Make sure that the distance from the forward end of the K-Grip sleeve to the shoulder of the connector shell is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

POSITION OF THE K-GRIP SLEEVE

Figure 11

(10) Examine the K-Grip sleeve.

Make sure that:

- The dimples on each side of the crimp area do not have cracks
- The base metal of the sleeve in the crimp area cannot be seen.

G. Insulation Installation

If the connector and the coax cable are not specified in Table 12, refer to Paragraph 6.A. for the standard insulation configuration.

Table 12

SELECTION OF A HEAT SHRINKABLE SLEEVE INSTALLATION PROCEDURE

4. CONNECTOR ASSEMBLY - RIGHT ANGLE CONNECTORS WITH SOLDER TYPE CONTACTS

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

20-51-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

A. Cable Preparation Dimensions

**Table 13
CABLE PREPARATION DIMENSIONS**

Connector	Dimension	Length (inch)	
		Target	Tolerance
KA-59-73	A	0.58	±0.02
	B	0.39	±0.02
	C	0.11	±0.02
	D	0.47	±0.02
KC-59-222	A	0.62	±0.02
	B	0.40	±0.02
	C	0.11	±0.02
	D	0.47	±0.02
KM-59-20	A	0.61	±0.02
	B	0.42	±0.02
	C	0.08	±0.02
	D	0.54	±0.02

B. Cable Preparation

- (1) Make a selection of a heat shrinkable sleeve from Table 4.
- (2) Put a 1.5 inch length of heat shrinkable sleeve on the cable.

Make sure the sleeve has the smallest diameter that can be moved easily on the cable.

- (3) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (4) Put the K-Grip sleeve on the cable. Refer to Figure 12.

If the K-Grip sleeve has one step, make sure that the end with the step is pointed forward to the end of the cable.

**POSITION OF THE K-GRIP SLEEVE
Figure 12**

- (5) If the cable dielectric is a metal, semi-rigid material, prepare the cable without trim jigs. Refer to Paragraph 5.A.
- (6) If the cable dielectric is not a metal, semi-rigid material:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

- (a) Make a selection of a cable jacket trim jig and a dielectric trim jig from Table 5.

NOTE: Preparation of the cable without a trim jig is a satisfactory alternative. Refer to Paragraph 5.A.

NOTE: If trim jigs are not specified for the connector, the cable must be prepared without trim jigs. Refer to Paragraph 5.A.

- (b) Prepare the cable with the trim jigs.

To prepare the cable with:

- A cable jacket trim jig with two slots, refer to Paragraph 5.B.
- A cable jacket trim jig with three slots, refer to Paragraph 5.C.

C. Connector Shell Installation

CONNECTOR SHELL INSTALLATION

Figure 13

Refer to Figure 13.

- (1) Make a selection of the K-Grip sleeve crimp tool from Table 9.

Make sure that the tool is applicable for the tool code.

- (2) Put the connector shell on the end of the cable.

Make sure that:

- If the cable has one shield, the inner ferrule is between the dielectric and the shield
- If the cable has an inner shield and an outer shield, the inner ferrule is between the inner shield and the outer shield
- If the cable has an inner shield and an outer shield, no strands of the outer shield are between the inner ferrule and the dielectric
- The end of the conductor is in the slot on the rear end of the contact.

- (3) If the inner ferrule does not move on the inner shield, cut the inner shield back until the ferrule can move on the shield.

- (4) Push the K-Grip sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.

- (5) Crimp the K-Grip sleeve.

Make sure that the distance between the forward end of the K-Grip sleeve and the shoulder of the connector shell is not more than 0.03 inch.

- (6) Examine the K-Grip sleeve.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS**

Make sure that:

- The dimples on each side of the crimp area do not have cracks
 - The base metal of the sleeve in the crimp area cannot be seen.
- (7) Install the heat shrinkable sleeve. Refer to Paragraph 6.A.

D. Center Contact Assembly

- (1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

- (2) Put the center conductor into the slot on the rear end of the center contact.
(3) Apply a small quantity of solder to the end of the conductor and the end of the contact.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE CONTACT. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CONTACT, THE CONNECTOR OR THE CABLE CAN OCCUR.

- (4) Hold the connector shell and lightly pull the cable to make sure that the solder joint is satisfactory.
(5) Put the access cap on the connector shell.
(6) Apply a small amount of solder around the edge of the cap.

CAUTION: DO NOT APPLY TOO MUCH HEAT TO THE CAP. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CAP, THE CONNECTOR OR THE CABLE CAN OCCUR.

5. COAX CABLE PREPARATION**A. Cable Preparation - No Trim Jigs**

NOTE: If the cable has two shields, the shields are prepared as one shield.

- (1) Remove the necessary length of the cable jacket to make the distance from the end of the cable jacket to the end of the cable equal to dimension A.

Refer to Figure 14 and Table 10.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

CABLE JACKET REMOVAL
Figure 14

- (2) Remove the necessary length of shield to make the distance from the end of the cable jacket to the end of the shield equal to dimension B.

Refer to Figure 14 and Table 10.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

- (3) For a cable dielectric that is a metal, semi-rigid material:
 - (a) Remove the necessary length of the dielectric to make the distance from the end of the cable jacket to the end of the dielectric equal to dimension D minus the width of the dielectric spacer. Refer to Figure 15 and Table 10.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL
Figure 15

- (b) Put the dielectric spacer on the end of the dielectric.
- (4) For a cable dielectric that is not a metal, semi-rigid material, remove the necessary length of the dielectric to make the distance from the end of the cable jacket to the end of the dielectric equal to dimension D.

Refer to Figure 16 and Table 10.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL
Figure 16

- (5) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C.

Refer to Figure 16 and Table 10.

B. Cable Preparation - Cable Jacket Trim Jig with Two Slots

- (1) Put the trim jig on the end of the cable.
Make sure that the end of the trim jig is against the end of the cable.
- (2) Turn the cable in the jig, and at the same time, apply light pressure on the cable at the location of the blades. Refer to Figure 17.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

LOCATIONS OF THE CUTS ON THE CABLE JACKET
Figure 17

- (3) Remove the length of the cable jacket from the second location to the end of the cable. Refer to Figure 18.

CABLE JACKET REMOVAL
Figure 18

- (4) Remove the length of the shield from the second location to the end of the cable. Refer to Figure 18.
- (5) Remove the length of cable jacket from the first location to the end of the shield. Refer to Figure 19.

REMAINING CABLE JACKET REMOVAL
Figure 19

- (6) Put the dielectric trim jig on the end of the cable.
- (7) Remove the length of the dielectric that extends farther than the end of the trim jig.
 Make sure that the distance from the end of the cable jacket to the end of the dielectric is equal to dimension D. Refer to Figure 20 and Table 10.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL
Figure 20

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

- (8) Remove the necessary length of conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 20 and Table 10.

C. Cable Preparation - Cable Jacket Trim Jig with Three Slots

- (1) Put the trim jig on the end of the cable.
Make sure that the end of the trim jig is against the end of the cable.
- (2) Turn the cable in the jig, and at the same time, apply light pressure on the cable at the area of the blades. Refer to Figure 21.

LOCATION OF THE CUTS ON THE CABLE
Figure 21

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

- (3) Remove the length of the cable jacket from the third location to the end of the cable. Refer to Figure 22.

CABLE JACKET REMOVAL
Figure 22

- (4) Remove the length of the outer and inner shields from the third location to the end of the cable. Refer to Figure 22.
- (5) Remove the length of the jacket from the first location to the end of the inner shield. Refer to Figure 23.

CABLE JACKET REMOVAL
Figure 23

- (6) Remove the length of the outer shield from the first location to the end of the cable. Refer to Figure 23.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

- (7) Remove the cable jacket from the second location to the end of the outer shield. Refer to Figure 24.

REMAINING CABLE JACKET REMOVAL

Figure 24

- (8) Put the dielectric trim jig on the end of the cable.
- (9) Remove the length of the dielectric that extends farther than the end of the trim jig.

Make sure that the distance from the end of the cable jacket to the end of the dielectric is equal to dimension D. Refer to Figure 25 and Table 10.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL

Figure 25

- (10) Remove the necessary length of conductor to make the distance from the end of the dielectric to the end of the conductor equal to dimension C. Refer to Figure 25 and Table 10.

6. INSULATION INSTALLATION CONFIGURATIONS

A. Heat Shrinkable Sleeve - Standard Configuration

- (1) Push the sleeve forward until the end of the sleeve is against the shoulder of the connector shell. Refer to Figure 26.

Make sure that:

- The distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.13 inch
- The distance from the rear end of the K-Grip sleeve to the rear end of the sleeve is not more than 0.3 inch
- The sleeve does not make an interference with the installation of the connector.

STANDARD WIRING PRACTICES MANUAL

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 26

(2) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Heat Shrinkable Sleeves - 125-88-9, 125-95-9, and KA-59-438-M06 Connectors

(1) Make a selection of a solvent from Table 4.

(2) Clean these areas:

- The K-Grip Sleeve
- The area of the connector shell with ribs
- 6 inches of the cable from the rear end of the K-Grip Sleeve.

(3) Push the first sleeve forward until the forward end of the sleeve is against the rear end of the K-Grip sleeve. Refer to Figure 27.

Make sure that the distance from the forward end of the sleeve to the rear end of the K-Grip sleeve is not more than 0.05 inch.

POSITION OF THE FIRST HEAT SHRINKABLE SLEEVE

Figure 27

(4) Shrink the sleeve into its position. Refer to Subject 20-10-14.

(5) Push the second sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell. Refer to Figure 28.

Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.05 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

POSITION OF THE SECOND AND THIRD HEAT SHRINKABLE SLEEVES
Figure 28

- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (7) Push the third sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell. Refer to Figure 28.
 Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.05 inch.
- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Heat Shrinkable Sleeves - 125-91-9 Connector

- (1) Make a selection of a solvent from Table 4.
- (2) Clean these areas:
 - The K-Grip Sleeve
 - The area of the connector shell with ribs
 - 6 inches of the cable from the rear end of the K-Grip Sleeve.
- (3) Push the first sleeve forward until the forward end of the sleeve is against the rear end of the K-Grip sleeve. Refer to Figure 29.
 Make sure that the distance from the forward end of the sleeve to the rear end of the K-Grip sleeve is not more than 0.05 inch.

POSITION OF THE FIRST HEAT SHRINKABLE SLEEVE
Figure 29

- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) Push the second sleeve forward until the forward end of the sleeve is against the rear end of the connector shell. Refer to Figure 30.
 Make sure that the distance from the forward end of the sleeve to the rear end of the connector shell is not more than 0.05 inch.

STANDARD WIRING PRACTICES MANUAL

POSITION OF THE FIRST HEAT SHRINKABLE SLEEVE

Figure 32

- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) Push the second sleeve forward until the forward end of the sleeve against the rear end of the connector shell. Refer to Figure 33.

Make sure that the distance from the forward end of the sleeve to the rear end of the connector shell is not more than 0.05 inch.

POSITION OF THE SECOND HEAT SHRINKABLE SLEEVE

Figure 33

- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (7) Push the third sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell. Refer to Figure 34.

Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.05 inch.

POSITION OF THE THIRD HEAT SHRINKABLE SLEEVE

Figure 34

- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

E. Heat Shrinkable Sleeves - 2985-3-() Connectors

- (1) Make a selection of a solvent from Table 4.
- (2) Clean these areas:
 - The K-Grip Sleeve
 - The area of the connector shell with ribs
 - 6 inches of the cable from the rear end of the K-Grip Sleeve.
- (3) Push the first sleeve forward until the forward end of the sleeve is against the rear end of the K-Grip sleeve. Refer to Figure 35.

Make sure that the distance from the forward end of the sleeve to the rear end of the K-Grip sleeve is not more than 0.05 inch.

POSITION OF THE FIRST HEAT SHRINKABLE SLEEVE
Figure 35

- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) Push the second sleeve forward until the forward end of the sleeve against the rear end of the connector shell. Refer to Figure 36.

Make sure that the distance from the forward end of the sleeve to the rear end of the connector shell is not more than 0.05 inch.

POSITION OF THE SECOND, THIRD AND FOURTH HEAT SHRINKABLE SLEEVES
Figure 36

- (6) Push the third sleeve forward until the forward end of the sleeve is against the rear end of the connector shell. Refer to Figure 36.

Make sure that the distance from the forward end of the sleeve to the rear end of the connector shell is not more than 0.05 inch.
- (7) Push the fourth sleeve forward until the forward end of the sleeve is against the rear end of the connector shell. Refer to Figure 36.

Make sure that the distance from the forward end of the sleeve to the rear end of the connector shell is not more than 0.05 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (9) Push the fifth sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell. Refer to Figure 37.

Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.05 inch.

POSITION OF THE FIFTH HEAT SHRINKABLE SLEEVE
Figure 37

- (10) Shrink the sleeve into its position. Refer to Subject 20-10-14.

F. Heat Shrinkable Sleeves - 2430-2-16 and 796-17-9 Connectors

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 38

Refer to Figure 38.

- (1) Push the first sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.
 Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.13 inch.
- (2) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (3) Push the second sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.
 Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.13 inch.
- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (5) Push the third sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS WEATHERPROOF K-GRIP JUNIOR CONNECTORS

Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.13 inch.

- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (7) Push the fourth sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.

Make sure that the distance from the forward end of the sleeve to the shoulder of the connector shell is not more than 0.13 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

B. Cable Preparation

For the general conditions that are applicable for the preparation of coax cable, refer to Subject 20-51-00.

For the preparation of Times SF-226 cable, refer to Paragraph 2.C.

- (1) Cut the end of the cable to make it perpendicular to the longitudinal axis.
- (2) In this sequence, put these components on the cable:
 - The clamp nut
 - The split washer
 - The vee gasket.

Refer to Figure 3.

POSITION OF THE NUT, THE WASHER, AND THE GASKET ON THE CABLE
Figure 3

- (3) Remove the necessary length of the cable jacket to make the distance from the end of the jacket to the end of the cable equal to dimension A.

Refer to Figure 4 and Table 4.

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

CABLE JACKET REMOVAL
Figure 4

- (4) Put the shield clamp on the cable.
 Make sure that the inner shoulder of the clamp is against the end of the cable jacket.
- (5) Move the strands of the shield apart.
- (6) Fold the strands of the shield back on the shield clamp. Refer to Figure 5.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

Make sure that the strands of the shield:

- Are parallel to the longitudinal axis of the cable
- Are symmetrical around the circumference of the clamp
- Do not make an overlap with each other.

POSITION OF THE SHIELD ON THE SHIELD CLAMP

Figure 5

- (7) Remove the necessary length of shield to make the distance from the end of the shield to the forward end of the shield clamp flange equal to 0.03 inch maximum.
- (8) Remove the necessary length of dielectric to make the distance from the forward edge of the shield to the end of the dielectric equal to dimension B.

Refer to Figure 6 and Table 4.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL

Figure 6

- (9) If these components are supplied with the connector, put them on the end of the cable in this sequence:
 - The dielectric spacer
 - The cable position insulator.
- (10) Remove the necessary length of the center conductor to make the distance from the forward end of the dielectric to the end of the conductor equal to dimension C.

Refer to Figure 6 and Table 4.

NOTE: If a dielectric spacer and an insulator are installed, the distance from the end of the center conductor to the end of the insulator must be equal to dimension C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

- (11) If these components are supplied with the connector, put them on the cable in this sequence:
- The retainer bushing
 - The insulator.

Refer to Figure 7.

Make sure that:

- The bushing is against the shield
- The shield clamp is against the bushing.

POSITION OF THE BUSHING AND THE INSULATOR ON THE CABLE

Figure 7

C. Preparation of the Times SF-226 Coax Cable for assembly of the KN-59-72 Connector

For the general conditions that are applicable for the preparation of coax cable, refer to Subject 20-51-00.

- (1) Make a selection of a 1/2 inch diameter heat shrinkable sleeve from Table 3.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (3) In this sequence, put these components on the cable:

- The clamp nut
- The split washer
- The vee gasket
- A 1.00 inch ± 0.06 inch length of the heat shrinkable sleeve.

Refer to Figure 8.

POSITION OF THE NUT, THE WASHER, THE GASKET, AND THE SLEEVE ON THE CABLE

Figure 8

- (4) Remove the necessary length of the cable jacket to make the distance from the end of the cable jacket to the end of the cable equal to dimension A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

Refer to Figure 9 and Table 4.

CABLE JACKET REMOVAL
Figure 9

- (5) Put the shield clamp on the end of the cable.
Make sure that the clamp is against the end of the cable jacket
- (6) Move the strands of the outer shield apart.
Make sure the strands are parallel to the longitudinal axis of the cable.
- (7) Fold the strands of the outer shield back on the shield clamp.
Make sure that the strands of the shield:
 - Are parallel to the longitudinal axis of the cable
 - Are symmetrical around the circumference of the clamp
 - Do not make an overlap with each other.
- (8) Remove the necessary length of shield to make the distance from the end of the shield to the forward end of the shield clamp flange equal to 0.03 inch maximum. Refer to Figure 10.

SHIELD REMOVAL
Figure 10

- (9) Remove the foil tape from the end of the cable to the forward end of the shield clamp.

CAUTION: DO NOT CUT OR BREAK THE STRANDS OF THE SHIELD. IF A STRAND OF THE SHIELD IS BROKEN, THE CABLE PREPARATION MUST BE DONE AGAIN.

- (10) Move the strands of the inner shield apart.
- (11) Fold the strands of the inner shield back on the shield clamp.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

Make sure that the strands of the shield:

- Are parallel to the longitudinal axis of the cable
- Are symmetrical around the circumference of the clamp
- Do not make an overlap with a each other.

- (12) Remove the necessary length of the strands to align the ends with the end of the strands of the outer shield. Refer to Figure 10.
- (13) Remove the necessary length of the dielectric to make the distance from the forward edge of the shield to the end of the dielectric equal to dimension B.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

Refer to Figure 11 and Table 4.

DIELECTRIC REMOVAL
Figure 11

- (14) Remove the necessary length of the center conductor to make the distance from the forward end of the dielectric to the end of the conductor equal to dimension C.
Refer to Figure 11 and Table 4.

D. Center Contact Assembly

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

- (1) Make a selection of a Temperature Grade C solder. Refer to Subject 20-00-11.

CAUTION: DO NOT USE A TEMPERATURE GRADE D SOLDER. IF TOO MUCH HEAT IS APPLIED, DAMAGE TO THE CABLE CAN OCCUR.

- (2) Tin the center conductor.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (3) Put the center conductor in the solder barrel of the center contact.

Make sure that:

- All of the strands of the conductor are in the solder barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the dielectric to the rear end of the solder barrel is not more than 0.03 inch.

- (4) Apply a small quantity of solder in the inspection hole of the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN OCCUR.

- (5) Remove all of the solder and the flux from the outer surface of the contact.
- (6) Examine the contact for damage to the finish.

NOTE: If the contact has damage, it must be replaced.

