the end of the folded back shield. Refer to Figure 193.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SHIELD MATERIAL ON THE CABLE
Figure 193

- (11) Measure the outer diameter of the shield assembly. Refer to Figure 194.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 194

- (12) Make a selection of the correct size of two Temperature Grade B or higher Shield-Kons from Table 34.
- (13) Assemble the splice of the shield:
- (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 193.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 195.

SHIELD SPLICE ASSEMBLY
Figure 195

- (14) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
- Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade B or higher.

E. One Shielded Cable to One Shielded Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 196

Refer to Figure 196.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Make a selection of a Temperature Grade B or higher heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Prepare the shielded cable.

Refer to:

- Figure 197
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches ±0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches ±0.25 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

PREPARATION OF THE SHIELDED CABLE
Figure 197

- (5) Fold the end of the shield against the outer jacket.
- (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (7) Cut the necessary length of the sleeve.
 Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the Shield-Kons on each end of the shield splice.
- (8) Cut the necessary length of the shield material.
 Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
- (9) Put the sleeve on one end of the cable.
- (10) Put the shield material on the end of the other cable.
NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.
- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Align one end of the shield material with the end of the folded back shield. Refer to Figure 198.

POSITION OF THE SHIELD MATERIAL ON THE CABLE
Figure 198

- (14) Measure the outer diameter of the shield assembly. Refer to Figure 199.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 199

- (15) Make a selection of the correct size of two Temperature Grade B or higher Shield-Kons from Table 34.
- (16) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 198.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.
 - (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 200.

SHIELD SPLICE ASSEMBLY
Figure 200

- (17) Tightly wind a layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 0.50 inch ± 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
- Stops 0.50 inch ± 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
- Makes a 50 percent overlap.

(18) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts where the first layer of tape stops
- Stops where the first layer of tape starts
- Makes a 50 percent overlap.

(19) Align the center of the sleeve with the center of the splice assembly.

(20) Shrink the sleeve into position. Refer to Subject 20-10-14.

13. SEALED SPlice CONFIGURATIONS WITH SHIELD-KONS FOR SHIELDED WIRE AND SHIELDED CABLE FOR HIGH TEMPERATURE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**Table 97
SPlice ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Applicable Condition	Splice Assembly	
			Configuration	Procedure
One Shielded Wire	One Shielded Wire	Fuel Vapor	Tape, Ties	Paragraph 13.B.
		No Fuel Vapor	Tape, Sleeves	Paragraph 13.C.
			Tape, Ties	Paragraph 13.B.
One Shielded Cable	One Shielded Cable	Fuel Vapor	Tape, Ties	Paragraph 13.D.
		No Fuel Vapor	Tape, Sleeves	Paragraph 13.E.
			Tape, Ties	Paragraph 13.D.

B. One Shielded Wire to One Shielded Wire - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 201

Refer to Figure 201.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (3) Prepare each end of the shielded wire.

Refer to:

- Figure 202
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION

Figure 202

- (a) Remove 1.3 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.50 inch \pm 0.06 inch.
- (4) Fold the end of the shield against the outer jacket.
- (5) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (6) Cut the necessary length of the shield material.

Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (7) Put the shield material on the end of the other wire.

NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.

- (8) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (9) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (10) Align one end of the shield material with the end of the folded back shield. Refer to Figure 203.

POSITION OF THE SHIELD MATERIAL ON THE WIRE

Figure 203

- (11) Measure the outer diameter of the shield assembly. Refer to Figure 204.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER

Figure 204

- (12) Make a selection of the correct size of two Temperature Grade D Shield-Kons from Table 34.
- (13) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 203.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that the center of the Shield-Kon is aligned with the center of the die.

- (h) Make the shield material smooth and tight.
- (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (j) Crimp the Shield-Kon.
- (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 205.

SHIELD SPLICE ASSEMBLY
Figure 205

- (14) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (15) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 1 inch minimum farther than where the first layer of tape stops
 - Stops 1 inch minimum farther than where the first layer of tape starts
 - Makes a 50 percent overlap.
- (16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.
Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

C. One Shielded Wire to One Shielded Wire - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 206

Refer to Figure 206.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.
Make sure that the shield material has the smallest diameter that can go on the folded back shield of the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (3) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Prepare each end of the shielded wire.

Refer to:

- Figure 207
- Subject 20-00-15 for the outer jacket removal procedures.

SHIELDED WIRE PREPARATION

Figure 207

- (a) Remove 1.3 inch minimum length of outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield from the end of the wire.
Make sure the remaining shield is 0.50 inch ±0.06 inch.
- (5) Fold the end of the shield against the outer jacket.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the Shield-Kons on each end of the shield splice.
- (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
- (9) Put the sleeve on one end of the wire.
- (10) Put the shield material on the end of the other wire.
NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the wire.
- (11) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Align one end of the shield material with the end of the folded back shield. Refer to Figure 208.

POSITION OF THE SHIELD MATERIAL ON THE WIRE
Figure 208

- (14) Measure the outer diameter of the shield assembly. Refer to Figure 209.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 209

- (15) Make a selection of the correct size of two Temperature Grade D Shield-Kons from Table 34.
- (16) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Align one end of the shield material with the end of the shield. Refer to Figure 208.
- (d) Put one of the Shield-Kons into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (e) Put the crimp tool and the Shield-Kon on the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (f) Crimp the Shield-Kon.
- (g) Put the other Shield-Kon into the die of the crimp tool.
Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (h) Make the shield material smooth and tight.
- (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (j) Crimp the Shield-Kon.
- (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 210.

SHIELD SPLICE ASSEMBLY
Figure 210

- (17) Tightly wind a layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (18) Tightly wind a second layer of the tape on the splice assembly.
Make sure that the layer of tape:
 - Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (19) Align the center of the sleeve with the center of the splice assembly.
- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

D. One Shielded Cable to One Shielded Cable - Tape, Ties

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 211

Refer to Figure 211.

- (1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade D insulation tape from Table 49.
- (3) Prepare the shielded cable.

Refer to:

- Figure 212
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches ± 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches ± 0.25 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

PREPARATION OF THE SHIELDED CABLE
Figure 212

- (4) Fold the end of the shield against the outer jacket.
- (5) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (6) Cut the necessary length of the shield material.
 Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
- (7) Put the shield material on the end of the other cable.
NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.
- (8) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (9) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (10) Align one end of the shield material with the end of the folded back shield. Refer to Figure 213.

POSITION OF THE SHIELD MATERIAL ON THE CABLE
Figure 213

- (11) Measure the outer diameter of the shield assembly. Refer to Figure 214.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 214

- (12) Make a selection of the correct size of two Temperature Grade D Shield-Kons from Table 34.
- (13) Assemble the splice of the shield:
 - (a) Make a selection of a Shield-Kon crimp tool from Table 46.
 - (b) Remove the temporary layer of tape around the end of each shield.
 - (c) Align one end of the shield material with the end of the shield. Refer to Figure 213.
 - (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (f) Crimp the Shield-Kon.
 - (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
 - (h) Make the shield material smooth and tight.
 - (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
 - (j) Crimp the Shield-Kon.
 - (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 215.

SHIELD SPLICE ASSEMBLY
Figure 215

- (14) Tightly wind a layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
- Makes a 50 percent overlap.

(15) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(16) Assemble a lacing tape wire harness tie on each end of the splice assembly approximately 0.25 inch from the end of the tape. Refer to Subject 20-10-11.

Make sure that the Temperature Grade of the lacing tape is Temperature Grade D.

E. One Shielded Cable to One Shielded Cable - Tape, Sleeve

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CONFIGURATION OF THE SPLICE ASSEMBLY
Figure 216

Refer to Figure 216.

(1) Make a selection of a Temperature Grade D shield material from Table 53.

Make sure that the shield material has the smallest diameter that can go on the folded back shield of the cable.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

(2) Make a selection of a Temperature Grade D insulation tape from Table 49.

(3) Make a selection of a Temperature Grade D heat shrinkable sleeve from Table 48.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

(4) Prepare the shielded cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Refer to:

- Figure 217
- Subject 20-00-15 for the outer jacket removal procedures.

Make sure that:

- The distance from the end of the outer jacket to the end of the shield is 0.5 inch to 1.0 inch
- The distance from the end of the shield to the center of the nearest sealed splice is 1.75 inches \pm 0.25 inch
- The distance from the center of a sealed splice on one wire to the center of the nearest sealed splice on another wire is 2.38 inches \pm 0.25 inch.

PREPARATION OF THE SHIELDED CABLE

Figure 217

- (5) Fold the end of the shield against the outer jacket.
- (6) Put a temporary layer of tape around the end of each shield to make sure that the shields do not move.
- (7) Cut the necessary length of the sleeve.
Make sure that the sleeve extends a minimum of 1 inch farther than the rear end of the Shield-Kons on each end of the shield splice.
- (8) Cut the necessary length of the shield material.
Make sure that the ends of the shield material extend farther than the rear end of the Shield-Kons on each end of the shield splice.
- (9) Put the sleeve on one end of the cable.
- (10) Put the shield material on the end of the other cable.
NOTE: If it is necessary, the strands at the end of the shield material can be moved apart to make it easier to put the shield material on the cable.
- (11) Make a selection of an applicable Temperature Grade D conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Align one end of the shield material with the end of the folded back shield. Refer to Figure 218.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SHIELD MATERIAL ON THE CABLE
Figure 218

(14) Measure the outer diameter of the shield assembly. Refer to Figure 219.

MEASUREMENT OF THE SHIELD ASSEMBLY OUTER DIAMETER
Figure 219

(15) Make a selection of the correct size of two Temperature Grade D Shield-Kons from Table 34.

(16) Assemble the splice of the shield:

- (a) Make a selection of a Shield-Kon crimp tool from Table 46.
- (b) Remove the temporary layer of tape around the end of each shield.
- (c) Align one end of the shield material with the end of the shield. Refer to Figure 218.
- (d) Put one of the Shield-Kons into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (e) Put the crimp tool and the Shield-Kon on the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (f) Crimp the Shield-Kon.
- (g) Put the other Shield-Kon into the die of the crimp tool.
 Make sure that the center of the Shield-Kon is aligned with the center of the die.
- (h) Make the shield material smooth and tight.
- (i) Put the crimp tool and the Shield-Kon on the other end of the shield material.
 Make sure that the rear end of the Shield-Kon is aligned with the ends of the shield and the shield material.
- (j) Crimp the Shield-Kon.
- (k) Remove the shield and the shield material that extend farther than the rear end of the Shield-Kon on each end of the shield splice. Refer to Figure 220.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

SHIELD SPLICE ASSEMBLY
Figure 220

- (17) Tightly wind a layer of the tape on the splice assembly.
 Make sure that the layer of tape:
 - Starts 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at one end of the splice
 - Stops 0.50 inch \pm 0.25 inch farther than the rear end of the Shield-Kon at the other end of the splice
 - Makes a 50 percent overlap.
- (18) Tightly wind a second layer of the tape on the splice assembly.
 Make sure that the layer of tape:
 - Starts where the first layer of tape stops
 - Stops where the first layer of tape starts
 - Makes a 50 percent overlap.
- (19) Align the center of the sleeve with the center of the splice assembly.
- (20) Shrink the sleeve into position. Refer to Subject 20-10-14.

14. SEALED SPLICE CONFIGURATIONS WITH SOLDER SHIELD SPLICE KITS FOR SHIELDED WIRE AND SHIELDED CABLE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

COMPONENTS OF THE RAYCHEM SOLDER SHIELD SPLICE KIT
Figure 221

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

ASSEMBLY CONFIGURATION OF THE SOLDER SHIELD SPLICE

Figure 222

	Two Class 3 Shielded Cables	3	Paragraph 14.Q.
One Class 4 Shielded Cable	One Class 4 Shielded Cable	4	Paragraph 14.R.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (1) Find the paragraph for the splice assembly configuration in Table 98.

Make sure the paragraph is applicable for:

- The configuration of the wiring
- The quantity of conductor splices.

- (2) Make a selection of a splice kit. Refer to the applicable paragraph for the splice assembly configuration.

NOTE: The specified splice kit can have more splices and sleeves than are necessary. Discard the unwanted parts.

- (a) Measure these dimensions of the wire or cable on each side of the splice:

- The jacket O.D.
- The shield O.D.

- (b) Calculate the total CAU of the conductors for each end of each conductor splice. Refer to Paragraph 1.D.

- (c) If the jackets do not have the correct O.D. for the splice kit, make a selection of an alternative splice configuration. Refer to Paragraph 1.C.

- (d) If the shields do not have the correct O.D. for the splice kit, the shield O.D. can be increased as specified in Step (9).

- (e) If the CAU of the conductors are not the correct size for the splice kit, the conductors can be increased.

Refer to:

- Paragraph 2.B. to assemble the conductor splice with a conductor that is folded back
- Paragraph 2.C. to assemble the conductor splice with a filler wire.

NOTE: As an alternative, make a selection of a different splice configuration. Refer to Paragraph 1.C.

- (3) Find the part number of the butt splice in the splice kit. Refer to Table 23.

- (4) Find the crimp barrel size of the butt splice.

Refer to:

- Table 12 for NAS1387-() splices
- Table 14 for D-609-() splices.

- (5) Make a selection of a crimp tool.

Refer to:

- Table 42 for crimp tools for NAS1387-() splices
- Table 43 for crimp tools for Raychem D-609-() splices.

- (6) Make a selection of a standard temperature hot air gun from Table 47.

- (7) Put the solder shield splice sleeve on each of the cables on one side of the splice assembly.

- (8) Remove these specified lengths from the end of the cable or the wire:

- The outer jacket
- The shield
- The primary insulation
- The conductor.

Refer to the applicable paragraph for the splice assembly configuration.

20-30-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(9) If it is necessary to increase the O.D. of the shield:

CAUTION: THIS PROCEDURE IS APPLICABLE ONLY FOR CABLES THAT HAVE ROUND CONDUCTOR STRANDS IN THE SHIELD. IF THE CABLE HAS A SHIELD WITH FLAT, RECTANGULAR CONDUCTOR STRANDS, DAMAGE TO THE SHIELD CAN OCCUR.

- (a) Remove the necessary length of the outer jacket.
Make sure that the distance from the end of the jacket to the end of the conductor is D2.
 - (b) Remove the necessary length of the shield.
Make sure that the distance from the end of the shield to the end of the outer jacket is D3 minus D2.
 - (c) Fold the shield back on the outer jacket of the cable.
- (10) Assemble the splice of each wire.
- (a) Put the seal sleeve on the wire or wires.
Make sure that the large end of the sleeve is pointed toward the end of the cable.
 - (b) Put the necessary conductors in one end of the butt splice.
Make sure that the end of each conductor is against the wire stop at the center of the splice.
 - (c) Crimp the splice.
 - (d) Put the necessary conductors in the other end of the splice.
Make sure that the end of each conductor is against the notch at the center of the splice.
 - (e) Crimp the splice.
 - (f) Align the center of the seal sleeve with the center of the butt splice.
 - (g) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (11) Align the center of the shield splice sleeve with the middle of the distance between the ends of the outer jackets of the cable on both sides of the splice assembly.
- (12) Shrink one end of the shield splice sleeve:
- (a) Apply heat at the center of the sleeve until the solder melts and the sleeve begins to shrink.
 - (b) Continue to apply heat from the center of the sleeve toward one end of the sleeve until the solder ring melts and flows.
- (13) Do Step (12) again for the other end of the sleeve.

B. One Shielded Wire to One Shielded Wire

If the splice is for one shielded 10 AWG wire to one shielded 16 AWG wire used on a pass thru bulkhead, refer to Paragraph 14.C..

**Table 99
SPLICE KITS FOR ONE SHIELDED WIRE TO ONE SHIELDED WIRE**

Jacket Maximum O.D.	Shield Minimum O.D.	Conductor CAU Range		Solder Shield Splice Kit	
		Minimum	Maximum	Part Number	Supplier
0.12	0.06	3	15	D-150-0168	Raychem

		Minimum	Maximum	Part Number	Supplier
0.22	0.14	43	138	D-150-0272	Raychem

For an AWG 16 conductor in the splice of the D-150-0272 splice kit, these conditions are applicable:

- A filler wire must be used
- The shield must be folded back.

ONE SHIELDED WIRE TO ONE SHIELDED WIRE

Figure 223

Table 100
CABLE TRIM DIMENSIONS

Cable	Conductor	Trim Dimension (inch)		
		Dimension	Target	Tolerance
A	C1	D1	0.28	± 0.02
		D2	0.70	± 0.02

		D2	0.70	± 0.02
		D3	1.08	± 0.02

C. One 10 AWG Shielded Wire to One 16 AWG Shielded Wire Used on Pass Thru Bulkheads

Table 101
NECESSARY MATERIALS

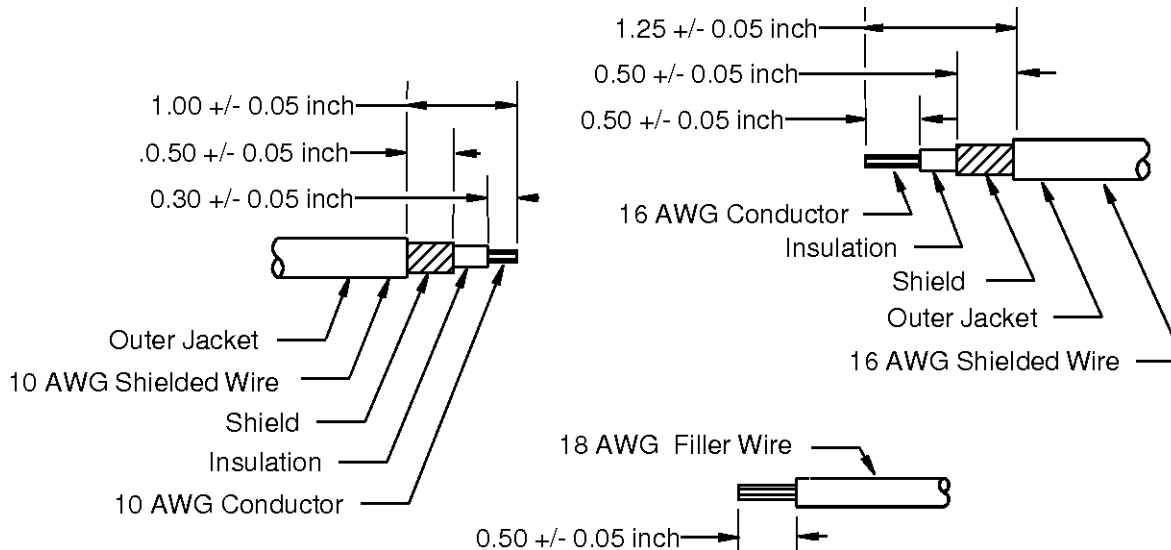

Part Number	Description	Quantity or Length Required	Supplier
D-150-0272	Splice Kit	1	Raychem
BACS13CT3N	solder sleeve	2	Boeing
BAC3108-2C	shield overbraid	2.5 inches ± 0.1 inch	Boeing
M23053/5-108-4	1/2 inch diameter heat shrinkable sleeve	4.0 inches ± 0.1 inch	An available source
M23053/12-102-C	1/4 inch diameter heat shrinkable sleeve	2.0 inches ± 0.1 inch	An available source

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(1) Prepare the end of each wire Refer to Figure 224.

Make sure that the 18 AWG filler wire is the same wire type as the 16 AWG wire.

PREPARED WIRE ENDS
Figure 224

(2) Make a selection of a splice kit from Table 101.

NOTE: In this procedure, the D-150-0675 large overall solder shield in the D-150-0272 splice kit is not used.

(3) Put these components on the 10 AWG wire in this order:

- A 4.0 inch ± 0.1 inch length of 1/2 inch diameter M23053/5-108-4 heat shrinkable sleeve
- A BACS13CT3N solder sleeve
- A 2.5 inch ± 0.1 inch length of BAC3108-2C shield overbraid
- A 2.0 inch ± 0.1 inch length of 1/4 inch diameter M23053/12-102-C heat shrinkable sleeve.

Refer to Figure 225.

COMPONENTS ON THE 10 AWG SHIELDED WIRE
Figure 225

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

(4) Put these components on the 16 AWG wire in this order:

- A BACS13CT3N solder sleeve
- A seal sleeve from the D-150-0272 splice kit.

Refer to Figure 226.

COMPONENTS ON THE 16 AWG SHIELDED WIRE
Figure 226

POSITION OF THE CONDUCTORS IN THE SPLICE
Figure 227

Refer to Figure 227:

- (5) Fold back 0.5 inch \pm 0.06 inch of the shield on the 10 AWG wire.
- (6) Fold back 0.5 inch \pm 0.06 inch of the shield on the 16 AWG wire.
- (7) Put the conductor of the 10 AWG wire in the crimp barrel of one end of the NAS1387-6 wire splice from the D-150-0272 splice kit.
- (8) Make a selection of a crimp tool from Table 42 for a size 12-10 crimp barrel for the NAS1387-6 splice.
- (9) Crimp the end of the splice that has the 10 AWG wire.
- (10) Put the conductor of the 16 AWG wire and the conductor of the 18 AWG filler wire in the crimp barrel of the other end of the splice.
- (11) Crimp the end of the splice that has the 16 AWG conductor and the 18 AWG filler wire conductor.
- (12) Remove the unwanted length of the 18 AWG filler wire. Refer to Figure 227.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that the distance from the end of the filler wire to the end of the crimp barrel of the splice is 0.25 inch \pm 0.06 inch.

- (13) Put the seal sleeve from the 16 AWG wire on the splice and on the filler wire. Refer to Figure 228.

INITIAL POSITION OF THE SEAL SLEEVE ON THE SPLICE
Figure 228

- (14) Shrink the seal sleeve into its position. Refer to Figure 229.

Make sure that the seal sleeve is on the splice and on the end of the filler wire.

POSITION OF THE SEAL SLEEVE
Figure 229

- (15) Put the 2 inch length of 1/4 inch diameter heat shrinkable sleeve from the 10 AWG wire on the seal sleeve.

- (16) Shrink the 1/4 inch diameter sleeve into its position. Refer to Figure 230.

Make sure that:

- The sleeve is on the seal sleeve
- The center of the sleeve is located at the center of the seal sleeve
- The ends of the sleeve are not on the folded back shields of the wires.

1/4 diameter heat shrinkable sleeve

POSITION OF THE SMALLER HEAT SHRINKABLE SLEEVE
Figure 230

- (17) Put the shield overbraid on the sleeve. Refer to Figure 231.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

Make sure that on both sides of the splice assembly, the shield overbraid makes an overlap on:

- The folded back shields
- The edges of the outer cable jacket.

**INITIAL POSITION OF THE SHIELD OVERBRAID****Figure 231**

(18) Put the two BACS13CT3N solder sleeves on the shield overbraid. Refer to Figure 232 and Figure 233.

**POSITION OF THE SOLDER SLEEVES****Figure 232**

Make sure that for the solder ring in each solder sleeve:

- The solder ring is on the shield overbraid and on the folded back shield of the cable
- The distance from the edge of the solder ring to the end of the shield overbraid is approximately 0.1 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

POSITION OF THE SOLDER RINGS OF THE SOLDER SLEEVES AND THE SHIELDS
Figure 233

- (19) Apply heat to each solder sleeve until the solder flows into the shield overbraid and into the folded back shield of each shielded wire. Refer to Figure 234.

POSITION OF THE SOLDER SLEEVES AND THE SHIELD OVERBRAID
Figure 234

- (20) If it is necessary, remove the unwanted length of the shields that extend farther than the far ends of the solder sleeves.
- (21) Put the 4 inch length of 1/2 inch diameter heat shrinkable sleeve on the splice assembly.
- (22) Shrink the sleeve into its position. Refer to Figure 235.

Make sure that the sleeve and approximately 1.0 inch of the cable jacket on each side of the splice assembly make an overlap.

POSITION OF THE LARGER HEAT SHRINKABLE SLEEVE
Figure 235

15. SEALED SPLICE CONFIGURATIONS WITH SOLDER SLEEVE SHIELD SPLICES FOR SHIELDED WIRE AND SHIELDED CABLE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

**Table 132
SPLICE ASSEMBLY CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Applicable Condition	Splice Assembly	
				Configuration	Procedure
One Shielded Wire	One Shielded Wire	1	No Fuel Vapor	Tape, Sleeve	Paragraph 15.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

B. One Shielded Wire to One Shielded Wire

SPLICE OF THE SHIELD
Figure 251

Refer to Figure 251.

- (1) Make a selection of a Temperature Grade B shield material from Table 53.
Make sure that the shield material has the smallest diameter that can go on the wire.

NOTE: For alternative shield materials, refer to Subject 20-00-11.

- (2) Make a selection of a Temperature Grade B or higher insulation tape from Table 49.
- (3) Make a selection of two solder sleeves from Table 51.
- (4) Prepare the wire.

Refer to:

- Figure 252
- Subject 20-00-15 for the outer jacket removal procedures.

WIRE PREPARATION
Figure 252

- (a) Remove 2.20 inches \pm 0.10 inch of the outer jacket from the end of each wire.
- (b) Remove the necessary length of shield from the wire that makes the distance from the end of the shield to the end of the jacket equal to 0.25 inch \pm 0.06 inch.
- (5) Cut the necessary length of the shield material.

Make sure that length is sufficient to extend from the end of the outer jacket on one wire to the end of the outer jacket on the other wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (6) Cut the necessary length of the heat shrinkable sleeve.
Make sure that length is sufficient to extend a minimum of 1 inch farther than the rear end of the solder sleeve on each wire after the solder sleeves are installed.
- (7) Clean the jacket with isopropyl alcohol.
Make sure:
 - To clean the area from each end of the jacket to a minimum of 3 inches to the rear
 - That the cleaned area is dry.
- (8) Put the heat shrinkable sleeve on one end of the wire.
- (9) Put a solder sleeve on each end of the wire.
- (10) Put the shield material on one end of the wire.
- (11) Make a selection of an applicable Temperature Grade B conductor splice configuration for one wire to one wire. Refer to Paragraph 9.A.
- (12) Assemble the conductor splice. Refer to the applicable procedure given in Paragraph 9.A.
- (13) Align the ends of the shield material with the ends of the cable jacket.
- (14) If it is necessary, trim the length of the shield material to make a fit between the ends of the jacket.
- (15) Assemble one end of the shield splice.
 - (a) Move the solder sleeve on the jacket and the shield material. Refer to Figure 253.
Make sure that:
 - The end of the shield material is a maximum of 0.1 inch from the end of the jacket
 - The inner edge of the rear seal ring is aligned with the end of the jacket
 - The seal ring does not make an overlap with the shield.

POSITION OF THE SOLDER SLEEVE ON THE SHIELD MATERIAL
Figure 253

- (b) Shrink the solder sleeve into its position.
Make sure that:
 - The solder sleeve stays in the correct position
 - A minimum of 75 percent of the indicator ring on top of the solder ring is melted.
- (16) Do Step (15) again to assemble the other end of the shield splice.
Make sure that the shield material is pulled tight before the splice is assembled.
- (17) Tightly wind a layer of the tape on the splice assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that the layer of tape:

- Starts 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at one end of the splice
- Stops 0.50 inch \pm 0.25 inch farther than the rear end of the solder sleeve at the other end of the splice
- Makes a 50 percent overlap.

(18) Tightly wind a second layer of the tape on the splice assembly.

Make sure that the layer of tape:

- Starts 1 inch minimum farther than where the first layer of tape stops
- Stops 1 inch minimum farther than where the first layer of tape starts
- Makes a 50 percent overlap.

(19) Align the center of the heat shrinkable sleeve with the center of the splice assembly.

(20) Shrink the sleeve into its position. Refer to Subject 20-10-14.

16. SEALED SPLICE CONFIGURATIONS WITH SOLDER SLEEVE SPLICE KITS FOR SHIELDED WIRE AND SHIELDED CABLE FOR HIGH TEMPERATURE

A. Splice Assembly Configurations

For the conditions that are applicable for:

- The repair of a wire or a cable with a splice, refer to Subject 20-10-13
- The selection of the correct sealed splice configuration, refer to Paragraph 1.C.