- (7) If a solder access cover is supplied with the contact, install the cover.
- (8) If the connector is supplied with a front insulator, put it on the center contact.
- (9) If a heat shrinkable sleeve is on the cable:
 - (a) Push the sleeve forward until the distance from the forward end of the sleeve to the rear of end of the shield clamp is equal to 0.16 inch \pm 0.03 inch. Refer to Figure 12.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 12

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

E. Connector Shell Installation

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

Table 5
CLAMP NUT TORQUE VALUES

Connector	Torque Value (inch-pounds)	
	Minimum	Maximum
KA-19-181	28	32
KA-59-21	90	100
KC-19-110	40	50
KC-39-75	40	50
KC-59-66	40	50
KD-59-03	90	100
KD-59-04	90	100
KD-59-04	28	32

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS

Table 5 (continued)

Connector	Torque Value (inch-pounds)	
	Minimum	Maximum
KD-59-130	40	50
KD-59-56	40	50
KN-59-298	90	100
KN-59-51	40	50
KN-59-72	90	100

- (1) Make a selection of a solvent from Table 3.
- (2) Make a selection of a primer from Table 3.
- (3) Make a selection of thread lock compound from Table 3.
- (4) Examine the threads on the rear of the connector shell for contamination or thread lock compound.
- (5) If the threads have material on them, clean the threads:
 - (a) Fully engage the threads the clamp nut and the threads of the connector.
 - (b) Remove the clamp nut from the connector shell.
- (6) Clean the clamp nut with a wiper and solvent.
- (7) Dry the nut with a clean wiper.
- (8) Apply the primer with a spray on the threads of the nut.
- (9) Let the primer to dry for 10 minutes minimum at room temperature.
- (10) Apply a layer of thread lock compound on the threads of the clamp nut.

CAUTION: THE THREAD LOCK COMPOUND DOES NOT MAKE A BOND IF THE COMPONENTS ARE ASSEMBLED MORE THAN 30 MINUTES AFTER THE COMPOUND IS APPLIED.

- (a) Put a small quantity of the compound on the tip of a non-metallic, pointed tool. Refer to Figure 13.

LOCATION OF THE THREAD LOCK COMPOUND ON THE TOOL
Figure 13

- (b) Apply a thin, smooth layer of the compound on one or two full threads of the nut. Refer to Figure 14.

20-51-16

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS CONVENTIONAL COAX CONNECTORS**

CAUTION: THREAD LOCK COMPOUND IS AN INSULATOR. TOO MUCH THREAD LOCK COMPOUND CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**LOCATION OF THE THREAD LOCK COMPOUND ON THE THREADS OF THE CLAMP NUT****Figure 14**

- (c) If too much thread lock compound is applied, remove the unwanted compound from the nut.
- (11) Push the vee gasket forward until it is against the rear end of the shield clamp.
 - (12) Push the split washer forward until it is against the vee gasket.
 - (13) Put a layer of the thread lock compound on the first two threads of the clamp nut.
 - (14) Push the clamp nut forward until it is against the washer.
 - (15) Put the contact assembly in the rear end of the connector shell.

Make sure that the shield clamp is aligned correctly against the rear end of the connector shell.

- (16) Fully engage the threads of the clamp nut and the threads of the connector shell.
- (17) Tighten the clamp nut to the specified torque value. Refer to Table 5.

3. CONNECTOR SEPARATION

A. Separation of the Plug and the Jack

- (1) Pull the outer ring of the plug rearward.
- (2) Pull the plug away from the jack.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-LOC COAX CONNECTORS

4. CONNECTOR ASSEMBLY

A. Cable Preparation

For the general conditions that are applicable for the preparation of coax cable, refer to Subject 20-51-00.

NOTE: If the cable has two shields, the shields are prepared as one shield.

**Table 6
CABLE PREPARATION DIMENSIONS**

Connector	Dimension	Length (inch)	
		Target	Tolerance
1075-13-9	A	0.94	±0.02
	B	0.63	±0.02
	C	0.19	±0.02
	D	0.75	±0.02

- (1) Make a selection of a heat shrinkable sleeve from Table 2.
Make sure the sleeve is the smallest diameter that can be moved easily on the cable.
- (2) Put a 1.5 inch length of heat shrinkable sleeve on the cable.
- (3) Cut the end of the cable to make it perpendicular to the longitudinal axis of the cable.
- (4) Put the K-Grip sleeve on the cable.
- (5) Prepare the cable jacket and shield. Refer to Figure 2 and Table 6.

**CABLE JACKET AND SHIELD REMOVAL
Figure 2**

- (a) Remove the necessary length of the cable jacket to make the distance from the end of the jacket to the end of the cable equal to dimension A.
CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.
 - (b) Remove the necessary length of shield to make the distance from the end of the cable jacket to the end of the shield equal to dimension B.
CAUTION: DO NOT CAUSE DAMAGE TO THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.
- (6) If the coax cable has a semi-solid dielectric, put the cable position insulator that is supplied with the connector on the center conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-LOC COAX CONNECTORS

- (7) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the center conductor equal to dimension C. Refer to Figure 3 and Table 6.

Make sure that the distance from the end of the cable jacket to the end of the dielectric is equal to dimension D.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

DIELECTRIC REMOVAL
Figure 3

B. Center Contact Assembly

For the general conditions that are applicable for the assembly of coax contacts, refer to Subject 20-51-00.

- (1) Find the center contact tool code. Refer to Table 3.
- (2) Make a selection of a contact crimp tool from Table 5.

Make sure the tool is applicable for the tool code.

- (3) Put the conductor in the crimp barrel of the center contact. Refer to Figure 4.

Make sure that:

- All of the strands of the conductor are in the crimp barrel of the contact
- The conductor can be seen in the inspection hole of the contact
- The distance from the end of the dielectric to the rear end of the crimp barrel is not more than 0.03 inch.

POSITION OF THE CONTACT ON THE CONDUCTOR
Figure 4

- (4) Crimp the contact.

Make sure that the crimp is between the inspection hole and the rear end of the crimp barrel.

- (5) Examine the contact assembly for these types of damage:

- The base metal of the contact can be seen
- The crimp barrel of the contact has a crack.

NOTE: If the contact has damage, the contact must be replaced.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF KINGS K-LOC COAX CONNECTORS****C. K-Grip Assembly**

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Find the K-Grip sleeve tool code. Refer to Table 3.
- (2) Make a selection of the K-Grip sleeve crimp tool from Table 5.
Make sure the tool is applicable for the tool code.
- (3) Put the connector shell on the end of the cable. Refer to Figure 5.

For a cable with one shield, make sure that:

- The inner ferrule is between the dielectric and the shield
- No strands of the shield are between the inner ferrule and the dielectric.

For a cable with an inner flat shield and an outer round shield, make sure that the inner ferrule is between the inner shield and the outer shield.

POSITION OF THE CONNECTOR SHELL ON THE CABLE

Figure 5

- (4) Push the K-Grip assembly rearward until the contact is fully installed in the connector shell.
- (5) Push the K-Grip sleeve forward until the forward end of the sleeve is against the shoulder of the connector shell.
- (6) Crimp the K-Grip sleeve. Refer to Figure 6.

Make sure that the distance between the forward end of the K-Grip sleeve and the shoulder of the connector shell is not more than 0.03 inch.

POSITION OF THE K-GRIP SLEEVE

Figure 6

- (7) Examine the K-Grip sleeve.

Make sure that:

- The dimples on each side of the crimp area do not have cracks
- The base metal of the sleeve in the crimp area cannot be seen.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF KINGS K-LOC COAX CONNECTORS

D. Installation of the Outer Body

For the general conditions that are applicable for the assembly of coax connectors, refer to Subject 20-51-00.

- (1) Put the insulator on the center contact. Refer to Figure 7.

POSITION OF THE INSULATOR ON THE CENTER CONTACT
Figure 7

- (2) Fully engage the threads of the outer body with the threads of the connector shell.
- (3) Tighten the outer body with the hand.
- (4) Tighten the outer body approximately 1/16 of a turn more with a wrench.
- (5) Push the heat shrinkable sleeve forward until the forward end of the sleeve is a not more than 0.05 inch from the rear end of the hex nut on the outer body. Refer to Figure 8.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 8

- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.

5. CONNECTOR INSTALLATION

A. Connection of the Plug and the Jack

- (1) Pull the outer ring of the plug rearward.
- (2) Push the jack into the plug.
- (3) Release the outer ring of the plug.
- (4) Pull the jack lightly to make sure the plug is locked in the jack.

ASSEMBLY OF TRIAX CABLE CONNECTORS

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Supplier
31-30383-1	Amphenol
30382-1	Dage
30383-1	Dage

B. Connector Description

**TRIAX CONNECTOR CABLE COMPONENTS
Figure 1**

**TRIAX PLUG CONNECTOR
Figure 2**

**TRIAX RECEPTACLE CONNECTOR
Figure 3**

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF TRIAX CABLE CONNECTORS****2. CONNECTOR ASSEMBLY****A. Cable Preparation**

- (1) Cut the cable so that the end of the cable is perpendicular to the longitudinal axis of the cable.
- (2) Remove 1 inch \pm 1/16 inch of the outer jacket from the end of the cable.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (3) Move the strands of the shield apart.
- (4) Cut the cable so that the distance from the end of the outer jacket to the end of the cable is 7/8 inch \pm 1/32 inch.

CAUTION: DO NOT CUT THE STRANDS OF THE SHIELD.

- (5) Put the strands of the shield flat against the cable so that they are parallel to the longitudinal axis of the cable.

Make sure that the end of the strands are beyond the end of the cable.

- (6) In this order, put these components on the cable:
 - The nut
 - The small gasket.

Refer to Figure 1.

NOTE: If it is necessary, the ends of the strands of the shield can be twisted together.

Make sure that the components are over all of the strands of the shield

- (7) Put the clamp on the cable so that the inner shoulder of the clamp is tight against end of the jacket.
- (8) Remove the necessary length of the shield so that the distance from the end of the shield to the end of the clamp is 5/32 inch \pm 1/32 inch.
- (9) Fold the strands of the shield back over the clamp so that they are flat and symmetrical against the cable.
- (10) In this order, put these components on the cable:
 - The bushing
 - The gasket

Refer to Figure 1.

- (11) Remove the necessary length of the inner jacket so that the distance from the gasket to the end of the jacket is 3/64 inch +0 inch, -1/32 inch.
- (12) Move the strands of the inner shield apart.

CAUTION: DO NOT CUT THE SHIELD OF THE CABLE. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (13) Remove a 1/8 inch \pm 1/16 inch length from the end of the cable.

CAUTION: DO NOT CUT THE STRANDS OF THE SHIELD.

- (14) Remove the necessary length of the inner jacket so that the forward edge of the inner jacket is aligned with the forward edge of the gasket.
- (15) Put the strands of the inner shield flat against the cable so that they are parallel to the longitudinal axis of the cable.

20-51-20

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF TRIAX CABLE CONNECTORS**

Make sure that the end of the strands are beyond the end of the cable.

- (16) Put the small clamp over the strands of the inner shield so that the shoulder of the clamp is tight against the end of the inner jacket.

NOTE: If it is necessary, the ends of the strands of the shield can be twisted together.

- (17) Fold the strands of the inner shield back over the clamp so that they are flat and symmetrical.
- (18) Remove the necessary length of the strands of the inner shield so that the distance from the end of the strands to the rear edge of the clamp is $1/32$ inch \pm $1/64$ inch.
- (19) Put the small bushing on the cable so that the bushing is against the clamp.
- (20) Remove the necessary length of the dielectric so that the distance from the clamp to the end of the dielectric is $3/16$ inch \pm $1/32$ inch.

CAUTION: DO NOT CUT OR CAUSE ANY DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (21) Remove the necessary length of the inner conductor so that that the distance from the end of the dielectric to the end of the conductor is $5/64$ inch \pm $1/64$ inch.

B. Contact Assembly

- (1) Put the contact on the inner conductor.
- (2) Solder the contact.

CAUTION: DO NOT PUT MORE THAN THE NECESSARY QUANTITY OF SOLDER ON THE CONTACT AND CONDUCTOR. UNWANTED SOLDER ON THE INNER CONTACT CAN PREVENT THE INSERTION OF THE CONTACT INTO THE INSULATOR.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER.

C. Connector Assembly

Refer to:

- Figure 2 for the plug connector
- Figure 3 for the receptacle connector.

- (1) Put the small insulator onto the contact assembly.
- (2) Put the body onto the contact assembly.
- (3) Put the large insulator onto the contact assembly.
- (4) Put the connector body onto the contact assembly.
- (5) Engage the threads of the nut and the connector body.

Make sure that the groove in the small gasket is alined with the sharp edge of the clamp. Refer to Figure 1.

- (6) Torque the nut to 45 inch-pounds.

M17/58-RG140	MIL-C-17/58	QPL
M17/97-RG210	MIL-C-17/97	QPL

2. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Cable Preparation

- (1) Put the ferrule on the cable.
- (2) Prepare the cable. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP 2-329083-1 COAX CONNECTORS

CABLE TRIM DIMENSIONS

Figure 2

- (a) Remove 21/32 inches \pm 1/32 inch of the outer jacket of the cable.
- (b) Remove 7/16 inch \pm 1/32 inch of the shield and dielectric.
- (3) Move the strands of the shield apart a small amount.

B. Connector Assembly

**Table 3
CONNECTOR CRIMP TOOLS**

Basic Tool		Die	
Part Number	Supplier	Part Number	Supplier
69141-1	AMP	-	AMP
69710	AMP	69224-1	AMP

- (1) Make a selection of a crimp tool from Table 3.
- (2) Push the prepared cable into the crimp end of the connector.
NOTE: The crimp end can be twisted a small amount to make it easier.
- (3) Push the crimp end under the expanded end of the shield.
NOTE: The crimp end can be twisted a small amount to make sure that the dielectric goes into the crimp end as far as possible.
- (4) Push the ferrule over the shield until the ferrule is against the shoulder of the crimp end of the connector.
- (5) Crimp the ferrule.
- (6) Put the gasket on the crimp end of the connector.
- (7) Engage the threads of the connector body and the crimp end.
- (8) Tighten connector body and crimp end of the connector with wrenches.

AMP 69467 HYDRAULIC TOOL
Figure 4

AMP 96467-1 HYDRAULIC TOOL WITH A FLEXIBLE HOSE
Figure 5

B. Cable Preparation

- (1) Cut the cable so that the end is perpendicular to the longitudinal axis of the cable.
- (2) Remove any burrs on the end of the cable.
- (3) Put the cable stop on the end of the chuck. Refer to Table 4 and Figure 3.
- (4) Put the chuck on the cable so that the end of the cable is against the cable stop.
- (5) Tighten the chuck with a pair of spanner wrenches. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES

POSITION OF THE SPANNER WRENCHES ON THE CHUCK

Figure 6

- (6) Remove the cable stop from end of the chuck.
- (7) If the coax cable has solid center conductor:
 - (a) Put the drill jig over the center conductor so that the end of the cable is against the jig.

NOTE: A satisfactory alternative for the AMP drill jig is given in Table 4.
 - (b) Drill the center of the conductor 0.25 inch to 0.40 inch with a 0.110 inch diameter drill bit.
 - (c) Remove the drill jig.
- (8) Put the tap jig on the cable so that:
 - The jig is over the center conductor
 - The end of the cable is against the jig.

Refer to Figure 7.

POSITION OF THE TAP JIG AND THE TAP ON THE CENTER CONDUCTOR

Figure 7

- (9) Put a 5-44 tap on the tap jig. Refer to Figure 7.
- (10) Turn the tap 8 turns to make a minimum of 7 threads in the center conductor.
- (11) Remove the tap and the tap jig from the cable.
- (12) Remove any burrs on the new threads of the conductor.
- (13) Put the loading ring on the cable. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES**

Make sure that the large end of the ring is on the end of the cable.

**POSITION OF THE LOADING RING****Figure 8**

- (14) Make a selection of a hydraulic tool from Table 4.

Refer to:

- Figure 4 for the hydraulic tool without a flexible hose
- Figure 5 for the hydraulic tool with a flexible hose.

- (15) Put the flat end of the flare tool into the hydraulic tool cylinder. Refer to Figure 9.

**POSITION OF THE FLARE TOOL IN THE TOOL CYLINDER****Figure 9**

- (16) Put the tool cylinder into the chuck.
- (17) Turn the cylinder approximately 1/4 of a turn to lock it in the chuck.
- (18) Close the release valve on the hydraulic tool.
- (19) Pump the handle of the hydraulic tool until:
- The flare tool is against the bottom of the chuck
 - The pressure is released.
- (20) Open the release valve.
- (21) Remove tool cylinder from the chuck.

C. Assembly of the Connector Body

- (1) Put the applicable pusher in the connector body. Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES**

CAUTION: THE CONNECTOR BODY MUST BE PUSHED ONTO THE CABLE WITH THE CORRECT PUSHER.

NOTE: The plug pusher has a shoulder.

(2) For the plug, put these components on the body:

- The O-ring
- The pusher
- The coupling nut.

Refer to Figure 10.

**ASSEMBLY OF THE BODY OF THE PLUG CONNECTOR****Figure 10**

(3) For the jack, put the connector body on the pusher. Refer to Figure 11.

**ASSEMBLY OF THE BODY OF THE JACK CONNECTOR****Figure 11**

(4) Put the pusher in the tool cylinder. Refer to Figure 12.

**POSITION OF THE PUSHER IN THE TOOL CYLINDER****Figure 12**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES

- (5) Turn the cylinder approximately 1/4 of a turn to lock it in the chuck.
- (6) Close the release valve on the hydraulic tool.
- (7) Pump the handle until:
 - The pusher is against the bottom of the chuck
 - The pressure is released.
- (8) Open the release valve.
- (9) Remove the tool cylinder from the chuck.
- (10) Remove the pusher from the connector body.
- (11) Remove the chuck with the spanner wrenches.
- (12) Remove the pusher from the chuck.

D. Assembly of the Center Contact

- (1) Engage the threads of the contact with the center conductor.
- (2) Tighten the contact on the center conductor.
- (3) Put the Teflon insert bead on the center contact.
- (4) Pus the contact into the connector body until the insert bead and the contact are against the connector body.
- (5) Put the coupling nut on the connector.
- (6) Hold the clamp nut so that it does not move.

CAUTION: DAMAGE TO THE SWAGED CONNECTION CAN OCCUR IF THE CLAMP MOVES WHILE IT IS TIGHTENED.

- (7) Turn the plug or the jack with the torque wrench.
- (8) Torque the coupling nut 90 inch-pounds ± 5 inch-pounds.

3. RG231 COAX CABLE REPAIR

Refer to Subject 20-51-00 for the general conditions that are applicable for the preparation of coax cables.

A. Conditions for Repair

The cable must be replaced or repaired if the cable has:

- Any damage that goes through the jacket
- A dent or a depression that is greater than 3 inches in length
- A dent or a depression that is greater than 1/32 inch in depth.

B. Necessary Tools

**Table 5
NECESSARY TOOLS**

Tool	Part Number	Supplier
Applicator Kit	69658	AMP
Ratchet Tool	69634	AMP

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES

Refer to:

- Figure 13 for the applicator kit
- Figure 14 for the ratchet tool.

CONTENTS OF THE AMP 69658 APPLICATOR KIT
Figure 13

AMP 69634 RATCHET TOOL
Figure 14

NOTE: The handle and the holding screw can be assembled on either side of the ratchet tool.

C. Cable Preparation

- (1) Make a selection of a splice from Table 2.
- (2) Cut each cable segment to make the end perpendicular to the longitudinal axis.
- (3) Remove any burrs from the end of each cable.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES**

(4) For the end of each cable:

- (a) Put a loading ring on the cable . Refer to Figure 15.

Make sure that the large end of the ring is toward the end of the cable.

**POSITION OF THE LOADING RING ON THE CABLE****Figure 15**

- (b) Put the chuck on the cable. Refer to Figure 16.