CAUTION: THESE SPLICE ASSEMBLY CONFIGURATIONS CONTAIN SOLDER SLEEVES THAT ARE APPLICABLE FOR WIRE AND CABLE WITH NICKEL PLATED SHIELDS. ASSEMBLY OF THE SPLICE ON WIRE AND CABLE WITHOUT NICKEL PLATED SHIELDS CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE SPLICE. REFER TO SUBJECT 20-00-13 FOR THE CONFIGURATION OF THE WIRE OR CABLE.

**Table 133
WIRE AND CABLE CONFIGURATIONS**

One End of Splice Assembly	Other End of Splice Assembly	Quantity of Conductor Splices	Splice Kit
One Shielded Wire	One Shielded Wire	1	D-150-0250
	Two Shielded Wires	1	D-150-0251
Two Shielded Wires	One Shielded Wire	1	D-150-0251
One Class 2 Shielded Cable	One Class 2 Shielded Cable	2	D-150-0252
	Two Class 2 Shielded Cables	2	D-150-0253
Two Class 2 Shielded Cables	One Class 2 Shielded Cable	2	D-150-0253

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

**Table 134
DIMENSIONS OF THE SPLICE KITS**

Splice Kit	One End of Splice Assembly		Other End of Splice Assembly		Conductor CAU Range		Conductor Splice Crimp Barrel Size
	Jacket Maximum O.D. (inch)	Shield Minimum O.D. (inch)	Jacket Maximum O.D. (inch)	Shield Minimum O.D. (inch)	Minimum	Maximum	
D-150-0250	0.18	0.10	0.18	0.10	8	27	20-16
D-150-0251	0.18	0.10	0.28	0.16	19	67	16-12

**Table 135
SPLICE ASSEMBLY CONFIGURATION PROCEDURES**

Splice Kit	Procedure
D-150-0250	Paragraph 16.B.
D-150-0251	Paragraph 16.C.
D-150-0252	Paragraph 16.D.
D-150-0253	Paragraph 16.E.

- (1) Make a selection of the applicable splice kit for the wire or cable configuration from Table 133.
- (2) Measure these dimensions of the wire or cable on each side of the splice:
 - The jacket O.D.
 - The shield O.D.
- (3) Compare these dimensions with the applicable dimensions of the splice kit in Table 134:
 - The jacket O.D.
 - The shield O.D.
- (4) If the O.D. of the jackets or the shields are not the correct dimension for the splice kit, make a selection of an alternative splice configuration. Refer to Paragraph 1.C.
- (5) Calculate the total CAU of the conductors for each end of each conductor splice. Refer to Paragraph 1.D.
- (6) Compare the total conductor CAU with the applicable conductor CAU of the splice kit in Table 134.
- (7) If the CAU of the conductors are not the correct size for the splice kit, the conductors can be increased.

Refer to:

- Paragraph 2.B. to assemble the conductor splice with a conductor that is folded back
- Paragraph 2.C. to assemble the conductor splice with a filler wire.

NOTE: As an alternative, make a selection of a different splice configuration. Refer to Paragraph 1.C.

- (8) Make a selection of a crimp tool from Table 43.

Refer to Table 134 for the crimp barrel size of the conductor splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (9) Make a selection of a high temperature type, hot air gun from Table 47.
- (10) Assemble the splice. Refer to Table 135 for the procedure.

B. One Shielded Wire to One Shielded Wire

Refer to Paragraph 16.A. first to start this procedure.

COMPONENTS OF THE RAYCHEM D-150-0250 SOLDER SLEEVE SPLICE KIT
Figure 254

Refer to Figure 254.

- (1) Prepare the end of each cable. Refer to Figure 255.

CABLE PREPARATION
Figure 255

- (a) Remove 1.50 inches ± 0.05 inch of the outer jacket from the end of the cable.
- (b) Remove the necessary length of the shield so that the distance from the end of the shield to the end of the outer jacket is 0.50 inch ± 0.05 inch.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Remove the necessary length of the insulation so that the distance from the end of the insulation to the end of the conductor is 0.30 inch \pm 0.05 inch.
- (2) Remove a short length of each end of the shield tube so that the diameter of the tube can be increased.
- (3) In this order, put these components on Cable A:
 - The outer sleeve
 - A solder sleeve
 - The shield tube.
- (4) In this order, put these components on Cable B:
 - A solder sleeve
 - The seal sleeve.
- (5) Assemble the Cable A end of the splice:
 - (a) Put the conductor in the splice so that the end of the conductor is aligned with the center of the splice.
 - (b) Crimp the splice.
- (6) Do Step (5) again for the Cable B end of the splice.
- (7) Align the center of the seal sleeve with the center of the splice.
- (8) Apply heat to shrink the seal sleeve into position.
- (9) Push the shield tube to Cable B so that the forward end of the tube is against the end of the cable jacket of Cable B.
- (10) Attach the end of the shield tube to the shield of Cable B:
 - (a) Twist the end of the shield tube down so that the end of the tube is tight against the shield of the cable.
 - (b) Push the solder sleeve toward the end of the cable until the rear edge of the solder ring is 0.10 inch from the end of the cable jacket.
 - (c) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shield of the cable.
- (11) Attach the remaining free end of the shield tube to the shield of the Cable A:
 - (a) Pull the shield tube across the splice so that it is tight.
 - (b) Remove the length of the shield tube that makes an overlap with the end of the outer jacket of the Cable A.
 - (c) Do Step (10) again.
- (12) Align the center of the outer sleeve with the center of the seal sleeve.

NOTE: On each end of the splice assembly, the outer sleeve should make approximately a 1.0 inch overlap with the cable jacket.
- (13) To shrink the outer sleeve into position:
 - (a) Apply heat from the center of the sleeve toward one end of the sleeve until the longitudinal line cannot be seen.
 - (b) Apply heat from the center of the sleeve toward the other end of the sleeve until the longitudinal line cannot be seen.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

C. One Shielded Wire to Two Shielded Wires

Refer to Paragraph 16.A. first to start this procedure.

**COMPONENTS OF THE RAYCHEM D-150-0251 SOLDER SLEEVE SPLICE KIT
Figure 256**

Refer to Figure 256.

(1) Prepare the end of each cable. Refer to Figure 257.

**CABLE PREPARATION
Figure 257**

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (a) Remove the necessary length of the outer jacket so that the distance from the end of the outer jacket to the end of the conductor is:
 - 1.80 inches ± 0.05 inch for Cable A
 - 1.50 inches ± 0.05 inch for Cable B and Cable C.
- (b) Remove the necessary length of the shield so that the distance from the end of the shield to the end of the outer jacket is 0.50 inch ± 0.05 inch for each cable.
- (c) Remove the necessary length of the insulation so that the distance from the end of the insulation to the end of the conductor is:
 - 0.60 inch ± 0.05 inch for Cable A
 - 0.30 inch ± 0.05 inch for Cable B and Cable C.
- (2) Remove a short length of each end of the shield tube so that the diameter of the tube can be increased.
- (3) In this order, put these components on cable A:
 - The outer sleeve
 - A seal insert
 - The large solder sleeve so that the end of the sleeve with the larger diameter is pointed toward the end of the wire
 - The small solder sleeve so that the end of the sleeve with the larger diameter is pointed toward the end of the wire
 - The shield tube
 - The seal sleeve.
- (4) Put a seal insert on Cable B or Cable C.
- (5) Assemble the Cable A end of the splice:
 - (a) Fold the conductor of Cable A back on itself so that the end of the conductor is aligned with the end of the insulation.
 - (b) Push the conductor into one end of the splice so that the end of the conductor is aligned with the center of the splice.
 - (c) Crimp the splice.
- (6) Assemble the other end of the splice:
 - (a) At the same time, push the conductors of Cable B and Cable C into the other end of the splice so that the end of the conductors is aligned with the center of the splice.
 - (b) Crimp the splice.
- (7) Align the center of the seal sleeve with the center of the splice.
- (8) Shrink the seal sleeve into position.
- (9) Push the shield tube toward Cable B and Cable C so that the rear end of the tube is against the end of the cable jacket of Cable A.
- (10) Attach the end of the shield tube to the shield of Cable A:
 - (a) Twist the end of the shield tube down so that the end of the tube is tight against the shield of the cable.
 - (b) Push the small solder sleeve toward the end of the cable until the rear edge of the solder ring is 0.10 inch from the end of the cable jacket.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

- (c) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shield of the cable.
- (11) Attach the remaining free end of the shield tube to the shields of the Cable B and Cable C:
 - (a) Pull the shield tube across the splice so that it is tight.
 - (b) Remove the length of the shield tube that makes an overlap with the end of the outer jackets of the Cable B and Cable C.
 - (c) Twist the end of the shield tube down so that the end of the tube is tight against the shields of the cables.
 - (d) Push the large solder sleeve toward Cable B and Cable C until the rear edge of the solder ring is 0.10 inch from the end of the cable jacket.
 - (e) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shield of the cable.
- (12) Push each seal insert toward the splice until the forward end is against each solder sleeve on each side of the splice.
- (13) Align the center of the outer sleeve with the center of the seal sleeve.

NOTE: On each end of the splice assembly, the outer sleeve should make approximately a 1.0 inch overlap with the seal insert.
- (14) To shrink the outer sleeve into position:
 - (a) Apply heat from the center of the sleeve toward one end of the sleeve until the longitudinal line cannot be seen.
 - (b) Apply heat from the center of the sleeve toward the other end of the sleeve until the longitudinal line cannot be seen.

D. One Class 2 Shielded Cable to One Class 2 Shielded Cable

Refer to Paragraph 16.A. first to start this procedure.

COMPONENTS OF THE RAYCHEM D-150-0252 SOLDER SLEEVE SPLICE KIT
Figure 258

Refer to Figure 258.

- (1) Prepare the end of each cable. Refer to Figure 259.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CABLE PREPARATION
Figure 259

- (a) Remove the necessary length of the outer jacket from each cable so that the distance from the end of the outer jacket to the end of the cable is 3.00 inches ± 0.05 inch.
- (b) Remove the necessary length of the shield from each cable so that the distance from the end of the shield to the end of the outer jacket is 0.50 inch ± 0.05 inch.
- (c) Cut the wires so that the distance from the end of the wire to the end of the outer jacket is 1.50 inches ± 0.05 inch:
 - Wire A2 of Cable A
 - Wire B1 of Cable B.
- (d) Remove the necessary length of insulation from each wire so that the distance from the end of the insulation to the end of the conductor is 0.30 inch ± 0.05 inch.
- (2) Remove a short length of each end of the shield tube so that the diameter of the tube can be increased.
- (3) In this order, put these components on cable A:
 - The outer sleeve
 - Two solder sleeves so that the end of each sleeve with the larger diameter points toward the end of the wire
 - The shield tube.
- (4) Put a seal sleeve on:
 - Wire A1 of Cable A
 - Wire B2 of Cable B.
- (5) Assemble the Cable A side of the splice configuration:
 - (a) Put the conductor of Wire A1 in one of the splices so that the end of the conductor is aligned with the center of the splice.
 - (b) Crimp the splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Put the conductor of Wire A2 in the other splice so that the end of the conductor is aligned with the center of the splice.
- (d) Crimp the splice.
- (6) Assemble the Cable B side of the splice configuration:
 - (a) Put the conductor of Wire B1 in the open end of the splice that has Wire A1 of Cable A so that the end of the conductor is aligned with the center of the splice.
 - (b) Crimp the splice.
 - (c) Put the conductor of Wire B2 in the open end of the splice that has Wire A2 of Cable A so that the end of the conductor is aligned with the center of the splice.
 - (d) Crimp the splice.
- (7) Align the center of each seal sleeve with the center of each splice.
- (8) Shrink each sleeve into position.
- (9) Push the shield tube toward Cable B until the forward end of the tube is against the end of the cable jacket of Cable B.
- (10) Attach the end of the shield tube to the shield of Cable B:
 - (a) Twist the end of the shield tube down so that the end of the tube is tight against the shield of the cable.
 - (b) Push one of the solder sleeves toward Cable B until the rear edge of the solder ring is 0.10 inch from the end of the outer jacket of the cable.
 - (c) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shield of the cable.
- (11) Attach the remaining free end of the shield tube to the shield of the Cable A:
 - (a) Pull the shield tube across the splice so that it is tight.
 - (b) Remove the length of the shield tube that makes an overlap with the end of the outer jacket of the Cable A.
 - (c) Do Step (10) again.
- (12) Align the center of the outer sleeve with the center of the seal sleeves.

NOTE: On each end of the splice assembly, the outer sleeve should make approximately a 1.0 inch overlap with the cable jacket.
- (13) To shrink the outer sleeve into position:
 - (a) Apply heat from the center of the sleeve toward one end of the sleeve until the longitudinal line cannot be seen.
 - (b) Apply heat from the center of the sleeve toward the other end of the sleeve until the longitudinal line cannot be seen.

E. One Class 2 Shielded Cable to Two Class 2 Shielded Cables

Refer to Paragraph 16.A. first to start this procedure.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

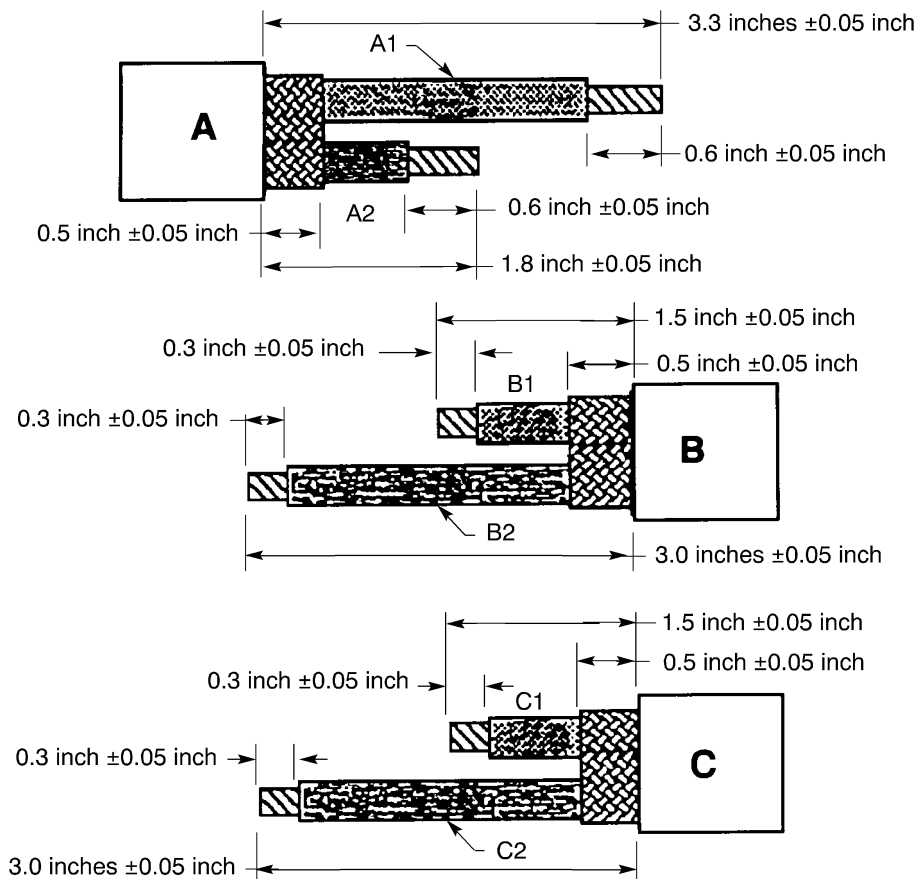

COMPONENTS OF THE RAYCHEM D-150-0253 SOLDER SLEEVE SPLICE KIT
Figure 260

Refer to Figure 260.

- (1) Prepare the end of each cable. Refer to Figure 261.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

CABLE PREPARATION
Figure 261

- (a) Remove the necessary length of the outer jacket so that the distance from the end of the outer jacket to the end of the cable is:
 - 3.30 inches \pm 0.05 inch for Cable A
 - 3.00 inches \pm 0.05 inch for Cable B
 - 3.00 inches \pm 0.05 inch for Cable C.
- (b) Remove the necessary length of the shield from each cable so that the distance from the end of the shield to the end of the outer jacket is 0.5 inch \pm 0.05 inch.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (c) Cut the wires so that the distance from the end of the wire to the end of the outer jacket is:
 - 1.80 inches \pm 0.05 inch for Wire A2 of Cable A
 - 1.50 inches \pm 0.05 inch for Wire B1 of Cable B
 - 1.50 inches \pm 0.05 inch for Wire C1 of Cable C.
- (d) Remove the necessary length of the insulation from each wire so that the distance from the end of the insulation to the end of the conductor is:
 - 0.60 inch \pm 0.05 inch for Wire A1 and Wire A2 of Cable A
 - 0.30 inch \pm 0.05 inch for Wire B1 and Wire B2 of Cable B
 - 0.30 inch \pm 0.05 inch for Wire C1 and Wire C2 of Cable C.
- (2) Remove a short length of each end of the shield tube so that the diameter of the tube can be increased.
- (3) If it is necessary, remove a length from each end of the shield tube.
- (4) In this order, put these components on Cable A:
 - A seal insert
 - The small solder sleeve so that the end of the sleeve with the larger diameter is pointed toward the end of the wire
 - The large solder sleeve so that the end of the sleeve with the larger diameter is pointed toward the end of the wire
 - The shield tube.
- (5) Put one seal insert on each of these cables:
 - Cable B
 - Cable C.
- (6) Put a seal sleeve on each of these wires:
 - Wire A1 of Cable A
 - Wire A2 of Cable A.
- (7) Assemble the Cable A side of the splice configuration:
 - (a) Fold the conductor of Wire A1 back on itself so that the end of the conductor is aligned with the end of the insulation.
 - (b) Put the conductor of Wire A1 in one of the splices so that the end of the conductor is aligned with the center of the splice.
 - (c) Crimp the splice.
 - (d) Fold the conductor of Wire A2 back on itself so that the end of the conductor is aligned with the end of the insulation.
 - (e) Put the conductor of Wire A2 in the other splice so that the end of the conductor is aligned with the center of the splice.
 - (f) Crimp the splice.
- (8) Assemble the Cable B and Cable C side of the splice configuration:
 - (a) Put the conductor of Wire B1 and Wire C1 in the open end of the splice that has Wire A1 of Cable A so that the end of the conductor is aligned with the center of the splice.
 - (b) Crimp the splice.
 - (c) Put the conductor of Wire B2 and Wire C2 in the open end of the splice that has Wire A2 of Cable A so that the end of the conductor is aligned with the center of the splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF SPLICES**

- (d) Crimp the splice.
- (9) Align the center of one seal sleeve with the center of the splice on that wire.
- (10) Shrink the sleeve into position.
- (11) Align the center of the other seal sleeve with the center of the splice on that wire.
- (12) Shrink the sleeve into position.
- (13) Push the shield tube toward Cable B and Cable C until the forward end of the tube is against the end of the cable jacket of Cable B.
- (14) Attach the end of the shield tube to the shields of Cable B and Cable C:
 - (a) Twist the end of the shield tube down so that the end of the tube is tight against the shields of both cables.
 - (b) Push the large solder sleeve toward Cable B and Cable C until the forward edge of the solder ring is 0.10 inch from the end of the outer jackets of both cables.
 - (c) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shields of both cables.
- (15) Attach the remaining free end of the shield tube to the shield of the Cable A:
 - (a) Pull the shield tube across the splice so that it is tight.
 - (b) Remove the length of the shield tube that makes an overlap with the end of the outer jacket of the Cable A.
 - (c) Push the small solder sleeve toward the end of the cable until the rear edge of the solder ring is 0.10 inch from the end of the outer jacket of the cable.
 - (d) Apply heat to the center of the solder sleeve until the solder melts and flows into the shield tube and the shield of the cable.
- (16) Push each seal insert toward the splice until the forward end is against each solder sleeve on each side of the splice.
- (17) Align the center of the outer sleeve with the center of the seal sleeves.

NOTE: On each end of the splice assembly, the outer sleeve should make approximately a 1.0 inch overlap with the cable jacket.
- (18) To shrink the outer sleeve into position:
 - (a) Apply heat from the center of the sleeve toward one end of the sleeve until the longitudinal line cannot be seen.
 - (b) Apply heat from the center of the sleeve toward the other end of the sleeve until the longitudinal line cannot be seen.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

17. REMOVABLE CONTACT SPLICES

A. Splice Separation

SPLICE SEPARATION
Figure 262

- (1) Hold both ends of the splice at the same time.
- (2) Turn one end of the splice approximately 1/4 turn.
- (3) Pull each end until the plug is disconnected from the receptacle.

B. Contact Removal

- (1) Make a selection of a size 16 contact removal tool. Refer to Subject 20-61-11.

NOTE: The contact is removed from the front face of the splice.

- (2) Remove the contact from each end of the splice.

C. Splice Assembly

For the applicable conditions for the assembly of a splice, refer to Paragraph 1.A.

SPLICE ASSEMBLY
Figure 263

Refer to Figure 263.

- (1) Make a selection of a splice plug and a splice receptacle from Table 27.
- (2) Make a selection of the contacts for the plug and receptacle from Table 29.
- (3) Make a selection of a contact crimp tool. Refer to Subject 20-61-11.
- (4) Make a selection of a size 16 contact insertion tool. Refer to Subject 20-61-11.
- (5) Remove 0.28 inch \pm 0.03 inch of insulation from the each end of the wire.
- (6) Assemble the receptacle side of the splice:
 - (a) Put the wire in the crimp barrel of the socket contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF SPLICES

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

- (b) Crimp the contact.
- (c) At the rear of the receptacle, axially align the contact and the tool with the contact cavity.
- (d) Push the tool into the contact cavity until it stops.
- (e) Remove the tool from the contact cavity.
- (f) Lightly pull the wire to make sure that the contact is locked in its position.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE SPLICE OR THE CONTACT.

- (7) Do Step (6) again for the plug side of the splice with a pin contact.
- (8) Push the plug straight into the receptacle until it stops.
- (9) Twist each half of the splice in opposite directions until the lock latches in the plug are fully engaged with the slots in the receptacle.

20-30-13 CONTENTS

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY AND REPAIR OF COPALUM SPLICES**

This Subject gives the procedures:

- To assemble a copalum splice with stranded aluminum and stranded copper wire
- To repair the insulation of a copalum splice
- To replace a copalum splice.

1. GENERAL DATA**A. General Conditions**

For the conditions that are applicable for the repair of wiring, refer to Subject 20-10-13.

B. Configuration of Splices on Adjacent Power Feeder Wires

These conditions are applicable:

- If more than one splice in a power feeder harness is necessary, the recommended configuration is to install splices intervals along the longitudinal axis of the wire harness; refer to Figure 1
- If it is not possible to install the splices at intervals, the splices can make 100 percent overlap; refer to Figure 2.

**CONFIGURATION OF SPLICES AT INTERVALS****Figure 1****CONFIGURATION OF SPLICES WITH A 100 PERCENT OVERLAP****Figure 2****20-30-13**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

Refer to Subject 20-10-11 for the necessary conditions that are applicable for:

- The installation of a power feeder wire harness
- The installation of a power feeder wire harness with splices on adjacent wires.

2. SELECTION OF SPLICES

A. Selection of Standard Butt Splices

Standard butt splices can be used to attach:

- An aluminum wire to a aluminum wire
- A copper wire to a copper wire
- A copper wire to an aluminum wire.

**Table 1
PERMITTED WIRE COMBINATIONS FOR THE STANDARD BUTT SPLICES**

Standard Butt Splice	Wire Combination					
	First Wire		Second Wire		O.D. of the Wire Insulation (inch)	
	Size (AWG)	Type	Size (AWG)	Type	Minimum	Maximum

	3/0	Al	2/0	Cu	0.520	0.645
			3/0	Al	0.520	0.645

CONFIGURATION OF A STANDARD BUTT SPLICE
Figure 3

NOTE: The size of the wire barrel of standard butt splices is the same at each end.

Refer to Figure 3.

- (1) Find the size of each wire that must have a splice. Refer to the WDM.
- (2) Find the conductor material type of each wire that must have a splice. Refer to the WDM and Subject 20-00-13.
- (3) Make a selection of a splice from Table 1, with the first wire to be installed in either end of the splice and the second wire to be installed in the other end of the splice.

B. Selection of Transitional Butt Splices

Transitional butt splices can be used to attach:

- An aluminum wire to a copper wire
- A larger copper wire to a smaller copper wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

Table 2
PERMITTED WIRE COMBINATIONS FOR THE TRANSITIONAL BUTT SPLICES

Transitional Splice	First Wire				Second Wire			
	Size (AWG)	Type	O.D. of the Wire Insulation (inch)		Size (AWG)	Type	O.D. of the Wire Insulation (inch)	
			Minimum	Maximum			Minimum	Maximum
277163-1	1/0	Cu	0.425	0.470	4	Cu	0.276	0.305
		Al	0.425	0.470	4	Cu	0.276	0.305
277164-1	4	Cu	0.276	0.305	8	Cu	0.210	0.255
		Al	0.276	0.305	8	Cu	0.210	0.255
277165-1	4	Cu	0.276	0.305	4	Cu	0.276	0.305
		Al	0.276	0.305	4	Cu	0.276	0.305
277168-1	3/0	Cu	0.520	0.645	1/0	Cu	0.430	0.495
		Al	0.520	0.645	1/0	Cu	0.430	0.495

CONFIGURATION OF A TRANSITIONAL BUTT SPLICE
Figure 4

Refer to Figure 4.

- (1) Find the size of each wire that must have a splice. Refer to the WDM.
- (2) Find the conductor material type of each wire that must have a splice. Refer to the WDM and Subject 20-00-13.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

(3) Make a selection of a splice from Table 2, with the first wire to be installed in End A and the second wire to be installed in End B.

NOTE: Transitional butt splices are designed to be assembled as follows:

- If one wire is aluminum and the other wire is copper, the end of the splice with the blue ring, End B, is for the copper wire
- If each wire is copper, the end of the splice with the larger wire barrel is for the larger copper wire.

3. PART NUMBERS AND DESCRIPTION

A. Copalum Splice Part Numbers

**Table 3

**Table 7
INSULATION REMOVAL LENGTH**

Splice	Removal Length (inch)	
	Target	Tolerance
277156-1	0.44	± 0.03
277157-1	0.50	± 0.03

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

- (1) Measure the O.D. of the wire insulation on each wire that must have a splice.
- (2) Make a selection of one of these splices:
 - A standard butt splice; refer to Paragraph 2.A.
 - A transitional butt splice; refer to Paragraph 2.B.

CAUTION: THE O.D. OF THE WIRE INSULATION IS VERY IMPORTANT. MAKE SURE THAT FOR THE SPECIFIED SPLICE IN TABLE 1 OR TABLE 2, THE O.D OF THE WIRE INSULATION IS NOT MORE THAN THE MAXIMUM O.D. SPECIFIED.

CAUTION: IF THE O.D. OF THE WIRE IS LESS THAN THE MINIMUM O.D SPECIFIED, THE O.D. OF THE INSULATION MUST BE INCREASED TO MAKE A SEAL IN THE SPLICE.

- (3) Make a selection of a heat shrinkable sleeve from Table 5.

NOTE: A satisfactory alternative is layers of self-bonding silicone tape that are applied after the splice is assembled. Refer to Paragraph 4.H.

- (4) Put a 1.5 inch length of 1/4 inch diameter sleeve on one wire.
- (5) Put a 1.5 inch length of 1/4 inch diameter sleeve on the other wire.
- (6) Put the 5 inch length of 1/2 inch diameter sleeve on a wire.
- (7) Remove the necessary length of the insulation from the end of each wire.

Refer to:

- Table 7
- Subject 20-00-15 for the insulation removal procedures.

Make sure that the end of each wire has not been crimped before.

- (8) If the O.D. of the wire insulation is less than the minimum O.D. specified in Table 1 or Table 2, increase the O.D. of the wire.