Make sure that the flat surface of the chuck is aligned with the end of the cable.

**POSITION OF THE CHUCK ON THE CABLE****Figure 16**

- (c) Tighten the chuck on the cable with a pair of spanner wrenches.
(d) Put the chuck in the movable jaw of the ratchet tool. Refer to Figure 17.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES

POSITION OF THE CHUCK IN THE RATCHET TOOL
Figure 17

- (e) Tighten the holding screw so that the chuck is held in position.
- (f) Put the flare tool on the tool holder.
- (g) Put the tool holder in the fixed jaw of the ratchet tool.
- (h) Turn the hex screw clockwise until the end of the cable is against the flare tool.
- (i) Turn hex screw counterclockwise until the tool holder can be removed.
- (j) Put the expander tool on the tool holder.
- (k) Put the tool holder into the fixed jaw of the ratchet tool.
- (l) Turn the hex screw clockwise until the cable is against the bottom of the expander tool.
 Make sure that the expander tool goes under the outer jacket of the cable.
- (m) Turn hex screw counterclockwise until the tool holder can be removed.
- (n) Remove the chuck from the ratchet tool.

D. Splice Assembly

- (1) Assemble the center contact. Refer to Figure 18.

CENTER CONTACT ASSEMBLY
Figure 18

- (a) Put the center contact in the one end of the cable.
- (b) Put the sleeve on the contact.
- (c) Put the two ends of the cable together.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES**

Make sure that:

- The sleeve is under the jacket on the end of each cable
- The dielectrics of each cable are against each other.

Refer to Figure 19.

POSITION OF THE TWO ENDS OF THE CABLE

Figure 19

- (2) Put a pusher in each end of the ratchet tool.
- (3) Push loading ring toward the end of each cable.
- (4) Put the cable in the ratchet tool so that:
 - The center of the splice is aligned with the center of the tool.
 - Each cable is in the groove of the applicable pusher.

Refer to Figure 20.

POSITION OF THE SPLICE IN THE RATCHET TOOL

Figure 20

- (5) Put the locking bolt assembly in the ratchet tool. Refer to Figure 21.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP COAXICLAMP CONNECTORS AND SPLICES

POSITION OF THE LOCKING BOLT ASSEMBLY IN THE RATCHET TOOL
Figure 21

- (6) Turn the handle of the locking bolt so that each pusher is in the locked position. Refer to Figure 22.

LOCKED POSITION OF THE PUSHERS
Figure 22

- (7) Tighten each holding screw so that the locking bolt stays in position.
- (8) To push the loading rings over the expanded ends of the cable, turn the hex screw clockwise with a ratchet wrench until the pushers are against the locking bolt assembly.
- (9) Loosen each holding screw.
- (10) Turn the locking bolt handle until it is in the vertical position. Refer to Figure 21.
- (11) Remove the locking bolt assembly.
- (12) Remove the cable from the ratchet tool.

2. CONNECTOR DISASSEMBLY

A. Coax Contact Removal

**Table 5
COAX CONTACT REMOVAL TOOLS**

Removal Tool	Supplier
RX20-25	Burndy
RXK20-25	Burndy

- (1) Make a selection of a coax contact removal tool from Table 5.
- (2) Push the tool into the contact cavity of the plug or the receptacle.
- (3) Pull the contact assembly and the tool from the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY RSCDEX-() COAX CONNECTORS

3. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Cable Preparation for the Assembly of Plug Connector

CABLE PREPARATION FOR A PLUG ASSEMBLY
Figure 3

Refer to Figure 3.

- (1) Cut the end of the cable perpendicular to the longitudinal axis of the cable.
- (2) Remove 7/16 inch ± 1/64 inch of the outer jacket from the end of the cable.

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY RELIABILITY OF THE CABLE OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

- (3) Remove 15/64 inch ± 1/64 inch of the shield and the dielectric from the end of the cable.

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY RELIABILITY OF THE CABLE OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

B. Cable Preparation for the Assembly of a Receptacle Connector

CABLE PREPARATION FOR A RECEPTACLE ASSEMBLY
Figure 4

Refer to Figure 4.

- (1) Cut the end of the cable perpendicular to the longitudinal axis of the cable.
- (2) Remove 7/8 inch ± 1/64 inch of the outer jacket from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY RSCDEX-() COAX CONNECTORS

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY RELIABILITY OF THE CABLE OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

- (3) Remove the necessary length of the shield.

Make sure that the distance from the end of the outer jacket to the end of the shield is 5/16 inch ± 1/64 inch.

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY RELIABILITY OF THE CABLE OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

- (4) Remove the necessary length of the dielectric.

Make sure that the distance from the end of the dielectric to the end of the cable is 1/4 inch ± 1/64 inch.

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY RELIABILITY OF THE CABLE OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM.

C. Coax Contact Assembly

**Table 6
COAX CONTACT CRIMP TOOLS**

Basic Unit		Locator		Die	
Part Number	Supplier	Part Number	Supplier	Part Number	Supplier
M10S-1	Burndy	SL-46	Burndy	S-26	Burndy

**Table 7
OUTER RING CRIMP TOOLS**

Basic Unit		Locator		Die	
Part Number	Supplier	Part Number	Supplier	Part Number	Supplier
M10S-1	Burndy	SL-47	Burndy	S-22	Burndy

- (1) Make a selection of a coax contact crimp tool from Table 6.
- (2) Make a selection of an outer ring crimp tool from Table 7.
- (3) Put the outer ring on the cable.

Refer to:

- Figure 1 for the plug connector
- Figure 2 for the receptacle connector.

- (4) Put the support sleeve on the cable.

Make sure that the sleeve is between the dielectric and the shield.

- (5) Put the pin or socket contact on the conductor.
- (6) Crimp the contact.
- (7) Put the outer contact on the cable.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY RSCDEX-() COAX CONNECTORS

Make sure that:

- The barrel of the outer contact is between the shield and the body of the pin or socket contact
 - The pin or socket contact is locked in the body of the outer contact
 - The outer contact holds the pin or socket contact in position.
- (8) Push the outer ring forward until it stops.
- (9) Crimp the outer ring.

D. Coax Contact Insertion

- (1) Put the wired contact into the rear end of the connector.

Make sure the contact is fully inserted in the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY M22T() COAX CONNECTORS

2. CONNECTOR DISASSEMBLY

A. Contact Removal

NOTE: The contact assembly:

- Is released from the front of the connector
- Cannot be repaired.

**Table 4
COAX CONTACT REMOVAL TOOLS**

Removal Tool	Supplier
RX8-1	Burndy

- (1) Remove the cable clamp hardware.
- (2) Make a selection of a coax contact removal tool from Table 4.
- (3) Put the tip of the removal tool over the front of the contact.
- (4) Carefully push the tool into the connector body until the contact is pushed out the rear of the connector.
- (5) If it is necessary to replace the contact:
 - (a) Cut the contact off the wire.
 - (b) Discard the contact.

3. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Contact Assembly

**Table 5
COAX CONTACT CRIMP TOOLS**

Basic Unit		Die		
Part Number	Supplier	Part Number	Size	Supplier

**Table 6
FERRULE CRIMP TOOLS**

Basic Unit		Die		
Part Number	Supplier	Part Number	Size	Supplier
M8ND	Burndy	N22RVMT-10	Large	Burndy

- (1) Make a selection of a contact crimp tool from Table 5.
- (2) Make a selection of a ferrule crimp tool from Table 6.
- (3) Prepare the cable. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY M22T() COAX CONNECTORS

CABLE PREPARATION
Figure 2

- (a) Remove 0.450 inch \pm 0.015 inch of the outer jacket from the end of the cable.
- (b) Remove 0.265 inch \pm 0.015 inch of the shield from the end of the cable.
- (c) Remove 0.155 inch \pm 0.015 inch of the dielectric from the end of the cable.
- (4) Put the center conductor into the wire barrel of the center contact.
- (5) Crimp the contact. Refer to Figure 3.

POSITION OF THE CENTER CONTACT
Figure 3

- (6) Put the ferrule on the cable.
- (7) Push the contact body:
 - Under the shield
 - Over the center contact until it makes a click.
- (8) Push the ferrule over the shield until the forward edge of the ferrule is against the contact body.
- (9) Crimp the ferrule.

B. Contact Insertion

NOTE: It is not necessary to install contacts into contact cavities that are not used.

- (1) Manually push the wired contact into the contact cavity.
Make sure that the contact is fully inserted.

C. Connector Assembly

- (1) Put the cable clamp on the rear of the connector.

A. Contact Removal

**Table 3
COAX CONTACT REMOVAL TOOLS**

Contact	Removal Tool
RMDX60-32D28	RX16D11-D1
RCDX60-32D28	RX16D11-D1

CAUTION: TO AVOID ANY DAMAGE TO THE CONNECTOR GROMMET, EACH CONTACT MUST BE FULLY REMOVED ONE AT A TIME.

- (1) Make a selection of a removal tool from Table 3.

CAUTION: DO NOT USE A PAIR OF PLIERS TO REMOVE A CONTACT. DAMAGE TO THE CONTACT CAN OCCUR.

- (2) Remove the grommet compression nut or strain relief clamp.

CAUTION: DO NOT TRY TO REMOVE THE GROMMET FROM THE CONNECTOR. THE GROMMET IS BONDED TO THE SHELL.

- (3) Put the plunger of the tool in the fully retracted position.

CAUTION: IF THE PLUNGER IS NOT IN THE FULLY RETRACTED POSITION, DAMAGE CAN OCCUR TO THE CONNECTOR OR THE CONTACTS, OR BOTH.

- (4) Put the end of the removal tool on the engaging end of the contact.
- (5) Push the tool into the contact cavity until it stops.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY G6F12-88() COAX CONNECTORS

- (6) Hold the tool in position and lightly turn it back and forth to make sure that it is correctly engaged in the retention clip.
- (7) Push the plunger in to eject the contact from the contact cavity.
- (8) Manually remove the contact from the grommet.

3. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Contact Assembly

**Table 4
COAX CONTACT CRIMP TOOLS**

Contact	Crimp Tool

RMDX60-32D28	M10S-1	S-80	SL-105
RCDX60-32D28	M10S-1	S-80	SL-105

- (1) Make a selection of a coax contact crimp tool from Table 4.
- (2) Prepare the cable. Refer to Figure 1.

**COAX CABLE PREPARATION
Figure 1**

- (a) Remove 0.40 inch ±0.01 inch of the outer jacket from the end of the cable.
- (b) Remove 0.30 inch ±0.01 inch of the shield from the end of the cable.
- (c) Remove 0.25 inch ±0.01 inch of the dielectric from the end of the cable.
- (3) Put the center conductor in the wire barrel of the contact.
- (4) Crimp the contact.

B. Contact Insertion

- (1) Put each wired contact into the correct contact cavity by hand.

2. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Contact Assembly

- (1) Remove these components from the coax connector package:
 - The jack body
 - The center contact.
- (2) Discard the remaining components.
- (3) Prepare the cable. Refer to Figure 1.

20-51-41

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-175 COAX CONNECTORS

CABLE PREPARATION
Figure 1

- (a) Cut the end of the cable.
Make sure that the end is perpendicular to the longitudinal axis.
 - (b) Lightly make a mark on the copper jacket $1 \text{ inch} \pm 1/32 \text{ inch}$ from the end of the cable with a tube cutter.
 - (c) Bend the cable at the mark approximately 30 degrees in each direction until the length of the copper jacket breaks at the mark.
 - (d) Remove $7/32 \text{ inch} \pm 1/32 \text{ inch}$ of the dielectric from the end cable.
- (4) In order, put these components from the adapter kit on the cable:
- The clamp nut
 - The teflon bushing
 - The V-groove gasket
 - The splined gland
 - The gland bushing.

Refer to Figure 2.

POSITION OF THE ADAPTER KIT COMPONENTS ON THE CABLE
Figure 2

- (5) Put the center contact on the center conductor.
Make sure that the end of the contact is a minimum of $1/32 \text{ inch}$ from the end of the dielectric.
- (6) Solder the contact.

B. Connector Assembly

- (1) Push the end of the cable into the jack body until it stops.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-175 COAX CONNECTORS

(2) In order, push these components into the jack body:

- The clamp nut
- The teflon bushing
- The V-groove gasket
- The splined gland
- The gland bushing.

Make sure that the components are aligned with each other.

(3) Torque the clamp nut 100 inch-pounds \pm 10 inch-pounds.

(4) Make an inspection of the center contact in relation to the dielectric.

Make sure that the forward end of the center contact is a maximum of 1/32 inch from the end of the dielectric.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-3292 COAX CONNECTORS

This Subject gives the procedure to assemble the Amphenol 82-3292 coax connectors with the specified coax cables.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
COAX CONNECTOR PART NUMBERS**

Part Number	Supplier
82-3292	Amphenol

B. Coax Cable Part Numbers

**Table 2
COAX CABLE PART NUMBERS**

Part Number	Supplier
BA14349	ITT Surprenant

2. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for assembly of coax connectors.

A. Cable Preparation

**Table 3
COAX CABLE TRIM DIMENSIONS**

Dimension	Target (inch)	Tolerance (inch)
A	0.687	0.02
B	0.390	0.02
C	0.187	0.02
D	0.500	0.02

- (1) Cut the end of the cable.
Make sure that the end is perpendicular to the longitudinal axis of the cable.
- (2) If a ferrule is supplied, put the ferrule on the cable.
Make sure that the end with the smaller outside diameter is pointed away from the end of the cable.
- (3) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to dimension A.
Refer to Table 3 and Figure 1.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-3292 COAX CONNECTORS

OUTER JACKET REMOVAL LENGTH

Figure 1

- (4) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the outer jacket equal to dimension B.

Refer to Table 3 and Figure 2.

LENGTH OF THE SHIELD

Figure 2

- (5) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end outer jacket equal to dimension D.

Refer to Table 3 and Figure 3.

DIELECTRIC REMOVAL LENGTH

Figure 3

- (6) Remove the necessary length of the center conductor to make the distance from the end of the conductor to the end of the dielectric equal to dimension C.

Refer to Table 3 and Figure 4.

LENGTH OF THE CENTER CONDUCTOR

Figure 4

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-3292 COAX CONNECTORS

B. Connector Assembly

**Table 4
COAX CONTACT CRIMP TOOLS**

Basic Unit	Die		
	Part Number	Cavity	Dimension (inch)
227-944	-	B	0.100
M22520/5-01	227-1221-57	B	0.100

**Table 5
FERRULE CRIMP TOOLS**

Basic Unit	Die		
	Part Number	Cavity	Dimension (inch)
227-944	-	A	0.213
M22520/5-01	227-1221-57	A	0.213

- (1) Make a selection of a crimp tool from Table 4.
- (2) Make a selection of a ferrule crimp tool from Table 5.
- (3) In this sequence, put these components on the cable:
 - The outer ferrule
 - The cable position insulator
 - The seal ring.
- (4) Put the contact on the center conductor. Refer to Figure 5.

**POSITION OF THE CENTER CONDUCTOR ON THE CABLE
Figure 5**

- (5) Crimp the contact.
Make sure that strands of the center conductor can be seen in the inspection hole.
- (6) Push the crimp barrel of the outer contact rearward between the dielectric and the shield until it stops. Refer to Figure 6.
Make sure that the outer contact is locked in position.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 82-3292 COAX CONNECTORS

POSITION OF THE OUTER CONTACT

Figure 6

(7) Make the shield smooth and symmetrical around the rear end of the crimp barrel.

(8) Move the ferrule forward over the shield. Refer to Figure 7.

Make sure that:

- The seal ring is under the ferrule
- The seal ring is against the shoulder of the outer contact
- The distance from the end of the ferrule to the shoulder of the outer contact is not more than 1/64 inch.

POSITION OF THE FERRULE AGAINST THE OUTER CONTACT

Figure 7

(9) Crimp the ferrule.

20-51-51 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ANDREWS 44ASN AND 40229 COAX CONNECTORS

This subject gives the procedure to assemble the Andrews coax connectors with the specified coax cables.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
COAX CONNECTOR PART NUMBERS**

Part Number	Supplier
44ASN	Andrews
40229	Andrews

B. Coax Cable Part Numbers

**Table 2
COAX CABLE PART NUMBERS**

Part Number	Supplier
FSJ4-50	Andrews

2. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Cable Preparation

- (1) Cut the end of the cable.
Make sure that the end is perpendicular to the longitudinal axis of the cable.
- (2) Remove 1-1/16 inches of the outer jacket from the end of the cable. Refer to Figure 1.

**CABLE PREPARATION
Figure 1**

- (3) Remove 3/16 inch of the outer conductor from the end of the cable.
 - (a) Lightly cut around the circumference of the outer conductor with a serrated knife or an equivalent tool.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE INNER CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (b) Remove any burrs on the outer conductor with a file.
- (4) Remove 3/16 inch of the foam from the end of the cable. Refer to Figure 1.
- (5) Put the gasket on the cable. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF ANDREWS 44ASN AND 40229 COAX CONNECTORS**

Make sure that the groove of the gasket is aligned with the corrugated groove of the outer conductor.

CAUTION: THE GASKET MUST BE AGAINST THE CORRUGATED GROOVE OF THE OUTER CONDUCTOR. A SEAL THAT IS NOT INSTALLED CORRECTLY CAN CAUSE UNSATISFACTORY PERFORMANCE.

POSITION OF THE GASKET ON THE CABLE
Figure 2

- (6) Put a thin layer of silicone grease on:
 - The outside surface of the gasket
 - The inside surface of the clamp nut.
- (7) Put the clamp nut on the cable.

Make sure that the outer conductor is extended 1/16 inch from the end of the clamp nut.
- (8) Cut the edge of the outer conductor approximately 1/16 inch at 12 locations with a pair of fine wire cutters or a knife. Refer to Figure 3.

Make sure that the outer conductor is cut equally and symmetrically around the circumference.

NOTE: If a knife is used to cut the outer conductor, a mallet can be used to lightly hit the back edge of the knife.

LOCATIONS TO CUT THE OUTER CONDUCTOR
Figure 3

- (9) With a rod or an equivalent tool, bend each length between the locations where the outer conductor is cut. Refer to Figure 4.

Make sure that each part of the outer conductor is flat against the end of the clamp nut.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ANDREWS 44ASN AND 40229 COAX CONNECTORS

CAUTION: APPLY ONLY THE SUFFICIENT AMOUNT OF FORCE TO MAKE EACH PART OF THE END OF THE OUTER CONDUCTOR FLAT. THE THICKNESS OF THE METAL MUST NOT DECREASED.

POSITION OF THE END OF THE OUTER CONDUCTOR AGAINST THE CLAMP NUT
Figure 4

- (10) Remove the unwanted parts of the outer conductor.
 Make sure that each end does not extend farther than the outside circumference of the clamp nut.

B. Inner Contact Assembly

- (1) Clean the inner conductor.
- (2) Put the inner contact on the inner conductor. Refer to Figure 5.

INNER CONTACT ASSEMBLY
Figure 5

- (3) Temporarily put the flare ring on the inner conductor.
 Make sure that:
 - The hole with the smaller diameter is pointed toward the cable
 - The rearward surface of the flare ring is flat against the shoulder of the inner contact.
- (4) Remove the flare ring.
- (5) Solder the inner contact.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER. DAMAGE TO THE CABLE CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (6) Immediately remove any unwanted solder.
- (7) Cut the foam dielectric to align the end of the dielectric with the end of the flat end of the outer conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ANDREWS 44ASN AND 40229 COAX CONNECTORS

C. Connector Body Assembly

- (1) Remove the copper particles from the foam dielectric with a small wire brush.
- (2) Put the flare ring over the inner contact. Refer to Figure 6.
Make sure that the hole with the smaller inner diameter is against the outer conductor.