For the procedure to increase the O.D. of the wire insulation with:

- Layers of tape, refer to Paragraph 4.E.
- Heat shrinkable sleeves, refer to Paragraph 4.F.

C. Wire Preparation - AMP 277156-1 Splices with AWG 8 Wire

**Table 8
INSULATION REMOVAL LENGTH**

Splice	Removal Length (inch)	
	Target	Tolerance
277156-1	0.44	± 0.03

- (1) Measure the O.D. of the wire insulation on each wire that must have a splice.
- (2) Make a selection of one of these splices:
 - A standard butt splice; refer to Paragraph 2.A.
 - A transitional butt splice; refer to Paragraph 2.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

CAUTION: THE O.D. OF THE WIRE INSULATION IS VERY IMPORTANT. MAKE SURE THAT FOR THE SPECIFIED SPLICE IN TABLE 1 OR TABLE 2, THE O.D. OF THE WIRE INSULATION IS NOT MORE THAN THE MAXIMUM O.D. SPECIFIED.

CAUTION: IF THE O.D. OF THE WIRE IS LESS THAN THE MINIMUM O.D. SPECIFIED, THE O.D. OF THE INSULATION MUST BE INCREASED TO MAKE A SEAL IN THE SPLICE.

- (3) Remove the necessary length of the insulation from the end of each wire.

Refer to:

- Table 8
- Subject 20-00-15 for the insulation removal procedures.

Make sure that the end of each wire has not been crimped before.

- (4) If the O.D. of the wire insulation is less than the minimum O.D. specified in Table 1 or Table 2, increase the O.D. of the wire.

For the procedure to increase the O.D. of the wire insulation with:

- Layers of tape, refer to Paragraph 4.E.
- Heat shrinkable sleeves, refer to Paragraph 4.F.

D. Wire Preparation - Splices with other Wire Size Combinations

**Table 9
INSULATION REMOVAL LENGTH**

Splice	Removal Length (inch)	
	Target	Tolerance
277156-1	0.44	± 0.03
277157-1	0.50	± 0.03
277158-1	0.69	± 0.03
277159-1	0.75	± 0.03
277160-1	0.88	± 0.03
277161-1	1.00	± 0.03
277162-1	1.00	± 0.03
277163-1	1.00	± 0.03

277165-1	0.69	± 0.03
277168-1	1.00	± 0.03

- (1) Measure the O.D. of the wire insulation on each wire that must have a splice.
- (2) Make a selection of one of these splices:
 - A standard butt splice; refer to Paragraph 2.A.
 - A transitional butt splice; refer to Paragraph 2.B.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY AND REPAIR OF COPALUM SPLICES**

CAUTION: THE O.D. OF THE WIRE INSULATION IS VERY IMPORTANT. MAKE SURE THAT FOR THE SPECIFIED SPLICE IN TABLE 1 OR TABLE 2, THE O.D. OF THE WIRE INSULATION IS NOT MORE THAN THE MAXIMUM O.D. SPECIFIED.

CAUTION: IF THE O.D. OF THE WIRE IS LESS THAN THE MINIMUM O.D. SPECIFIED, THE O.D. OF THE INSULATION MUST BE INCREASED TO MAKE A SEAL IN THE SPLICE.

- (3) Make a selection of a cold shrink sleeve from Table 6.

NOTE: A satisfactory alternative is a minimum of two layers of self-bonding silicone tape that are applied after the splice is assembled. Refer to Paragraph 4.J.

- (4) If a cold shrink sleeve is used, put the cold shrink sleeves on one end of the wire.
(5) Remove the necessary length of the insulation from the end of each wire.

Refer to:

- Table 9
- Subject 20-00-15 for the insulation removal procedures.

Make sure that the end of each wire has not been crimped before.

- (6) If the O.D. of the wire insulation is less than the minimum O.D. specified in Table 1 or Table 2, increase the O.D. of the wire.

For the procedure to increase the O.D. of the wire insulation with:

- Layers of tape, refer to Paragraph 4.E.
- Heat shrinkable sleeves, refer to Paragraph 4.F.

E. Increase of the O.D. of the Wire with Layers of Tape

This paragraph gives the procedure to increase the outer diameter of the wire insulation to make a seal in the crimp barrel of the splice if the outer diameter is less than the minimum diameter specified in Table 1 or Table 2.

- (1) Make a selection of a solvent from Table 5.
- (2) Make a selection of a TFE tape from Table 5.
- (3) With a clean wiper and solvent, clean the wire insulation a minimum of 2.5 inches from the end of the wire.
- (4) Dry the clean area with clean wiper.
- (5) Wind the necessary number of layers of tape on the wire insulation to make the O.D. of the wire between the minimum and the maximum O.D. of the wire.

Make sure that the layers of tape make a 100 percent overlap.

F. Increase of the O.D. of the Wire with Heat Shrinkable Sleeves

This paragraph gives the procedure to increase the outer diameter of the wire insulation to make a seal in the crimp barrel of the splice if the outer diameter is less than the minimum diameter specified in Table 1 or Table 2.

- (1) Make a selection of a solvent from Table 5.
- (2) Make a selection of a heat shrinkable sleeve from Table 5.
- (3) With a clean wiper and solvent, clean the wire insulation a minimum of 2.5 inches from the end of the wire.
- (4) Dry the clean area with clean wiper.

20-30-13

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

- (5) Put a 1.25 inch length of heat shrinkable sleeve on the wire.
- (6) Push the heat shrinkable sleeve to the end of the wire until the forward end of the heat shrinkable sleeve is aligned with the end of the wire insulation.
- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Measure the O.D. of the wire.
- (9) If the diameter is less than the minimum diameter for the splice, do Step (5) through Step (8) again.

G. Splice Assembly

Table 12

SATISFACTORY PRESSURES FOR THE OPERATION OF CRIMP HEADS

Crimp Head	Pressure (psi)	
	Minimum	Maximum
58422-1	8000	8400
69066	8000	8400
PPFC-1H	8500	9000

- (1) Make a selection of a splice crimp tool from Table 10.

CAUTION: COPALUM SPLICES MUST BE CRIMPED WITH THE SPECIFIED TOOLS FOR THE SPLICE. IF THE SPECIFIED TOOLS ARE NOT USED, UNSATISFACTORY PERFORMANCE OF THE SPLICE CAN OCCUR.

- (2) Make a selection of a power pump from Table 11.

Make sure that the power pump pressure is satisfactory for the crimp tool head. Refer to Table 12.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY AND REPAIR OF COPALUM SPLICES**

CAUTION: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, DAMAGE TO THE CRIMP HEAD CAN OCCUR.

WARNING: IF THE PRESSURE OF THE POWER PUMP IS MORE THAN THE MAXIMUM PRESSURE PERMITTED FOR THE CRIMP TOOL HEAD, AN INJURY TO PERSONNEL CAN OCCUR.

NOTE: A satisfactory alternative is a power pump that can make an minimum pressure of 8000 PSI to a maximum pressure of 8400 PSI for AMP heads and minimum pressure of 8500 PSI to a maximum pressure of 9000 PSI for Daniels heads.

- (3) Make a selection of a release agent from Table 5.
- (4) Examine the crimp tool equipment.
 - (a) Do a check of the operation of the crimp tool and power pump as specified by the manufacturers instructions.
 - (b) Release the hydraulic pressure from the crimp head.
 - (c) Examine the crimp head for:
 - Contamination
 - Cracks
 - Damage
 - Worn parts
 - Leaks

Make sure that:

- The crimp head is clean
- The crimp head and crimp dies do not have damage
- The crimp tool equipment does not have worn parts

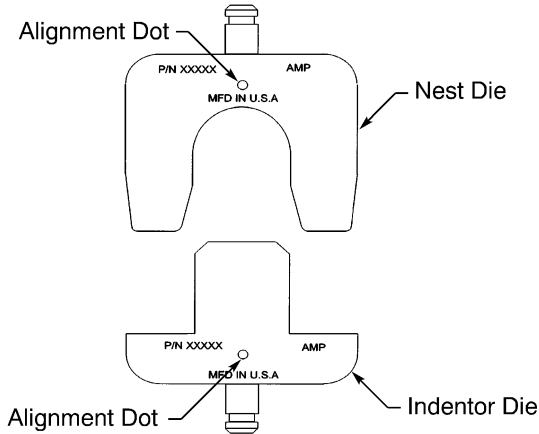

CAUTION: CRIMP TOOLS THAT HAVE DAMAGE, ARE DIRTY, OR HAVE WORN PARTS MUST NOT BE USED. UNSATISFACTORY PERFORMANCE OF THE SPLICE CAN OCCUR.

- (5) Examine the dies for the correct alignment in the crimp head.

Make sure that the alignment dot on the nest die and the alignment dot on the indenter die are on the same side of the crimp head.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

POSITION OF THE NEST DIE AND INDENTOR DIE
Figure 5

- (6) Put a small quantity of release agent on the crimp area of the dies.
- (7) Put the end of one of the wires in the crimp barrel of the splice. Refer to Figure 6.

Make sure that:

- If the end of the splice has a blue ring, the wire in that end of the splice is a copper wire
- All of the conductor strands are in the crimp barrel
- The end of the wire insulation is against the insert funnel.

CAUTION: DO NOT TURN THE WIRE DURING OR AFTER THE INSERTION OF THE WIRE INTO THE SPLICE.

POSITION OF THE WIRE IN THE COPALUM SPLICE
Figure 6

- (8) Put the wire and the splice in the crimp tool dies.
- (9) Align the splice in the die.

Refer to:

- Figure 7 for the location of the alignment marks on the splice
- Figure 8 for the front view of the position of the splice in the dies
- Figure 9 for the side view of the position of the splice in the dies.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

Figure 8

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

POSITION OF THE SPLICE IN THE CRIMP TOOL - SIDE VIEW
Figure 9

- (a) Align the center of the circumferential splice crimp alignment mark with the edge of the nest die.
- (b) Align the longitudinal crimp alignment mark with the alignment dot on the nest die.
- (10) Crimp the splice.
 Make sure that the alignment of the splice in the die does not change.
- (11) Remove the splice from the crimp tool.
- (12) Remove all the flash and the sharp edges on the splice.
- (13) Examine the splice.

Make sure that:

- The edge of the mold line from the die is between the ends of the circumferential alignment mark on the splice; refer to Figure 10
- The side of the splice with the longitudinal alignment mark is opposite the side of the splice with the certification mark
- The certification mark can be seen in the bottom and the center of the crimp dent; refer to Figure 11
- The certification mark is a clearly formed, cylindrical button; refer to Figure 12
- If the indentor die has a symmetrical pap in the certification mark, the certification mark on the splice has a circular, symmetrical pap at the center of mark; refer to Figure 11.

NOTE: It is usual for some base metal to be seen in the crimp area. This is not a cause to reject the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

INSPECTION OF THE SPLICE ASSEMBLY

Figure 10

CERTIFICATION MARK

Figure 11

SATISFACTORY AND UNSATISFACTORY CERTIFICATION MARKS

Figure 12

- (14) Turn the splice assembly approximately 180 degrees longitudinally.
- (15) Put the end of the other wire in the empty crimp barrel of the splice. Refer to Figure 6.

Make sure that:

- If the end of the splice has a blue ring, the wire in that end of the splice is a copper wire
- All of the conductor strands are in the crimp barrel
- The end of the wire insulation is against the insert funnel.

CAUTION: DO NOT TURN THE WIRE DURING OR AFTER THE INSERTION OF THE WIRE INTO THE SPLICE.

- (16) Do again Step (8) through Step (13) again for the other end of the splice.
- (17) Examine the angle of the splice. Refer to Figure 13.

Make sure the angle of the crimped end of the splice to the longitudinal axis is less than 10 degrees.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

CONFIGURATION OF THE SPLICE

Figure 13

H. Insulation of the Splice - AMP 277156-1 and AMP 277157-1 Splices with AWG 10 Wire

- (1) Make a selection of a solvent from Table 5.
- (2) With a clean wiper and solvent, clean the splice and a minimum of two inches of the wire from each end of the splice.
- (3) Dry the cleaned area with a clean wiper.
- (4) If heat shrinkable sleeves are used for splice insulation, install the sleeves.

- (a) On one of the wires, push the 1/4 inch diameter sleeve to the splice until the forward end of the sleeve is against the end of the splice. Refer to Figure 14.

Make sure that:

- The end of the sleeve is a maximum of 0.1 inch from the end of the splice.
- The sleeve does not make an overlap with the splice.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 14

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (c) On the other wire, push the 1/4 inch diameter sleeve to the splice until the forward end of the sleeve is against the end of the splice. Refer to Figure 14.

Make sure that the end of the sleeve is a maximum of 0.1 inch from the end of the splice.

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (e) Align the center of the 1/2 inch diameter sleeve with the center of the splice. Refer to Figure 15.

POSITION OF THE SLEEVES ON THE SPLICE ASSEMBLY

Figure 15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

- (f) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) If layers of tape will be used for the splice insulation, install the layers of tape.
 - (a) Make a selection of an insulation tape from Table 5.
 - (b) Wind three layers of tape on the wire insulation at one end of the splice. Refer to Figure 16.

Make sure that:

- The end of the layer of tape is a maximum of 0.1 inch from the end of the splice
- The layers of tape do not make an overlap with the splice
- The layers of tape have 100 percent overlap.

POSITION OF THE TAPE ON THE WIRE
Figure 16

- (c) Wind three layers of tape on the wire insulation at the other end of the splice. Refer to Figure 17.

Make sure that:

- The end of the layer of tape is a maximum of 0.1 inch from the end of the splice
- The layers of tape do not make an overlap with the splice
- The layers of tape have 100 percent overlap.

POSITION OF THE TAPE ON THE WIRE
Figure 17

- (d) Start the first layer of tape a minimum of 2 inches from the end of the splice.
- (e) Wind the tape on the splice and a minimum of 2 inches farther than the other end of the splice. Refer to Figure 18.

Make sure that each edge of the tape makes a 50 percent overlap with the tape below it.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

POSITION OF THE FIRST LAYER OF TAPE ON THE SPLICE ASSEMBLY
Figure 18

- (f) Start the second layer a tape where the first layer of tape ends.
- (g) Wind the tape on the first layer of tape in the direction of the start of the first layer of tape. Refer to Figure 19.

Make sure that:

- Each edge of the tape makes a 50 percent overlap with the tape below it
- The second layer of tape is wound in the opposite direction of the first layer of tape
- The second layer of tape stops where the first layer of tape starts.

POSITION OF THE FIRST LAYER OF TAPE ON THE SPLICE ASSEMBLY
Figure 19

I. Insulation of the Splice - AMP 277156-1 Splices with AWG 8 Wire

- (1) Make a selection of an insulation tape from Table 5.
- (2) Make a selection of a solvent from Table 5.
- (3) With a clean wiper and solvent, clean the splice and a minimum of two inches of the wire from each end of the splice.
- (4) Dry the clean area with a clean wiper.
- (5) Wind two layers of tape on the splice. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

CONFIGURATION OF THE SPLICE ASSEMBLY

Figure 20

- (a) Start the first layer of tape a minimum of 2 inches from the end of the splice.
- (b) Wind the tape on the splice and a minimum of 2 inches farther than the other end of the splice. Make sure that each edge of the tape makes a 50 percent overlap with the tape below it.
- (c) Start the second layer a tape where the first layer of tape stops.
- (d) Wind the tape on the first layer of tape in the direction of the start of the first layer of tape. Make sure that:
 - Each edge of the tape makes a 50 percent overlap with the tape below it
 - The second layer of tape is wound in the opposite direction of the first layer of tape
 - The second layer of tape stops where the first layer of tape starts.

277165-1	4	4	-
277168-1	3/0	1/0	-

- (1) Make a selection of a solvent from Table 5.
- (2) With a clean wiper and solvent, clean the splice and a minimum of two inches of the wire from each end of the splice.
- (3) Dry the clean area with a clean wiper.
- (4) Find if layers of tape are necessary to fill the area between the cold shrink sleeve and the wire insulation. Refer to Table 13.
- (5) If layers of buildup tape are necessary to fill the area between the cold shrink sleeve and the wire insulation, install a minimum of three layers of tape on the wire insulation.
 - (a) Make a selection of an insulation tape from Table 5.
 - (b) Wind three layers of tape on the wire insulation at one end of the splice. Refer to Figure 21.

Make sure that:

- The end of the layer of tape is a maximum of 0.1 inch from the end of the splice
- The layers of tape do not make an overlap with the splice
- The layers of tape have 100 percent overlap.

POSITION OF THE LAYERS OF TAPE ON THE WIRE

Figure 21

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

- (c) Wind three layers of tape on the wire insulation at the other end of the splice. Refer to Figure 22.

Make sure that:

- The end of the layer of tape is a maximum of 0.1 inch from the end of the splice
- The layers of tape do not make an overlap with the splice
- The layers of tape have 100 percent overlap.

POSITION OF THE LAYERS OF TAPE ON THE WIRE
Figure 22

- (6) Install the cold shrink sleeve. Refer to Figure 23.

NOTE: If the specified cold shrink sleeve is not available, the a satisfactory alternative insulation is to install two layers of self-bonding silicone tape and wire harness ties. Refer to Step (7).

INSULATION OF THE SPLICE WITH A COLD SHRINKABLE SLEEVE
Figure 23

- (a) Align the center of the sleeve with the center of the splice.
 - (b) Hold the sleeve in its position.
 - (c) Pull the core of the sleeve in the direction that is parallel to the longitudinal axis of the sleeve until the core is fully removed.
 - (d) Examine the cold shrink sleeve for a tight fit on the splice.
 - (e) If the cold shrink sleeve does not make a tight fit, assemble a wire harness tie approximately 0.5 inch from each end of the sleeve.
- Refer to Subject 20-10-11 for the procedure to assemble a wire harness tie.
 Make sure that the lacing tape is a Temperature Grade D material.
- (7) If a cold shrink sleeve is not available:
- (a) Make a selection of a tape from Table 5.
 - (b) Start the first layer of tape a minimum of 2 inches from the end of the splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY AND REPAIR OF COPALUM SPLICES

- (c) Wind the tape on the splice and a minimum of 2 inches farther than the other end of the splice. Refer to Figure 24.

Make sure that each edge of the tape makes a 50 percent overlap with the tape below it.

POSITION OF THE FIRST LAYER OF TAPE ON THE SPLICE ASSEMBLY

Figure 24

- (d) Start the second layer a tape where the first layer of tape ends.
- (e) Wind the tape on the first layer of tape in the direction of the start of the first layer of tape. Refer to Figure 25.

Make sure that:

- Each each edge of the tape makes a 50 percent overlap with the tape below it
- The second layer of tape is wound in the opposite direction of the first layer of tape
- The second layer of tape stops where the first layer of tape starts.

POSITION OF THE FIRST LAYER OF TAPE ON THE SPLICE ASSEMBLY

CONFIGURATION OF A SPLICE INSULATION REPAIR

Figure 26

Refer to Figure 26.

- (1) Make a selection of a solvent from Table 14.
- (2) Make a selection of these materials from Table 14:
 - A film strip
 - An insulation tape.
- (3) With a clean wiper and solvent, clean the splice assembly and the wire a minimum of 2 inches farther than the end of the splice.
- (4) Dry the cleaned area with a clean wiper.
- (5) Wind two layers of film strip on the splice assembly.
 - (a) Start the first layer of tape one inch to 1.5 inches from the end of the splice.
 - (b) Wind the tape on the splice 1 to 1.5 inches farther than the other end of the splice.
Make sure that each edge of the tape makes a 50 percent overlap with the tape below it.
 - (c) Start the second layer of film strip where the first layer of film strip ends.
 - (d) Wind the tape on the first layer of tape in the direction of the start of the first layer of tape.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY AND REPAIR OF COPALUM SPLICES**

Make sure that:

- Each edge of the film strip makes a 50 percent overlap with the film strip below it
- The second layer of film strip is wound in the opposite direction of the first layer of film strip
- The second layer of film strip ends where the first layer of film strip starts.

(6) Wind two layers of insulation tape on the layers of film strip.

(a) Start the first layer of tape one inch to 1.5 inches from the end of the splice.

(b) Wind the tape on the splice 1 to 1.5 inches farther than the other end of the splice.

Make sure that each edge of the tape makes a 50 percent overlap with the tape below it.

(c) Start the second layer a tape where the first layer of tape ends.

(d) Wind the tape on the first layer of tape in the direction of the start of the first layer of tape.

Make sure that:

- Each edge of the tape makes a 50 percent overlap with the tape below it
- The second layer of tape is wound in the opposite direction of the first layer of tape
- The second layer of tape ends where the first layer of tape starts.

(7) Assemble three lacing tape wire harness ties on the layers of tape.

Refer to Subject 20-10-11 for the procedure to assemble a wire harness tie.

Make sure that:

- The lacing tape is Temperature Grade D material
- A wire harness tie is assembled at each end of the layers of tape
- A wire harness tie is assembled at the center of the layers of tape.

B. Splice Removal

(1) Remove the insulation sleeves or layers of insulation tape from the splice.

(2) Remove one end of the splice from the wire. Refer to Figure 27.

LOCATION TO CUT THE SPLICE
Figure 27

(a) Cut one end the splice with a saw at the mold line of the crimp next to the insulation grip barrel.

(b) Cut the remaining insulation grip barrel of the splice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF COPALUM AND ALUMINUM TERMINALS**

- (1) Make a selection of one of these types of insulation sleeves:
- A heat shrinkable sleeve
 - A cold shrinkable sleeve.

NOTE: A heat gun is necessary to install a heat shrinkable sleeve.

- (2) If the selection is a heat shrinkable sleeve:
- (a) Cut a length of a Raychem PD or Remtek MWSF heat shrinkable sleeve that is equal to the length of the crimp area of the terminal plus 0.5 inch.
- Make sure that the sleeve has the smallest diameter that can move over the terminal and the wire.
- (b) Put the sleeve on the wire.
- (3) If the selection is a cold shrinkable sleeve:
- (a) Make a selection of a cold shrinkable sleeve from Table 5.

NOTE: If the wire size is not given in Table 5, a heat shrinkable sleeve must be used. Refer to Step (2).

NOTE: The number after the dash in the part number is the length of the sleeve after the sleeve is installed.

- (b) Put the sleeve on the wire.
- (4) Prepare the wire. Refer to Table 4 and Figure 6.

WIRE PREPARATION
Figure 6

- (a) If the wire has an outer jacket or shield, remove the necessary length of the jacket or shield so that the distance from the end of the jacket or shield to the end of the wire is dimension A. Refer to Subject 20-00-15.
- (b) Remove the necessary length of the primary insulation so that the distance from the end of the insulation to the end of the wire is dimension B. Refer to Subject 20-00-15.

NECESSARY MATERIALS**

Material	Description	Part Number	Supplier
Tape, Insulation	1.0 inch wide	Scotch 70	3M
		A-A-59163	QPL

(1) Make a selection of a terminal from Table 1 or Table 3.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF COPALUM AND ALUMINUM TERMINALS

- (2) Make a selection of a crimp tool from Table 6.
- (3) Put the wire in the crimp barrel of the terminal so that the end of the wire is against the bottom of the crimp barrel.
- (4) Crimp the terminal. Refer to Figure 7 and Figure 8.

Make sure that the crimp certification mark:

- Is in the correct position
- Has the correct shape.

TOP VIEW OF THE CRIMP CERTIFICATION MARKS

Figure 7

BOTTOM VIEW OF THE CRIMP CERTIFICATION MARKS

Figure 8

- (5) Remove any sharp edges from the terminal.

NOTE: The condition where the base metal of the terminal can be seen:

- Is not recommended
- Is permitted.

- (6) If the insulation is a heat shrinkable sleeve:

- (a) Push the sleeve over the end of the insulation so that the sleeve makes an overlap with the crimp barrel of the terminal. Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF COPALUM AND ALUMINUM TERMINALS

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE TERMINAL AND THE WIRE
Figure 9

- (b) Shrink the sleeve in position. Refer to Subject 20-10-14.
- (7) If the insulation is a cold shrink sleeve:
 - (a) For AWG 6 wire, make a selection of an insulating tape from Table 7.

POSITION OF THE LAYERS OF TAPE ON THE WIRE
Figure 10

- (b) Put 3 layers of insulating tape on the wire so that:
 - One end of the tape is aligned with the rear end of the crimp barrel
 - The other end of the tape is 1 inch from the rear end of the crimp barrel.

Refer to Figure 10.

Make sure that:

- The tape is not tightened more than necessary
- The contour of the wire is visible under the tape.
- (c) Push the cold shrink sleeve toward the terminal until the end of the sleeve is aligned with the end of the crimp barrel. Refer to Figure 11 and Figure 12.

POSITION OF THE COLD SHRINK SLEEVE AND THE TAPE ON THE TERMINAL ASSEMBLY
Figure 11

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF COPALUM AND ALUMINUM TERMINALS

POSITION OF THE COLD SHRINK SLEEVE ON THE TERMINAL ASSEMBLY
Figure 12

- (d) Hold the sleeve in position.
- (e) Pull the sleeve core out from the rear end of the sleeve. Refer to Figure 13.

LOCATION OF THE SLEEVE CORE

USUAL FASTON TERMINAL
Figure 1

- (1) Remove the necessary length of insulation from the end of the wire. Refer to Table 3 and Figure 1.
- (2) If it is specified, fold the wire back. Refer to Table 4 and Figure 2.

CONDUCTOR FOLDED BACK
Figure 2

- (3) If it is specified, increase the diameter of the wire. Refer to Table 4 and Subject 20-30-22.
- (4) Make a selection of a crimp tool from Table 4.

20-30-15

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP FASTON TERMINALS**

- (5) Put the terminal in the crimp tool.
- (6) Lightly apply pressure to hold the terminal in the tool.
- Make sure that the shape of these parts of the terminal are not changed:
- The insulation barrel
 - The wire barrel.
- (7) Put the wire in the terminal so that:
- The end of the wire is aligned with the forward end of the wire barrel
 - The end of the insulation is aligned with the forward end of the insulation barrel.

Refer to Figure 1.

- (8) Crimp the terminal.
- (9) Install a terminal housing on these terminals:
- The 42640-2 terminal for the Speaker Terminal wires
 - The 61873-1 terminal for the Passenger Information Signal section of the PSU.

B. Terminal Insulation

- (1) Install insulation on these terminals for the Passenger Address Speaker terminals:
- The 42628-2
 - The 42888-1
 - The 61048-1.

Refer to Figure 3.

**POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE TERMINAL****Figure 3**

- (a) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (b) Put a 1.0 inch ± 0.06 inch length of the heat shrinkable sleeve on the terminal.
- Make sure that the end of the sleeve extends 0.06 inch to 0.09 inch beyond the end of the terminal.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP FASTON TERMINALS

(c) Shrink the end of the sleeve that is on:

- The wire
- The insulation barrel of the terminal
- The wire barrel of the terminal.

Make sure that no heat is applied to the part of the sleeve that is on the terminal receptacle.

- (1) Make a selection of an end cap from Table 2.
- (2) Make a selection of a crimp tool from Table 7.
- (3) Make a selection of a sealant from Table 6.
- (4) If it is necessary, cut the wire to make the end perpendicular to the longitudinal axis of the wire.
Make sure that the end of the wire insulation is aligned with the end of the conductor.
- (5) Put a small quantity of sealant in the crimp barrel of the end cap. Refer to Figure 1.

LOCATION OF THE COLOR CODED RING ON THE END CAP
Figure 1

- (6) Put the end cap in the crimp tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF END CAPS

Make sure that:

- The closed end of the end cap is against the crimp tool locator
- The end cap is correctly aligned in the crimp tool dies
- If it is applicable, the color of Ring B of the end cap is the same as the color code of the crimp tool die; refer to Figure 1 and Figure 2.

COLOR CODE OF THE CRIMP TOOL DIES
Figure 2

- (7) Apply the minimum pressure necessary to close the handles of the crimp tool to hold the end cap in position.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY PRESSURE TO HOLD THE CAP IN POSITION. DAMAGE TO THE END CAP CAN OCCUR.

- (8) Put the end cap on the wire.
Make sure that the end of the wire is against the closed end of the end cap.
- (9) Crimp the end cap.
- (10) Remove the remaining sealant.
- (11) Hold the wire tight and lightly pull the end cap.
- (12) If the end cap does not stay on the end of the wire, do Step (5) through Step (11) again.

B. Assembly of a Crimp Type End Cap with Insulation Removal

- (1) Make a selection of an end cap from Table 3.
- (2) Make a selection of a crimp tool from Table 9.
- (3) Make a selection of a sealant from Table 6.
- (4) Remove the necessary length of the insulation from the end of the wire. Refer to Table 8 and Subject 20-00-15.
- (5) Put a small quantity of sealant in the crimp barrel of the end cap.
- (6) Put the end cap in the tool.
Make sure that the closed end of the end cap is against the locator.
- (7) Apply the minimum pressure necessary to close the handles of the crimp tool to hold the end cap in position.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY PRESSURE TO HOLD THE CAP IN POSITION. DAMAGE TO THE END CAP CAN OCCUR.

- (8) Put the end cap on the wire.
Make sure that the end of the wire is against the closed end of the end cap.
- (9) Crimp the end cap.
- (10) Remove the remaining sealant.
- (11) Hold the wire tight and lightly pull the end cap.
- (12) If the end cap does not stay on the end of the wire, do Step (5) through Step (11) again.

4. ASSEMBLY OF HEAT SHRINKABLE END CAPS

A. Assembly of a Heat Shrinkable End Cap with a Wire

- (1) Make a selection of a heat shrinkable end cap from Table 4.
Make sure that the cap is the smallest size that can move easily on the wire.
- (2) Put the end cap on the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF END CAPS

Make sure that the end of the wire is against the closed end of the end cap.

- (3) Shrink the end cap into position. Refer to Subject 20-10-14.

B. Assembly of a Heat Shrinkable End Cap with a Coax Cable

- (1) Make a selection of a heat shrinkable end cap from Table 4.

Make sure that the cap is the smallest size that can move easily on the cable.

- (2) If it is necessary, cut the cable to make the end perpendicular to the longitudinal axis of the cable.
- (3) Prepare the cable. Refer to Figure 3.

COAX CABLE PREPARATION
Figure 3

- (a) Remove 0.45 inch \pm 0.05 inch of the outer jacket.
- (b) Fold the shield back against the outer jacket.
- (c) Remove the necessary length of the shield to make the distance from the end of the shield to end of the outer jacket equal to 0.32 inch \pm 0.06 inch.

CAUTION: DO NOT CUT AGAINST THE OUTER JACKET WITH A KNIFE. DAMAGE TO THE JACKET CAN OCCUR.

- (4) Put the end cap on the cable. Refer to Figure 4.

Make sure that the end of the cable is against the closed end of the end cap.

POSITION OF THE HEAT SHRINKABLE END CAP ON THE COAX CABLE
Figure 4

- (5) Shrink the end cap in position. Refer to Subject 20-10-14.

- (1) Remove 5/32 inch ± 1/32 inch of the insulation from the end of the wire.
- (2) Make a selection of a crimp tool from Table 2.
- (3) Fully open the handles of the crimp tool.
- (4) Put the insulation barrel of the receptacle into the front side of the crimp tool so that the locator slot of the receptacle is pointed toward the top of the tool.

NOTE: The front side of the crimp tool is marked with the crimp tool part number.

Refer to Figure 1 and Figure 2.

STANDARD WIRING PRACTICES MANUAL

AMP PRINTED CIRCUIT BOARD TERMINAL RECEPTACLES

POSITION OF THE RECEPTACLE IN THE CRIMP TOOL
Figure 2

- (5) To hold the receptacle in position, move the handles of the crimp tool together until one click is made.

CAUTION: DO NOT CHANGE THE SHAPE OF THE INSULATION BARREL OR WIRE BARREL OF THE RECEPTACLE. THE WIRE WILL NOT GO INTO THE RECEPTACLE CORRECTLY.

- (6) Put the wire into the receptacle so that the end of the insulation is against the insulation stop.
- (7) Close the handles tool of the until the ratchet releases.

B. Terminal Receptacle Installation

Table 3
TERMINAL RECEPTACLE INSERTION TOOLS

Insertion Tool	Supplier
452383-1	AMP

- (1) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (2) Put a 0.60 inch length of the heat shrinkable sleeve on the wire.
- (3) Make a selection of an insertion tool from Table 3.
- (4) Put the insertion tool on the wire between the heat shrinkable sleeve and the receptacle.
- (5) Move the insertion tool toward the end of the wire until it is against the rear end of the receptacle.
- (6) Push the receptacle onto the pin until the ring on the inside of the receptacle is in the groove on the pin. Refer to Figure 3.

CAUTION: THE INSERTION TOOL MUST STAY PARALLEL WITH THE PIN SO THAT DAMAGE TO THE PIN OR THE RECEPTACLE DOES NOT OCCUR.

STANDARD WIRING PRACTICES MANUAL

AMP PRINTED CIRCUIT BOARD TERMINAL RECEPTACLES

POSITION OF THE RECEPTACLE IN RELATION TO THE PIN

Figure 3

- (7) Push the heat shrinkable sleeve forward so that the both ends of the sleeve make an overlap with both ends of the receptacle.
- (8) Shrink the sleeve into position. Refer to Subject 20-10-14.

20-30-22 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

This Subject gives the procedures to assemble terminals and splices when:

- The wire size is smaller than the crimp barrel of the terminal or splice
- The size of the wire insulation is smaller than the insulation grip of the terminal or splice
- The terminal or splice is assembled with more than one wire.

1. CIRCULAR AREA UNITS

A. Circular Area Units of Conductors

For the Circular Area Units (CAU) of a conductor, refer to Table 1.

CAU can be calculated if the Circular Mil Area (CMA) of a conductor is known. Refer to Figure 1.

NOTE: The circular mils of a conductor can be found in all wire tables. If the tables are not available, the CMA can be calculated. Refer to Figure 1.

$$CAU = \frac{CMA}{100} = \frac{(1000 \times \text{Strand Diameter})^2}{100} \times \text{Number of Strands}$$

CIRCULAR AREA UNITS OF A CONDUCTOR

65	BACS13S128C	Blue
138	BACS13S156C	Yellow

2. ASSEMBLY WHEN THE WIRE SIZE IS SMALLER THAN THE CRIMP BARREL SIZE

A. CAU of the Conductor and the Crimp Barrel

- (1) Find the CAU of the conductor. Refer to Table 1.
- (2) Find the CAU of the crimp barrel.

Refer to:

- Table 2 for the CAU of a terminal
- Table 3 for the CAU of a butt splice
- Table 4 for the CAU of a parallel splice.

- (3) If the CAU of the conductor is not within the minimum and maximum CAU of the crimp barrel, it is necessary to increase the CAU of the conductor.

For example, an AWG 20 wire and an AWG 12 wire can be spliced in a NAS1388 size 12-10 butt splice. However, the CAU of the AWG 20 conductor must be increased by a minimum of 31 CAU and a maximum of 126 CAU because:

- The CAU of the AWG 20 conductor is 12
- The minimum CAU of the size 12-10 splice is 43
- The maximum CAU of the size 12-10 splice is 138.

Refer to:

- Paragraph 2.B. for the assembly with the conductor folded back
- Paragraph 2.C. for the assembly with a splice adapter
- Paragraph 2.D. for the assembly with a filler wire stub
- Paragraph 2.E. for the assembly with a filler wire loop.

B. Assembly with the Conductor Folded Back

NOTE: Usually, a conductor that is folded back on itself does not sufficiently increase the CAU of the conductor. For the example in Paragraph 2.A., an AWG 20 conductor that is folded back has a CAU of 24 which is less than the necessary CAU for a size 12-10 splice.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

Table 7
CONDITIONS FOR A CONDUCTOR THAT IS FOLDED BACK

Crimp Barrel Size	Length		
	Dimension	Minimum (inch)	Maximum (inch)
22-18	A	15/32	17/32
	B	7/32	9/32
	C	7/32	9/32
16-14	A	7/16	1/2
	B	3/16	1/4
	C	7/32	9/32
12-10	A	21/32	23/32
	B	1/4	5/16
	C	3/8	7/16

DIMENSIONS FOR A CONDUCTOR THAT IS FOLDED BACK
Figure 3

- (1) Remove the necessary length of insulation from the end of the wire so that the conductor can be folded back.

Refer to Figure 3 and Table 7.

- (2) Fold the conductor back on itself.
- (3) Assemble the terminal or splice.

Refer to the applicable Subject for the assembly.

C. Assembly with a BACA14AN() Splice Adapter

- (1) To make a selection of a splice adapter from Table 5, add the CAU of the conductor to the CAU of the adapter.

Make sure that the total CAU is within the minimum and maximum CAU of the crimp barrel.

- (2) Put the wire into the adapter so that the end of the insulation is against the bottom of the insulation grip support of the adapter. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

POSITION OF THE WIRE AND SPLICE ADAPTER IN THE CRIMP BARREL
Figure 4

- (3) Assemble the terminal or splice. Refer to the applicable Subject for the assembly.
 Make sure that the end of the adapter is against the bottom of the crimp barrel. Refer to Figure 4.

D. Assembly with a Filler Wire Stub

CAUTION: ONLY ONE FILLER WIRE STUB CAN BE USED TO INCREASE THE CAU OF A CONDUCTOR.

CONFIGURATION OF AN ASSEMBLY WITH FILLER WIRE STUBS
Figure 5

- (1) Make a selection of a filler wire that will give the necessary CAU for the crimp barrel when the CAU of the filler wire is added to the CAU of the conductor.
- (2) Assemble the terminal or splice.
 Refer to:
 - Figure 5
 - The applicable Subject for the assembly
 - Subject 20-30-11 to install the necessary insulation on the free end of the stub wire.

E. Assembly with a Filler Wire Loop

- (1) Make a selection of a filler wire that will give the necessary CAU for the crimp barrel when the CAU of the filler wire is added to itself and to the CAU of the conductor.
- (2) Assemble the terminal or splice.

NOTE: A heat shrinkable sleeve or a tie, or both must be used to attach the filler loop to the conductor.

- Refer to:
- Figure 6
 - The applicable Subject for the assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

CONFIGURATION OF AN ASSEMBLY WITH FILLER WIRE LOOPS

Figure 6

3. ASSEMBLY WHEN THE WIRE INSULATION IS SMALLER THAN THE INSULATION GRIP

A. Applicable Conditions

When the insulation grip cannot sufficiently hold the wire insulation because of the crimp tool adjustment and the wire size, the O.D. of the wire must be increased.

Refer to Paragraph 3.A.

B. Installation of a Heat Shrinkable Sleeve

- (1) Install a 1/2 inch to 1 inch length of heat shrinkable sleeve with the smallest possible diameter on the wire so that the end of the sleeve is aligned with the end of the insulation.

Refer to Figure 7 and Subject 20-10-14.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE

Figure 7

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

4. ASSEMBLY WITH MORE THAN ONE WIRE

A. General Conditions for Wire Insulation

These conditions are applicable:

- If it is possible, the end of the insulation of all the wires must be held in the area of insulation grip that makes an overlap with the insulated area of the terminal or splice; refer to Figure 8
- When the dimensions of the crimp tool adjustment and the termination insulation grip support area permits, the necessary length of heat shrinkable sleeve must be installed on the wires; refer to Figure 9 and Figure 10.

As an alternative when the applicable conditions are not possible, the end of the insulation of the wires can be outside the insulation grip of the terminal or splice, but the wires must be supported and insulated with:

- The applicable Grade and Class of heat shrinkable sleeve; refer to Subject 20-00-11 and Subject 20-10-14
- A sleeve that has a loose fit over the wires and terminal or splice, but stays tight after heat is applied
- A sleeve that has a loose fit over the wires and terminal or splice, but is held in position with ties if it is not possible to apply heat.

CAUTION: HEAT MUST NOT BE APPLIED TO A HEAT SHRINKABLE SLEEVES THAT IS INSTALLED OVER A SOLDER JOINT.

INSULATION OF THE WIRES IN THE INSULATION GRIP
Figure 8

CONFIGURATION OF THE INSULATION OF THE WIRES
Figure 9

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

ALTERNATIVE CONFIGURATION OF THE INSULATION OF THE WIRES
Figure 10

B. Installation of a Sleeve Adapter

A BACS13S() sleeve adapter can be installed on two or more conductors to increase the CAU that is necessary for the crimp barrel.

- (1) Find the CAU of the conductors. Refer to Table 1.
- (2) Find the CAU of the crimp barrel.

Refer to:

- Table 2 for the CAU of a terminal
- Table 3 for the CAU of a butt splice
- Table 4 for the CAU of a parallel splice.

- (3) If the total CAU of the conductors is not within the minimum and maximum CAU of the crimp barrel, increase the total CAU:
 - (a) Make a selection of the applicable sleeve adapter from Table 6.
 - (b) Remove the color code dye from all of the surfaces of the sleeve.
 - (c) Remove the necessary length of insulation from the end of each wire.
 - (d) Install the sleeve adapter on the wires. Refer to Figure 11.
- (4) Assemble the terminal or splice. Refer to the applicable Subject for the assembly.

BACS13S() SLEEVE ADAPTER INSTALLED ON TWO CONDUCTORS
Figure 11

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF TERMINALS AND SPLICES UNDER SPECIAL CONDITIONS

C. Assembly with More Than One Conductor

When more than one conductor is necessary in a terminal or splice, the CAU of the conductors can be increased and the terminal or splice can be assembled with any of these procedures:

- Paragraph 2.B. for the assembly with the conductor folded back
- Paragraph 2.C. for the assembly with a splice adapter
- Paragraph 2.D. for the assembly with a filler wire stub
- Paragraph 2.E. for the assembly with a filler wire loop
- Paragraph 4.B. for the assembly with a sleeve adapter.

CAUTION: THESE CONDITIONS MUST BE OBEYED:

- THE CONDITIONS FOR THE END OF THE INSULATION OF THE WIRES; REFER TO PARAGRAPH Paragraph 4.A.
- ONLY ONE CONDUCTOR THAT HAS BEEN FOLDED BACK ON ITSELF IS PERMITTED IN AN END OF A TERMINAL OR SPLICE
- ONLY ONE WIRE STUB IS PERMITTED IN AN END OF A TERMINAL OR SPLICE.

NOTE: As an alternative to a specified size of terminal or splice, a selection of a terminal or splice can be made in relation to the number and size of wires. Refer to Paragraph 4.D.

D. Selection of a Terminal or a Splice

- (1) Count the number of wires.
- (2) Find the size of each wire.
- (3) Find the crimp barrel size that agrees with the number of wires and the size of each wire in Table 8.
- (4) Make a selection of the terminal or splice.

Refer to:

- Table 2 for the terminals
- Table 3 for the butt splices
- Table 4 for the parallel splices.

Figure 3**

**65B47866-5 CABLE TRIM DIMENSIONS
Figure 4**

STANDARD WIRING PRACTICES MANUAL**CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE**

Refer to:

- Figure 1 and Figure 3 for the cable with one shield
- Figure 2 and Figure 4 for the cable with two shields
- Table 5 for the cable trim dimension values
- Table 2 for the location of the assembly procedures of the applicable connector.

- (1) Remove the necessary length of the cable jacket.

Make sure that the distance from the end of the jacket to the end of the cable is:

- Dimension B for a cable that has one shield
- Dimension A for a cable that has two shields

- (2) If the cable has two shields, remove the necessary length of the inner jacket.

Make sure that the distance from the end of the jacket to the end of the cable is dimension B.

- (3) Remove the necessary length of the middle carbon layer.

Make sure that the distance from the end of the layer to the end of the wires is dimension C.

NOTE: Damage of the primary insulation is permitted if the strands of the conductor cannot be seen.

- (4) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.

- (5) Clean the insulation with acetone or an equivalent solvent.

- (6) Assemble a shield ground wire with mechanical ferrules for each shield. Refer to Subject 20-10-15.

These conditions are applicable:

- The selection of the ferrules is from Table 4
- The selection of the shield ground wire is from Table 3
- The length of the shield ground wire is 3.0 inches maximum
- The heat shrinkable sleeve is a 1.0 inch length of 3/8 inch diameter CRN or TFE 2X sleeve
- The CRN sleeve has temperature grade A or B
- The TFE 2X sleeve has a temperature grade C or D.

- (7) Remove the necessary length of the primary insulation from the end of each component wire.

Refer to the applicable Subject for the assembly of the connector.

- (8) Put the necessary length of a 1/8 inch diameter TFE 2X heat shrinkable sleeve on each component wire.

Make sure that:

- The rearward end of each sleeve is against the ferrule
- The forward end of each sleeve is aligned with the end of the primary insulation of the component wire.

- (9) Shrink each sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

C. 65B47866-1 and -2 Cable Preparation for the Assembly of Bendix 10-244() Connectors

CABLE PREPARATION
Figure 5

Refer to Figure 5.

- (1) Remove 3.00 inches ±0.13 inch of the cable jacket and the shield.
 - (2) Cut the outer carbon layer along the longitudinal axis of the cable between the two component wires.
 - (3) Remove the necessary length of the outer carbon layer.
- Make sure that the end of the carbon layer is aligned with the end of the cable jacket.
- (4) Move the two component wires apart from the end of the cable to the end of the jacket.
 - (5) Remove the necessary length of the middle carbon layer on each component wire.

Make sure that the distance from the end of the carbon layer to the end of the primary insulation is 0.50 inch ±0.06 inch.

Refer to Subject 20-61-18.

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (6) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (7) Clean the insulation with acetone or an equivalent solvent.
- (8) Assemble a shield ground wire with mechanical ferrules. Refer to Subject 20-10-15.

These conditions are applicable:

- The selection of the ferrules is from Table 4
- The selection of the shield ground wire is from Table 3
- The length of the shield ground wire is 3.00 inches ±0.13 inch maximum.

D. 65B47866-1 and -2 Cable Preparation for the Assembly of Matrix MT30K(-) and MT37K(-) Connectors

Table 6
CONNECTOR PART NUMBERS

Part Number	Supplier

MT37K-1203-299	Matrix

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

**Table 7
CABLE TRIM DIMENSIONS**

Connector	Trim Dimension		
	Dimension	Target (inch)	Tolerance (inch)
MT37K-1203-191	A	1-1/2	± 1/8
MT37K-1203-299	A	1	± 1/8
MT30K-2219-299	A	1-1/4	± 1/8

**CABLE PREPARATION
Figure 6**

- (1) Remove the necessary length of the cable jacket and the shield. Refer to Figure 6 and Table 7.
- (2) Cut the outer carbon layer along the longitudinal axis of the cable between the two component wires.
- (3) Remove the necessary length of the outer carbon layer.
Make sure that the end of the carbon layer is aligned with the end of the cable jacket.
- (4) Move the two component wires apart from the end of the cable to the end of the jacket.
- (5) Remove the necessary length of the middle carbon layer on each component wire.
Make sure that the distance from the end of the carbon layer to the end of the primary insulation is 0.50 inch ± 0.06 inch.
Refer to Subject 20-63-13.

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (6) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (7) Clean the insulation with acetone or an equivalent solvent.
- (8) Assemble a shield ground wire with mechanical ferrules. Refer to Subject 20-10-15.

These conditions are applicable:

- The selection of the ferrules is from Table 4
- The selection of the shield ground wire is from Table 3
- The length of the shield ground wire is 3.00 inches ± 0.13 inch maximum.

E. 65B47866-1 and -2 Cable Preparation for the Assembly of Connectors with Glenair 387()020 and Boeing S280W603 Backshells

This paragraph gives the procedure to prepare the 65B47866-2 cable.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

CABLE TRIM DIMENSIONS
Figure 7

Refer to Figure 7.

- (1) Put the backshell on the cable so that it is away from the end of the cable.
- (2) Remove 1.50 inches ± 0.06 inch of the jacket from the end of the cable.
- (3) Remove 1.12 inches ± 0.06 inch of the shield from the end of the cable.
- (4) Move the two wires apart from the end of the cable to the end of the jacket.
- (5) Cut the outer carbon layer along the longitudinal axis of the cable between the two component wires.
- (6) Remove 1.12 inches ± 0.06 inch of the outer carbon layer.
- (7) Remove 1.00 inch ± 0.06 inch of the middle carbon layer from the end of each component wire. Refer to Figure 8.

REMOVAL LENGTH OF THE MIDDLE CARBON LAYER
Figure 8

- (8) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (9) Clean the insulation with acetone or an equivalent solvent.
- (10) Assemble the shield ground wire with mechanical ferrules and a 6.0 inch length of the shield from a BMS 13-58 Type 7 Class 1 AWG 20 wire. Refer to Subject 20-10-15.
Make sure that the shield ground wire makes an exit from the cable at the rear end of the ferrule. Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

POSITION OF THE SHIELD GROUND WIRE

Figure 9

- (11) Remove 1.00 inch \pm 0.06 inch of insulation from the end of each wire. Refer to Figure 10.

INSULATION REMOVAL

Figure 10

- (12) Put a 1.12 inch \pm 0.06 inch length of 1/8 inch diameter of TFE 4X heat shrinkable sleeve on each conductor.

Make sure that the sleeve makes an overlap with the middle carbon layer of the conductor.

Refer to Figure 11.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONDUCTORS

Figure 11

- (13) Shrink each sleeve into its position. Refer to Subject 20-10-14.
- (14) Put a 1.00 inch \pm 0.06 inch length of 3/8 inch diameter TFE 4X heat shrinkable sleeve on the cable. Make sure that the center of the sleeve is aligned with the center of the ferrule. Refer to Figure 12.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 12

(15) Shrink the sleeve into its position. Refer to Subject 20-10-14.

3. TERMINAL ASSEMBLY

A. Cable Preparation

Table 8
APPLICABLE TERMINALS

Part Number	Supplier
321893	AMP

- (1) Remove 1.0 inch \pm 0.1 inch of the cable jacket and the shield from the end of the cable.
 Make sure that the end of the jacket and the shield are perpendicular to the longitudinal axis of the cable.
- (2) Move the two component wires in the outer carbon layer apart.
 Make sure that the wires are parallel.
- (3) Cut the outer carbon layer along the longitudinal axis of the cable between the two wires.
- (4) Remove the necessary length of the outer carbon layer.
 Make sure that the end of the carbon layer is aligned with the end of the cable jacket.
- (5) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (6) Clean the insulation with acetone or an equivalent solvent.
- (7) Cut each wire so that the distance from the end of the cable jacket to the end of the wire is 0.85 inch \pm 0.03 inch. Refer to Figure 13.

NECESSARY LENGTH OF THE WIRES
Figure 13

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

- (8) Remove 0.25 inch \pm 0.03 inch of the primary insulation from each component wire. Refer to Figure 14.

INSULATION REMOVAL
Figure 14

- (9) Remove the necessary length of the middle carbon layer.
Make sure that the distance from the end of the layer to the end of the primary insulation is 0.50 inch \pm 0.03 inch.
- (10) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (11) Clean the insulation with acetone or an equivalent solvent.
- (12) Measure the insulation resistance at 500V DC between:
- The conductors
 - The shield and each conductor.
- Make sure that there are no carbon tracks.
- (13) Put a 0.60 inch \pm 0.06 inch length of 1/8 inch diameter TFE 4X heat shrinkable sleeve on each component wire.
Make sure that the forward end of the sleeve is aligned with the end of the primary insulation of the component wire. Refer to Figure 15.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRES
Figure 15

- (14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Terminal Assembly

- (1) Make a selection of a terminal from Table 8.
- (2) Make a selection of a crimp tool. Refer to Subject 20-30-11.
- (3) Attach a terminal to each wire:
- (a) Put the terminal on the wire. Refer to Figure 16.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

POSITION OF THE TERMINAL ON THE WIRE

Figure 16

- (b) Crimp the terminal.
- (c) Put a 0.60 inch \pm 0.06 inch length of 1/4 inch diameter TFE 4X heat shrinkable sleeve on the terminal. Refer to Figure 17.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE TERMINAL

Figure 17

- (d) Shrink the sleeve into its position. Refer to Subject 20-10-14.

4. ASSEMBLY OF THE VIBRO-METER CG505M1-03 CONNECTOR WITH 65B47866-1 AND -2 CABLE

A. Part Numbers and Description

**Table 9
CONNECTOR PART NUMBERS**

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

B. Cable Preparation

CABLE PREPARATION
Figure 18

- (1) Remove 1.75 inches ±0.06 inch of the cable jacket from the end of the cable.
- (2) Move the strands of the shield apart.
- (3) Fold the strands back over the end of the cable jacket.
- (4) Remove the necessary length of the ends of the strands.
Make sure that the distance from the strand ends to the end of the jacket is 0.25 inch to 0.38 inch. Refer to Figure 18.
- (5) Put a 1.63 inch ±0.06 inch length of TFE 2X heat shrinkable sleeve on the cable.
- (6) Move the two wires apart from the end of the cable to the end of the jacket.
- (7) Cut the outer carbon layer along the longitudinal axis of the cable between the two component wires.
- (8) Remove the necessary length of the outer carbon layer.
Make sure that the end of the carbon layer is aligned with the end of the cable jacket.
- (9) Remove the necessary length of the middle carbon layer on each component wire.
Make sure that the end of the layer is aligned with the end of the jacket.

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (10) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (11) Clean the insulation with acetone or an equivalent solvent.
- (12) Remove 0.16 inch ±0.02 inch of the primary insulation from the end of each component wire.
- (13) Put the necessary length of a 1/8 inch diameter TFE 2X heat shrinkable sleeve on each component wire.
Make sure that:
 - The rearward end of each sleeve is against the shield
 - The forward end of each sleeve is aligned with the end of the primary insulation of the component wire.
- (14) Push the TFE 2X heat shrinkable sleeve toward the end of the cable until the forward end of the sleeve is beyond the end of the cable jacket or inner jacket.
Make sure that the distance from the forward end of the sleeve to the end of the cable jacket or inner jacket is 0.81 inch ±0.03 inch. Refer to Figure 19.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE

Figure 19

(15) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Connector Assembly

**Table 11
CONTACT CRIMP TOOLS**

Basic Unit	Locator
M22520/2-01	M22520/2-02

CONNECTOR ASSEMBLY

Figure 20

- (1) Make a selection of a crimp tool from Table 11.
- (2) Assemble a contact, from the connector kit, on the end of both wires.
- (3) Put the 1.00 inch \pm 0.06 inch Teflon heat shrinkable sleeve, from the connector kit, on the cable.
- (4) Push the rear housing of the connector, without the saddle clamp and the screws, rearward as far as possible on the wires and the TFE 2X heat shrinkable sleeve.
- (5) Make a selection of an insertion tool from Table 10.
- (6) With the red end of the tool, push each socket contact through the grommet of the connector front housing into the contact cavity until the contact is locked in position.
- (7) Lightly pull on the wire to make sure that the contact is locked in position.
- (8) If the contact is not locked in position:
 - (a) Push the white end of the tool forward on the wire into the contact cavity until it stops.
 - (b) At the same time, hold the wire against the tool and remove the wired contact and the tool.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

- (c) Turn the insertion tool 90 degrees on its longitudinal axis.
- (d) Do Step (6) and Step (7) again.
- (9) Engage the threads of the rear housing and the front housing.
- (10) Tighten the rear housing.
 - Make sure that the clamp bar support at the rear of the connector housing is:
 - Parallel to the two socket contacts on the front of the connector
 - On the opposite side of the connector keyway.
- (11) Put the 1.0 inch \pm 0.06 inch length of heat shrinkable sleeve on the TFE 2X sleeve. Refer to Figure 21.
 - Make sure that the rear end of the sleeve is aligned with the end of the strands of the shield.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 21

- (12) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (13) Install the cable clamp on the connector.
- (14) Tighten the two saddle clamp screws.
- (15) Torque each screw 8.0 in-lbs \pm 0.5 in-lbs.
- (16) Install the safety wire on the screw heads. Refer to Figure 20.
- (17) Put the nickel washer on connector interface.
- (18) Put the protective cap on the engaging end of the connector. Refer to Figure 20.