POSITION OF THE FLARE RING AND INSULATOR
Figure 6

- (3) Push the insulator into the inner contact until it makes a click.
- (4) Put the heat shrinkable sleeve on the cable.
- (5) Put a thick layer of silicone grease on the large O-ring gasket.
- (6) Put the O-ring in the groove for the gasket on the clamp nut. Refer to Figure 7.

CONNECTOR BODY ASSEMBLY
Figure 7

- (7) Push the outer body onto the contact assembly.
- (8) Engage the threads of the outer body and the clamp nut.
- (9) Torque the outer body 95 inch-pounds \pm 5 inch-pounds.
NOTE: Hold the clamp nut in position and turn the connector body.
- (10) Push the heat shrinkable sleeve forward until the forward end of the sleeve is 1-5/16 inch from the end of the connector connector body. Refer to Figure 8.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 8

- (11) Shrink the sleeve in position. Refer to Subject 20-10-14.

	A. Cable Preparation	1
	B. Connector Assembly	2

20-51-90 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CABLEWAVE COAX CONNECTORS

This subject gives the procedure to assemble the specified Cablewave coax connectors with the specified coax cables.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
COAX CONNECTOR PART NUMBERS**

Part Number	Supplier
75-500	Cablewave
76-500	Cablewave

B. Coax Cable Part Numbers

**Table 2
COAX CABLE PART NUMBERS**

Part Number	Description	Supplier
64-500	Coax Cable, Aluminum Sheath	Prodelin

2. CONNECTOR ASSEMBLY

Refer to Subject 20-51-00 for the general conditions that are applicable for the assembly of coax connectors.

A. Cable Preparation

- (1) Make a selection of a tube cutting tool with a flat-sided blade.
- (2) Cut through the cable jacket and the outer conductor 1-1/2 inches from the end of the cable. Refer to Figure 1.

Make sure the flat side of the blade is opposite of the end of the cable.

CAUTION: TO PREVENT DEFORMATION OF THE OUTER CONDUCTOR, A FLAT-SIDED BLADE MUST BE USED.

**CABLE JACKET AND OUTER CONDUCTOR REMOVAL
Figure 1**

- (3) Cut the hollow dielectric cores at the end of the outer conductor.
- (4) Remove the sheath and the core.
- (5) Cut the inner conductor 1/2 inch \pm 1/16 inch from the end of the outer conductor. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CABLEWAVE COAX CONNECTORS

INNER CONDUCTOR PREPARATION
Figure 2

- (6) Hold the cable down and file the end of inner conductor to make the radius equal to or more than 1/32 inch.

NOTE: The inner conductor is the center contact.

CAUTION: MAKE SURE THAT NO PARTICLES GO INTO THE HOLLOW DIELECTRIC CORE.

- (7) Cut the outer jacket 2-1/4 inches \pm 1/32 inch from the end of the outer conductor. Refer to Figure 3.
- (8) Remove the jacket.

CAUTION: MAKE SURE THAT DAMAGE TO THE OUTER CONDUCTOR DOES NOT OCCUR WHEN THE JACKET IS REMOVED.

OUTER JACKET REMOVAL LENGTH
Figure 3

B. Connector Assembly

- (1) Put the nut assembly of connector on the cable.
- (2) Put the O-Ring approximately 1/4 inch from of the end of the cable. Refer to Figure 4.

POSITION OF THE O-RING
Figure 4

- (3) Hold the connector body against the end of the cable.
- (4) Engage the threads of the connector body and the nut assembly.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CABLEWAVE COAX CONNECTORS**

- (5) Manually tighten the nut.
- (6) Make one additional turn of the nut with a wrench.

CAUTION: ONLY THE NUT MUST BE TURNED. DO NOT TURN THE CONNECTOR BODY.

- (7) Put a 3 inch to 4 inch length of 1 inch diameter heat shrinkable sleeve on the assembly. Refer to Figure 5.

Make sure that the forward edge of the sleeve is 0 inch to 1/8 inch from the edge of the nut assembly.

**POSITION OF THE HEAT SHRINKABLE SLEEVE****Figure 5**

- (8) Shrink the sleeve in position. Refer to Subject 20-10-14.

707, 727-787

	48	WS 516	J and R Industries	Polysulfide
C	2 (10 Percent Catalyst F)	3110 RTV	Dow Corning	Silicone
	6.5 (10 Percent Catalyst S)	3110 RTV	Dow Corning	Silicone

2. ASSEMBLY OF MIL-C-26482 AND MIL-C-26500 CONNECTORS WITH TRIAX CABLE

This paragraph gives the procedures to assemble connectors with these triax cables:

- Raychem 10363
- Raychem 7524D5011
- Surprenant BA6416A.

A. Connector Assembly with a Straight Heat Shrinkable Boot

This paragraph gives the procedure to assemble the connector with the Raychem 202A132-3-00 heat shrinkable boot.

- (1) Prepare the cable. Refer to Paragraph 2.C.
- (2) Discard the ferrule and the grommet nut if they are supplied with the connector.

NOTE: The ferrule and the grommet nut are not used for assembly of a connector with a heat shrinkable boot.

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH TRIAX CABLE**

- (3) Make a selection of a 500 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (4) For a connector that has a long rubber compression seal, prepare the surfaces of the boot, the connector and the cable that make a bond with an adhesive. Refer to Figure 1 and Paragraph 2.F.

**BOND SURFACE OF A CONNECTOR WITH A LONG RUBBER COMPRESSION SEAL****Figure 1**

- (5) Put the boot on the cable.
(6) Assemble the connector.

Refer to:

- Subject 20-61-16 for the procedures to assemble a MIL-C-26482 type connector
- Subject 20-61-11 for the procedures to assemble a MIL-C-26500 type connector.

- (7) For a connector that that has a long rubber compression seal:
- (a) Make a selection of an adhesive from Table 4.
 - (b) Make a selection of a solvent from Table 4.
 - (c) Apply the adhesive on the bond surface of these components:
 - The boot
 - The connector
 - The cable.

Make sure that the adhesive extends 0.13 inch farther than the bond surface.

- (8) Move the boot into its position on the threads of the connector.

Make sure that the coupling nut can be turned freely.

Refer to:

- Figure 2 for the installation of a boot on a connector that has a short rubber compression seal
- Figure 3 for the installation of a boot on a connector that has a long rubber compression seal.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

INSTALLATION OF A BOOT ON A CONNECTOR THAT HAS A SHORT RUBBER COMPRESSION SEAL

Figure 2

INSTALLATION OF A BOOT ON A CONNECTOR THAT HAS A LONG RUBBER COMPRESSION SEAL

Figure 3

(9) Shrink the boot.

Make sure that:

- The intake air vent on the hot air gun is open
- The hot air gun is at the full operation temperature
- A heat shield is used to give the cable protection from damage
- Heat is applied for no longer than 40 seconds at one time.

(10) If unwanted adhesive is on the boot or the connector, remove the unwanted adhesive immediately with a clean wiper and solvent.

(11) If it is necessary to apply heat again, let the boot cool for 5 minutes before the heat is applied again.

(12) Seal the boot with potting compound. Refer to Paragraph 2.G.

B. Connector Assembly with a 90 Degree Heat Shrinkable Boot

This paragraph gives the procedure to assemble the connector with the Raychem 222A132-3-00 heat shrinkable boot.

(1) Prepare the cable. Refer to Paragraph 2.D.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

- (2) Discard the ferrule and the grommet nut if they are supplied with the connector.

NOTE: The ferrule and the grommet nut are not used for assembly of a connector with a heat shrinkable boot.

- (3) Make a selection of an adhesive from Table 4.
 (4) Make a selection of a 500 degree F hot air gun. Refer to Subject 20-10-14.

NOTE: A reflector is recommended.

- (5) Prepare the boot. Refer to Paragraph 2.E.
 (6) Prepare the surfaces of the boot, the connector, and the cable that make a bond with an adhesive. Refer to Paragraph 2.F.
 (7) Put the boot on the cable.
 (8) Assemble the connector.

Refer to:

- Subject 20-61-16 for the procedures to assemble a MIL-C-26482 type connector
- Subject 20-61-11 for the procedures to assemble a MIL-C-26500 type connector.

- (9) Put the cable or wire harness in an approximate 90 degree position. Refer to Figure 17.
 (10) Apply the adhesive on the bond surface of these components:

- The boot
- The connector
- The cable.

Make sure that the adhesive extends 0.13 inch farther than the bond surface.

- (11) Move the boot into its position on the threads of the connector. Refer to Figure 4.

Make sure that:

- The coupling nut can be turned freely
- The boot assembly is in the correct clock position on the connector.

INSTALLATION OF A 90 DEGREE BOOT
Figure 4

- (12) Shrink the boot.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

Make sure that:

- The intake air vent on the hot air gun is open
- The hot air gun is at the full operation temperature
- A heat shield is used to give the cable protection from damage
- Heat is applied for no longer than 40 seconds at one time.

- (13) Remove the unwanted adhesive immediately with a clean wiper and solvent.
- (14) If it is necessary to apply heat again, let the boot cool for 5 minutes before the heat is applied again.
- (15) Seal the boot with potting compound. Refer to Paragraph 2.G.

C. Cable Preparation for Assembly with a Straight Heat Shrinkable Boot

- (1) Remove 1-15/16 inches \pm 1/16 inch of the outer jacket of the cable.
- (2) Install a shield ground wire to the outer shield at the end of the outer jacket.
Use mechanical ferrules. Refer to Figure 5 and Subject 20-10-15.
- (3) Remove the necessary length of the inner jacket so that the edge of the jacket is 5/32 inch \pm 1/32 inch from the ferrule on the outer shield.

Refer to Figure 5.

TERMINATION OF THE OUTER SHIELD
Figure 5

- (4) Install a shield ground wire to the inner shield.
Use mechanical ferrules. Refer to Figure 6 and Subject 20-10-15.
- (5) Remove the necessary length of the dielectric so that the edge of the dielectric is 7/32 inch \pm 1/32 inch from the ferrule on the inner shield.

Refer to Figure 6.

TERMINATION OF THE INNER SHIELD
Figure 6

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

- (6) Put a 3/8 inch \pm 1/16 inch length of 3/32 inch diameter heat shrinkable sleeve over the center conductor. Refer to Figure 7.

Make sure that the sleeve touches the end of the dielectric.

POSITION OF THE FIRST SLEEVE
Figure 7

- (7) Shrink the sleeve in position.
- (8) Put a 7/16 inch \pm 1/16 inch length of 3/32 inch diameter of heat shrinkable sleeve on the dielectric and the first sleeve. Refer to Figure 8.

Make sure that the sleeve touches the ferrule of the inner shield.

POSITION OF THE SECOND SLEEVE
Figure 8

- (9) Shrink the sleeve in position.
- (10) Put a 1-1/2 inch \pm 1/4 inch length of 1/4 inch heat shrinkable sleeve on the outer shield termination. Refer to Figure 9.

POSITION OF THE SLEEVE ON THE OUTER SHIELD TERMINATION
Figure 9

- (11) Shrink the sleeve in position.
- (12) Fold the center conductor back on itself so that the end of the conductor is 3/16 inch \pm 1/32 inch from the end of the sleeve. Refer to Figure 10.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

CONDUCTOR FOLDED BACK
Figure 10

D. Cable Preparation for Assembly with a 90 Degree Heat Shrinkable Boot

- (1) Remove 1-15/16 inches $\pm 1/16$ inch of the outer jacket of the cable.
- (2) Install a shield ground wire to the outer shield at the end of the outer jacket.
Use mechanical ferrules. Refer to Figure 11 and Subject 20-10-15.
- (3) Remove the necessary length of the inner jacket so that the edge of the jacket is 5/32 inch $\pm 1/32$ inch from the ferrule on the outer shield.
Refer to Figure 11.

TERMINATION OF THE OUTER SHIELD
Figure 11

- (4) Install a shield ground wire to the inner shield.
Use mechanical ferrules. Refer to Figure 12 and Subject 20-10-15.
- (5) Remove the necessary length of the dielectric so that the edge of the dielectric is 7/32 inch $\pm 1/32$ inch from the ferrule on the inner shield.
Refer to Figure 12.

TERMINATION OF THE INNER SHIELD
Figure 12

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

- (6) Put a 3/8 inch \pm 1/16 inch length of 3/32 inch diameter heat shrinkable sleeve over the center conductor. Refer to Figure 13.

Make sure that the sleeve touches the end of the dielectric.

POSITION OF THE FIRST SLEEVE

Figure 13

- (7) Shrink the sleeve in position.
- (8) Put a 7/16 inch \pm 1/16 inch length of 3/32 inch diameter of heat shrinkable sleeve on the dielectric and the first sleeve. Refer to Figure 14.

Make sure that the sleeve touches the ferrule of the inner shield.

POSITION OF THE SECOND SLEEVE

Figure 14

- (9) Shrink the sleeve in position.
- (10) Put a 1/2 inch \pm 1/16 inch length of 1/4 inch heat shrinkable sleeve on the second shield ferrule and the inner jacket. Refer to Figure 15.

Make sure that the sleeve is against the outer shield ferrule.

INSTALLATION OF INSULATION ON THE SHIELD TERMINATION

Figure 15

- (11) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

- (12) Put a 1-1/2 inch \pm 1/4 inch length of 3/8 inch heat shrinkable sleeve on the inner shield termination. Refer to Figure 15.
- (13) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (14) Fold the center conductor back on itself so that the end of the conductor is 3/16 inch \pm 1/32 inch from the end of the sleeve. Refer to Figure 16.

CONDUCTOR FOLDED BACK

Figure 16

E. Boot Preparation for a 90 Degree Heat Shrinkable Boot

For the conditions that are applicable to this procedure, refer to Paragraph 2.B.

PREPARATION OF A 90 DEGREE BOOT

Figure 17

Refer to Figure 17.

- (1) Put a 1/4 to 5/16 inch diameter rod approximately 0.5 inch into the square cut end of the boot. Refer to Figure 17.
- (2) Shrink the boot on the rod.
- (3) Let the boot cool.
- (4) Remove the rod from the boot.
- (5) For a connector that has a short rubber compression seal, do Step (1) through Step (4) again for the slant cut end of the boot. Refer to

F. Bond Surface Preparation

For the conditions that are applicable for this procedure, refer to Paragraph 2.B.

- (1) Make a selection of an aliphatic naphtha from Table 4.

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH TRIAX CABLE**

- (2) Prepare the surfaces of the boot that must make a bond with the adhesive.
 - (a) Wind a piece of emery cloth around an applicable rod or tool.
 - (b) Make the bond surfaces rough.
 - (c) Shake the loose particles out of the boot.
 - (d) Clean the bond surfaces with a clean wiper and naphtha.
 - (e) Dry the boot with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE BOOT. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (3) Clean the other surfaces that must make a bond with the adhesive.
 - (a) Clean the bond surfaces of the connector threads with a clean wiper and naphtha.
 - (b) Dry the connector with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE CONNECTOR. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (c) Clean the bond surface on the cable with a clean wiper and naphtha.
Make sure to clean the insulation the cable approximately 1 inch farther than the bond surface.
- (d) Dry the insulation with a wiper immediately.

CAUTION: DO NOT LET THE NAPHTHA DRY ON THE INSULATION. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

G. Seal of the Boot with Potting Compound

For the conditions that are applicable for this procedure, refer to Paragraph 2.B.

- (1) Make a selection of a potting compound from Table 6.
- (2) If the potting compound is a silicone compound, make a selection of a catalyst from Table 4.
Refer to the manufacturer's instructions to mix the compound with the catalyst.
- (3) Fill the boot assembly with potting compound.
Make sure that air is not caught in the boot.

NOTE: To make a continuous flow of the potting compound, a constant pressure is recommended.

- (4) Lightly tap the boot on a solid surface or shake the boot to release air that is caught in the boot.
- (5) Let the potting compound cure for the specified time. Refer to Table 6.

3. ASSEMBLY OF AMPHENOL 83-59 RIGHT ANGLE UHF CONNECTORS WITH TRIAX CABLE

This paragraph gives the procedures assemble an Amphenol 83-185 cable adapter with these triax cables:

- Raychem 7524D5011
- Surprenant BA6416A.

A. Cable Preparation

- (1) Put the 83-185 cable adapter on the cable.
Make sure that the small end is toward the end of the cable.
- (2) Cut the cable so that the end of the cable is perpendicular with its longitudinal axis.
- (3) Remove 7/8 inch to 5/16 inch of the outer jacket from the end of the cable.

20-53-05

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH TRIAX CABLE**

- (4) Align the edge of the adapter with the edge of the outer jacket.
- (5) Open the outer shield braid and separate the strands.
- (6) Fold the shield strands back over the end of the adapter.
Make sure that the strands are applied evenly around the adapter.
- (7) Remove 27/32 inch to 29/32 inch of the inner jacket.
- (8) Open the inner shield braid and separate the strands.
- (9) Fold the shield strands back over the end of the adapter. Refer to Figure 18.
Make sure the strands are applied evenly around the adapter.

**POSITION OF THE INNER SHIELD****Figure 18**

- (10) Solder the shield strands to the adapter.
- (11) Remove the ends of the strands at the first thread of the adapter. Refer to Figure 19.

**TERMINATION OF THE INNER SHIELD****Figure 19**

- (12) Remove 5/8 inch to 11/16 inch of dielectric from the end of the cable.
- (13) Cut the conductor so that the end of the conductor is 1/8 inch to 3/16 inch for the end of the dielectric.

B. Connector Assembly

- (1) Remove the connector cap screw.
- (2) Align the slot of the contact with the cable axis.
- (3) Hold the shoulder of the adapter with pair of padded pliers.
- (4) Turn the connector body on the adapter.
Make sure to guide the center conductor into the slot of the pin.
- (5) Tighten the adapter on the body of the connector.
- (6) Solder the shield strands to the body of the connector through the four solder holes.
Make sure to:
 - Use only the necessary quantity of solder
 - Apply only the necessary amount of heat.
- (7) Solder the conductor in the slot of the connector pin.
- (8) Tighten the connector cap screws.

20-53-05

STANDARD WIRING PRACTICES MANUAL

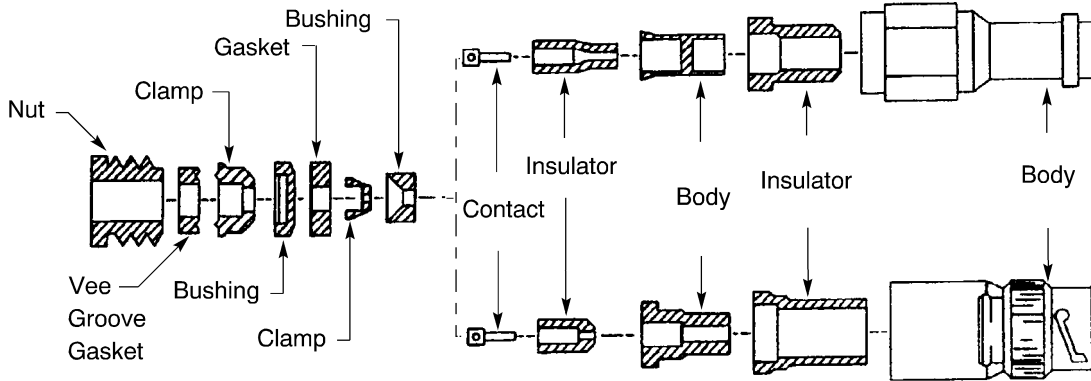

CONNECTOR ASSEMBLY WITH TRIAX CABLE

4. ASSEMBLY OF DAGE 30382-1 AND 30391-1 CONNECTORS WITH TRIAX CABLE

This paragraph gives the procedures to assemble the connectors with these triax cables:

- Raychem 10363
- Raychem 7524D5011
- Surprenant BA6416A.