D. Connector Installation

- (1) Remove the protective cap.
- (2) Engage the threads of the plug and the receptacle.
- (3) Tighten the coupling nut 80 inch-pounds to 110 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

5. ASSEMBLY OF THE VIBRO-METER VMCG505M3-01, VIBRO-METER 812-505-000-301, ENDEVCO 26574, AND GLENAIR GC501 CONNECTORS WITH 65B47866-1, -2, AND -5 CABLE

A. Part Numbers and Description

**Table 12
CONNECTOR PART NUMBERS**

Part Number	Supplier
CG505M3-01	Vibro-Meter
VMCG505M3-01	Vibro-Meter
26574	ENDEVCO
GC501	Glenair

B. Cable Preparation

- (1) Remove the necessary length of the cable jacket from the end of the cable:
 - 1.50 inches \pm 0.06 inch for the 65B47866-1 and 65B47866-2 cables; refer to Figure 22
 - 2.75 inches \pm 0.06 inch for the 65B47866-5 cable.

**65B47866-1 AND 65B47866-2 CABLE PREPARATION
Figure 22**

- (2) For the 65B47866-5 cable, assemble a shield ground wire for the outer shield. Refer to Figure 23.

**CONFIGURATION OF THE SHIELD GROUND WIRE OF THE OUTER SHIELD OF THE 54B47866-5
CABLE
Figure 23**

STANDARD WIRING PRACTICES MANUAL**CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE**

- (a) Assemble a shield ground wire with mechanical ferrules. Refer to Subject 20-10-15.
These conditions are applicable:
- The selection of the ferrules is from Table 4
 - The selection of the shield ground wire is from Table 3
 - The length of the shield ground wire is 2.0 inches maximum.
 - The heat shrinkable sleeve is a 1.0 inch ± 0.06 inch length of TFE 2X sleeve.
- (b) Assemble a BACT12M terminal on the end of the shield ground wire. Refer to Subject 20-30-11.
Make sure that a 1.0 inch ± 0.06 inch length of heat shrinkable sleeve is installed on the terminal.
- (c) Remove 1.50 inches ± 0.06 inch of the inner jacket from the cable.
- (3) Move the strands of the shield or the inner shield apart.
- (4) Fold the strands back over the end of the cable jacket or the inner jacket.
- (5) Remove the necessary length of the shield strands.
Make sure that the distance from the strand ends to the end of the jacket is 0.25 inch to 0.38 inch. Refer to Figure 22.
- (6) Put a 1.63 inch ± 0.06 inch length of TFE 2X heat shrinkable sleeve on the cable.
- (7) Move the two wires apart from the end of the cable to the end of the jacket.
- (8) Cut the outer carbon layer along the longitudinal axis of the cable between the two component wires.
- (9) Remove the necessary length of the outer carbon layer.
Make sure that the end of the carbon layer is aligned with:
- The end of the cable jacket for the cable with one shield
 - The end of the inner jacket for the cable with two shields.
- (10) Remove the necessary length of the middle carbon layer on each component wire.
Make sure that the end of the layer is aligned with the end of the jacket.
- CAUTION:** MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.
- (11) Remove all of the unwanted carbon from the primary insulation with a fiberglass eraser or an abrasive pad.
- (12) Clean the insulation with acetone or an equivalent solvent.
- (13) Remove 0.16 inch ± 0.02 inch of the primary insulation from the end of each component wire.
- (14) Put the necessary length of a 1/8 inch diameter TFE 2X heat shrinkable sleeve on each component wire.
Make sure that:
- The rearward end of each sleeve is against the shield
 - The forward end of each sleeve is aligned with the end of the primary insulation of the component wire.
- (15) Push the TFE 2X heat shrinkable sleeve forward, toward the end of the cable, until the forward end of the sleeve is beyond the end of the cable jacket or inner jacket.
Make sure the distance from the forward end of the sleeve to the end of the cable jacket or inner jacket is 0.81 inch ± 0.03 inch. Refer to Figure 24.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 24

- (16) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (17) Remove 0.16 inch \pm 0.02 inch of the primary insulation from the end of each component wire.

C. Connector Assembly

Table 13
CONTACT CRIMP TOOLS

Basic Unit	Locator
ST2220-1-Y	ST2220-1-1

CONNECTOR ASSEMBLY
Figure 25

- (1) Make a selection of a crimp tool from Table 13.
- (2) Assemble a contact, from the connector kit, on the end of both wires.
- (3) Put the 1.0 inch \pm 0.06 inch Teflon heat shrinkable sleeve, from the connector kit, on the cable.
- (4) Push the rear housing of the connector, without the saddle clamp and the screws, rearward as far as possible on the wires and the TFE 2X heat shrinkable sleeve.
- (5) Make a selection of a contact insertion tool from Table 10.
- (6) With the red end of the tool, push each socket contact through the grommet of the connector front housing into the contact cavity until the contact is locked in position.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR AND TERMINAL ASSEMBLY WITH 65B47866() SHIELDED CABLE

- (7) Lightly pull on the wire to make sure that the contact is locked in position.
- (8) If the contact is not locked in position:
 - (a) Push the white end of the tool forward on the wire into the contact cavity until it stops.
 - (b) At the same time, hold the wire against the tool and remove the wired contact and the tool.
 - (c) Turn the insertion tool 90 degrees on its longitudinal axis.
 - (d) Do Step (6) and Step (7) again.
- (9) Put the 1.0 inch \pm 0.06 inch length of heat shrinkable sleeve on the TFE 2X sleeve. Refer to Figure 26. Make sure that the rear end of the sleeve is aligned with the end of the strands of the shield.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CABLE
Figure 26

- (10) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (11) Install the cable clamp on the connector.
- (12) For the 65B47866-5 cable, attach the terminal of the shield ground wire on one of the saddle clamp screws.
- (13) Tighten the two screws.
- (14) Torque each screw 8.0 in-lbs \pm 0.5 in-lbs.
- (15) Install the safety wire on the screw heads. Refer to Figure 25.

**Table 1
CABLE PART NUMBERS**

Boeing Specification	Description
S280T004-1	Audio Cable

**CONFIGURATION OF THE S280T004-1 CABLE
Figure 1**

B. Cable Preparation

- (1) Put a 2 inch \pm 1/2 inch length of 3/8 inch diameter heat shrinkable sleeve over the cable.
- (2) Remove 2 inches \pm 1/8 inch of the cable jacket.

CAUTION: DO NOT CAUSE ANY DAMAGE TO ANY OF THE WIRES.

- (3) Cut the shield and the fillers so that the ends are within 1/8 inch of the jacket.

CAUTION: DO NOT CUT THE BLACK INSULATED WIRE WITH THE FILLERS.

- (4) Remove the wire insulation. Refer to Subject 20-61-11.
- (5) Put a Thermofit heat shrinkable sleeve on the uninsulated ground wire so that the sleeve:
 - Is within 1/8 inch of the insulation barrel of the contact
 - Is over the cable jacket
 - Extends 1/2 inch \pm 1/8 inch beyond the saddle bar.
- (6) Shrink the sleeve in position.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

2. CONNECTOR ASSEMBLY WITH THE S280T006-1 SPOILER CABLE

A. Connector Assembly

Refer to Subject 20-61-11.

3. ASSEMBLY OF THE BACC45FM16-10S, BACC63BV16-10S, AND 48-00R16-10S RECEPTACLES WITH S280T006-2 CABLE

A. Shield Ground Wire Preparation

- (1) For a shield ground wire that must be attached to a ground stud, cut a 12.00 inch ± 0.25 inch length of BMS 13-48 Type 8 AWG 18 wire.
- (2) For a shield ground wire that must be attached to a backshell, cut a 2.00 inch ± 0.25 inch length of BMS 13-48 Type 8 AWG 18 wire.
- (3) Remove 0.25 inch ± 0.06 inch of insulation from one end of the wire.
- (4) Make a selection of a terminal lug from Table 4.
- (5) Assemble the terminal lug on the wire. Refer to Subject 20-30-11.

B. Case Ground Wire Preparation

- (1) Cut a 12.00 inch ± 0.25 inch length of BMS 13-48 Type 8 AWG 18 wire.
- (2) Put the wire number code on the wire. Refer to Subject 20-10-11.
- (3) Remove 0.25 inch ± 0.06 inch of insulation from one end of the wire.
- (4) Make a selection of a terminal lug from Table 4.
- (5) Assemble the terminal lug on the wire. Refer to Subject 20-30-11.

C. Cable Preparation

- (1) Put the connector backshell on the cable approximately 6 inches from the end.
- (2) Make a selection of a 0.5 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (3) Put a 2.50 inch ± 0.50 inch length of the heat shrinkable sleeve on the cable.
- (4) Put a 1.50 inch ± 0.13 inch length the heat shrinkable sleeve on the cable.
- (5) Prepare the cable. Refer to Figure 1.

CABLE PREPARATION
Figure 1

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

- (a) If it is necessary, cut the end of the cable to make the end perpendicular to its longitudinal axis.
- (b) Remove the necessary length of cable jacket from the end of the cable:
 - 2.50 inches \pm 0.13 inch for a straight backshell
 - 3.00 inches \pm 0.13 inch for a 45 degree backshell
- (c) Remove the necessary length of the shield from the end of the cable:
 - 2.13 inches \pm 0.06 inch for a straight backshell
 - 2.63 inches \pm 0.06 inch for a 45 degree backshell
- (d) Remove 0.25 inch +0.06 inch, -0 inch of insulation from the end of each wire of the cable.

D. Shield Ground Wire Assembly with Mechanical Ferrules

A satisfactory alternative to the assembly of a shield ground wire with mechanical ferrules is the assembly with:

- A Shield-Kon; refer to Paragraph 3.E.
- A solder sleeve; refer to Paragraph 3.F.

**Table 5
FERRULE CRIMP TOOLS**

Outer Ferrule	Crimp Tool			
	Basic Unit	Die		
		Part Number	Cavity	Dimension (inch)
BACS13S297C	44-000	44-140	A	0.290
	612648	612893	-	
	613214	613011	-	
	620175	620308	A	
	HX-4	Y140	A	
	M22520/5-01	M22520/5-41	A	
	ST2966M	-	10	
	ST965-2	-	L

	ST965B	ST965B-14	-	
	WT211-14	-	L	
	WT214	-	-	
	WT414	-	-	
	WT440	4414	-	

- (1) Make a selection of an inner ferrule and outer ferrule from Table 4.
- (2) Make a selection of a ferrule crimp tool from Table 5.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

- (3) Make a selection of a 3/8 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (4) Put a 1.0 inch ± 0.13 inch length of the heat shrinkable sleeve on the cable.
- (5) Put the outer ferrule on the cable.
- (6) Put the inner ferrule on the cable. Refer to Figure 2.

Make sure that the ferrule is:

- Between the shield and the wires of the cable
- Tight against the end of the cable jacket.

POSITION OF THE INNER FERRULE
Figure 2

- (7) From the forward end of the cable, put the end of the shield ground wire without insulation between the cable jacket and the outer ferrule. Refer to Figure 3.

INITIAL POSITION OF THE OUTER FERRULE AND THE SHIELD GROUND WIRE
Figure 3

- (8) Push the outer ferrule and the shield ground wire forward at the same time until the center of the outer ferrule is aligned with the center of the inner ferrule. Refer to Figure 4.

Make sure that:

- The distance from the forward edge of the inner ferrule to the forward edge of the outer ferrule is not more than 0.06 inch
- The end of the shield ground wire is between the rear edge of the outer ferrule and the rear edge of the inner ferrule.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

POSITION OF THE OUTER FERRULE AND THE SHIELD GROUND WIRE
Figure 4

- (9) Crimp the outer ferrule.
- (10) Remove the length of the shield that extends forward farther than the forward edge of the outer ferrule.

NOTE: The surface of the inner ferrule can be used to cut against.

- (11) Align the center of the 1 inch sleeve with the center of the outer ferrule.
- (12) Shrink the sleeve into position. Refer to Subject 20-10-14.

E. Shield Ground Wire Assembly with a Shield-Kon

Refer to Subject 20-10-15.

Make sure that the shield ground wire is extended forward from the forward end of the Shield-Kon. Refer to Figure 4.

F. Shield Ground Wire Assembly with a Solder Sleeve

Refer to Subject 20-10-15.

Make sure that the shield ground wire is extended forward from the forward end of the solder sleeve. Refer to Figure 4.

G. Splice Assembly

Table 6
SPLICE CRIMP TOOLS

Splice	Crimp Tool Basic Unit
34137	49900
	49935
	WT130
	WT1300
D-436-59	AD-1377

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

NOTE: The applicable shield termination mechanism can be:

- A mechanical ferrule
- A Shield-Kon
- A solder sleeve.

- (1) Make a selection of a splice from Table 4.
Two splices are necessary.
- (2) Make a selection of a crimp tool from Table 6.
- (3) Prepare four BMS 13-48 Type 8 AWG 20 splice wires. Refer to Figure 5.

INSULATION REMOVAL LENGTH

Figure 5

- (a) Cut each wire 3.75 inches \pm 0.13 inch.
- (b) Remove 0.25 inch \pm 0.06 inch of insulation from the end of each wire.
- (4) Bend the red and the blue wires back across the applicable shield termination mechanism. Refer to Figure 6.

PREPARATION FOR THE ASSEMBLY OF SPLICES

Figure 6

- (5) If the splice is a moisture proof splice:
 - (a) Put the end of the red wire and the ends of the two splice wires in the same end of the splice. Refer to Figure 7.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

CONFIGURATION OF THE SPLICES

Figure 7

- (b) Crimp the splice.
- (c) Put the moisture proof sleeve on the splice.
Make sure that the center of the sleeve is aligned with the center of the splice.
- (d) Shrink the sleeve. Refer to Subject 20-10-14.
Make sure that the lining of the sleeve is fully melted.
- (e) Do Step (a) through Step (d) again with the blue wire.
- (6) If the splice is a parallel splice:
 - (a) Put the end of the red wire and the ends of the two splice wires in the same end of the splice. Refer to Figure 7.
 - (b) Crimp the splice.
 - (c) Put a 0.75 inch length of Thermofit PD heat shrinkable sleeve on the splice assembly.
Make sure that:
 - The sleeve has the smallest possible diameter that can move easily on the splice assembly
 - The center of the sleeve is aligned with the center of the splice.
 - (d) Shrink the sleeve into position. Refer to Subject 20-10-14.
 - (e) Do Step (a) through Step (d) again with the blue wire.
- (7) Cut the ends of the four splice wires to align them with the ends of the remaining wires of the cable. Refer to Figure 7.

H. Contact Assembly

- (1) Make a selection of a contact from Table 3.
10 contacts are necessary.
- (2) Remove 0.25 inch \pm 0.06 inch of insulation from the end of each splice wire. Refer to Figure 5.
- (3) Remove 0.25 inch \pm 0.06 inch of insulation from one end of the case ground wire.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

- (4) Assemble a contact on the end of:
- Each of the five remaining AWG 20 wires of the cable
 - Each of the four AWG 18 splice wires
 - The AWG 18 case ground wire.

Refer to Subject 20-61-11.

I. Connector Assembly

NOTE: The applicable shield termination mechanism can be:

- A mechanical ferrule
- A Shield-Kon
- A solder sleeve.

- (1) Install each assembled contact in the connector.

Refer to:

- Figure 8
- Subject 20-61-11 for the contact insertion procedure.

Make sure to install the contact of the case ground wire in pin 10 of the connector.

CONTACT INSERTION
Figure 8

- (2) If the shield ground wire must be attached to a ground stud:
- (a) Bend the wire back across the applicable shield termination mechanism.
 - (b) Align the forward edge of the 1.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 9.

Make sure that the shield ground wire is between the sleeve and the cable.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

CONFIGURATION OF THE SHIELD GROUND WIRE FOR INSTALLATION ON A GROUND STUD
Figure 9

- (c) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (d) Fold the wire forward across the 1.5 inch sleeve.
- (e) Align the forward edge of the 2.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 10.

Make sure that:

- The shield ground wire is between the sleeves
- The case ground wire is between the sleeves.

CONFIGURATION OF THE SHIELD GROUND WIRE FOR INSTALLATION ON A GROUND STUD
Figure 10

- (f) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (g) Install the backshell.
- (h) To make a tight fit under the saddle clamp, put the necessary layers of Permacel P-440 tape on the cable.

Make sure that:

- The center each layer of tape is aligned with the center of the saddle clamp
- Each layer of tape makes 100 percent overlap.

- (3) If the shield ground wire must be attached to a backshell:

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

- (a) Align the forward edge of the 1.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 11.

CONFIGURATION OF THE SHIELD GROUND WIRE FOR INSTALLATION ON A BACKSHELL

Figure 11

- (b) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (c) Align the forward edge of the 2.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 12.

Make sure that the case ground wire is between the sleeves.

CONFIGURATION OF THE SHIELD GROUND WIRE FOR INSTALLATION ON A BACKSHELL

Figure 12

- (d) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (e) Install the backshell.
- (f) To make a tight fit under the saddle clamp, put the necessary layers of Permacel P-440 tape on the cable.

Make sure that:

- The center each layer of tape is aligned with the center of the saddle clamp
- Each layer of tape makes 100 percent overlap.

- (g) Put the terminal lug of the shield ground wire on a saddle clamp screw.

- (4) Install the saddle clamp.

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES****4. ASSEMBLY OF THE BACC45FM14-7P AND BACC63BV14-7P RECEPTACLES WITH S280T006-2 CABLE****A. Shield Ground Wire Preparation**

- (1) For a shield ground wire that must be attached to a ground stud, cut an 8.00 inch \pm 0.25 inch length of BMS 13-48 Type 8 AWG 18 wire.
- (2) For a shield ground wire that must be attached to a backshell, cut a 2.00 inch \pm .025 inch length of BMS 13-48 Type 8 AWG 18 wire.
- (3) Remove 0.25 inch \pm 0.06 inch of insulation from one end of the wire.
- (4) Make a selection of a terminal lug from Table 4.
- (5) Assemble the terminal lug on the wire. Refer to Subject 20-30-11.

B. Cable Preparation

- (1) Put the connector backshell on the cable approximately 6 inches from the end.
- (2) Make a selection of a 0.5 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (3) Put a 2.50 inch \pm 0.50 inch length of the heat shrinkable sleeve on the cable.
- (4) Put a 1.50 inch \pm 0.13 inch length of the heat shrinkable sleeve on the cable.
- (5) Prepare the cable. Refer to Figure 1.
 - (a) If it is necessary, cut the end of the cable to make the end perpendicular to its longitudinal axis.
 - (b) Remove 2.50 inches \pm 0.13 inch of the outer jacket from the end of the cable.
 - (c) Remove 2.13 inches \pm 0.06 inch of the shield from the end of the cable.
 - (d) Remove 0.25 inch \pm 0.06 inch, -0 inch of insulation from the end of each wire of the cable.

C. Shield Ground Wire Assembly with Mechanical Ferrules

A satisfactory alternative to the assembly of a shield ground wire with mechanical ferrules is the assembly with:

- A Shield-Kon; refer to Paragraph 4.D.
 - A solder sleeve; refer to Paragraph 4.E.
- (1) Make a selection of an inner ferrule and outer ferrule from Table 4.
 - (2) Make a selection of a ferrule crimp tool from Table 5.
 - (3) Make a selection of a 3/8 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
 - (4) Put a 1.0 inch \pm 0.13 inch length of the heat shrinkable sleeve on the cable.
 - (5) Put the outer ferrule on the cable.
 - (6) Put the inner ferrule on the cable. Refer to Figure 2.

Make sure that the ferrule is:

 - Between the shield and the wires of the cable
 - Tight against the end of the cable jacket.
 - (7) From the forward end of the cable, put the end of the shield ground wire without insulation between the cable jacket and the outer ferrule. Refer to Figure 3.
 - (8) Push the outer ferrule and the shield ground wire forward at the same time until the center of the outer ferrule is aligned with the center of the inner ferrule. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES**

Make sure that:

- The distance from the forward edge of the inner ferrule to the forward edge of the outer ferrule is not more than 0.06 inch
 - The end of the shield ground wire is between the rear edge of the outer ferrule and the rear edge of the inner ferrule.
- (9) Crimp the outer ferrule.
- (10) Remove the unwanted length of the shield that extends forward farther than the forward edge of the outer ferrule.

NOTE: The surface of the inner ferrule can be used to cut against.

- (11) Align the center of the 1 inch sleeve with the center of the outer ferrule.
- (12) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Shield Ground Wire Assembly with a Shield-Kon

Refer to Subject 20-10-15.

Make sure that the shield ground wire is extended forward from the forward end of the Shield-Kon. Refer to Figure 4.

E. Shield Ground Wire Assembly with a Solder Sleeve

Refer to Subject 20-10-15.

Make sure that the shield ground wire is extended forward from the forward end of the solder sleeve. Refer to Figure 4.

F. Contact Assembly

- (1) Make a selection of the contacts from Table 3.
- (2) Assemble a contact on the end of each of the seven AWG 20 wires of the cable. Refer to Subject 20-61-11.

G. Connector Assembly

NOTE: The applicable shield termination mechanism can be:

- A mechanical ferrule
 - A Shield-Kon
 - A solder sleeve.
- (1) Install each assembled contact in the connector.
- Refer to:
- Figure 8
 - Subject 20-61-11 for the contact insertion procedure.
- (2) If the shield ground wire must be attached to a ground stud:
- (a) Bend the wire back across the applicable shield termination mechanism.
- (b) Align the forward edge of the 1.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 9.
- Make sure that the shield ground wire is between the sleeve and the cable.
- (c) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (d) Fold the wire forward across the 1.5 inch sleeve.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH S280T006-1 AND S280T006-2 SPOILER CABLES

- (e) Align the forward edge of the 2.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 10.
 Make sure that the shield ground wire is between the sleeves.
 - (f) Shrink the sleeve into position. Refer to Subject 20-10-14.
 - (g) Install the backshell.
 - (h) To make a tight fit under the saddle clamp, put the necessary layers of Permacel P-440 tape on the cable.
 Make sure that:
 - The center each layer of tape is aligned with the center of the saddle clamp
 - Each layer of tape makes 100 percent overlap.
- (3) If the shield ground wire must be attached to a backshell:
- (a) Align the forward edge of the 1.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 11.
 - (b) Shrink the sleeve into position. Refer to Subject 20-10-14.
 - (c) Align the forward edge of the 2.5 inch sleeve with the forward edge of the shield termination mechanism. Refer to Figure 12.
 - (d) Shrink the sleeve into position. Refer to Subject 20-10-14.
 - (e) Install the backshell.
 - (f) To make a tight fit under the saddle clamp, put the necessary layers of Permacel P-440 tape on the cable.
 Make sure that:
 - The center each layer of tape is aligned with the center of the saddle clamp
 - Each layer of tape makes 100 percent overlap.
 - (g) Put the terminal lug of the shield ground wire on a saddle clamp screw.
- (4) Install the saddle clamp.

2. SHIELD TERMINATION**A. Cable Preparation**

- (1) Remove 2 inches of the jacket from the end of the cable.
- (2) Remove the length of the shield so that the end of the shield is 1/4 inch from the end of the jacket.
- (3) For contact assembly with size 22 contacts:
 - (a) Remove 1-1/4 inches of insulation from the end of the wire.
 - (b) Put a 2 inch length of 1/16 inch diameter Kynar heat shrinkable sleeve on the wire and under the shield so that:
 - The end of the sleeve is against the end of the jacket
 - The other end of the sleeve extends a minimum of 5/8 inch beyond the end of the wire insulation.
 - (c) Shrink the sleeve in position. Refer to Subject 20-10-14.

B. Shield Ground Wire Assembly

- (1) Assemble a shield ground wire with a solder sleeve. Refer to Subject 20-10-15.

SHIELD TERMINATION OF RAYCHEM 55A6087 CABLES

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Type	Supplier
BACC63BP	Plug	Boeing

B. Shield Termination Components

**Table 2
SHIELD TERMINATION COMPONENTS**

Component	Part Number	Supplier
Heat Shrinkable Solder Sleeve	BACS13BH2	Boeing
Terminal	BACT12AC3	Boeing

2. SHIELD TERMINATION

A. Cable Preparation

(1) Prepare the cable. Refer to Figure 1.

CABLE TRIM DIMENSIONS

Figure 1

- (a) Remove 3 inches \pm 1/16 inch of the outer jacket from the end of the cable.
- (b) Remove the length of the outer shield so that the end of the shield is 3/8 inch \pm 1/32 inch from the end of the outer jacket.
- (c) Remove 2-1/4 inches \pm 1/8 inch of the inner jacket from the end of the cable.
- (d) Remove the length of the inner shield so that the end of the shield is 3/8 inch \pm 1/32 inch from the end of the inner jacket.

STANDARD WIRING PRACTICES MANUAL

SHIELD TERMINATION OF RAYCHEM 55A6087 CABLES

B. Inner and Outer Shield Ground Wire Assembly

INNER SHIELD AND OUTER SHIELD GROUND WIRES

Figure 2

- (1) Cut a 6 inch \pm 1/16 inch length of BMS 13-16 Type I Class 1 AWG 18 wire for the shield ground wire.
- (2) Remove the insulation from both ends of the wire. Refer to Subject 20-30-11.
- (3) Make a selection of a heat shrinkable solder sleeve from Table 2.
- (4) To terminate an inner shield with a shielded contact:
 - (a) Hold the shield ground wire on the inner shield.
 - (b) Put the sleeve on the cable and the end of the ground wire. Refer to Figure 2.
 - (c) Assemble the contact. Refer to Subject 20-61-11.
- (5) To terminate either an inner shield without a shielded contact or an outer shield:
 - (a) Make a selection of a terminal lug from Table 2.
 - (b) Crimp the terminal lug on one end of one ground wire. Refer to Subject 20-30-11.
 - (c) Hold the shield ground wire on the cable.
 - (d) Put the sleeve on the cable and the end of the ground wire. Refer to Figure 2.
 - (e) Shrink the sleeve in position.

Make sure that the shield ground wire points away from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

SHIELD TERMINATION OF THE RAYCHEM 55A6090 CABLE

This Subject gives the procedures to terminate the outer shield of the Raychem 55A6090 cable.

1. CABLE SHIELD TERMINATION

A. Cable Preparation

**CABLE TRIM DIMENSIONS
Figure 1**

**Table 1
CABLE TRIM DIMENSIONS**

Connector	Cable Trim		
	Dimension	Minimum (inch)	Maximum (inch)
BACC45FS20C	A	2-7/8	3-1/8
	B	11/32	13/32
BACC63BP18R	A	2-3/4	3
	B	11/32	13/32
BACC63BP22R	A	3	3-1/4
	B	11/32	13/32
BACC63BV18R	A	2-3/4	3
	B	11/32	13/32
BACC63BV22R	A	3	3-1/4
	B	11/32	13/32

- (1) Prepare the cable.
Refer to Figure 1 and Table 1.
 - (a) Remove the necessary length of the outer jacket so that the distance from the end of the jacket to the end of the cable is Dimension A.
 - (b) Remove the necessary length of the shield so that the distance from the end of the shield to the end of the outer jacket is Dimension B.

STANDARD WIRING PRACTICES MANUAL**SHIELD TERMINATION OF THE RAYCHEM 55A6090 CABLE****B. Shield Ground Wire Assembly****SHIELD GROUND WIRE ASSEMBLY****Figure 2**

- (1) Prepare the shield ground wire. Refer to Subject 20-10-15.
 - (a) Make a selection of the shield ground wire.
 - (b) Cut a 6.0 inch \pm 0.1 inch length of the wire.
 - (c) Remove the necessary insulation from both ends of the wire.
- (2) Assemble the BACT12AC3 general purpose terminal on the end of the ground wire. Refer to Subject 20-30-11.
- (3) Attach the shield ground wire to the shield with mechanical ferrules. Refer to Subject 20-10-15.
- (4) Make a selection of a 3/8 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (5) Put a 1.06 inch \pm 0.06 inch length of the sleeve on the cable.

Make sure that the center of the sleeve is aligned with the center of the outer ferrule.
- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.

	B	11/32	13/32
BACC63BV22	A	3	3-1/4
	B	11/32	13/32

- (1) Prepare the cable.
Refer to Figure 1 and Table 1.
- (2) Remove the necessary length of the outer jacket so that the distance from the end of the jacket to the end of the cable is Dimension A.

STANDARD WIRING PRACTICES MANUAL**SHIELD TERMINATION OF THE RAYCHEM 55A6088 CABLE**

- (3) Remove the necessary length of the shield so that the distance from the end of the shield to the end of the jacket is Dimension B.

B. Shield Ground Wire Assembly**SHIELD GROUND WIRE ASSEMBLY****Figure 2**

- (1) Prepare the shield ground wire. Refer to Subject 20-10-15.
 - (a) Make a selection of the shield ground wire.
 - (b) Cut a 6.0 inch ± 0.1 inch length of the wire.
 - (c) Remove the necessary length of insulation from both ends of the wire.
- (2) If a terminal is specified:
 - (a) Assemble the BACT12AC3 general purpose terminal on the end of the ground wire. Refer to Subject 20-30-11.
 - (b) Attach the shield ground wire to the shield with mechanical ferrules. Refer to Subject 20-10-15.
- (3) If a contact is specified, install a contact on the shield ground wire. Refer to Subject 20-61-11.
- (4) Make a selection of a 5/8 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (5) Put a 1.06 inch ± 0.06 inch length of the sleeve on the cable.
Make sure that the center of the sleeve is aligned with the center of the outer ferrule.
- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

SHIELD TERMINATION OF RAYCHEM 55A6160 AND 55A6160-20 CABLES, AND CHAMPLAIN 61-02651 AND 61-02783 CABLES

CABLE PREPARATION
Figure 1

Refer to Table 2 and Figure 1.

- (1) Remove the necessary length of the outer jacket so that the distance from the end of the jacket to the end of the cable is dimension A.
- (2) Remove the necessary length of the outer shield so that the distance from the end of the outer shield to the end of the outer jacket is dimension B.
- (3) Remove the necessary length of the inner jacket so that the distance from the end of the inner jacket to the end of the cable is dimension C.
- (4) Remove the necessary length of the inner shield so that the distance from the end of the inner shield to the end of the inner jacket is dimension D.

2. TERMINATION OF THE OUTER SHIELD

A. Shield Ground Wire Assembly

SHIELD GROUND WIRE ON THE OUTER SHIELD
Figure 2

- (1) Assemble a shield ground wire with mechanical ferrules on the outer shield. Refer to Figure 2 and Subject 20-10-15.

NOTE: A satisfactory alternative for the Raychem 55A6160 cable is the assembly of the shield ground wire with a BACS13BH2 solder sleeve. Refer to Subject 20-10-15.

STANDARD WIRING PRACTICES MANUAL

SHIELD TERMINATION OF RAYCHEM 55A6160 AND 55A6160-20 CABLES, AND CHAMPLAIN 61-02651 AND 61-02783 CABLES

Make sure that:

- The shield ground wire is a 6 inch \pm 1/16 inch length of AWG 20 wire
- The length of the heat shrinkable sleeve is 1-1/8 inches \pm 1/16 inch.

NOTE: If the shield ground wire is assembled with a solder sleeve, the heat shrinkable sleeve is not used.

(2) Assemble a BACT12M terminal on the ground wire. Refer to Subject 20-30-11.

3. TERMINATION OF THE INNER SHIELD

A. Shield Ground Wire Assembly

(1) Assemble a shield ground wire with mechanical ferrules on the inner shield. Refer to Figure 2 and Subject 20-10-15.

NOTE: A satisfactory alternative for the Raychem 55A6160 cable is the assembly of the shield ground wire with a BACS13BH2 solder sleeve. Refer to Subject 20-10-15.

Make sure that:

- The shield ground wire is a 6 inch \pm 1/16 inch length of AWG 20 wire
- The length of the heat shrinkable sleeve is 1-1/8 inches \pm 1/16 inch.

NOTE: If the shield ground wire is assembled with a solder sleeve, the heat shrinkable sleeve is not used.

B. Assembly of a Shield Dead End

SHIELD DEAD END ON THE INNER SHIELD
Figure 3

(1) Assemble a shield dead end on the inner shield. Refer to Figure 3 and Subject 20-10-15.

Make sure that the length of the heat shrinkable sleeve is 1-1/8 inches \pm 1/16 inch.

C. Assembly of a Shield Ground Wire That Is Attached to a Cable Conductor

(1) Assemble a shield ground wire with mechanical ferrules on the inner shield. Refer to Subject 20-10-15.

STANDARD WIRING PRACTICES MANUAL**SHIELD TERMINATION OF RAYCHEM 55A6160 AND 55A6160-20 CABLES, AND CHAMPLAIN 61-02651 AND 61-02783 CABLES**

Make sure that:

- The shield ground wire is a 4.5 inch ± 0.06 inch length of AWG 20 wire
- The length of the heat shrinkable sleeve is 1.06 inches ± 0.06 inch.

(2) Attach these wires with a parallel splice:

- The end of the shield ground wire
- One end of a 4.5 inch ± 0.06 inch length of the same type of wire as the shield ground wire
- The specified conductor of the cable.

Refer to Figure 4 and Subject 20-30-12.

CONFIGURATION OF THE SHIELD GROUND WIRE
Figure 4

- (3) Put one layer of the TFE Stage B tape on the splice.
- (4) For the Raychem 55A6160-20 cable, put the sufficient length of PD or an equivalent heat shrinkable sleeve on the splice so that both ends of the sleeve extend beyond the ends of the splice.
- (5) For the Raychem 61-02651 and the 61-02783 cables, put one layer of PTFE tape on the splice so that both ends of the layer of tape extend beyond the ends of the splice.
- (6) Fold the shield ground wire and the cable conductor back over the ferrule so that free end of the wire opposite the splice is aligned with the end of the remaining conductor of the cable.

Refer to Figure 4.

- (7) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (8) Put a 1.5 inch ± 0.06 inch length of the sleeve on the wires with the splice and the cable.
- (9) Shrink the sleeve into position. Refer to Subject 20-10-14.

2. ASSEMBLY OF BACC66() CONNECTORS

A. Cable Preparation

Refer to Figure 1.

**CABLE TRIM DIMENSIONS
Figure 1**

- (1) Remove 2-1/2 inches ± 1/8 inch of the outer jacket from the end of the cable.
- (2) Push the shield back.
- (3) Remove 1-9/16 inches ± 1/8 inch of the carbon layer from the end of each conductor.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH MICRODOT 202-3836-0000 AVM CABLE

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (4) Remove the remaining carbon from the primary insulation with acetone or an equivalent solvent.
- (5) Remove 3/16 inch of the primary insulation from the end of each conductor.

B. Connector Assembly

- (1) Assemble the contacts. Refer to Subject 20-71-14.
- (2) Put a 1-3/8 inch \pm 1/8 inch length of 1/16 inch diameter of Kynar heat shrinkable sleeve on each conductor.
Make sure that the distance from the end of the sleeve to the end of the primary insulation is 7/8 inch \pm 1/16 inch.
- (3) Shrink the sleeves in position. Refer to Subject 20-10-14.
- (4) Install the contacts in the connector. Refer to Subject 20-71-14.
- (5) Assemble a shield dead end on the free end of the shield. Refer to Subject 20-10-15.
- (6) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (7) Put a 1.00 inch \pm 0.25 inch length of the sleeve on the end of the cable.
Make sure that the end of the sleeve is 0.25 inch from the connector grommet.
- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

3. ASSEMBLY OF BACC45F(), BACC63BP(), AND BACC63BV() CONNECTORS

A. Cable Preparation

- (1) Remove 2 inches \pm 1/8 inches of the outer jacket from the end of the cable.
- (2) Remove 2 inches \pm 1/8 inches of the shield from the end of the cable.
- (3) Remove 1 inch \pm 1/16 inch of the carbon layer from the end of each conductor.

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (4) Remove the remaining carbon from the primary insulation with acetone or an equivalent solvent.

B. Connector Assembly

CONNECTOR ASSEMBLY WITH A MICRODOT 202-3836-0000 CABLE

Figure 2

- (1) Assemble the contacts. Refer to Subject 20-61-11.
- (2) Put a 3/4 inch \pm 1/16 inch length of 1/16 inch diameter of Kynar heat shrinkable sleeve on each conductor.

20-35-22

707, 727-787

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH MICRODOT 202-3836-0000 AVM CABLE

- (3) Shrink the sleeves in position. Refer to Subject 20-10-14.
- (4) Assemble the shield ground wire.
Refer to Figure 2 and Subject 20-10-15.
- (5) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (6) Put a 2.00 inch ± 0.13 inch length of the sleeve on the cable.
- (7) Install the contacts in the connector. Refer to Subject 20-61-11.
- (8) Push the sleeve over the shield and the conductors until the end of the sleeve is 1/4 inch or less from the connector grommet.
- (9) Shrink the sleeve in position. Refer to Subject 20-10-14.

- (1) Assemble a shield ground wire on each shield of the 3 shielded pairs. Refer to Subject 20-10-15 and Figure 2.

These conditions are applicable:

- The shield ground wires are 6 inches \pm 1/16 inch in length
- The shield ground wires are assembled with a BACS13S109B inner ferrule and a BACS13S175C outer ferrule.

NOTE: The assembly of a shield ground wire with a solder sleeve is a satisfactory alternative.

- (2) Assemble a shield ground wire on the outer shield of the cable. Refer to Subject 20-10-15 and Figure 2.

These conditions are applicable:

- The shield ground wire is 6 inches \pm 1/16 inch in length
- The shield ground wire is assembled with a BACS13S297B inner ferrule and a BACS13S375C outer ferrule.
- The heat shrinkable sleeve is 4-1/2 inches \pm 1/8 in length.

- (3) Push the heat shrinkable sleeve over the shield ground wires and the shielded pairs.
- (4) Shrink the sleeve in position. Refer to Subject 20-10-14.

2. SHIELD TERMINATION

A. Cable Preparation

Refer to Subject 20-00-15 and Figure 1.

- (1) Remove 2.25 inches ± 0.06 inch of the outer jacket from the end of the cable.

Either of these tools can be used:

- A pair of Meisei 4C tweezers with a Meisei M-10 power supply
- An X-ACTO knife.

- (2) Remove 1.80 inches ± 0.06 inch of the shield from the end of the cable.

- (3) Remove 0.30 inch ± 0.03 inch of the insulation from the end of each wire.

**CABLE TRIM DIMENSIONS
Figure 1**

B. Shield Ground Wire Assembly

- (1) Assemble a shield ground wire with either of these:

- A mechanical ferrule
- A solder sleeve.

Refer to Subject 20-10-15.

2. SHIELD TERMINATION FOR THE ASSEMBLY OF AMPHENOL 115-5066 AND 115-5074 CONNECTORS

A. Shield Termination

Refer to Subject 20-62-12.

3. SHIELD TERMINATION FOR THE ASSEMBLY OF BACC63AE, BACC63AF, BACC63X AND BACC63Y CONNECTORS

A. Cable Preparation

- (1) Remove 1-3/4 inches \pm 1/8 inch of the outer jacket from the end of the cable.
- (2) Remove 1-3/4 inches \pm 1/8 inch of the shield from the end of the cable.
- (3) Carefully cut the outer carbon layer along the groove between the two conductors.
- (4) Pull the conductors apart back to the end of the outer jacket.
- (5) Remove the unwanted outer carbon layer.
- (6) Remove the inner carbon layer so that the end of the layer is 1/2 inch \pm 1/16 inch beyond the location on the wire that is specified for the assembly of the contact.

Refer to Subject 20-61-11.

CAUTION: MAKE SURE THAT DAMAGE DOES NOT OCCUR TO THE PRIMARY INSULATION.

- (7) Remove the remaining carbon from primary insulation with acetone or an equivalent solvent.

B. Shield Ground Wire Assembly

- (1) Assemble a shield ground wire with a mechanical ferrule.

STANDARD WIRING PRACTICES MANUAL

TERMINAL ASSEMBLY WITH ALUMEL-CHROMEL THERMOCOUPLE WIRE

This Subject gives the procedure to assemble AMP and Thermo-Electric terminals with Alumel-Chromel (Al-Ch) thermocouple wire.

1. PART NUMBERS AND DESCRIPTION

A. Thermocouple Terminal Part Numbers

**Table 1
ALUMEL AND CHROMEL THERMOCOUPLE TERMINAL PART NUMBERS**

Material	Terminal	
	Part Number	Supplier
Alumel	1387-4	Thermo-Electric
	1-321898-0	AMP
Chromel	1387-3	Thermo-Electric
	1-321897-0	AMP

B. Alumel-Chromel Thermocouple Cable Part Numbers

**Table 2
ALUMEL AND CHROMEL THERMOCOUPLE WIRE PART NUMBERS**

Part Number	Supplier
WC-94102	Revere
252-94102	Galite
852-4000311	Pirelli
852-4985321	Pirelli

2. TERMINAL ASSEMBLY

A. Wire Preparation

**Table 3
INSULATION REMOVAL LENGTH**

Terminal	Wire Insulation		
	Color	Removal Length (inch)	
		Target	Tolerance
1387-3	White	5/16	± 1/16
1387-4	Green	5/16	± 1/16
1-321897-0	White	1/4	± 1/16
1-321898-0	Green	1/4	± 1/16

(1) Remove the necessary length of insulation from the end of each wire. Refer to Table 3.

STANDARD WIRING PRACTICES MANUAL

TERMINAL ASSEMBLY WITH ALUMEL-CHROMEL THERMOCOUPLE WIRE

B. Terminal Assembly

Table 4
TERMINAL CRIMP TOOLS

Terminal	Crimp Tool		
	Basic Unit	Setting	Supplier
1387-3	Y14MV	-	Burndy
1387-4	Y14MV	-	Burndy
1-321897-0	46673	3	AMP
1-321898-0	46673	3	AMP

- (1) Make a selection of a crimp tool from Table 4.
- (2) Put the end of the white wire into the crimp barrel of the chromel terminal.
NOTE: The Thermo-Electric 1387-3 terminals are identified on the under side with a CR mark.
- (3) Crimp the terminal.
- (4) Put the end of the green wire into the crimp barrel of the alumel terminal.
NOTE: The Thermo-Electric 1387-4 terminals are identified on the under side with a AL mark.
- (5) Crimp the terminal.
- (6) For the Thermo-Electric terminals, lightly solder the terminal to the wire with AG5.5 silver solder.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTORS WITH SOLDER TYPE CONTACTS

1. GENERAL DATA

A. Applicable Conditions

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT. DAMAGE TO THE CONNECTOR OR THE WIRE CAN OCCUR

CAUTION: DO NOT LET THE STRANDS OF THE CONDUCTOR THAT ARE IN THE INSULATION OF THE WIRE ABSORB THE SOLDER. THE WIRE:

- CANNOT BEND AT THE NECESSARY LOCATION
- CAN BREAK AT THE END OF THE SOLDER.

B. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

**Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL**

Connector	Description	Contact Cavity Size	Minimum Wire O.D. (inch)
PT06E()	MIL-C-26482 series I type; front release, rear removal solder contacts	20	0.060
		16	0.066
		12	0.097
SM3106()	MIL-C-5015 type, front release, rear removal solder contacts	16	0.064
		12	0.114
		8	0.164
		4	0.272
		0	0.415

**Table 3
SOLDER ADAPTER PART NUMBERS**

Boeing Standard	Part Number	Supplier
BACA14AB164	460-3094-01-01-00	Cambion

3. CONTACT ASSEMBLY

A. Installation of One Wire in a Contact Solder Cup

- (1) If a solder adapter is specified, make a selection of a solder adapter from Table 3.
- (2) If the connector does not have a grommet, put a 0.75 inch \pm 0.13 inch length of MIL-DTL-23053/5 Class 1 heat shrinkable sleeve on the wire.

Make sure that the sleeve has the smallest possible diameter that can be put on the wire.

NOTE: For alternative equivalent heat shrinkable sleeves, refer to Subject 20-00-11.

- (3) Remove the necessary length of insulation from the end of the wire.

NOTE: When the wire is fully installed in the contact, the end of the insulation must not be more than 0.06 inch from the rear end of the solder cup.

- (4) If a solder adapter is specified:
 - (a) Tin these components of the contact assembly:
 - The wire
 - The solder adapter
 - The contact solder cup.

- (b) Solder the end of the wire in the adapter.

- (c) Solder the adapter in the solder cup.

- (5) If a solder adapter is not specified:
 - (a) Tin these components of the contact assembly:
 - The wire
 - The contact solder cup.

- (b) Solder the end of the wire in the solder cup.

- (6) If the connector has a grommet and the contacts can be removed:

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH SOLDER TYPE CONTACTS**

- (a) Measure the O.D. of the wire.
 - (b) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.B.
- (7) If the connector does not have a grommet:
- (a) Push the heat shrinkable sleeve forward until the forward end of the sleeve is between 0 inch and 0.06 inch from the rear face of the connector.
 - (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Installation of More Than One Wire in a Contact Solder Cup

This paragraph gives the procedure to solder two or three AWG 22 wires in an size 20 contact with a solder cup.

- (1) Make a selection of a solder adapter from Table 3.
- (2) If the connector does not have a grommet, put a 0.75 inch \pm 0.13 inch length of MIL-DTL-23053/5 Class 1 heat shrinkable sleeve on the wire.

Make sure that the sleeve has the smallest possible diameter that can be put on the wire.

NOTE: For alternative equivalent heat shrinkable sleeves, refer to Subject 20-00-11.

- (3) Remove the necessary length of insulation from the end of the wire.

NOTE: When the wire is fully installed in the contact, the end of the insulation must not be more than 0.06 inch from the rear end of the solder cup.

- (4) Tin these components of the contact cavity:
 - The wire
 - The solder adapter
 - The contact solder cup.
- (5) Solder the end of the wire in the adapter.
- (6) Solder the adapter in the solder cup.
- (7) If the connector does not have a grommet:
 - (a) Push the heat shrinkable sleeve forward until the forward end of the sleeve is between 0 inch and 0.06 inch from the rear face of the connector.
 - (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

GRIMES-HONEYWELL A-4135 MAP LIGHT - LAMP BASE AND LENS ASSEMBLY
Figure 1

Refer to Figure 1.

- (1) Pull the lens assembly away from the lamp base.
Make sure to keep the lens assembly aligned with the lamp base.
- (2) Remove the lamp bulb:
 - (a) Push the old lamp bulb into the lamp bulb socket until it stops.
 - (b) While you hold the lamp bulb in, turn it counterclockwise until it stops.
 - (c) Remove the old lamp bulb from the lamp bulb socket.
- (3) Make a selection of a lamp bulb from Table 2.
- (4) Install the lamp bulb:
 - (a) Push the new lamp bulb into the lamp bulb socket until it stops.
 - (b) While you hold the lamp bulb in, turn it clockwise until it stops.
Make sure that the new lamp bulb is locked in its position.
- (5) Align the lens assembly and the lamp base.
- (6) Push the lens assembly on the lamp base until it stops.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE GRIMES-HONEYWELL A-4135 MAP LIGHT

3. MAP LIGHT ASSEMBLY

A. Wire Preparation

**Table 4
INSULATION REMOVAL LENGTH FOR THE A-4135 MAP LIGHT**

Contact Assembly Procedure	Wire Size	Insulation Removal Length		Special Instructions
		Target (inch)	Tolerance (inch)	
Crimp Paragraph 3.B..	22	0.69	± 0.03	Fold back the conductor
	20	0.69	± 0.03	Fold back the conductor
	16	0.34	± 0.03	-
Solder Paragraph 3.C..	22	0.47	± 0.03	-
	16			-
	12			-

**GRIMES-HONEYWELL A-4135 MAP LIGHT
Figure 2**

Refer to Figure 2.

- (1) Put the cap nut on the wire.
Make sure that the threads of the cap nut point forward to the end of the wire.
- (2) Put the insulator on the wire.
Make sure that the smaller diameter end of the insulator points forward to the end of the wire.
- (3) Remove the correct length of insulation from the end of the wire. Refer to Table 4.

B. Contact Assembly - Crimp Procedure

NOTE: The contact can be assembled by this crimp procedure, or by the solder procedure in Paragraph 3.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE GRIMES-HONEYWELL A-4135 MAP LIGHT

**Table 5
CRIMP TOOLS FOR THE A-4135 MAP LIGHT**

Basic Unit	Die	Position	Supplier
WT-400	-	-	Thomas and Betts
WT-400	WT-4400	-	Thomas and Betts
M22520/5-01	M22520/5-35	B	QPL

Refer to Figure 2.

- (1) Make a selection of a crimp tool from Table 5.
- (2) Put the end of the wire into the contact.

Make sure that:

- The cap nut and the insulator are on the wire.
- The larger diameter end of the contact points forward to the end of the wire.
- The distance between the end of the wire insulation and the contact is between 0.03 inch and 0.09 inch.

- (3) Crimp the contact.

Make sure that:

- The flash on the contact crimp barrel does not touch the side of the insulator when the contact is installed in the insulator.

C. Contact Assembly - Solder Procedure

NOTE: The contact can be assembled by this solder procedure, or by the crimp procedure in Paragraph 3.B.

POSITION OF THE WIRE IN THE CONTACT

Figure 3

Refer to Figure 3.

- (1) Put the end of the wire into the contact.

Make sure that:

- The cap nut and the insulator are on the wire. Refer to Figure 2.
- The larger diameter end of the contact points forward to the end of the wire.
- The distance between the end of the wire insulation and the contact is between 0.03 inch and 0.09 inch.

- (2) Put the ends of the conductor strands evenly around the large end of the contact.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE GRIMES-HONEYWELL A-4135 MAP LIGHT

- (3) Make a selection of one of these. Refer to Subject 20-00-11.
 - A solder and a flux
 - A flux cored solder.
- (4) Solder the conductor strands to the front surface of the large end of the contact.

Make sure that:

 - A sufficient amount of solder is applied for a satisfactory lamp contact surface.
 - Solder is not on the side of the contact
 - The distance between the end of the wire insulation and the contact is between 0.03 inch and 0.09 inch.

D. Map Light Assembly

Refer to Figure 2.

- (1) Put the insulator against the shoulder of the assembled contact.
- (2) Push the insulator and the contact into the rear of the lamp base.
- (3) Engage the threads of the cap nut and the threads on the rear of the lamp base.
- (4) Tighten the cap nut.

	B. Installation of the Wire	1

20-40-13 CONTENTS

707, 727-787

STANDARD WIRING PRACTICES MANUAL

TERMINATION OF WIRE IN MS25257 TYPE INDICATOR LIGHTS

This Subject gives the procedure to attach AWG 20 and larger wire to the terminals of MS25257 type indicator lights.

1. WIRE TERMINATION

A. Terminal Preparation

- (1) Apply the sufficient amount of Kester 1544 flux to both sides of each terminal on the indicator light.
- (2) Put a heat sink on each terminal so that each heat sink is adjacent to the light base.
- (3) Lightly tin each terminal.
Make sure that the hole in each terminal is open.
- (4) Remove the heat sinks.

B. Installation of the Wire

- (1) Put the conductor strands of each wire into 2 groups.
- (2) For each terminal:
 - (a) Put one group of strands through the hole of the terminal.
 - (b) Put the other group of strands over the terminal near the hole.
- (3) Apply the sufficient amount of Kester 1544 flux to the strands that are against the terminal.
- (4) Put a heat sink on each terminal so that each heat sink is adjacent to the light base.
- (5) Solder each wire to the terminals.

CAUTION: DO NOT APPLY MORE HEAT THAN IS NECESSARY FOR THE SOLDER TO FLOW.
DAMAGE CAN OCCUR TO THE WIRE OR THE INDICATOR LIGHT OR BOTH.

- (6) Remove the heat sinks.

	A. Wire Preparation	1
	B. Installation of the Wire	1

20-40-14 CONTENTS

STANDARD WIRING PRACTICES MANUAL**TERMINATION OF WIRE IN THE JOHNSON 105-0303-001 TIP PLUG CONNECTOR**

This Subject gives the procedure to attach BMS 13-48 AWG 22 wire to the tip plug connector.

1. WIRE TERMINATION**A. Wire Preparation**

- (1) Remove 1/4 inch \pm 1/16 inch of insulation from the end of the wire.
- (2) Tin the bare conductor strands.
- (3) Put the insulated handle on the wire.
- (4) Make a selection of these Grade B, Class 1 heat shrinkable sleeves from Subject 20-00-11:
 - 1/16 inch diameter sleeve
 - 3/16 inch diameter sleeve.
- (5) Put the heat shrinkable sleeves on the wire:
 - Two 1 inch lengths of 1/16 inch diameter sleeve
 - One 1 inch length of 3/16 inch diameter sleeve.

B. Installation of the Wire

- (1) Tin the area around the wire exit hole on the side of the pin body.
- (2) Put the sufficient amount of Kester 197 flux or an equivalent flux on the tinned area.
- (3) Put the end of the wire into the wire entry hole so that 1/8 inch to 3/16 inch of the wire is on the other side of the hole.
- (4) Solder the wire in the tip plug.
- (5) Install each heat shrinkable sleeve:
 - (a) Push the sleeve until the end of the sleeve is against the rear of the plug.
 - (b) Shrink the sleeve in position. Refer to Subject 20-10-14.
- (6) Engage the threads of the insulated handle and the body of the tip plug.
- (7) Tighten the handle.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

This Subject gives these procedures for the twinax plug connectors:

- Separation
- Disassembly
- Assembly
- Installation.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
TWINAX PLUG CONNECTOR PART NUMBERS**

Part Number	Contact Type	Clamp Configuration	Supplier
150900-0302	Socket	Shield clamp only	ITT Gremar
150900-0303	Pin	Shield clamp only	ITT Gremar
150900-2341	Socket	Shield clamp and jacket clamp	ITT Gremar
150900-2342	Pin	No clamps; does not accept a shield	ITT Gremar
150900-2343	Socket	No clamps; does not accept a shield	ITT Gremar
204-18291-2	Pin	Shield clamp only	Boeing

NOTE: Some Wiring Diagrams show the Boeing 204-18291-2 plug as an alternative to the 150900-0303 twinax plug.

B. Connector Description

The twinax plug connector has these technical features:

- Solder cup contacts
- Integral shield to connector shell electrical bond.

Refer to Figure 1 and Figure 2.

**THE ITT GREMAR 150900-() TWINAX PLUG CONNECTOR ASSEMBLY
Figure 1**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

COMPONENTS OF THE ITT GREMAR 150900-() TWINAX PLUG
Figure 2

2. CONNECTOR DISASSEMBLY

A. Separation of the Plug from the Receptacle

- (1) Turn the coupling nut until the threads are disengaged from the threads on the receptacle receptacle. Refer to Figure 1.
- (2) Pull the shell of the plug away from the receptacle.
 Make sure that the shell stays perpendicular to the receptacle.

CAUTION: DO NOT PULL THE CABLE TO DISCONNECT THE PLUG FROM THE RECEPTACLE. IT CAN CAUSE DAMAGE TO THE CABLE.

B. Contact Disassembly

CONTACT DISASSEMBLY
Figure 3

Refer to Figure 3.

- (1) Disengage the threads of the clamp nut from the threads of the connector shell.
- (2) Move the nut and the washer away from the connector.
- (3) From the forward end of the connector, carefully push the connector insert out of the connector shell.
- (4) Remove the bushing with a slot.
- (5) For each contact:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

- (a) Apply heat to the solder cup of the contact with a soldering iron.
- (b) Remove the conductor from the contact.

C. Connector Disassembly

**CONNECTOR DISASSEMBLY
Figure 4**

Refer to Figure 4.