A. Connector Description

DAGE 30382-1 AND 30391-1 CONNECTORS

Figure 20

B. Cable Preparation

Refer to Figure 20.

- (1) Cut the cable so that the end is perpendicular to its longitudinal axis.
- (2) Remove 1 inch \pm 1/16 inch of the outer jacket of the cable. Refer to Figure 21.

OUTER JACKET REMOVAL LENGTH

Figure 21

- (3) Open the shield braid and separate the strands.

CAUTION: DO NOT REMOVE THE PLATING ON THE SHIELD STRANDS.

- (4) Remove an additional 1/8 inch \pm 1/16 inch of the cable so that shield strands extend past the end of the cable. Refer to Figure 22.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

OUTER SHIELD STRANDS EXTENDED PAST THE END OF THE CABLE

Figure 22

- (5) Put tape on the braid so the connector components can be moved over the shield strands.
- (6) In order, put these components over the tapes strands of the shield:
 - The nut
 - The vee groove gasket
 - The clamp.

Make sure that:

- The vee of the gasket is turned toward the clamp
- The inner shoulder of the clamp is tight against the end of the jacket.

Refer to Figure 23.

POSITION OF THE NUT, THE GASKET, AND THE CLAMP

Figure 23

- (7) Remove the necessary length of the taped strands of the shield so that the distance from the end of the strands to the clamp is $5/32 \text{ inch} \pm 1/32 \text{ inch}$.

Refer to Figure 24.

LENGTH OF THE TAPED STRANDS OF THE SHIELD

Figure 24

- (8) Remove the tape from the shield strands.
- (9) Fold the shield strands back over the clamp. Refer to Figure 25.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

SHIELD STRANDS FOLDED BACK OVER THE CLAMP

Figure 25

- (10) Put the bushing and the gasket on the cable and push them until the bushing is against the shield strands. Refer to Figure 26.

POSITION OF THE BUSHING AND THE GASKET

Figure 26

- (11) Remove the necessary length of the inner jacket so that the end of the jacket is 3/64 inch + 0 inch, -1/32 inch from the gasket. Refer to Figure 27.

LENGTH OF THE BARE INNER JACKET

Figure 27

- (12) Open the inner shield and separate the strands.
- (13) Remove 1/8 inch ± 1/16 inch from the end of the conductor so that the strands of the shield extend past the end of the cable. Refer to Figure 28.

CAUTION: DO NOT REMOVE THE PLATING ON THE SHIELD STRANDS.

INNER SHIELD STRANDS EXTENDED PAST THE END OF THE CABLE

Figure 28

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH TRIAX CABLE**

- (14) Put tape on the braid so the connector components can be moved over the shield strands.
- (15) Put the clamp on the cable and over the inner shield so that the shoulder of the clamp is tight against the end of the inner jacket. Refer to Figure 29.

**CLAMP POSITION OVER THE INNER SHIELD****Figure 29**

- (16) Remove the tape from the shield strands.
- (17) Fold the shield strands back over the clamp. Refer to Figure 30.

**STRANDS OF THE INNER SHIELD FOLDED OVER THE CLAMP****Figure 30**

- (18) Remove the unwanted length of the shield strands. Refer to Figure 30.
- (19) Put the small bushing on the cable so that the bushing is tight against the shield strands. Refer to Figure 31.

**POSITION OF THE BUSHING****Figure 31**

- (20) Remove the necessary length of the dielectric so that the end of the dielectric is $5/64$ inch $\pm 1/32$ inch from the bushing. Refer to Figure 32.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

LENGTH OF THE BARE DIELECTRIC

Figure 32

- (21) Remove the necessary length of the conductor so that the end of the conductor is 5/64 inch \pm 1/32 inch from the end of the dielectric.

Refer to Figure 33.

LENGTH OF THE BARE CONDUCTOR

Figure 33

C. Contact Assembly

ASSEMBLED CONTACT

Figure 34

- (1) Solder the contact to the conductor. Refer to Figure 34.

CAUTION: DO NOT APPLY TOO MUCH HEAT. THE DIELECTRIC WILL NOT ENTER THE INSULATOR PROPERLY.

- (2) Remove any unwanted solder.

STANDARD WIRING PRACTICES MANUAL**CONNECTOR ASSEMBLY WITH TRIAX CABLE****D. Connector Assembly**

CONNECTOR ASSEMBLY
Figure 35

- (1) Put the assembled contact into the connector body. Refer to Figure 35.
Make sure the gasket is against the sharp edge of the clamp.
- (2) Torque the nut 45 inch-pounds \pm 5 inch-pounds.

5. ASSEMBLY OF KINGS 1965-12-9 CONNECTORS WITH TRIAX CABLE

This paragraph gives the procedure to assemble the Kings 1965-12-9 connector with a Raychem 7524D5011 triax cable.

20-53-05Page 18
Feb 01/2008

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

A. Connector Description

KINGS 1965-12-9 TRIAX CONNECTOR
Figure 36

B. Cable Preparation

Refer to Figure 36.

- (1) Cut the cable so that the end is perpendicular to its longitudinal axis.
- (2) In order, put these components on the cable:
 - The clamp nut
 - The washer
 - The gasket.
- (3) Remove 11/16 inch \pm 1/64 inch of the outer jacket of the cable. Refer to Figure 37.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

OUTER JACKET REMOVAL LENGTH

Figure 37

- (4) Put the outer jacket shield clamp over the outer shield and against the edge of the outer jacket.
- (5) Use a non-metallic pick to open the outer shield braid and separate the strands.
- (6) Fold the shield strands back over the clamp. Refer to Figure 38.

STRANDS OF THE OUTER SHIELD FOLDED OVER THE CLAMP

Figure 38

- (7) Remove the unwanted length of the shield strands. Refer to Figure 38.
- (8) Put the retainer and the insulator on the cable against the shield strands.
- (9) Remove the necessary length of the inner jacket so that the end of the jacket is 3/32 inch, - 0 inch, + 1/64 inch from the insulator. Refer to Figure 39.

LENGTH OF THE BARE INNER JACKET

Figure 39

- (10) Put the inner jacket shield clamp over the inner shield and against the edge of the inner jacket.
- (11) Use a non-metallic pick to open the inner shield braid and separate the strands.
- (12) Fold the shield strands back over the clamp. Refer to Figure 40.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

STRANDS OF THE INNER SHIELD FOLDED OVER THE CLAMP

Figure 40

- (13) Remove the unwanted length of the shield strands. Refer to Figure 40.
- (14) Put the inner washer on the cable against the shield strands.
- (15) Remove the necessary length of the dielectric so that the end of the dielectric is 0.210 inch from the washer. Refer to Figure 41.

Make sure that the length of the bare conductor is $3/32$ inch $\pm 1/64$ inch.

LENGTH OF THE BARE DIELECTRIC AND THE BARE CONDUCTOR

Figure 41

C. Contact Assembly

- (1) Solder the contact to the center conductor. Refer to Figure 42.

CONTACT SOLDERED TO THE CENTER CONDUCTOR

Figure 42

D. Connector Assembly

- (1) In order, put these components over the center contact:
 - The inner insulator
 - The inner shield contact
 - The outer insulator.
- (2) Put the assembled contact in the connector body. Refer to Figure 43.

STANDARD WIRING PRACTICES MANUAL

CONNECTOR ASSEMBLY WITH TRIAX CABLE

CONNECTOR ASSEMBLY
Figure 43

- (3) Turn the clamp nut to tighten the assembled contact in the connector body.
- (4) Torque the clamp nut 45 inch-pounds \pm 5 inch-pounds.

20-60-00 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

This Subject gives the procedures for the assembly of a connector contact with a wire that is smaller than the size of the contact crimp barrel.

1. GENERAL CONDITIONS

A. Size of the Contact Crimp Barrel and the Wire

If the size of the wire conductor is smaller than the size of the contact crimp barrel, it is possible that the size of the conductor must be adjusted.

These are alternative configurations of the contact assembly:

- The conductor is folded back on itself; refer to Paragraph 2.A.
- One or more filler wires are installed adjacent to the conductor; refer to Paragraph 2.B.
- An eyelet is installed in the contact crimp barrel; refer to Paragraph 2.C.

2. CONTACT ASSEMBLY WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

A. Contact Assembly with a Conductor That Is Folded Back

**Table 1
APPLICABLE CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Necessary Data for the Selection of a Crimp Tool	
		Adjusted Wire Size (AWG)	Crimp Barrel Size
24	16	20	16
22	16	20	16
20	12	14	12
18	12	14	12

- (1) Find the insulation removal length for the specified contact. Refer to the Subject that is applicable for the assembly of the connector.

Make sure that the insulation removal length is the length that is specified for:

- The crimp barrel size of the contact
- A wire size that is the same size as the size of the crimp barrel.

- (2) Multiply the insulation removal length by two.

NOTE: This becomes the necessary length of insulation to remove.

- (3) Remove the necessary length of insulation from the end of the wire.

Refer to Figure 1 and Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

CAUTION: MAKE SURE THAT THE END OF THE INSULATION IS EQUAL AND SYMMETRICAL AROUND THE CIRCUMFERENCE OF THE CONDUCTOR. UNWANTED INSULATION IN THE CRIMP JOINT CAN INCREASE THE ELECTRICAL RESISTANCE.

CAUTION: MAKE SURE THAT THE BASE METAL OF THE CONDUCTOR CANNOT BE SEEN. CORROSION OF THE CONDUCTOR CAN OCCUR.

INSULATION REMOVAL LENGTH
Figure 1

(4) Fold the conductor back. Refer to Figure 2.

Make sure that the distance from the end of the insulation to the end of the conductor is 1/2 of the length of the insulation that is removed.

CONDUCTOR FOLDED BACK
Figure 2

(5) Make a selection of a contact crimp tool.

Refer to:

- Table 1
- The Subject that is applicable for the assembly of the connector.

Make sure that the crimp tool from the applicable Subject for the connector is a tool that is specified for:

- The adjusted wire size that is specified for the selection of a crimp tool in Table 1
- The crimp barrel size that is specified for the selection of a crimp tool in Table 1.

(6) Make the necessary adjustment of the crimp tool setting.

Make sure that the setting is applicable for the adjusted wire size that is specified for the selection of a crimp tool in Table 1.

(7) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 3.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 3

(8) Crimp the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Contact Assembly with Filler Wire

Table 2
APPLICABLE CONTACT CRIMP TOOLS AND FILLER WIRE

Wire Size (AWG)	Crimp Barrel Size	Filler Wire		Necessary Data for the Selection of a Crimp Tool	
		Quantity	Wire Size (AWG)	Adjusted Wire Size (AWG)	Crimp Barrel Size
24	16	1	18	16	16
22	16	1	18	16	16
20	12	2	16	12	12
	8	4	14	8	8
18	12	1	14	12	12
	8	4	14	8	8
16	8	4	14	8	8
14	8	2	12	8	8
12	8	2	12	8	8
10	8	3	16	8	8

- (1) Find the quantity and size of filler wire that are applicable for the wire size and crimp barrel size in Table 2.
- (2) Find the insulation removal length for the specified contact. Refer to the Subject that is applicable for the assembly of the connector.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE**

Make sure that the insulation removal length is the length that is specified for:

- The crimp barrel size of the contact
- A wire size that is the same size as the size of the crimp barrel.

NOTE: This length is the necessary length of insulation to remove.

- (3) Remove the necessary length of insulation from the end of the wire and the end of each filler wire. Refer to Figure 4 and Subject 20-00-15.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

CAUTION: MAKE SURE THAT THE END OF THE INSULATION IS EQUAL AND SYMMETRICAL AROUND THE CIRCUMFERENCE OF THE CONDUCTOR. UNWANTED INSULATION IN THE CRIMP JOINT CAN INCREASE THE ELECTRICAL RESISTANCE.

CAUTION: MAKE SURE THAT THE BASE METAL OF THE CONDUCTOR CANNOT BE SEEN. CORROSION OF THE CONDUCTOR CAN OCCUR.

INSULATION REMOVAL LENGTH

Figure 4

- (4) Make a selection of a contact crimp tool.

Refer to:

- Table 2
- The Subject that is applicable for the assembly of the connector.

Make sure that the crimp tool from the applicable Subject for the connector is a tool that is specified for:

- The adjusted wire size that is specified for the selection of a crimp tool in Table 2
- The crimp barrel size that is specified for the selection of a crimp tool in Table 2.

- (5) Make the necessary adjustment of the crimp tool setting.

Make sure that the setting is applicable for the adjusted wire size that is specified for the selection of a crimp tool in Table 2.

- (6) Put the end of the wire and the end of each filler wire in the crimp barrel of the contact. Refer to Figure 5.

NOTE: If it is possible, put the primary wire in the center of the crimp barrel.

Make sure that:

- All of the strands of each conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation of the primary wire to the end of the crimp barrel is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

POSITION OF THE WIRE AND THE FILLER WIRES IN THE CRIMP BARREL
Figure 5

(7) Crimp the contact.

Make sure that:

- All of the strands of each conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation of the primary wire to the end of the crimp barrel is not more than 0.03 inch.

(8) Remove the unwanted length of the filler wires as close as possible to the end of the crimp barrel. Refer to Figure 6.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE PRIMARY WIRE. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 6

C. Contact Assembly with an Eyelet

Table 3
APPLICABLE CONTACT CRIMP TOOLS AND EYELETS

Wire Size (AWG)	Crimp Barrel Size	Eyelet	Necessary Data for the Selection of a Crimp Tool		
			Adjusted Wire Size (AWG)	Crimp Barrel Size	Special Instructions
24	16	CE46FC	20	16	-
		Y-6015-C	20	16	-
	12	CE66FC	14	12	Fold the conductor back
		Y-9015-C	14	12	Fold the conductor back

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE

Table 3 (continued)

Wire Size (AWG)	Crimp Barrel Size	Eyelet	Necessary Data for the Selection of a Crimp Tool		
			Adjusted Wire Size (AWG)	Crimp Barrel Size	Special Instructions
22	16	CE46FC	20	16	-
		Y-6015-C	20	16	-
	12	CE66FC	14	12	Fold the conductor back
		Y-9015-C	14	12	Fold the conductor back
20	12	CE66FC	14	12	-
		Y-9015-C	14	12	-
18	12	CE66FC	14	12	-
		Y-9015-C	14	12	-

**Table 4
EYELET PART NUMBERS**

Part Number	Plating Material	Supplier
CE46FC	Gold	Circon
CE66FC	Gold	Circon
Y-6015-C	Gold	International Eyelets
Y-9015-C	Gold	International Eyelets

- (1) Make a selection of the applicable eyelet from Table 3.
- (2) Find the insulation removal length for the specified contact. Refer to the Subject that is applicable for the assembly of the connector.
 Make sure that the insulation removal length is the length that is specified for:
 - The crimp barrel size of the contact
 - A wire size that is the same size as the size of the crimp barrel.

NOTE: If a folded back conductor is not specified in Table 3, this length is the necessary length of insulation to remove.
- (3) If a folded back conductor is specified in Table 3, multiply the insulation removal length by two.

NOTE: This becomes the necessary length of insulation to remove.
- (4) Remove the necessary length of insulation from the end of the wire.
 Refer to Figure 7 and Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE**

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

CAUTION: MAKE SURE THAT THE END OF THE INSULATION IS EQUAL AND SYMMETRICAL AROUND THE CIRCUMFERENCE OF THE CONDUCTOR. UNWANTED INSULATION IN THE CRIMP JOINT CAN INCREASE THE ELECTRICAL RESISTANCE.

CAUTION: MAKE SURE THAT THE BASE METAL OF THE CONDUCTOR CANNOT BE SEEN. CORROSION OF THE CONDUCTOR CAN OCCUR.

**INSULATION REMOVAL LENGTH****Figure 7**

- (5) If a folded back conductor is specified in Table 3, fold the conductor back. Refer to Figure 8. Make sure that the distance from the end of the insulation to the end of the conductor is $1/2$ of the length of the insulation that is removed.

**CONDUCTOR FOLDED BACK****Figure 8**

- (6) Make a selection of a contact crimp tool.
- Refer to:
- Table 3
 - The Subject that is applicable for the assembly of the connector.
- Make sure that the crimp tool from the applicable Subject for the connector is a tool that is specified for:
- The adjusted wire size that is specified for the selection of a crimp tool in Table 3
 - The crimp barrel size that is specified for the selection of a crimp tool in Table 3.
- (7) Make the necessary adjustment of the crimp tool setting.
- Make sure that the setting is applicable for the adjusted wire size that is specified for the selection of a crimp tool in Table 3.
- (8) Put the eyelet in the crimp barrel of the contact.
- Make sure that the shoulder of the eyelet is against the end of the crimp barrel.
- (9) Put the end of the wire in the eyelet. Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTOR CONTACTS WITH THE ADJUSTMENT OF THE CONDUCTOR SIZE**

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the shoulder of the eyelet is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL

Figure 9

(10) Crimp the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the shoulder of the eyelet is not more that 0.03 inch.

20-60-01 CONTENTS

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

This Subject gives procedures to clean an electrical connector when the connector has too much contamination on the connector interface, but the replacement of the connector is not necessary.

1. GENERAL DATA**A. Recommended Solvents**

In order, the recommended solvents to clean all electrical connectors are:

- Isopropyl alcohol
- Methyl alcohol
- Acetone.

NOTE: When a fast turnaround is necessary, high temperature connectors can be cleaned with the recommended procedure to clean general purpose connectors with acetone. Refer to Paragraph 3.B.

Before any solvent is used, obey:

- The local environmental regulations
- The local necessary conditions for personnel safety.

NOTE: The solvents must only be used for authorized or approved purposes.

B. Conditions of Inspection

After an inspection:

- The connector must be replaced if the steel bayonet pins on the receptacle shell are worn
- The contacts must be replaced if the contacts are worn.

C. Personnel Safety

To make sure that the solvent does not touch the skin, any of these items can be used if they do not permit the solvent to touch the skin:

- Aprons
- Boots
- Coveralls
- Neoprene gloves
- Rubber gloves.

To make sure that the solvent does not touch an eye, any of these items can be used:

- Chemical goggles
- Approved eye protection.

To make sure that the solvent vapors do not get breathed, any of these conditions must occur:

- The area has a good air flow
- Respiratory protection is used.

D. Fire Safety Precautions

Refer to Subject 20-00-10 for the precautions in relation to the electrical power of the circuits.

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

These conditions are applicable in an area where there are flammable solvents or vapors:

- All flames, smoking, sparks, and other sources of ignition must not occur
- Tools that are used must not make sparks
- Clothing, materials, or processes that can make electrostatic discharges must not be used
- All electrical equipment, such as lights, motors, wiring, etc., must meet the necessary electrical and fire codes
- The accumulation of vapors must be prevented by sufficient ventilation.
- Flammable solvents must be kept in closed containers
- Only the sufficient quantity of a flammable solvent must be used or kept near.