- (1) Remove the bushing from the cable.
- (2) Push the strands of the shield against the conductors.
Make sure that the strands are flat against the outer jacket of the cable.
- (3) In this order, carefully remove these components from the cable:
 - The shield clamp
 - The washer
 - The clamp nut.

3. CONNECTOR ASSEMBLY WITH RG108/U OR RAYCHEM 10599 TWINAX CABLE

A. Cable Preparation

- (1) In order, put these components on the end of the cable:
 - The clamp nut
 - The washer.

Refer to Figure 5.

**POSITION OF THE CLAMP NUT AND THE WASHER ON THE CABLE
Figure 5**

- (2) Remove 0.30 inch \pm 0.03 inch of the outer jacket from the end of the cable. Refer to Subject 20-00-15 and Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

- (3) Remove 0.20 inch \pm 0.02 inch of the shield from the end of the cable. Refer to Figure 6.

OUTER JACKET AND SHIELD REMOVAL
Figure 6

- (4) Remove 0.13 inch \pm 0.02 inch of the insulation from each conductor. Refer to Figure 7.

INSULATION REMOVAL
Figure 7

- (5) For the Raychem 10599 cable, the outer diameter of the cable must be increased so that the clamp nut has the correct fit. Refer to Figure 8.

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 8

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

- (a) Make a selection of these Grade B, Class 1 heat shrinkable sleeves from Subject 20-00-11:
 - 0.19 inch diameter sleeve
 - 0.25 inch diameter sleeve.
- (b) Cut these lengths of the heat shrinkable sleeve:
 - Two 1.0 inch \pm 0.1 inch lengths of the 0.19 inch diameter sleeve
 - Two 1.0 inch \pm 0.1 inch lengths of the 0.25 inch diameter sleeve.
- (c) Put one of the sleeves that has the smaller diameter on the cable.
Make sure that the end of the sleeve is aligned with the end of the outer jacket.
- (d) Shrink the sleeve into its position. Refer to Subject 20-10-15.
- (e) Put the other sleeve that has the smaller diameter on the cable.
Make sure that the end of the sleeve is aligned with the end of the outer jacket.
- (f) Shrink the sleeve into its position. Refer to Subject 20-10-15.
- (g) Do Step (c) through Step (f) again for the sleeves that have the larger diameter.
- (6) Move the strands of the shield apart with a plastic awl or an equivalent tool.
- (7) Push the shield against the conductors.
Make sure that the strands are flat against the cable jacket.
- (8) Put the shield clamp on the cable.
Make sure that the clamp is:
 - On the strands of the shield
 - Against the end of the outer jacket of the cable.
- (9) Fold the strands of the shield on the front end of the clamp.
Make sure that the strands are:
 - Even and symmetrical around the clamp
 - Flat against the clamp
 - The strands of the shield go on the edge of the clamp.
- (10) Put the bushing on cable.
Make sure that the bushing holds the strands of the shield against the shield clamp. Refer to Figure 9.

POSITION OF THE BUSHING, THE STRANDS OF THE SHIELD, AND THE SHIELD CLAMP
Figure 9

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR

B. Contact Assembly

NOTE: The conductor that:

- Has tin coated strands is identified as White by the Wiring Diagram
- Is solid copper is identified as Blue by the Wiring Diagram.

CONDUCTORS SOLDERED IN THE CONTACTS
Figure 10

- (1) Examine the rear end of the connector insert.

Make sure that there is not any of these types of damage:

- Gouges or cracks between two contact cavities
- Gouges or cracks from a contact cavity to the edge of the connector insert.

- (2) Solder each conductor in the solder cup of the applicable contact. Refer to Subject 20-40-00 and Figure 10.

Make sure that:

- There are no bad solder joints
- There are no broken strands of the conductor at the solder joint
- There is no damage to the strands of the conductor that shows the base metal.

C. Connector Assembly

- (1) Put the bushing that has the slot on the connector insert.

Make sure that the bushing is on the solder cups of the contacts and the conductors. Refer to Figure 11.

POSITION OF THE BUSHING WITH A SLOT
Figure 11

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF THE ITT GREMAR 150900-() TWINAXPLUG CONNECTOR**

- (2) Push the connector insert into the connector shell until it stops.
- (3) Engage the threads of the clamp nut and the connector shell.
Make sure that there is no damage to the threads of the nut or the shell.
- (4) Tighten the nut until it stops. Refer to Figure 12.

**ASSEMBLED PLUG CONNECTOR****Figure 12****4. CONNECTOR INSTALLATION****A. Installation of a Plug into a Receptacle**

- (1) Examine the front face.
Make sure that there is not an of these types of damage:
 - A bent contact pin
 - A crack or a chip from one contact cavity to another contact cavity
 - A crack or a chip from a contact cavity to the edge of the connector insert.
- (2) Align the plug with the receptacle.
Make sure that:
 - The contacts in the plug are aligned with the contacts in the receptacle
 - The longitudinal axis of the plug is parallel to the longitudinal axis of the receptacle.
- (3) Push the plug into the receptacle.
Make sure that the contacts are fully engaged.
- (4) Engage the threads of the coupling nut and the threads of the receptacle shell.
- (5) Tighten the nut until it stops.

437-027	Backshell	Glenair
667-047	Dust Cover	Glenair
D105A067-60	Connector	W. W. Fisher

2. CONNECTOR ASSEMBLY

A. Dust Cover Installation

POSITION OF THE DUST COVER ON THE CONNECTOR

Figure 1

Refer to Figure 1.

- (1) Install the dust cover over the rear of the connector.
- (2) Open the dust cover so that it is against the front end of the connector.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF THE W. W. FISHER D105A067-60 CONNECTOR****B. Connector Assembly**

POSITION OF THE CONNECTOR ON THE PANEL
Figure 2

Refer to Figure 2.

- (1) Put the connector into the correct panel cutout.
- (2) Engage the threads of the gland nut the rear of the connector body.
- (3) Torque the gland nut 50 inch-pounds \pm 5 inch-pounds.
- (4) Close the dust cover.

C. Wire Installation

- (1) Remove a 0.25 inch \pm 0.1 inch length of insulation from the end of each wire. Refer to Subject 20-00-15.
- (2) Find the correct solder cup for each wire. Refer to the Wiring Diagram Manual.
- (3) Put each wire through the applicable hole in the insulator of the backshell.
- (4) Push each wire into the correct solder cup.

Make sure the distance from the end of the wire insulation to the end of the solder cup is less than 0.03 inch.

- (5) Solder each wire in the applicable solder cup.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE W. W. FISHER D105A067-60 CONNECTOR

D. Backshell Installation

INSTALLATION OF THE BACKSHELL

Figure 3

- (1) Align the holes in the insulator with the solder cups.
Refer to Figure 3.
- (2) Push the backshell until it is against the body of the connector.
- (3) Engage the threads of the coupling ring and the body of the connector.
- (4) Torque the backshell 50 inch-pounds \pm 5 inch-pounds.

20-41-01 CONTENTS

STANDARD WIRING PRACTICES MANUAL**ELECTROSTATIC SENSITIVE DEVICE IDENTIFICATION****1. GENERAL DATA****A. Electrostatic Discharge (ESD)**

Electrostatic charges:

- Are generated when surfaces of different materials come into contact
- Are stored on the surfaces of physical objects; the human body is included.

ESD from nylon or human hair onto polyethylene or steel can cause these types of damage to unprotected electrostatic discharge sensitive devices:

- Changes in basic characteristics
- Degradation of performance
- Catastrophic failures.

B. Electrostatic Discharge Sensitive (ESDS) Devices

Any equipment that can have damage from ESD is an ESDS device.

An LRU is a line replaceable unit that can be:

- An assembly or part that is not ESDS
- A metal encased assembly or box that contains ESDS parts and may or may not be ESDS
- A nonmetal encased assembly or box that contains ESDS part and may or may not be ESDS
- An ESDS printed wiring board assembly (PWA) or card.

ESDS LRUs:

- Have ESDS labels for identification
- Have more necessary precautions than equipment that is not ESDS.

C. General Conditions for Work with ESDS Devices

All persons who remove, install, or move ESDS devices should have knowledge of:

- How static electricity is generated
- How ESDS equipment is protected from static electricity.

D. Identification of ESDS Line Replaceable Units (LRUs)

Three types of labels are used to identify:

- Which LRUs are ESDS
- What precautions are necessary to install and remove the LRUs.

Refer to:

- Figure 1 for the three types of labels
- Figure 2 for the usual locations of the labels in the E/E bay
- Figure 3 for the usual locations of the labels in the card file.

3. NECESSARY TESTS

A. Wrist Strap Continuity Test

This paragraph gives the procedures to test the continuity of a ESDS protective wrist strap with either of these:

- A wrist strap tester
- An ohmmeter.

NOTE: The continuity test with a wrist strap tester is the recommended procedure.

- (1) To do the test with a wrist strap tester:
 - (a) Make a selection of a wrist strap tester from Table 5.
 - (b) Put the wrist strap on.
 - (c) Plug the jack end of the wrist strap into the tester.
 - (d) Do the touch test.
- (2) To do the test with an ohmmeter:
 - (a) Plug the jack end of the wrist strap into the ground or common receptacle of the meter.
 - (b) Adjust the meter to the applicable resistance to range.
 - (c) Touch the red lead of the meter to the resistor portion of the wrist strap.

STANDARD WIRING PRACTICES MANUAL**ELECTROSTATIC SENSITIVE DEVICE IDENTIFICATION**

The acceptable range is from 250,000 ohms to 1,500,000 ohms.

- (d) Put the wrist strap on.
- (e) Hold the red lead of the meter between the forefinger and the thumb.

The acceptable range is less than 10,000,000 ohms.

- (3) Discard any wrist strap that does not operate in the acceptable range.

4. REMOVAL OF ESDS LRUS**A. Printed Wiring Board Removal**

- (1) Make a selection of a wrist strap from Table 2.

WARNING: USE ONLY WRIST STRAPS THAT HAVE A GROUND LEAD RESISTANCE OF 250,000 OHMS MINIMUM TO 1.5 MEGOHMS MAXIMUM. CONTACT BETWEEN A LOW RESISTANCE WRIST STRAP AND A HIGH VOLTAGE IS A SHOCK HAZARD AND WILL CAUSE INJURY TO THE PERSON.

- (2) Do the wrist strap test. Refer to Paragraph 3.
- (3) Disconnect the system electrical power to the LRU.
- (4) Make a selection of a conductive bag from Table 1.
- (5) Plug the jack end of the wrist strap to the electrostatic ground jack of the card file.
- (6) Put the wrist strap on.
- (7) Open the access door on the card file.
- (8) Find the location of the printed circuit board.

NOTE: The label on the card file door identifies the location of each LRU.

- (9) Hold the printed wiring board with either pair of these extractors:
 - The top and the bottom
 - The left and the right.
- (10) Pull the printed wiring board from the card file.
- (11) Put the printed wiring board in the conductive bag.
- (12) Close the bag with any of these:
 - A fold lock
 - A zip lock
 - An ESDS label
 - A tie material from Table 4.

CAUTION: DO NOT USE STAPLES TO CLOSE CONDUCTIVE BAGS. DAMAGE TO THE BAG WILL EXPOSE THE CONTENTS TO ESD.

- (13) Close the card file access door.
- (14) Disconnect the wrist strap from the electrostatic ground jack.
- (15) If it is necessary to move the LRU, put it into a protective container so that no damage occurs to either the conductive bag or the LRU.

B. Metal Encased Assembly Removal

- (1) Make a selection of a wrist strap from Table 2.

20-41-01

STANDARD WIRING PRACTICES MANUAL**ELECTROSTATIC SENSITIVE DEVICE IDENTIFICATION**

WARNING: USE ONLY WRIST STRAPS THAT HAVE A GROUND LEAD RESISTANCE OF 250,000 OHMS MINIMUM TO 1.5 MEGOHMS MAXIMUM. CONTACT BETWEEN A LOW RESISTANCE WRIST STRAP AND A HIGH VOLTAGE IS A SHOCK HAZARD AND WILL CAUSE INJURY TO THE PERSON.

- (2) Do the wrist strap test. Refer to Paragraph 3.
- (3) Disconnect the system electrical power to the LRU.
- (4) Make a selection of either of these:
 - A conductive bag from Table 1
 - A conductive dust cap from Table '3.

NOTE: The conductive dust cap from the new LRU can be used.

- (5) Connect the jack end of the wrist strap to an electrostatic ground jack on the E/E rack or to an unpainted surface of the primary structure.
- (6) Put the wrist strap on.
- (7) Remove the LRU from the rack.
- (8) Put the dust cap on the connector of the LRU.

NOTE: A satisfactory alternative is to put the LRU into a conductive bag.

CAUTION: DO NOT TO TOUCH THE ELECTRICAL PINS. DAMAGE CAN OCCUR TO THE INTERNAL ESDS COMPONENTS.

5. INSTALLATION OF ESDS LRUS**A. Printed Wiring Board Installation**

- (1) Make a selection of a wrist strap from Table 2.

WARNING: USE ONLY WRIST STRAPS THAT HAVE A GROUND LEAD RESISTANCE OF 250,000 OHMS MINIMUM TO 1.5 MEGOHMS MAXIMUM. CONTACT BETWEEN A LOW RESISTANCE WRIST STRAP AND A HIGH VOLTAGE IS A SHOCK HAZARD AND WILL CAUSE INJURY TO THE PERSON.

- (2) Do the wrist strap test. Refer to Paragraph 3.
- (3) Disconnect the system electrical power.
- (4) Open the access door on the card file.
- (5) Find the location for the printed circuit board.

NOTE: The label on the card file door identifies the location of each LRU.

- (6) Remove the printed wiring board from the conductive bag.
- (7) Hold the printed wiring board with either pair of these extractors:
 - The top and the bottom
 - The left and the right.
- (8) Push the LRU into the card file.
- (9) Lock the extractors.
- (10) Close and the card file access door.
Make sure that the access door is in position.
- (11) Disconnect the wrist strap from the electrostatic ground jack.

20-41-01

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ELECTROSTATIC SENSITIVE DEVICE IDENTIFICATION

B. Metal Encased Assembly Installation

- (1) Make a selection of a wrist strap from Table 2.

WARNING: USE ONLY WRIST STRAPS THAT HAVE A GROUND LEAD RESISTANCE OF 250,000 OHMS MINIMUM TO 1.5 MEGOHMS MAXIMUM. CONTACT BETWEEN A LOW RESISTANCE WRIST STRAP AND A HIGH VOLTAGE IS A SHOCK HAZARD AND WILL CAUSE INJURY TO THE PERSON.

- (2) Do the wrist strap test. Refer to Paragraph 3.
- (3) Disconnect the system electrical power.
- (4) Connect the jack end of the wrist strap to an electrostatic ground jack on the E/E rack or to an unpainted surface of the primary structure.
- (5) Put the wrist strap on.
- (6) Remove the conductive dust caps from the connectors of the LRU.
- (7) Push the LRU into the rack.
- (8) Disconnect the jack end of the wrist strap from ground.

2. CONNECTOR DISASSEMBLY

A. Contact Removal

**Table 3
CONTACT REMOVAL TOOLS**

Removal Tool	Supplier
724668-1	AMP

**CONTACT REMOVAL TOOL
Figure 2**

- (1) Make a selection of a contact removal tool from Table 3. Refer to Figure 2.
- (2) Hold the wire of the contact.
- (3) Put the tool into the contact cavity on the side that is opposite the wire.
- (4) Push the tool into the contact cavity until the contact retention latches are opened. Refer to Figure 3.

**CONTACT REMOVAL
Figure 3**

- (5) Turn the handle of the tool until the contact retention latches are released. Make sure that the tool stays fully inserted in the contact cavity.
- (6) Push the rod button on the tool to eject the contact.
- (7) Pull the contact from the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP MATE-N-LOK CONNECTORS

3. CONNECTOR ASSEMBLY

A. Wire Preparation

WIRE PREPARATION
Figure 4

- (1) Make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (2) Put a 1/2 inch ± 1/32 inch length of the heat shrinkable sleeve on the wire.
- (3) Remove 3/16 inch ± 1/32 inch of insulation from the end of the wire. Refer to Figure 4.
- (4) Move the heat shrinkable sleeve so that the end of the sleeve is aligned with the end of the wire insulation. Refer to Figure 4.

Make sure that:

- The end of the sleeve is within 1/32 inch of the end of the insulation
- The sleeve does not make an overlap with the conductor.

- (5) Shrink the sleeve into position. Refer to Subject 20-10-14.

B. Contact Assembly

Table 4
CONTACT CRIMP TOOLS

Wire Size (AWG)	Crimp Tool		
	Basic Unit	Die	Supplier
22	724651-1	A	AMP

	755331-1		
18	724651-1	B	AMP
	755331-1		

- (1) Make a selection of a contact crimp tool from Table 4.
- (2) Put the contact in the crimp tool so that:
 - The insulation grip of the contact is against the locator
 - The end of the contact is in the locator slot of the tool.

Make sure the contact is in the correct tool die.

Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP MATE-N-LOK CONNECTORS

POSITION OF THE CONTACT IN THE CRIMP TOOL
Figure 5

- (3) Lightly close the handles of the tool so that the contact stays in the die.
- (4) Push the wire into the crimp barrel of the contact until the wire insulation is against the contact insulation stop. Refer to Figure 6.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The end of the conductor can be seen in the contact inspection hole.

POSITION OF THE CONTACT ON THE WIRE
Figure 6

- (5) Close the handles of the tool until the ratchet is released.

C. Contact Insertion

NOTE: It is not necessary to use a contact insertion tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP MATE-N-LOK CONNECTORS

- (1) Put the contact into the contact cavity from the wire side of the connector. Refer to Figure 7.

CONTACT INSERTION
Figure 7

- (2) To make sure that the contact is fully inserted, lightly pull on the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF COAX CONNECTORS

<u>Paragraph</u>		<u>Page</u>
1.	<u>GENERAL CONDITIONS FOR THE ASSEMBLY OF COAX CONNECTORS</u>	1
	A. Applicable Conditions for the Preparation of Coax Cable	1
	B. Applicable Conditions for the Assembly of Coax Contacts	1
	C. Applicable Conditions for the Assembly of Coax Connectors	2
2.	<u>COAX CABLE REPAIR</u>	2
	A. Coax Connectors for a Coax Cable Splice	2

20-51-00 CONTENTS

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF COAX CONNECTORS**

This Subject gives:

- The general conditions for the preparation and assembly of connectors and contacts with coax cable
- The coax jack and plug connectors for the splice of coax cable.

1. GENERAL CONDITIONS FOR THE ASSEMBLY OF COAX CONNECTORS**A. Applicable Conditions for the Preparation of Coax Cable****USUAL CONFIGURATION OF A COAX CABLE****Figure 1**

NOTE: Cable preparation dimensions are very important and the specified tolerances must be obeyed.

These conditions are applicable:

- The ends of the outer jacket and the dielectric must be perpendicular to the longitudinal axis of the cable
- The ends of the outer jacket and the dielectric must be smooth and symmetrical to have the correct fit in the contact or the connector
- The outer jacket and the dielectric must not have damage after the specified length of the outer jacket is removed
- The shield must not have damage after the specified length of the outer jacket is removed
- The conductor must not have damage after the specified length of the dielectric is removed.

In order to prepare a cable that agrees with the applicable conditions, it is necessary to use the correct tools that do not cause deformation of the cable.

B. Applicable Conditions for the Assembly of Coax Contacts

These conditions are applicable for the assembly of all coax contacts:

- The end of the contact must be against the end of dielectric of the cable
- Before the contact is soldered or crimped, the conductor must be in the correct position in the crimp barrel or the solder barrel of the contact
- The conductor is in the correct position in the crimp barrel or the solder barrel of the contact when the conductor can be seen in the inspection hole of the contact.

These conditions are applicable for the assembly of solder type coax contacts:

- Solder must be applied with only the necessary amount of heat for the solder to flow
- Flux and unwanted solder must be removed from the outer surface of the contact.

CAUTION: MORE THAN THE NECESSARY AMOUNT OF HEAT CAN CAUSE DAMAGE TO THE DIELECTRIC OF THE CABLE OR THE COAX CONTACT.

20-51-00

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF COAX CONNECTORS****C. Applicable Conditions for the Assembly of Coax Connectors**

These general conditions are applicable:

- The different components of the connector must be correctly aligned and in the correct position
- If a connector that has a vee gasket is disassembled, a new vee gasket must be installed when the connector is assembled again.

Connector assemblies must be tested for:

- Continuity
- Short circuits
- Unwanted grounds
- Insulation resistance.

NOTE: The minimum, acceptable insulation resistance is 100 megohms.

A connector that is not connected must have one of these seals for protection:

- A metallic cap that engages the connector coupling mechanism
- A plastic cap that has a tight fit
- A polyethylene bag that is held in position with a wire harness tie.

2. COAX CABLE REPAIR

For the applicable damage conditions and repair conditions of coax cables, refer to Subject 20-10-13.

A. Coax Connectors for a Coax Cable Splice

Table 1

APPLICABLE COAX JACK AND PLUG CONNECTORS FOR SPECIFIED COAX CABLES

20-51-05 CONTENTS

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF STANDARD CONNECTORS WITH COAX CABLE**

This Subject gives the procedure to prepare a coax cable for the assembly of a connector that is not a coax connector.

1. PART NUMBERS AND DESCRIPTION**A. Coax Cable Part Numbers**

Table 1
COAX CABLE PART NUMBERS

Coax Cable	Supplier
BA14349	ITT Surprenant
5020G3442	Raychem

2. CONNECTOR ASSEMBLY WITH ITT SURPRENANT BA14349 AND RAYCHEM 5020G3442 COAX CABLE**A. Necessary Parts and Materials**

Table 2
FERRULE PART NUMBERS

Part	Boeing Standard
Ferrule, Inner	BACS13S124B
Ferrule, Outer	BACS13S199C

B. Cable Preparation

Refer to Subject 20-51-00 for the general conditions that are applicable for the preparation of coax cable.

- (1) Remove 2.5 inches ± 0.06 inch of the outer jacket from the end of the cable.
- (2) Remove 2.5 inches ± 0.06 inch of the outer shield from the end of the cable.
- (3) Make a selection of an outer ferrule from Table 2.
- (4) Put the outer ferrule on the cable.
- (5) Put a 2 inch length of 1/4 inch diameter heat shrinkable sleeve on the cable.
- (6) Remove 1.13 inches ± 0.03 inch of the inner shield from the end of the cable.
- (7) Remove 1.13 inches ± 0.03 inch of the dielectric from the end of the cable.

CAUTION: DO NOT CUT OR CAUSE ANY DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (8) Put a 1.06 inch $+0$ inch, -0.03 inch length of 1/16 inch diameter heat shrinkable sleeve on the conductor.

Make sure that the forward end of the sleeve is aligned with the end of the dielectric.

- (9) Shrink the sleeve in position. Refer to Subject 20-10-14.

C. Shield Termination

- (1) Make a selection of the inner ferrule from Table 2.
- (2) Put the inner ferrule on the cable.

20-51-05

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF STANDARD CONNECTORS WITH COAX CABLE**

- (3) Assemble a shield ground wire with the mechanical ferrules.

Make sure that:

- The shield ground wire is 4 inches in length
- The heat shrinkable sleeve is 1/2 inch in length and has a 1/8 inch diameter
- The end of the sleeve is aligned with the end of the outer jacket.

Refer to Subject 20-10-15 for:

- The selection of the wire
- The crimp tools for the specified ferrules.

- (4) Put the strands of the shield:

- Against the dielectric
- Symmetrically around the circumference of the dielectric.

- (5) Assemble a shield dead end. Refer to Subject 20-10-15.

- (6) Push the 2 inch length of 1/4 inch diameter heat shrinkable sleeve forward until the forward end of the sleeve makes an overlap with the rear end of the shield ground wire.

- (7) Shrink the sleeve in position. Refer to Subject 20-10-14.

D. Connector Assembly

- (1) Assemble the connector.

Refer to the applicable Subject for the connector.

707, 727-787

B. Cable Preparation

For the general conditions that are applicable for the preparation of coax connectors, refer to Subject 20-51-00.

- (1) Make a selection of a heat shrinkable sleeve from Table 3.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) Put a 1.5 inch length of heat shrinkable sleeve on the cable.
- (3) Examine the threads on the rear of the connector shell for contamination or thread lock compound.
- (4) If the threads have material on them, clean the threads:
 - (a) Fully engage the threads the clamp nut and the threads of the connector shell.
 - (b) Remove the clamp nut from the connector shell.
- (5) Put these components on the cable in this sequence:
 - The clamp nut
 - The gland
 - The vee gasket
 - The K-Grip sleeve
 - The jacket gasket.

Refer to Figure 3.

NOTE: The jacket gasket is not supplied with all connectors.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

POSITION OF THE COMPONENTS ON THE CABLE
Figure 3

- (6) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (7) Make a selection of a cable jacket trim jig from Table 4.

NOTE: Cable preparation without a trim jig is a satisfactory alternative. Refer to Paragraph 4.A.

NOTE: If a trim jig is not specified for the connector, the cable must be prepared without a trim jig. Refer to Paragraph 4.A.

- (8) Prepare the cable with the trim jig. Refer to Paragraph 4.B.

C. K-Grip Assembly

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Find the K-Grip sleeve crimp tool code. Refer to Table 6.
- (2) Make a selection of the K-Grip sleeve crimp tool from Table 8.
 Make sure that the tool is applicable for the tool code.
- (3) Move the strands of the shield apart.
- (4) Put the K-Grip on the end of the cable. Refer to Figure 4.
 Make sure that the inner ferrule is between the shield and the dielectric.

POSITION OF THE K-GRIP ON THE CABLE
Figure 4

- (5) Push the K-Grip rearward on the cable. Refer to Figure 5.
 Make sure that:
 - The rear end of the inner ferrule is against the end of the jacket
 - The end of the shield is not more than 0.03 inch from the rear end of the K-Grip.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

POSITION OF THE K-GRIP
Figure 5

- (6) If a jacket gasket is on the cable, push the jacket gasket forward until the forward end of the gasket is aligned with the end of the cable jacket. Refer to Figure 6.

POSITION OF THE K-GRIP, THE JACKET GASKET, AND THE K-GRIP SLEEVE
Figure 6

- (7) Push the K-Grip sleeve forward until the forward end of the sleeve is against the rear end of the K-Grip. Refer to Figure 6.
- (8) Hold the K-Grip, the K-Grip sleeve, and the cable in their positions.
- (9) Put the assembly in the crimp tool.
- (10) Align the rear end of the K-Grip sleeve with the nearest edge of the tool die.
- (11) Crimp the K-Grip sleeve. Refer to Figure 7.

Make sure the forward end of the K-Grip sleeve is not more than 0.03 inch from the rear end of the K-Grip.

POSITION OF THE K-GRIP SLEEVE
Figure 7

- (12) Push the vee gasket forward until it is against the rear end of the K-Grip. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

POSITION OF THE VEE GASKET, THE GLAND, AND THE CLAMP NUT

Figure 8

(13) Push the gland forward until it is against the vee gasket. Refer to Figure 8.

(14) Push the clamp nut forward until it is against the gland. Refer to Figure 8.

D. Center Contact Assembly - Crimp Type Contacts

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

(1) Find the center contact tool code. Refer to Table 6.

(2) Make a selection of a contact crimp tool from Table 7.

Make sure that the tool is applicable for the tool code.

(3) If the connector is supplied with these components, put them on the end of the cable in this sequence:

- A smaller O-Ring
- A spacer
- A larger O-Ring
- A bushing
- An insulator.

Refer to Figure 9.

POSITION OF THE COMPONENTS ON THE END OF THE CABLE

Figure 9

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

- (4) If the connector is supplied with these components, put them on the end of the cable in this sequence:
- A bushing or a washer
 - A cable end insulator
 - A mating end insulator.

Refer to:

- Figure 10 for the installation of the insulator and the bushing or the washer
- Figure 11 for the installation of the washer, the cable end insulator, and the mating end insulator.