2. CLEANING OF GENERAL PURPOSE CONNECTORS WITH METHYL OR ISOPROPYL ALCOHOL

WARNING: METHYL ALCOHOL AND ISOPROPYL ALCOHOL ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY ON HAND IS NO MORE THAN IS NECESSARY TO CLEAN THE CONNECTOR.

A. Necessary Materials and Tools

These are the necessary tools and materials:

- Alcohol, either methyl or isopropyl
- A small, fine brush that is long enough to reach the bottom of the connector and has bristles that are not affected by methyl or isopropyl alcohol
- Swabs that do not have any lint
- An container of the sufficient size to catch any solvent
- Compressed air or nitrogen that is clean and dry.

B. Connector Cleaning with Methyl or Isopropyl Alcohol

- (1) Separate the plug and the receptacle.
- (2) Clean each connector:
 - (a) Apply the alcohol with a brush or swab.
 - (b) Brush the face of the connector until the contaminants have been dissolved.
 - (c) Flush the face of the connector with the sufficient quantity of alcohol to remove the contamination.
 - (d) Let the connector dry in the air for one hour.

When it is possible, put the connector in a position so that it is not fully on its side to let the solvent drain.

NOTE: A satisfactory alternative to decrease the time that is necessary for the connector to dry is to use compressed air or nitrogen.

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN THE DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

CAUTION: THE CONNECTOR MUST BE FULLY DRY BEFORE THE PLUG IS INSTALLED. ANY REMAINING SOLVENT CAN CAUSE DAMAGE TO THE CONNECTOR OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM, OR BOTH.

- (3) Install the connectors again. Refer to the applicable maintenance manual.

NOTE: To make the installation easier, a silicone lubricant compound can be applied to the inner O-ring.

CAUTION: DO NOT PUT SILICONE LUBRICANT ON THE CONNECTOR INSERT OR THE CONTACTS. SILICONE CONTAMINATION CAUSES UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (4) Do the necessary functional tests.

3. CLEANING OF GENERAL PURPOSE CONNECTORS WITH ACETONE

WARNING: ACETONE IS VERY FLAMMABLE. MAKE SURE THAT THE QUANTITY ON HAND IS NO MORE THAN 0.25 PINT (0.125 LITER) IN A CLOSED, ONE PINT (0.5 LITER) SQUEEZE CONTAINER.

A. Necessary Materials and Tools

These are the necessary tools and materials:

- 0.25 pint (0.125 liter) of acetone
- A closed, one pint (0.5 liter) squeeze container
- A small, fine brush that is long enough to reach the bottom of the connector and has bristles that are not affected by acetone
- Swabs that do not have any lint
- An container of the sufficient size to catch any solvent
- Compressed air or nitrogen that is clean and dry.

B. Connector Cleaning with Acetone

- (1) Separate the plug and the receptacle.

WARNING: DO NOT SEPARATE THE CONNECTORS UNTIL THE TEMPERATURE IS LESS THAN 150 DEGREES F (65 DEGREES C). DAMAGE TO THE PLUG OR THE RECEPTACLE, OR BOTH CAN OCCUR.

CAUTION: DO NOT SEPARATE THE CONNECTORS UNTIL THE TEMPERATURE IS SUFFICIENTLY COOL ENOUGH, APPROXIMATELY 100 DEGREES F (28 DEGREES C), TO TOUCH WITH BARE HANDS.

- (2) Clean each connector:

- (a) Put 3 cc to 5 cc of acetone into the connector with the squeeze container.

WARNING: DO NOT PERMIT ANY DROPS OF ACETONE TO FALL ON THE ENGINE.

- (b) Brush the face of the connector until all of the contamination has been loosened.
(c) Let any remaining solvent drain from the connector into a container.
(d) Remove the unwanted solvent in the container from the work area.

20-60-01

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

- (e) Flush the connector with no more than 5 cc of the solvent to remove the thin film of contamination from the connector.

Make sure to catch the solvent in the container.

- (f) Remove the unwanted solvent in the container from the work area.
(g) If the connector has any remaining contamination, do Step (e) again.
(h) Dry the connector with compressed air or nitrogen.

Make sure the inside of the socket contacts and the inserts around the socket contacts are fully dry.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN THE DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

CAUTION: THE CONNECTOR MUST BE FULLY DRY BEFORE THE PLUG IS INSTALLED. ANY REMAINING SOLVENT CAN CAUSE DAMAGE TO THE CONNECTOR OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM, OR BOTH.

- (3) Install the connectors again. Refer to the applicable maintenance manual.

NOTE: To make the installation easier, a silicone lubricant compound can be applied to the inner O-ring.

CAUTION: DO NOT PUT SILICONE LUBRICANT ON THE CONNECTOR INSERT OR THE CONTACTS. SILICONE CONTAMINATION CAUSES UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (4) Do the necessary functional tests.

4. CLEANING OF WALTER KIDDE FIRE DETECTION SYSTEM CONNECTORS**A. General Conditions for Connector Cleaning**

Before any plug and receptacle in the sensing element loop are connected, they must be free from contamination.

These conditions are applicable for connectors with contamination:

- If it is thought that the connector is contaminated, the connector must be cleaned with acetone or alcohol; refer to Paragraph 4.D. or Paragraph 4.C.
- If any of the connectors in the fire detection system show possible contamination from liquids, the connector must be cleaned with acetone or alcohol; refer to Paragraph 4.D. or Paragraph 4.C.
- Whenever the flex cable connector has been disconnected, the sensing element connectors must be inspected and, if it is necessary, cleaned.

These conditions are applicable for connectors with corrosion:

- If the internal part of a connector shows corrosion or does not have the correct color, the connector must be cleaned with a grit blast; refer to Paragraph 4.E.
- If the connector is connected to the aircraft wiring, it is possible that it is better to replace it with a new connector
- If the connector is part of a sensing element, it possible that it is better to replace the sensing element with a serviceable spare and clean the connector in the maintenance facility.

20-60-01

STANDARD WIRING PRACTICES MANUAL

CLEANING OF ELECTRICAL CONNECTORS

B. Necessary Materials

CAUTION: ONLY THOSE CLEANERS SPECIFIED IN TABLE 1 CAN BE USED. OTHER SOLVENTS, ESPECIALLY ANY THAT ARE MADE WITH CHLORIDES MUST NOT BE USED.

**Table 1
NECESSARY MATERIALS**

Material	Part Number or Specification	Supplier
Acetone	-	Any source
Alcohol, Isopropyl	-	Any source
Alcohol, Methyl	-	Any source
Contact, Hooded Socket	802508	Walter Kidde
Grit, 100 Mesh Aluminum Oxide	AEX 602	Hunter Associates
Grit Blast Kit	Model AEC-K	Hunter Associates
Lubricant, Silicone	DC-4	Dow Chemical
	MIL-S-8660	QPL

NOTE: The grit blast kit has the sufficient quantity of aluminum oxide abrasive to clean approximately ten connectors.

C. Connector Cleaning with Methyl or Isopropyl Alcohol

This procedure is used to clean a connector if there is contamination from oil or other solutions in the connector cavity.

WARNING: METHYL ALCOHOL AND ISOPROPYL ALCOHOL ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY ON HAND IS NO MORE THAN IS NECESSARY TO CLEAN THE CONNECTOR.

- (1) Separate the plug and the receptacle.
- (2) If it is necessary, remove the hooded socket contact:
 - (a) Carefully pull the contact out with a small pair of needle nose pliers.
 - (b) Discard the contact; it cannot be used again.
- (3) Clean each connector:
 - (a) Apply the alcohol with a brush or swab.
 - (b) Brush the applicable surface of the connector until all of the contamination has been loosened.
 - (c) Flush the face of the connector with the sufficient quantity of alcohol to remove the contamination.
 - (d) Let the connector dry in the air for one hour.

When it is possible, put the connector in a position so that it is not fully on its side to let the solvent drain.

NOTE: A satisfactory alternative to decrease the time that is necessary for the connector to dry is to use compressed air or nitrogen.

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN THE DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

CAUTION: THE CONNECTOR MUST BE FULLY DRY BEFORE THE PLUG IS INSTALLED. ANY REMAINING SOLVENT CAN CAUSE DAMAGE TO THE CONNECTOR OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM, OR BOTH.

D. Connector Cleaning with Acetone

This procedure is used to clean a connector if there is contamination from oil or other solutions in the connector cavity.

WARNING: ACETONE IS VERY FLAMMABLE. MAKE SURE THAT THE QUANTITY ON HAND IS NO MORE THAN 0.25 PINT (0.125 LITER) IN A CLOSED, ONE PINT (0.5 LITER) SQUEEZE CONTAINER.

- (1) Separate the plug and the receptacle.
- (2) If it is necessary, remove the hooded socket contact:
 - (a) Carefully pull the contact out with a small pair of needle nose pliers.
 - (b) Discard the contact; it cannot be used again.
- (3) Clean each connector:
 - (a) Put 3 cc to 5 cc of acetone into the connector with the squeeze container.
 - (b) Brush the face of the connector until all of the contamination has been loosened.
 - (c) Let any remaining solvent drain from the connector into a container.
 - (d) Remove the unwanted solvent in the container from the work area.
 - (e) Flush the connector with no more than 5 cc of the solvent to remove the thin film of contamination from the connector.

Make sure to catch the solvent in the container.

- (f) Remove the unwanted solvent in the container from the work area.
- (g) If the connector has any remaining contamination, do Step (e) again.
- (h) Dry the connector with compressed air or nitrogen.

Make sure the inside of the socket contacts and the inserts around the socket contacts are fully dry.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN THE DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

CAUTION: THE CONNECTOR MUST BE FULLY DRY BEFORE THE PLUG IS INSTALLED. ANY REMAINING SOLVENT CAN CAUSE DAMAGE TO THE CONNECTOR OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM, OR BOTH.

E. Connector Cleaning with Grit Blast

A grit blast gun:

- Can be used to clean a connector either on or off the aircraft
- Is used to clean a connector with corrosion or heavy contamination.

20-60-01

STANDARD WIRING PRACTICES MANUAL**CLEANING OF ELECTRICAL CONNECTORS**

WARNING: THE GRIT BLAST GUN MUST BE USED ONLY IN AREAS WITH SUFFICIENT VENTILATION. A RESPIRATOR WITH A DUST FILTER AND EYE PROTECTION MUST BE WORN BY THE OPERATOR SO THAT THE OPERATOR DOES NOT BREATHE THE ALUMINUM OXIDE DUST.

CAUTION: DUST FROM THE GRIT BLAST GUN IS ABRASIVE. OBEY THESE PRECAUTIONS:

- PUT A COVER ON OR REMOVE THE ACTUATOR RODS OR ANY OTHER POLISHED FINISHES
- KEEP THE COVER ON THE OIL TANK SCUPPER IN ORDER TO PREVENT CONTAMINATION OF THE ENGINE OIL SYSTEM.

- (1) Separate the plug and the receptacle.
- (2) If it is necessary, remove the hooded socket contact:
 - (a) Carefully pull the contact out with a small pair of needle nose pliers.
 - (b) Discard the contact; it cannot be used again.
- (3) Clean each connector:
 - (a) With a fine tool, carefully scrape away as much of the corrosion as possible.
 - (b) Attach the source of clean, dry compressed air or nitrogen to the grit blast gun.
 - (c) Set the air pressure of the grit blast gun at 20 psi to 25 psi.
 - (d) Clean the internal part of the connector with the grit blast.
Make sure to clean the bottom of the connector and around the base of the pin.
 - (e) Flush the connector with acetone or methyl alcohol.
 - (f) Dry the connector with compressed air or nitrogen.

WARNING: COMPRESSED GAS CAN BE DANGEROUS. TO PREVENT AN INJURY, CAREFULLY APPLY THE GAS IN THE DIRECTION AWAY FROM THE EYES, THE FACE, AND OTHER PERSONNEL.

CAUTION: THE CONNECTOR MUST BE FULLY DRY BEFORE THE PLUG IS INSTALLED. ANY REMAINING SOLVENT CAN CAUSE DAMAGE TO THE CONNECTOR OR UNSATISFACTORY PERFORMANCE OF THE SYSTEM, OR BOTH.

F. Connector Installation

- (1) After the connector is cleaned, install a new hooded socket contact, if it was removed:
 - (a) Putt the glazed end of the hooded socket contact on a 0.060 maximum diameter pin.
 - (b) Push the unglazed end onto the connector pin until it touches the bottom.
- (2) Install the plug in the receptacle to make the environmental seal.

CAUTION: IT IS ABSOLUTELY NECESSARY THAT THE ENVIRONMENTAL SEAL IS MADE.

- (a) Put a very light layer of silicone lubricant on the copper sealing gasket of the plug connector.

CAUTION: DO NOT PUT SILICONE LUBRICANT ON THE CONNECTOR INSERT OR THE CONTACTS. SILICONE CONTAMINATION CAUSES UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (b) Push the nose of the plug connector into the threaded bushing of the receptacle.
- (c) Engage the threads of the nut and the threaded bushing.

20-60-01

707, 727-787

STANDARD WIRING PRACTICES MANUAL

CLEANING OF ELECTRICAL CONNECTORS

(d) Torque the nut approximately 50 inch-pounds to 70 inch-pounds.

NOTE: Use two wrenches to so that the connectors do not turn.

(3) Do the fire detection cockpit test.

B. Replacement of a Contact	1

20-60-02 CONTENTS

STANDARD WIRING PRACTICES MANUAL**REPLACEMENT OF CONTACTS****1. CONTACT REPLACEMENT****A. General Conditions**

The replacement of a contact on a wire in a wire harness can occur a minimum of two times before the wire does not have sufficient length.

B. Replacement of a Contact

- (1) If applicable, remove the contact from the connector. Refer to the applicable Subject for the connector.
- (2) Cut the wire near the end:
 - The solder cup for solder type contacts
 - The crimp barrel for crimp type contacts.

Make sure to keep as much length of the wire as possible.

Refer to:

- Figure 1 for a contact without a wire insulation grip
- Figure 2 for a contact with a wire insulation grip.

**CONTACT WITHOUT A WIRE INSULATION GRIP****Figure 1****CONTACT WITH A WIRE INSULATION GRIP****Figure 2**

- (3) Assemble a new contact. Refer to the applicable Subject for the connector.

CAUTION: DO NOT CRIMP THE AREA OF A CONDUCTOR THAT HAS BEEN CRIMPED BEFORE. UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE CRIMP JOINT CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

This subject gives the procedures to:

- Give special protection to a replacement connector
- Give special protection to a connector at some time after the initial protection.

1. GENERAL DATA

A. **Applicable Connectors**

Connectors that must have special protection are specified in:

- The Aircraft Maintenance Manual
- The applicable Service Bulletin or Service Letter.

CAUTION: THE SPECIAL PROTECTION OF CONNECTORS IS APPLICABLE ONLY FOR THE CONNECTORS IDENTIFIED IN THE AIRCRAFT MAINTENANCE MANUAL, THE SERVICE BULLETINS OR THE SERVICE LETTER.

The applicable Service Bulletins and Service Letter are:

- SB 737-26-1112
- SB 737-26-1114
- SB 737-24A1148
- SB 737-24-1149
- SL 737-24-171.

CAUTION: IF THE PROTECTION FROM CORROSION IS NOT SUFFICIENT, DAMAGE TO THE CONNECTOR OCCURS.

B. **Necessary Intervals for Special Protection**

Special protection must be applied to a connector:

- Again if the protection is removed or is not sufficient
- Again if the plug and receptacle are disconnected
- At specified intervals. Refer to Table 1.

Table 1
SPECIAL PROTECTION INTERVALS

Service Document	Interval
SB 737-26-1112	-
SB 737-26-1114	-
SB 737-24A1148	12 Months
SB 737-24-1149	12 Months
SL 737-24-171	24 Months

20-60-03

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

C. Necessary Conditions for Personal Safety

These conditions are applicable when you use a corrosion inhibiting compound:

- The conditions for personal safety specified by the manufacturer must be obeyed
- The necessary local conditions for personal safety must be obeyed
- A corrosion inhibiting compound must not touch the skin or the eyes
- The fumes from a corrosion inhibiting compound must not be breathed.

It is recommended to use this personal protection equipment:

- Nitrile or latex rubber gloves
- Protective clothes
- Respiratory protection
- Chemical goggles or approved eye protection.

D. Necessary Conditions for Fire Safety

These conditions are applicable when you use a corrosion inhibiting compound:

- The conditions for fire safety specified by the manufacturer must be obeyed
- The necessary local conditions for fire safety must be obeyed
- The material must be kept in an approved closed container
- Only the quantity of material that is necessary to give protection to the connectors must be kept near the airplane
- The airplane must be electrostatically grounded; refer to the Aircraft Maintenance Manual.

For more safety practices, refer to Subject 20-00-10.

E. Necessary Materials and Tools

WARNING: CORROSION INHIBITING COMPOUNDS CAN BE DANGEROUS TO THE HEALTH. THE INSTRUCTIONS FROM THE MANUFACTURER SPECIFY THE NECESSARY SAFETY CONDITIONS. IF THE SPECIFIED CONDITIONS ARE NOT OBEYED, INJURY TO A PERSON CAN OCCUR.

WARNING: CORROSION INHIBITING COMPOUNDS ARE FLAMMABLE. THE INSTRUCTIONS FROM THE MANUFACTURER OF THE MATERIAL SPECIFY THE NECESSARY SAFETY CONDITIONS. IF THE SPECIFIED CONDITIONS ARE NOT OBEYED, INJURY TO A PERSON CAN OCCUR.

CAUTION: CORROSION INHIBITING COMPOUNDS ARE FLAMMABLE. THE INSTRUCTIONS FROM THE MANUFACTURER OF THE MATERIAL SPECIFY THE NECESSARY SAFETY CONDITIONS. IF THE SPECIFIED CONDITIONS ARE NOT OBEYED, DAMAGE TO EQUIPMENT CAN OCCUR.

2. INSPECTION FOR CORROSION

A. Connector Assembly Inspection

- (1) If it is necessary to remove dirt or other contamination to examine the surfaces for corrosion, clean the connector. Refer to Subject 20-10-04.
 Make sure that you only remove contamination that prevents the inspection of the connector for corrosion. Do not remove the corrosion or corrosion products at this time.
- (2) Disconnect the backshell. Refer to the applicable connector subject.
NOTE: Corrosion can make the operation of the backshell threads or coupling mechanism impossible.
- (3) Find the damage condition and the repair condition of the operation of the backshell threads and the coupling mechanism. Refer to Table 8.
- (4) Examine the internal and the external surfaces of the backshell for:
 - Corrosion material
 - Damage to the plated finish
 - Damage to the base metal
 - Damage to the threads.
- (5) Find the damage conditions and the repair conditions of the internal and external surfaces of the backshell. Refer to Table 8.
- (6) Examine the external surface of the connector for:
 - Corrosion material
 - Damage to the plated finish
 - Damage to the base metal
 - Damage to the threads or coupling mechanism.
- (7) Find the damage conditions and the repair conditions of the external surface of the connector. Refer to Table 6.

20-60-03

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

- (8) Disconnect the plug and the receptacle. Refer to the applicable subject for the connector.
NOTE: Corrosion can make the operation of the connector coupling mechanism impossible.
- (9) Find the damage condition and the repair condition of the connector coupling mechanism. Refer to Table 6.
- (10) Examine the internal surface of the connector shell for:
 - Corrosion materials
 - Damage to the plated finish
 - Damage to the base metal.
- (11) Examine the connector contacts for:
 - Base metal that can be seen
 - Blue-green deposits
 - Black stains or red stains
 - Pits in the base metal.
- (12) Examine the connector for moisture.
- (13) Find the damage condition and the repair condition for the internal surfaces of the connector. Refer to Table 7.

B. Damage Conditions and Repair Conditions

**Table 6
DAMAGE AND REPAIR CONDITIONS - CONNECTOR EXTERNAL SURFACES**

Type of Damage	Damage Condition	Repair Condition	Reference
Layer of corrosion material	A heavy layer of white corrosion materials in most areas	Replacement of the connector	The applicable subject for the connector
	A medium layer of white corrosion materials in some areas	Protection of the external surface with corrosion inhibiting compound	Paragraph 3.C.
			Paragraph 5.C.
A light layer of white corrosion materials in some areas	Protection of the external surface with corrosion inhibiting compound	Paragraph 3.C. Paragraph 5.C.	
Damage to the plated finish on the shell	The color of the finish is completely gone in the areas with corrosion	Replacement of the connector	The applicable subject for the connector
	The color of the finish is faded in some areas	Protection of the external surface with corrosion inhibiting compound	Paragraph 3.C.
Paragraph 5.C.			
Damage to the base metal of the shell	Many pits or holes in the connector shell	Replacement of the connector	The applicable subject for the connector
	Some pits in the connector shell	Protection of the external surface with corrosion inhibiting compound	Paragraph 3.C. Paragraph 5.C.

	The threads engage and disengage easily	Protection of the external surface with corrosion inhibiting compound	Paragraph 3.C.
			Paragraph 5.C.

3. CONNECTORS THAT CONNECT TO AN LRU

A. Applicable Conditions

Corrosion inhibiting compound must be applied to a connector:

- That is a replacement of a connector that has protection with corrosion inhibiting compound
- Again if the plug and the receptacle that have protection with corrosion inhibiting compound are disconnected
- Again if the corrosion inhibiting compound is removed or is not sufficient
- At specified intervals. Refer to Table 1.

CAUTION: PROTECTION WITH CORROSION INHIBITING COMPOUND MUST BE SUFFICIENT. IF THE PROTECTION FROM CORROSION IS NOT SUFFICIENT, DAMAGE TO THE CONNECTOR CAN OCCUR.

B. Protection of the Engaging Face

- (1) Clean the internal surfaces of the connector with isopropyl alcohol. Refer to Subject 20-60-01.
- (2) Make a selection of a corrosion inhibiting compound from Table 2.
- (3) If the corrosion inhibiting compound is not in an aerosol can, make a selection of equipment that can be used to apply the compound as a spray from Table 5.
- (4) Apply the compound to the engaging face of the connector as a spray. Refer to Figure 1.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The metal surfaces on the engaging face of the connector
- The rubber grommet
- The ground springs.

NOTE: It is not necessary to remove the corrosion inhibiting compound that gets on the contacts.

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

DIRECTION TO APPLY A SPRAY
Figure 1

- (a) Hold the nozzle 4 to 8 inches away from the engaging face of the connector approximately at a 20 degree angle from the longitudinal axis of the connector.
 - (b) Apply the compound across the engaging face with sprays of 2 seconds to 4 seconds.
 - (c) Move the nozzle direction approximately 120 degrees around the engaging face of the connector.
- NOTE:** As an alternative, the connector can be turned approximately 120 degrees.
- (d) Do Step (a) through Step (c) again.
 - (e) Do Step (a) through Step (b) again.
- (5) Do Step (4) again for the other engaging face of the connector.
 - (6) Let the connector dry in the air for a minimum of 20 minutes before it is assembled.

CAUTION: THE CONNECTOR MUST GIVEN PROTECTION FROM CONTAMINATION AFTER THE CORROSION INHIBITING COMPOUND IS APPLIED. CONTAMINATION IN THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

C. Protection of the External Surface

APPLICATION OF THE CORROSION INHIBITING COMPOUND
Figure 2

STANDARD WIRING PRACTICES MANUAL**SPECIAL PROTECTION OF ELECTRICAL CONNECTORS**

Refer to Figure 2.

CAUTION: THE NECESSARY BOND TESTS MUST BE DONE BEFORE THE CORROSION INHIBITING COMPOUND IS APPLIED.

CAUTION: THE NECESSARY OPERATIONAL TESTS MUST BE DONE BEFORE THE CORROSION INHIBITING COMPOUND IS APPLIED.

- (1) If the plug and receptacle are not connected, connect them. Refer to the applicable Subject for the connector and the Aircraft Maintenance Manual.
- (2) Clean the external surfaces of the connector with isopropyl alcohol. Refer to Subject 20-10-04.
- (3) Make a selection of a corrosion inhibiting compound from Table 3.
- (4) Make a selection of equipment that can be used to apply the compound as a spray from Table 5.
- (5) Apply compound to the external surface of the connector from the side of the connector until drops of the compound start to fall from the connector.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The connector shell
- The backshell.

CAUTION: NONE OF THE CORROSION INHIBITING COMPOUND MUST BE REMOVED. DAMAGE TO THE CONNECTOR FROM CORROSION CAN OCCUR.

- (a) Hold the nozzle 4 inches to 8 inches away from the side of the connector.
- (b) Apply the compound across the connector with sprays of 2 seconds to 4 seconds.
- (c) Move the nozzle approximately 120 degrees around the outer surface of the connector.
NOTE: As an alternative, the connector can be turned approximately 120 degrees.
- (d) Do Step (a) through Step (c) again.
- (e) Do Step (a) through Step (b) again.
- (6) Apply compound to the external surface of the connector from the rear of the connector until drops of the compound start to fall from the connector.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The connector shell
- The backshell
- The rubber grommet
- The terminal lugs.

CAUTION: NONE OF THE CORROSION INHIBITING COMPOUND MUST BE REMOVED. DAMAGE TO THE CONNECTOR FROM CORROSION CAN OCCUR.

- (a) Hold the nozzle 4 inches to 8 inches away from the rear of the connector approximately at a 45 degree angle from the longitudinal axis of the connector.
- (b) Apply the compound across the connector and the backshell with sprays of 2 seconds to 4 seconds.
- (c) Move the nozzle approximately 120 degrees around the connector.

NOTE: As an alternative, the connector can be turned approximately 120 degrees.

- (d) Do Step (a) through Step (c) again.

20-60-03

STANDARD WIRING PRACTICES MANUAL**SPECIAL PROTECTION OF ELECTRICAL CONNECTORS**

(e) Do Step (a) through Step (b) again.

4. FENWAL CONNECTORS**A. Necessary Conditions**

Insulating compound must be applied to a connector:

- If the connector is a replacement of a connector that has protection with insulating compound
- Again if the compound is removed or is not sufficient.

CAUTION: IF THE PROTECTION FROM CORROSION WITH INSULATING COMPOUND IS NOT SUFFICIENT, DAMAGE TO THE CONNECTOR CAN OCCUR.

B. Protection of the Engaging Face

- (1) Make a selection of an insulating compound from Table 4.
- (2) Fill a syringe or an equivalent tool with the insulating compound.
- (3) Fill the inner surfaces of the connector full with insulating compound. Refer to Figure 3.

Make sure to fully fill these areas:

- The space between the sleeve and the contact pin
- The socket of the detector element
- The space between the socket and the threaded shell on the detector element connector.

CAUTION: THE CONNECTOR MUST BE ASSEMBLED OR GIVEN PROTECTION FROM CONTAMINATION AFTER THE INSULATING COMPOUND IS APPLIED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

PROTECTION OF THE CONNECTOR
Figure 3

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

5. OTHER CONNECTORS

A. Applicable Conditions

Corrosion inhibiting compound must be applied to a connector:

- That is a replacement of a connector that has protection with corrosion inhibiting compound
- Again if the plug and the receptacle that have protection with corrosion inhibiting compound are disconnected
- Again if the corrosion inhibiting compound is removed or is not sufficient
- At specified intervals. Refer to Table 1.

CAUTION: PROTECTION WITH CORROSION INHIBITING COMPOUND MUST BE SUFFICIENT. IF THE PROTECTION FROM CORROSION IS NOT SUFFICIENT, DAMAGE TO THE CONNECTOR CAN OCCUR.

B. Protection of the Engaging Face

- (1) Clean the internal surfaces of the connector using isopropyl alcohol. Refer to Subject 20-60-01.
- (2) Make a selection of a corrosion inhibiting compound from Table 2.
- (3) If the corrosion inhibiting compound is not in an aerosol can, make a selection of equipment that can be used to apply the compound as a spray from Table 5.
- (4) Apply the compound to the engaging face of the connector as a spray. Refer to Figure 4.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The metal surfaces on the engaging face of the connector
- The rubber grommet
- The ground springs.

NOTE: It is not necessary to remove the corrosion inhibiting compound that gets on the contacts.

DIRECTION TO APPLY A SPRAY
Figure 4

- (a) Hold the nozzle 4 inches to 8 inches away from the engaging face of the connector approximately at a 20 degree angle from the longitudinal axis of the connector.
- (b) Apply the compound across the engaging face with sprays of 2 seconds to 4 seconds.

STANDARD WIRING PRACTICES MANUAL

SPECIAL PROTECTION OF ELECTRICAL CONNECTORS

- (c) Move the nozzle direction approximately 120 degrees around the engaging face of the connector.

NOTE: As an alternative, the connector can be turned approximately 120 degrees.

- (d) Do Step (a) through Step (c) again.
- (e) Do Step (a) through Step (b) again.
- (5) Do Step (4) again for the other engaging face of the connector.
- (6) Let the connector dry in the air for a minimum of 20 minutes before it is assembled.

CAUTION: THE CONNECTOR MUST GIVEN PROTECTION FROM CONTAMINATION AFTER THE CORROSION INHIBITING COMPOUND IS APPLIED. CONTAMINATION IN THE CONNECTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

C. Protection of the External Surface

APPLICATION OF THE CORROSION INHIBITING COMPOUND

Figure 5

Refer to Figure 5.

CAUTION: THE NECESSARY BOND TESTS MUST BE DONE BEFORE THE CORROSION INHIBITING COMPOUND IS APPLIED.

CAUTION: THE NECESSARY OPERATIONAL TESTS MUST BE DONE BEFORE THE CORROSION INHIBITING COMPOUND IS APPLIED.

- (1) If the plug and receptacle are not connected, connect them. Refer to the applicable Subject for the connector.
- (2) Clean the external surfaces of the connector using Isopropyl Alcohol. Refer to Subject 20-60-01.
- (3) Make a selection of a corrosion inhibiting compound from Table 3.
- (4) Make a selection of equipment that can be used to apply the compound as a spray from Table 5.
- (5) Apply compound to the external surface of the connector from the side of the connector until drops of the compound start to fall from the connector.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The connector shell
- The backshell.

STANDARD WIRING PRACTICES MANUAL**SPECIAL PROTECTION OF ELECTRICAL CONNECTORS**

CAUTION: NONE OF THE CORROSION INHIBITING COMPOUND MUST BE REMOVED. DAMAGE TO THE CONNECTOR FROM CORROSION CAN OCCUR.

- (a) Hold the nozzle 4 inches to 8 inches away from the side of the connector.
 - (b) Apply the compound across the connector with sprays of 2 seconds to 4 seconds.
 - (c) Move the nozzle approximately 120 degrees around the outer surface of the connector.
 - (d) Do Step (a) through Step (c) again.
 - (e) Do Step (a) through Step (b) again.
- (6) Apply compound to the external surface of the connector from the rear of the connector until drops of the compound start to fall from the connector.

Make sure that a layer of compound is fully applied on each of these surfaces:

- The connector shells
- The backshells
- The rubber grommets
- The terminal lugs.

CAUTION: NONE OF THE CORROSION INHIBITING COMPOUND MUST BE REMOVED. DAMAGE TO THE CONNECTOR FROM CORROSION CAN OCCUR.

- (a) Hold the nozzle 4 inches to 8 inches away from the rear of the connector approximately at a 45 degree angle from the longitudinal axis of the connector.
 - (b) Apply the compound across the connector and the backshell with sprays of 2 seconds to 4 seconds.
 - (c) Move the nozzle approximately 120 degrees around the connector.
- NOTE:** As an alternative, the connector can be turned approximately 120 degrees.
- (d) Do Step (a) through Step (c) again.
 - (e) Do Step (a) through Step (b) again.

6. REPLACEMENT OF CONNECTORS**A. Replacement of Connectors that Connect to an LRU**

- (1) Clean the connector.
Refer to:
 - Subject 20-10-04 for the procedures to clean the external surfaces of a connector
 - Subject 20-60-01 for the procedures to clean the internal surfaces of a connector.
- (2) Disassemble the connector. Refer to the applicable Subject for the connector.
- (3) Clean the contacts. Refer to Subject 20-60-01.
- (4) Examine these wire harness components:
 - The contacts
 - The backshell
 - The wires.
- (5) Replace or repair a component that has damage. Refer to the applicable Subject for the component.
- (6) Assemble the new connector. Refer to the applicable Subject for the connector.
- (7) Apply corrosion inhibiting compound on the engaging faces of the connector. Refer to Paragraph 3.B.

20-60-03

STANDARD WIRING PRACTICES MANUAL**SPECIAL PROTECTION OF ELECTRICAL CONNECTORS**

CAUTION: THE CONNECTOR MUST BE ASSEMBLED OR GIVEN PROTECTION FROM CONTAMINATION AFTER THE CORROSION INHIBITING COMPOUND IS APPLIED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (8) Connect the connector to the LRU. Refer to the applicable Subject for the connector and the Aircraft Maintenance Manual.
- (9) After the connector is connected to the LRU, apply corrosion inhibiting compound on the external surface of the connector. Refer to Paragraph 3.C.

B. Replacement of a Fenwal Connector

- (1) Disassemble the connector. Refer to Subject 20-62-14.
- (2) Assemble the new connector. Refer to Subject 20-62-14.
- (3) Apply insulation compound on the engaging faces of the connector and the detector element. Refer to Paragraph 4.B.

CAUTION: THE CONNECTOR MUST BE ASSEMBLED OR GIVEN PROTECTION FROM CONTAMINATION AFTER THE INSULATING COMPOUND IS APPLIED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (4) After the connector is connected to the detector element, remove the insulating compound that is on the outer surface of the connector.

C. Replacement of Other Connectors

- (1) Clean the connector.

Refer to:

- Subject 20-10-04 for the procedures to clean the external surfaces of a connector
- Subject 20-60-01 for the procedures to clean the internal surfaces of a connector.

- (2) Disassemble the connector. Refer to the applicable Subject for the connector.
- (3) Clean the contacts. Refer to Subject 20-60-01.
- (4) Examine these wire harness components:
 - The contacts
 - The backshell
 - The wires.
- (5) Replace or repair a component that has damage. Refer to the applicable Subject for the component.
- (6) Assemble the new connector. Refer to the applicable Subject for the connector.
- (7) Apply corrosion inhibiting compound on the engaging faces of the connector. Refer to Paragraph 5.B.

CAUTION: THE CONNECTOR MUST BE ASSEMBLED OR GIVEN PROTECTION FROM CONTAMINATION AFTER THE CORROSION INHIBITING COMPOUND IS APPLIED. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (8) Connect the plug and the receptacle. Refer to the applicable Subject for the connector.
- (9) Apply corrosion inhibiting compound on the external surface of the connector. Refer to Paragraph 5.C.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

1. CIRCULAR CONNECTOR INSTALLATION TOOLS

A. Tool Part Numbers

NOTE: The tools given in Table 1 are:

- Used to install connectors and connector hardware
- Designed to be used in the field.

**Table 1
CIRCULAR CONNECTOR TOOLS**

Part Number	Description	Supplier	Special Instructions
600-006	Backshell Assembly Tool	Glenair	-
G77015	Replacement Jaws	Glenair	For TG69 pliers
M83507/15-0	Circular Connector Tool Kit	Glenair	-
TG69	Universal Soft Jaw Pliers	Glenair	For medium size connector shells
TG70	Mini Strap Wrench	Glenair	For small, threaded connectors
TG80	Circular Connector Tool Kit	Glenair	-

2. INSTALLATION OF RECEPTACLE CONNECTORS

A. General Conditions

For firewall receptacles, refer to Paragraph 2.B.

Receptacles must be installed with:

- The installation hardware in Table 2
- The screws located in 2 diagonally opposite installation holes
- The heads of the screws on the same side as the related plug
- The major keyway in the UP or FORWARD position, if it is not specified differently.

An adapter plate:

- Is not used when the shield of a cable is terminated through the connector or the cable clamp, or both
- Must have a conductive finish for a coax connector.

Refer to Paragraph 6. for the procedure to install an adapter plate.

**Table 2
NECESSARY INSTALLATION HARDWARE FOR RECEPTACLES**

Hardware	Quantity	Specification or Standard	Supplier	Special Instructions
Nut	2	BACN10NW1	QPL	Clip Nut

Screw	2	NAS1801-04	QPL	-
Washer	2	AN960-D4L	QPL	Installed under the screw head; necessary only in unpressurized areas

20-60-06

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

B. Firewall Receptacles

Firewall receptacles must be installed with:

- The installation hardware in Table 3
- The screws located in the 4 installation holes
- A layer of primer and sealant from Table 4 on the applicable surfaces of the connector flange
- The major keyway in the UP or FORWARD position, if it is not specified differently.

**Table 3
NECESSARY INSTALLATION HARDWARE FOR FIREWALL RECEPTACLES**

Hardware	Quantity	Specification or Standard	Supplier	Special Instructions
Locknut	4	BACN10JC()C	QPL	-
Screw	4	NAS1801-04	QPL	-

Material	Part Number	Supplier
Primer	DAPCO1-100	D Aircraft Products Company
Sealant	DAPCOCAST 18-4	D Aircraft Products Company

C. Electrical Bonds

An electrical bond is necessary for:

- Receptacles that are installed on disconnect brackets and are attached to plugs that have specified torque values
- Engine firewall disconnects.

Refer to Subject 20-20-00.

3. INSTALLATION OF FEEDTHROUGH CONNECTORS

- (1) Make a selection of an abrasive from Table 7.
- (2) Make a selection of a cleaning solvent from Table 8.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (3) Make a selection of a sealant that is applicable for an electrical connector shell bond. Refer to Subject 20-20-00.
- (4) Make a selection of a torque wrench, breaker bar, connector socket tool and box end wrench tool from Table 12.
- (5) Prepare the faying surface on the pressurized side of the structure. Refer to Subject 20-20-00. Make sure that the abrasive cleaning method is used.
- (6) Clean the faying surfaces of the structure with solvent and a clean wiper.
 - (a) Dispense solvent onto a clean wiper.
 - (b) Rub the faying surface with the solvent soaked wiper.
 - (c) When the wiper is dirty, replace it with a clean wiper.
 - (d) Do Step (a) through Step (c) again until the wiper is clean.
 - (e) Immediately dry the surface with another clean cloth.
- (7) Clean the faying surface of the connector with solvent and a clean wiper.
- (8) Apply a thin layer of sealant on the surface of the connector flange that will be against the structure.
- (9) From the pressurized side of the structure, align the flat spot on the connector with the flat spot in the cutout.
- (10) Insert the connector through the structure from the pressurized side of the structure. Refer to Figure 4.