POSITION OF THE INSULATOR AND THE BUSHING OR THE WASHER
Figure 10

POSITION OF THE WASHER, THE CABLE END INSULATOR, AND THE MATING END INSULATOR
Figure 11

- (5) If an insulator is installed, or the dielectric is a metal, semi-rigid material, remove the necessary length of dielectric without a trim jig.

Refer to Paragraph 4.C.

- (6) If an insulator is not installed and the dielectric is not a metal, semi-rigid material:

- (a) Make a selection of a dielectric trim jig from Table 4.

NOTE: Removal of the dielectric without a trim jig is a satisfactory alternative. Refer to Paragraph 4.C.

NOTE: If a trim jig is not specified for the connector, the dielectric must be removed without a trim jig. Refer to Paragraph 4.C.

- (b) Remove the dielectric with the trim jig. Refer to Paragraph 4.D.

- (7) If the dielectric is a metal, semi-rigid material and a spacer is supplied with the connector, put the spacer on the end of the dielectric.

- (8) Put the conductor in the crimp barrel of the center contact. Refer to Figure 12.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

Make sure that:

- All of the strands of the conductor are in the crimp barrel of the contact
- The conductor can be seen in the inspection hole
- The distance from the end of the dielectric to the rear end of the crimp barrel is not more than 0.03 inch.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR
Figure 12

(9) Crimp the contact.

Make sure that the crimp is between the inspection hole and the rear end of the crimp barrel.

(10) Examine the contact assembly for these types of damage:

- The finish has damage
- The crimp barrel of the contact has a crack.

NOTE: If the contact has damage, it must be replaced.

E. Center Contact Assembly - Solder Type Contacts

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

(1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

(2) If the connector is supplied with these components, put them on the end of the cable in this sequence:

- A smaller O-Ring
- A spacer
- A larger O-Ring
- A bushing
- An insulator.

Refer to Figure 13.

POSITION OF THE COMPONENTS ON THE END OF THE CABLE
Figure 13

20-51-11

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS**

(3) If the connector is supplied with these components, put them on the end of the cable in this sequence:

- A bushing or the washer
- A cable end insulator
- A mating end insulator.

Refer to:

- Figure 14 for the installation of the insulator and the bushing or the washer
- Figure 15 for the installation of the washer, the cable end insulator, and the mating end insulator.

POSITION OF THE INSULATOR AND THE BUSHING OR THE WASHER

Figure 14

POSITION OF THE WASHER, THE CABLE END INSULATOR, AND THE MATING END INSULATOR

Figure 15

(4) If an insulator is installed, or the dielectric is a metal, semi-rigid material, remove the necessary length of dielectric without a trim jig.

Refer to Paragraph 4.C.

(5) If an insulator is not installed and the dielectric is not a metal, semi-rigid material:

(a) Make a selection of a dielectric trim jig from Table 4.

NOTE: Removal of the dielectric without a trim jig is a satisfactory alternative. Refer to Paragraph 4.C.

NOTE: If a trim jig is not specified for the connector, the dielectric must be removed without a trim jig. Refer to Paragraph 4.C.

(b) Remove the dielectric with the trim jig. Refer to Paragraph 4.D.

(6) Tin the center conductor.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS**

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (7) If the dielectric is a metal, semi-rigid material and a spacer is supplied with the connector, put the spacer on the end of the dielectric.
- (8) Put the center conductor in the solder barrel of the center contact. Refer to Figure 16.

Make sure that:

- All of the strands of the conductor are in the solder barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the dielectric to the rear end of the solder barrel is not more than 0.03 inch.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR

Figure 16

- (9) Apply a small quantity of solder in the inspection hole of the contact.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (10) Remove all of the solder and the flux from the outer surface of the contact.
- (11) Examine the contact for damage to the finish.

NOTE: If the contact has damage, it must be replaced.

- (12) If a solder access cover is supplied with the contact, install the cover.

F. Center Contact Assembly - Solder Type Contacts of Right Angle Plug Connectors

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

- (1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

- (2) Make a selection of a solvent from Table 3.
- (3) Make a selection of a primer from Table 3.
- (4) Make a selection of a thread lock compound from Table 3.
- (5) If an insulator is installed, or the dielectric is a metal, semi-rigid material, remove the necessary length of dielectric without a trim jig.

Refer to Paragraph 4.C.

- (6) If an insulator is not installed and the dielectric is not a metal, semi-rigid material:

20-51-11

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS**

- (a) Make a selection of a dielectric trim jig from Table 4.
- NOTE:** Removal of the dielectric without a trim jig is a satisfactory alternative. Refer to Paragraph 4.C.
- NOTE:** If a trim jig is not specified for the connector, the dielectric must be removed without a trim jig. Refer to Paragraph 4.C.
- (b) Remove the dielectric with the trim jig. Refer to Paragraph 4.D.
- (7) Tin the center conductor.
- CAUTION:** DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.
- (8) If the dielectric is a metal, semi-rigid material and a spacer is supplied with the connector, put the spacer on the end of the dielectric.
- (9) Install the connector shell. Refer to Paragraph 3.G.
- (10) Apply a small quantity of solder to the end of the conductor and the contact.
- CAUTION:** DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.
- (11) Hold the connector shell and lightly pull the cable to make sure that the solder joint is satisfactory.
- (12) If the access cap has threads:
- (a) Clean the cap with solvent and a clean wiper.
- (b) Dry the cap with a clean wiper.
- (c) Apply the primer to the threads of the cap.
- (d) Let the primer dry for 10 minutes minimum at room temperature.
- (e) Apply a thin smooth layer of the compound to one or two full threads of the cap.
- CAUTION:** THE THREAD LOCK COMPOUND DOES NOT MAKE A BOND IF THE COMPONENTS ARE ASSEMBLED MORE THAN 30 MINUTES AFTER THE COMPOUND IS APPLIED.
- (f) Remove the unwanted compound from the cap.
- (g) Fully engage the threads of the cap and the threads of the connector shell.
- (h) Tighten the cap.
- (13) If the access cap does not have threads:
- (a) Put the cap on the connector shell.
- (b) Apply a small amount of solder around the edge of the cap.

G. Connector Shell Installation

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Make a selection of a solvent from Table 3.
- (2) Make a selection of a primer from Table 3.
- (3) Make a selection of a thread lock compound from Table 3.
- (4) If the connector is a right angle connector with an access cap, remove the cap.
- (5) Clean the clamp nut with solvent and a clean wiper.
- (6) Dry the nut with a clean wiper.
- (7) Apply the primer with a spray to the threads of the nut

20-51-11

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS**

- (8) Let the primer to dry for 10 minutes minimum at room temperature.
- (9) Apply a layer of thread lock compound on the threads of the clamp nut.

CAUTION: THE THREAD LOCK COMPOUND DOES NOT MAKE A BOND IF THE COMPONENTS ARE ASSEMBLED MORE THAN 30 MINUTES AFTER THE COMPOUND IS APPLIED.

- (a) Put a small quantity of the compound on the tip of a non-metallic, pointed tool. Refer to Figure 17.

**LOCATION OF THE THREAD LOCK COMPOUND ON THE TOOL****Figure 17**

- (b) Apply a thin smooth layer of the compound to one or two full threads of the nut. Refer to Figure 18.

CAUTION: THREAD LOCK COMPOUND IS AN INSULATOR. TOO MUCH THREAD LOCK COMPOUND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**LOCATION OF THE LOCTITE COMPOUND ON THE THREADS OF THE CLAMP NUT****Figure 18**

- (c) If too much thread lock compound is applied, remove the unwanted compound from the nut.
- (10) Push the components rearward until they are against the K-Grip.
- (11) Fully engage the threads of the clamp nut and the threads of the connector shell. Refer to Figure 19. If the connector is a right angle connector with a solder type contact, make sure the end of the center conductor goes in the slot on the end of the center contact. Refer to Figure 20.

20-51-11

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

POSITION OF THE CONNECTOR SHELL AND THE CLAMP NUT
Figure 19

INSTALLATION OF A RIGHT ANGLE CONNECTOR SHELL WITH A SOLDER TYPE CONTACT
Figure 20

- (12) Tighten the clamp nut to the specified torque value. Refer to Table 10.
- (13) Push the heat shrinkable sleeve forward on the cable until the forward end of the sleeve is against the shoulder of the K-Grip assembly. Refer to Figure 21.

Make sure that the forward end of the heat shrinkable sleeve is not more than 0.13 inch from the rear end of the clamp nut.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 21

- (14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

4. COAX CABLE PREPARATION PROCEDURES

A. Cable Preparation - No Trim Jig

NOTE: If the cable has two shields, the shields are prepared as one shield.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

- (1) Remove the necessary length of jacket to make the distance from the end of the jacket to the end of the cable equal to dimension A.

Refer to Figure 22 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

REMOVAL OF THE CABLE JACKET AND THE SHIELD

Figure 22

- (2) Remove the necessary length of shield to make the distance from the end of the cable jacket to the end of the shield equal to dimension B.

Refer to Figure 22 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

B. Cable Preparation - Cable Jacket Trim Jig

NOTE: If the cable has two shields, the shields are prepared as one shield.

- (1) Put the trim jig on the end of the cable.
Make sure that the end of the trim jig is against the end of the cable.
- (2) Turn the cable in the jig, and at the same time, apply light pressure to the cable at the location of the blades. Refer to Figure 23.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD OR THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

LOCATIONS TO CUT THE CABLE JACKET

Figure 23

- (3) Remove the trim jig from the end of the cable.
- (4) Remove the length of the cable jacket and the shield from the second location to the end of the cable. Refer to Figure 24.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

SHIELD REMOVAL
Figure 24

- (5) Remove the length of the cable jacket from the first location to the end of the shield. Refer to Figure 25.

CABLE JACKET REMOVAL
Figure 25

C. Dielectric Removal - No Trim Jig

- (1) For a cable with a spacer and an insulator installed:
 - (a) Remove the length of the dielectric from the forward end of the insulator to the end of the cable. Refer to Figure 26 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL WITH A SPACER AND AN INSULATOR INSTALLED
Figure 26

- (b) Remove the necessary length of the conductor to make the distance from the forward end of the insulator to the end of the conductor equal to dimension C. Refer to Figure 26 and Table 9.
- (2) For a cable with a bushing and an insulator installed:
 - (a) Remove the length of dielectric from the forward end of the insulator to the end of the cable. Refer to Figure 27 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

DIELECTRIC REMOVAL WITH A BUSHING AND AN INSULATOR INSTALLED
Figure 27

- (b) Remove the necessary length of the conductor to make the distance from the end of the insulator to the end of the conductor equal to dimension C. Refer to Figure 27 and Table 9.
- (3) For a cable with a semi-rigid dielectric:
 - (a) Remove the necessary length of dielectric to make the distance from the end of the K-Grip to the end of the dielectric equal to dimension D minus the width of the spacer. Refer to Figure 28 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL WITH A DIELECTRIC SPACER INSTALLED
Figure 28

- (b) Install the dielectric spacer.
- (c) Remove the necessary length of the conductor to make the distance from the end of the spacer to the end of the conductor equal to dimension C. Refer to Figure 28 and Table 9.
- (4) For a cable without spacers, insulators, or bushings installed:
 - (a) Remove the necessary length of dielectric to make the distance from the end of the K-Grip to the end of the dielectric equal to dimension D. Refer to Figure 29 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-GRIP WEATHERPROOF COAX CONNECTORS

DIELECTRIC REMOVAL
Figure 29

- (b) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 29 and Table 9.

D. Dielectric Removal - Dielectric Trim Jig

- (1) Put the dielectric trim jig on the end of the cable.
- (2) Remove the necessary length of dielectric that extends farther than the end of the trim jig. Refer to Figure 30 and Table 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL
Figure 30

- (3) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 30 and Table 9.

3. CONNECTOR ASSEMBLY

A. Cable Preparation Dimensions

**Table 8
CABLE PREPARATION DIMENSIONS**

Connector	Dimension	Length (inch)	
		Target	Tolerance
KD-19-08	A	1.28	± 0.02
	B	0.97	± 0.02
	C	0.16	± 0.02
	D	0.13	± 0.02
KM-59-05	A	0.88	± 0.02
	B	0.56	± 0.02
	C	0.08	± 0.02
	D	0.05	± 0.02
KY-59-02	A	0.88	± 0.02
	B	0.56	± 0.02
	C	0.08	± 0.02
	D	0.05	± 0.02

B. Cable Preparation

For the general conditions that are applicable for the preparation of coax cable, refer to Subject 20-51-00.

- (1) Make a selection of a heat shrinkable sleeve from Table 3.
Make sure that the sleeve has the smallest diameter that can be moved easily on the K-Grip sleeve.
- (2) Put a 1.5 inch length of heat shrinkable sleeve on the cable.
- (3) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (4) Put the K-Grip sleeve on the cable.
- (5) Prepare the cable with a trim jig.

NOTE: Preparation of the cable without a trim jig is a satisfactory alternative. Refer to Paragraph 4.A.

- (a) Make a selection of a cable jacket trim jig from Table 4.
- (b) Prepare the cable with the trim jig. Refer to Paragraph 4.B.

C. K-Grip Assembly

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Find the K-Grip sleeve crimp tool code. Refer to Table 6.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS**

- (2) Make a selection of the K-Grip sleeve crimp tool from Table 7.
Make sure that the tool is applicable for the tool code.
- (3) Examine the threads on the rear of the connector shell for contamination or thread lock compound.
- (4) If the threads have material on them, clean the threads:
 - (a) Fully engage the threads the clamp nut and the threads of the connector shell.
 - (b) Remove the clamp nut from the connector shell.
- (5) Move the strands of the shield apart.
- (6) Put the K-Grip assembly on the end of the cable. Refer to Figure 1.
Make sure that the inner ferrule is between the shield and the dielectric.

POSITION OF THE K-GRIP ASSEMBLY ON THE CABLE
Figure 1

- (7) Push the K-Grip assembly rearward.
Make sure that:
 - The rear end of the inner ferrule is against the end of the jacket
 - The end of the shield is not more than 0.03 inch from the rear end of the K-Grip assembly.
- (8) Push the K-Grip sleeve forward until the forward end of the sleeve is against the rear end of the K-Grip assembly.
- (9) Put the assembly in the crimp tool.
Make sure that the K-Grip assembly, the sleeve, and the cable stay in their position.
- (10) Align the rear end of the sleeve with the nearest edge of the tool die.
- (11) Crimp the sleeve. Refer to Figure 2.
Make sure the forward end of the sleeve is not more than 0.03 inch from the rear end of the K-Grip assembly.

POSITION OF THE K-GRIP SLEEVE
Figure 2

D. Center Contact Assembly

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

20-51-13

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS

- (1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

- (2) Remove the necessary length of dielectric with a trim jig.

NOTE: Removal of the dielectric without a trim jig is a satisfactory alternative. Refer to Paragraph 4.C.

- (a) Make a selection of a dielectric trim jig from Table 4.

NOTE: If a trim jig is not specified for the connector, the dielectric must be removed without a trim jig. Refer to Paragraph 4.C.

- (b) Remove the dielectric with the trim jig. Refer to Paragraph 4.D.

- (3) If the connector is supplied with a vee gasket and a braid clamp, put gasket and the clamp on the end of the cable. Refer to Figure 3.

POSITION OF THE VEE GASKET AND THE BRAID CLAMP ON THE END OF THE CABLE

Figure 3

- (4) Tin the center conductor.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (5) Put the center conductor in the solder barrel of the center contact. Refer to Figure 4.

Make sure that:

- All of the strands of the conductor are in the solder barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the dielectric to the rear end of the solder barrel is not more than 0.03 inch.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR

Figure 4

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS

- (6) Apply a small quantity of solder in the inspection hole of the contact.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (7) Remove all of the solder and the flux from the outer surface of the contact.
- (8) Examine the contact for damage to the finish.

NOTE: If the contact has damage, it must be replaced.

- (9) If a solder access cover is supplied with the contact, install the cover.

E. Connector Shell Installation

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

**Table 9
CLAMP NUT TORQUE VALUES**

Connector	Torque Value (inch-pound)	
	Minimum	Maximum
KD-19-08	40	50
KM-59-05	40	50
KY-59-02	40	50

- (1) Make a selection of a solvent from Table 3.
- (2) Make a selection of a primer from Table 3.
- (3) Make a selection of a thread lock compound from Table 3.
- (4) Clean the clamp nut with a wiper and solvent.
- (5) Dry the nut with a clean wiper.
- (6) Apply the primer with a spray on the threads of the nut.
- (7) Let the primer to dry for 10 minutes minimum at room temperature.
- (8) Apply a layer of thread lock compound on the threads of the clamp nut.

CAUTION: THE THREAD LOCK COMPOUND DOES NOT MAKE A BOND IF THE COMPONENTS ARE ASSEMBLED MORE THAN 30 MINUTES AFTER THE COMPOUND IS APPLIED.

- (a) Put a small quantity of the compound on the tip of a non-metallic, pointed tool. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS****LOCATION OF THE THREAD LOCK COMPOUND ON THE TOOL****Figure 5**

- (b) Apply a thin smooth layer of the compound on one or two full threads of the nut. Refer to Figure 6.

CAUTION: THREAD LOCK COMPOUND IS AN INSULATOR. TOO MUCH THREAD LOCK COMPOUND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**LOCATION OF THE THREAD LOCK COMPOUND ON THE THREADS OF THE CLAMP NUT****Figure 6**

- (c) If too much thread lock compound is applied, remove the unwanted compound from the nut.
- (9) If a vee gasket is on the cable, push it rearward until it is against the K-Grip assembly.
- (10) If a braid clamp is on the cable, push it rearward until it is against the vee gasket.
- (11) Put the K-Grip assembly in the rear end of the connector shell.
- (12) Fully engage the threads of the connector shell and the threads of the clamp nut on the K-Grip assembly. Refer to Figure 7.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS

POSITION OF THE CONNECTOR SHELL ON THE K-GRIP ASSEMBLY
Figure 7

- (13) Tighten the clamp nut to the specified torque value. Refer to Table 9.
- (14) Push the heat shrinkable sleeve forward on the cable until the forward end of the sleeve is against the shoulder of the K-Grip assembly. Refer to Figure 8.

Make sure that the forward end of the sleeve is not more than 0.13 inch from the shoulder of the K-Grip assembly.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 8

- (15) Shrink the sleeve into its position. Refer to Subject 20-10-14.

4. COAX CABLE PREPARATION

A. Cable Preparation - No Trim Jig

NOTE: If the cable has two shields, the shields are prepared as one shield.

- (1) Put the trim jig on the end of the cable.
 Make sure that the end of the cable is against the end of the trim jig.
- (2) Turn the cable in the jig, and at the same time, apply light pressure on the cable at the location that is opposite the blades. Refer to Figure 9.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD OR THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

LOCATIONS TO CUT THE CABLE JACKET
Figure 9

- (3) Remove the trim jig from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS

- (4) Remove the lengths of the cable jacket and the shield from the second location to the end of the cable. Refer to Figure 10.

SHIELD REMOVAL
Figure 10

- (5) Remove the length of cable jacket from the first location to the end of the shield. Refer to Figure 11.

CABLE JACKET REMOVAL
Figure 11

B. Cable Preparation - Cable Jacket Trim Jig

NOTE: If the cable has two shields, the shields are prepared as one shield.

CABLE PREPARATION
Figure 12

- (1) Remove the necessary length of jacket to make the distance from the end of the jacket to the end of the cable equal to dimension A.

Refer to Figure 12 and Table 8.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

- (2) Remove the necessary length of shield to make the distance from the end of the shield to the end of the cable equal to dimension B.

Refer to Figure 12 and Table 8.

CAUTION: DO NOT CAUSE DAMAGE TO THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS STANDARD K-GRIP COAX CONNECTORS

C. Dielectric Removal - No Trim Jig

- (1) Remove the necessary length of the dielectric to make the distance from the forward end of the K-Grip assembly to the end of the dielectric equal to dimension D.

Refer to Figure 13 and Table 8.

DIELECTRIC REMOVAL

Figure 13

- (2) Remove the necessary length of conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 13 and Table 8.

D. Dielectric Removal - Dielectric Trim Jig

- (1) Put the trim jig on the end of the cable.
- (2) Remove the dielectric that extends farther than the end of the trim jig. Refer to Figure 14 and Table 8.

Make sure that the distance from the forward end of the K-Grip assembly to the end of the dielectric is equal to dimension D.

DIELECTRIC REMOVAL

Figure 14

- (3) Remove the necessary length of conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 14 and Table 8.

<u>Paragraph</u>		<u>Page</u>
1.	<u>PART NUMBERS AND DESCRIPTION</u>	1
	A. Connector Part Numbers and Description	1
	B. Necessary Materials	17
2.	<u>COAX CONNECTOR ASSEMBLY TOOLS</u>	17
	A. Coax Cable Trim Jigs	17
	B. Coax Connector Crimp Tools	26
3.	<u>CONNECTOR ASSEMBLY</u>	58
	A. Cable Preparation Dimensions	59
	B. Heat Shrinkable Sleeve Configurations	119
	C. Cable Preparation	121
	D. Center Contact Assembly - Crimp Type Contacts	122
	E. Center Contact Assembly - Solder Type Contacts	123
	F. Connector Shell Installation	124
	G. Insulation Installation	126
4.	<u>CONNECTOR ASSEMBLY - RIGHT ANGLE CONNECTORS WITH SOLDER TYPE CONTACTS</u>	126
	A. Cable Preparation Dimensions	127
	B. Cable Preparation	127
	C. Connector Shell Installation	128
	D. Center Contact Assembly	129
5.	<u>COAX CABLE PREPARATION</u>	129
	A. Cable Preparation - No Trim Jigs	129
	B. Cable Preparation - Cable Jacket Trim Jig with Two Slots	130
	C. Cable Preparation - Cable Jacket Trim Jig with Three Slots	132
6.	<u>INSULATION INSTALLATION CONFIGURATIONS</u>	133
	A. Heat Shrinkable Sleeve - Standard Configuration	133
	B. Heat Shrinkable Sleeves - 125-88-9, 125-95-9, and KA-59-438-M06 Connectors	134
	C. Heat Shrinkable Sleeves - 125-91-9 Connector	135
	D. Heat Shrinkable Sleeves - 126-58-9, 126-71-9, and KA-59-439-M06 Connectors	136
	E. Heat Shrinkable Sleeves - 2985-3-() Connectors	138
	F. Heat Shrinkable Sleeves - 2430-2-16 and 796-17-9 Connectors	139
7.	<u>CONNECTOR INSTALLATION</u>	140
	A. Connection of N, TNC, and SC Series Plugs and Jacks	140
8.	<u>APPROVED TOOL SUPPLIERS</u>	141
	A. Coax Cable Trim Jig Tools	141
	B. Crimp Tools	143

3. CONNECTOR ASSEMBLY

This paragraph gives the procedures to assemble:

- A bulkhead jack
- An in-line jack
- A panel jack
- A straight plug
- A right angle plug with crimp type contacts.

For the procedures to assemble a right angle plug with solder type contacts, refer to Paragraph 4.

C. Cable Preparation

For the general conditions that are applicable for the preparation of coax cable, refer to Subject 20-51-00.

- (1) Make a selection of a heat shrinkable sleeve from Table 4.
- (2) Put the specified number of heat shrinkable sleeves on the cable. Refer to Table 11.
- (3) If the connector and coax cable are not specified in Table 11, put a 1.5 inch length of heat shrinkable sleeve on the cable.

Make sure that the sleeve has the smallest diameter that can be moved easily on the cable.

- (4) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (5) Put the K-Grip sleeve on the cable. Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

If the K-Grip sleeve has one step, make sure that the end with the step is pointed forward to the end of the cable.

POSITION OF THE K-GRIP SLEEVE
Figure 3

- (6) If the cable dielectric is a metal, semi-rigid material, prepare the cable without trim jigs. Refer to Paragraph 5.A.
- (7) If the cable dielectric is not a metal, semi-rigid material:
 - (a) Make a selection of a cable jacket trim jig and a dielectric trim jig from Table 5.

NOTE: Preparation of the cable without a trim jig is a satisfactory alternative. Refer to Paragraph 5.A.

NOTE: If trim jigs are not specified for the connector, the cable must be prepared without trim jigs. Refer to Paragraph 5.A.

- (b) Prepare the cable with the trim jigs.

To prepare the cable with:

- A cable jacket trim jig with two slots, refer to Paragraph 5.B.
- A cable jacket trim jig with three slots, refer to Paragraph 5.C.

D. Center Contact Assembly - Crimp Type Contacts

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

- (1) Find the center contact tool code. Refer to Table 7.
- (2) Make a selection of a contact crimp tool from Table 8.
Make sure that the tool is applicable for the tool code.
- (3) Put the conductor in the crimp barrel of the center contact. Refer to Figure 4.

Make sure that:

- All of the strands of the conductor are in the crimp barrel of the contact
- The conductor can be seen in the inspection hole of the contact
- The distance from the end of the dielectric to the rear end of the crimp barrel is not more than 0.03 inch.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR
Figure 4

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS**

- (4) Crimp the contact.

Make sure that the crimp is between the inspection hole and the rear end of the crimp barrel.

- (5) Examine the contact assembly for these types of damage:

- The finish has damage
- The crimp barrel of the contact has a crack.

NOTE: If the contact has damage, it must be replaced.

E. Center Contact Assembly - Solder Type Contacts

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

- (1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

- (2) Put the conductor in the solder barrel of the contact. Refer to Figure 5.

Make sure that:

- All of the strands of the conductor are in the solder barrel of the contact
- The conductor can be seen in the inspection hole of the contact
- The distance from the end of the dielectric to the rear end of the solder barrel is not more than 0.03 inch.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR

Figure 5

- (3) Apply a small quantity of solder in the inspection hole of the contact. Refer to Figure 6.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE CONTACT. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CONTACT, THE CONNECTOR OR THE CABLE CAN OCCUR.

SOLDER CONTACT ASSEMBLY

Figure 6

- (4) Remove all of the solder and the flux from the outer surface of the contact.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS**

- (5) Examine the contact for damage to the finish.

NOTE: If the contact has damage, the contact must be replaced.

- (6) If a solder access cover is supplied with the contact, install the cover.

F. Connector Shell Installation

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Find the K-Grip sleeve tool code. Refer to Table 7.
- (2) Make a selection of the K-Grip sleeve crimp tool from Table 9.
Make sure that the tool is applicable for the tool code.
- (3) Move the strands of the shield apart.
- (4) Put the connector shell on the end of the cable. Refer to Figure 7.

Make sure that:

- If the cable has one shield, the inner ferrule is between the dielectric and the shield
- If the cable has an inner shield and an outer shield, the inner ferrule is between the inner shield and the outer shield
- If the cable has an inner shield and an outer shield, no strands of the outer shield are between the inner ferrule and the dielectric.

POSITION OF THE CONNECTOR SHELL ON THE CABLE

Figure 7

- (5) If the inner ferrule does not move on the inner shield, cut the inner shield back until the ferrule can move on the shield.
- (6) Push the connector shell rearward until the center contact is fully installed in the shell.

Refer to:

- Figure 8 for the position of the connector shell on the cable
- Figure 9 for the position of the pin contact in the plug connector
- Figure 10 for the position of the socket contact in the jack connector.

Make sure that:

- The distance the forward end of the socket contact extends out from the end of the insulator is not more than 0.02 inch
- The distance from the forward end of the socket contact to the end of the insulator is not more than 0.02 inch
- The distance from the forward end of the pin contact to the end of the insulator is not more than 0.04 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

POSITION OF THE CONNECTOR SHELL ON THE CABLE
Figure 8

POSITION OF THE SOCKET CONTACT IN THE JACK CONNECTOR
Figure 9

POSITION OF THE PIN CONTACT IN THE PLUG CONNECTOR
Figure 10

- (7) Hold the connector shell and lightly pull the cable to make sure that the contact is locked in the connector.
- (8) Push the K-Grip sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.
- (9) Crimp the K-Grip sleeve. Refer to Figure 11.