Make sure that the pin contacts are on the pressurized side of the structure.

CONNECTOR INSTALLATION
Figure 4

- (11) Apply a thin layer of sealant on the surface of the thrust washer that will be against the structure.
- (12) Put the thrust washer on the unpressurized side of the connector. Refer to Figure 4.

Make sure that the sealant on the thrust washer is against the structure.
- (13) On the unpressurized side of the structure, engage the threads of the panel nut with the threads of the connector. Refer to Figure 4.
- (14) Tighten the panel nut with the hand.
- (15) Remove the excess sealant from the thrust washer.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (16) On the unpressurized side of the structure, put the connector socket tool into the feedthrough connector.
- (17) Engage the box end wrench on the connector panel nut.
- (18) Torque the connector panel nut to 144 inch pounds.
- (19) Use the connector socket tool and breaker bar tool to align the connector flat spot with the cutout flat spot.
 - (a) Turn the connector clockwise and record the wrench position at the point of resistance.
 - (b) Turn the connector counter clockwise and record the wrench position at the point of resistance.
 - (c) Turn the connector to the point in the middle of the two recorded positions.
- (20) Hold the connector and, at the same time, torque the panel nut to 600 inch pounds.

CAUTION: DO NOT ALLOW THE FLAT SPOTS ON THE CONNECTOR AND THE CUTOUT IN THE STRUCTURE TO HOLD THE CONNECTOR WHILE THE PANEL NUT IS TIGHTENED. DAMAGE TO THE CONNECTOR OR THE STRUCTURE CAN OCCUR.

- (21) Remove the connector socket tool and box end wrench tool.
- (22) Do a test of the electrical resistance between the connector shell and the structure. Refer to Subject 20-20-00.
- (23) Apply a fillet seal on the pressurized side of the connector.
Make sure that the fillet seal is applied between the edge of the connector flange and the structure.
- (24) Apply the fillet seals on the unpressurized side of the connector.
 - (a) Apply a fillet seal between the structure and the thrust washer.
 - (b) Apply a fillet seal between the thrust washer and the edge of the panel nut.
 - (c) Apply a fillet seal between the edge of the panel nut and the connector.
- (25) If the area of the structure adjacent to the connector has bare metal:
 - (a) Make a selection of a primer from Table 9.
 - (b) Apply the primer to the bare metal on the pressurized side of the structure.
 - (c) Apply the primer to the bare metal on the unpressurized side of the structure.

D. Feedthrough Connector Installation - BACC63CR() Flange Mount

**Table 13

Screw	NAS1801-()-()	4	An available source
Washer	NAS1149D()J	4	An available source

- (1) Make a selection of an abrasive from Table 7.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (2) Make a selection of a cleaning solvent from Table 8.
- (3) Make a selection of a chemical conversion coat material from Table 9.
- (4) Make a selection of a sealant that is applicable for an electrical connector shell bond. Refer to Subject 20-20-00.
- (5) Make a selection of a torque wrench from Table 13.
- (6) Prepare the faying surface of the structure that touches the connector flange. Refer to Figure 5 and Subject 20-20-00.

Make sure that the abrasive cleaning method is used.

LOCATION OF THE FAYING SURFACES

Figure 5

- (7) Prepare the faying surfaces of the structure for each screw. Refer to Figure 5 and Subject 20-20-00. Make sure that the abrasive cleaning method is used.
- (8) Clean the faying surfaces on the structure.
 - (a) Dispense solvent onto a clean wiper.
 - (b) Rub the faying surface with the solvent soaked wiper.
 - (c) When the wiper is dirty, replace it with a clean wiper.
 - (d) Do Step (a) through Step (c) again until the wiper is clean.
- (9) Apply the chemical conversion coat material to the faying surface that touches the connector flange.

CAUTION: DO NOT APPLY CHEMICAL CONVERSION COAT MATERIAL TO THE CLEANED AREA THAT TOUCHES THE SCREW HEAD AND WASHER. THESE AREAS MUST BE BARE ALUMINUM.

- (10) Clean each side of the connector flange with solvent and a clean wiper.
- (11) Align and insert the connector through the cutout from the pressurized side of the structure. Refer to Figure 6.

Make sure that the pin contacts are on the pressurized side of the structure.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

CONNECTOR INSTALLATION
Figure 6

- (12) Put a washer on each mounting screw. Refer to Figure 6.
- (13) Fully engage the threads of the mounting screws and the threads of the clinch nuts.
- (14) Torque the screws 9 inch-pounds to 12 inch-pounds.
- (15) Do a test of the electrical resistance between the connector shell and the structure. Refer to Subject 20-20-00.
- (16) Apply a fillet seal to the pressurized side of the connector.
 - (a) Apply a fillet seal between the edge of the connector flange and the structure.
 - (b) Apply a fillet seal to the clinch nuts.
 - (c) Apply a fillet seal to the screw threads.

NOTE: It is permitted to encapsulate the clinch nuts and screw threads with sealant.
- (17) Apply a fillet seal to the unpressurized side of the connector.
 - (a) Apply a fillet seal between the connector shell and the structure.
 - (b) Apply a fillet seal to the screw heads and washers.

NOTE: It is permitted to encapsulate the screw heads and washers with sealant.
- (18) If the area adjacent to the connector has bare metal:
 - (a) Make a selection of a primer from Table 9.
 - (b) Apply the primer to the bare metal on the pressurized side of the structure.
 - (c) Apply the primer to the bare metal on the unpressurized side of the structure.

- (1) Make a selection of an abrasive from Table 7.
- (2) Make a selection of a cleaning solvent from Table 8.
- (3) Make a selection of a chemical conversion coat material from Table 9.
- (4) Make a selection of a sealant that is applicable for an electrical connector shell bond. Refer to Subject 20-20-00.
- (5) Make a selection of a torque wrench from Table 15.
- (6) Prepare the faying surface of the structure that touches the connector flange. Refer to Figure 7 and Subject 20-20-00.

Make sure that the abrasive cleaning method is used.

**LOCATION OF THE FAYING SURFACES
Figure 7**

- (7) Prepare the faying surfaces of the structure for each screw. Refer to Figure 7 and Subject 20-20-00. Make sure that the abrasive cleaning method is used.
- (8) Clean the faying surfaces on the structure.

20-60-06

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (a) Dispense solvent onto a clean wiper.
- (b) Rub the faying surface with the solvent soaked wiper.
- (c) When the wiper is dirty, replace it with a clean wiper.
- (d) Do Step (a) through Step (c) again until the wiper is clean.
- (9) Apply the chemical conversion coat material to the faying surface that touches the connector flange.

CAUTION: DO NOT APPLY CHEMICAL CONVERSION COAT MATERIAL TO THE CLEANED AREA THAT TOUCHES THE SCREW HEAD AND WASHER. THESE AREAS MUST BE BARE ALUMINUM.

- (10) Clean each side of the connector flange with solvent and a clean wiper.
- (11) Align and insert the connector through the cutout from the pressurized side of the structure. Refer to Figure 8.

Make sure that the pin contacts are on the pressurized side of the structure.

CONNECTOR INSTALLATION
Figure 8

- (12) Put a washer on each mounting screw. Refer to Figure 8.
- (13) Fully engage the threads of the mounting screws and the threads of the nuts.
- (14) Torque the screws 7 inch-pounds to 9 inch-pounds.
- (15) Do a test of the electrical resistance between the connector shell and the structure. Refer to Subject 20-20-00.

Make sure that the resistance is less than 1.5 milliohms.

- (16) Apply a fillet seal to the pressurized side of the connector.
 - (a) Apply a fillet seal between the edge of the connector flange and the structure.
 - (b) Apply a fillet seal to the nuts.
 - (c) Apply a fillet seal to the screw threads.

NOTE: It is permitted to encapsulate the nuts and screw threads with sealant.

- (17) Apply a fillet seal to the unpressurized side of the connector.
 - (a) Apply a fillet seal between the connector shell and the structure.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (b) Apply a fillet seal to the screw heads and washers.

NOTE: It is permitted to encapsulate the screw heads and washers with sealant.

- (18) If the area adjacent to the connector has bare metal:

- (a) Make a selection of a primer from Table 9.
- (b) Apply the primer to the bare metal on the pressurized side of the structure.
- (c) Apply the primer to the bare metal on the unpressurized side of the structure.

4. INSTALLATION OF PLUG CONNECTORS

A. ARINC 600 Connectors

ARINC 600 rack and panel connectors must be installed so that the connector tab at the lower edge of the connector touches the bottom of the tray while the mounting screws are tightened.

B. Matrix 42839KS14S5SX-190 Plugs of the Systron Donner Engine Fire Detector

These conditions are applicable:

- The connector must be torqued 50 inch-pounds +5 inch-pounds , -0 inch-pounds
- Putty must be put on the coupling ring of the plug and the receptacle body so that it can be seen if the connectors become loose.

5. CONNECTION OF PLUGS AND RECEPTACLES

A. Satisfactory Connections

**Table 18
CONDITIONS OF A SATISFACTORY CONNECTION**

Coupling Mechanism	Full Connection	
	Reference	Condition
Bayonet Coupling	Three axial stripes on the coupling ring of the plug and receptacle shell; three holes around coupling ring	Stripes on the plug and receptacle are aligned
		Bayonet pins can be seen in the holes of the coupling ring
		A click can be heard or felt
	Three holes around the plug coupling ring	Bayonet pins can be seen in the holes of the coupling ring
		A click can be heard or felt
	Holes in the plug coupling ring and a stripe around the circumference of the receptacle	Plug coupling ring over the color stripe on receptacle so that the stripe cannot be seen
Bayonet pins can be seen in the holes of the coupling ring		
A click can be heard or felt		
Breech Coupling	Axial stripe on the receptacle key and the coupling ring of the plug; color stripe around the rear shell of the plug	Color stripe on the rear shell of the plug cannot be seen
		Stripes on the receptacle key and coupling ring are aligned

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

Table 18 (continued)

Coupling Mechanism	Full Connection	
	Reference	Condition
Threaded Coupling	None	Tightened by hand plus a maximum 1/8 turn more
		Lockwire installed if specified
	Color stripe around the circumference of the threaded end of the receptacle	Tightened by hand plus a maximum 1/8 turn more
		Engaging end of the coupling ring of the plug over the color stripe so that the stripe cannot be seen
Threaded, Self-Locking Coupling	Indicator windows with color stripe on the coupling ring of the plug	Tightened by hand plus a maximum 1/8 turn more
		Flag in the windows of the indicator is aligned with the color stripes
		Clicks that are heard and felt can be ignored
	Indicator slots in the coupling ring of the plug	Tightened by hand plus a maximum 1/8 turn more
		Indicator slots are filled with colored indicators
	Color indicator band on the receptacle shell	The coupling ring is fully tightened
Approximately three to five more clicks after the color indicator band cannot be seen		

B. Installation Torque for General Purpose, Threaded Connectors

NOTE: Connectors that need to be torqued are identified by a white or pink identification sleeve.

**Table 19
TORQUE VALUES FOR GENERAL PURPOSE CONNECTORS**

Connector Shell Size	Torque (inch-pound)	
	Minimum	Maximum
10	21	26
12	24	29
14	30	35
16	36	41
18	45	50
20	60	65
22	69	74
24	83	88

FRONT VIEW OF AN ADAPTER INSTALLATION

Figure 9

SIDE VIEW OF AN ADAPTER INSTALLATION

Figure 10

- (1) Make a selection of an adapter plate from Table 20.
- (2) Put the adapter plate flat against the disconnect panel so that it is over the cutout.
- (3) Turn the adapter plate on the cutout to get the best fit:
 - The fastener holes on the adapter plate are aligned with the holes of the cutout
 - There is the minimum of plate movement when the screws and nuts are tightened.
- (4) Attach the adapter plate to the disconnect panel with the necessary installation hardware from Table 2 or Table 3.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF ELECTRICAL CONNECTORS

- (5) Install the receptacle with the necessary installation hardware from Table 2 or Table 3. Refer to Figure 9 and Figure 10.
- (6) If the receptacle installation screws cannot be fully installed in the adapter plate because of the interference from the disconnect panel:
 - (a) Remove the adapter plate.
 - (b) Turn the plate over to its opposite side.
 - (c) Attach the plate to the panel again.
 - (d) Attach the connector to the plate again.

20-60-07 CONTENTS

STANDARD WIRING PRACTICES MANUAL**INSTALLATION OF LOCKWIRE AND SAFETY CABLE ON ELECTRICAL CONNECTORS, CONNECTOR BACKSHELL CABLE CLAMPS AND SWITCH GUARDS**

This subject gives the procedure to install lockwire or safety cable on electrical connectors, connector backshell cable clamps and switch guards.

1. GENERAL DATA**A. Definitions**

Lockwire:

- Is solid wire
- Gives the same performance as Safety Cable
- Requires no special tooling.

Safety Cable:

- Is stranded cable
- Gives the same performance as Lockwire
- Cannot be used on a connector jam nut that has holes drilled through the corners
- Requires a special tool that puts tension on the cable, crimps a ferrule on the end of the cable, and cuts off the excess cable.

B. Conditions for Lockwire and Safety Cable on Connectors, Connector Backshell Cable Clamps and Switch Guards

Lockwire or Safety Cable must be installed on a threaded connector when both of these conditions occur:

- The connector is not self-locking
- The connector is installed in an area that is not pressurized.

Lockwire or Safety Cable must be installed on a threaded connector if the connector had Lockwire or Safety cable before maintenance.

Lockwire or Safety Cable must be installed on the connector backshell cable clamp and the cable clamp screws if the backshell had lockwire or safety cable before maintenance.

Lockwire or Safety Cable must be installed on a switch guard if the switch guard had lockwire or safety cable before maintenance.

CAUTION: DO NOT INSTALL LOCKWIRE OR SAFETY CABLE ON SELF-LOCKING CONNECTORS BECAUSE SELF-LOCKING CONNECTORS DO NOT HAVE LOCKWIRE INSTALLATION HOLES.

CAUTION: IF IT IS NOT KNOWN IF LOCKWIRE OR SAFETY CABLE IS NECESSARY, INSTALL THE LOCKWIRE OR SAFETY CABLE .

The Lockwire or Safety Cable installed on electrical connectors and on connector backshell cable clamps:

- Must be 0.020 inch to 0.026 inch in diameter
- Must not be installed through an installation hole larger than 0.035 inch in diameter.

Lockwire or Safety Cable can be installed on a switch guard to prevent inadvertent switch operation.

20-60-07

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF LOCKWIRE AND SAFETY CABLE ON ELECTRICAL CONNECTORS, CONNECTOR BACKSHELL CABLE CLAMPS AND SWITCH GUARDS

C. Lockwire and Safety Cable Precautions

CAUTION: LOCKWIRE OR SAFETY CABLE THAT IS REMOVED FROM AN INSTALLATION MUST NOT BE USED AGAIN.

Lock Wire or Safety Cable must not be attached:

- From the cable clamp to the coupling nut of the connector
- From the grommet compression nut to the connector coupling nut
- To adjacent connector coupling nuts
- To fuel, oil, hydraulic, or oxygen lines.

NOTE: Safety Cable must not be attached to connector jam nuts that have holes drilled through the corners.

2. INSTALLATION OF LOCKWIRE

A. Selection of Lockwire

**Table 1
0.020 INCH DIAMETER LOCKWIRE FOR CONNECTORS AND BACKSHELLS**

Specification	Material	Supplier
MS20995NC20	Monel	An available source
MS20995N20	Inconel	An available source
MS20995C20	Corrosion Resistant Steel	An available source
NASM20995NC20	Monel	An available source
NASM20995N20	Inconel	An available source
NASM20995C20	Corrosion Resistant Steel	An available source

**Table 2
0.020 INCH DIAMETER LOCKWIRE FOR SWITCH GUARDS**

Specification or Description	Material	Plating	Color	Supplier
MS20995CY20	Copper	Cadmium	Yellow	An available source
0.020 inch diameter	Copper per QQ-W-343, Type S Annealed	Cadmium per QQ-P-416 Type II, Class 2	Yellow	An available source

(1) For connectors and backshell cable clamps, make a selection of a lockwire from Table 1.

NOTE: Monel wire is recommended.

CAUTION: WHEN LOCKWIRE IS INSTALLED, ONLY USE NEW LOCKWIRE.

(2) For switch guards, make a selection of a lockwire from Table 2.

CAUTION: WHEN LOCKWIRE IS INSTALLED, ONLY USE NEW LOCKWIRE.

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF LOCKWIRE AND SAFETY CABLE ON ELECTRICAL CONNECTORS, CONNECTOR BACKSHELL CABLE CLAMPS AND SWITCH GUARDS

B. Lockwire Installation

- (1) Cut a length of the lockwire.
Make sure that the length is twice the distance between the points where the lockwire will be attached.
- (2) Put one end of the lockwire through the lockwire installation hole at the first attachment point.
- (3) Pull the end of the lockwire until it is aligned with the other end.
- (4) Twist the lockwire.
Make sure that there are 9 to 12 twists per inch between the attachment points.
- (5) Put one end of the lockwire through the lockwire installation hole at the next attachment point.
Make sure that the lockwire is in the position that will keep the component from disengaging if the component becomes loose.
- (6) Twist the lockwire.
Make sure that there are 9 to 12 twists per inch between the attachment points.
- (7) Repeat steps Step (5) through Step (6) for each attachment point.
- (8) Twist the ends of the wire.
Make sure that there are 3 to 6 twists past the last attachment point.
- (9) Bend the end of the lockwire over.

3. INSTALLATION OF SAFETY CABLE

A. Necessary Materials

STANDARD WIRING PRACTICES MANUAL

INSTALLATION OF LOCKWIRE AND SAFETY CABLE ON ELECTRICAL CONNECTORS, CONNECTOR BACKSHELL CABLE CLAMPS AND SWITCH GUARDS

B. Safety Cable Installation

- (1) Make a selection of a safety cable tool from Table 4.
- (2) Find the necessary length of safety cable.
 - (a) Add together:
 - The distance in inches from the first attachment point to the last attachment point
 - The length in inches of the tool nose
 - 5 inches for the length of safety cable the tool needs to put tension on the safety cable.
- (3) Make a selection of a safety cable from Table 3.
Make sure that the safety cable has sufficient length.
- (4) Put the end of the safety cable that does not have a ferrule through the installation hole at the first attachment point.
- (5) Put that same end of the cable through the installation holes in the other attachment points.
Make sure that:
 - The safety cable will stop the parts from becoming loose
 - The maximum length of the safety cable between each component is 6 inches.
- (6) Put a safety cable ferrule on the end of the cable and push it against the last attachment point.
- (7) Put the end of the cable through the hole in the tool nose and push the tool along the cable until the ferrule is against the last attachment point.
Make sure that:
 - The ferrule is fully seated in the tool nose
 - The tool nose is perpendicular to the safety cable.
- (8) Put the end of the safety cable in the cable entrance hole on the tool.
- (9) Increase the tension on the cable. Open and close the tool handle again and again until the cable has tension.
Allow the tool handle to fully open before you close it again.
- (10) When the cable has tension, release the handle to the full open position.
Make sure that the tool nose is perpendicular to the safety cable.
- (11) Fully close the handles to crimp the ferrule and cut the cable in one motion.
- (12) Pull the unwanted length of cable from the tool and discard it.

20-60-08 CONTENTS

STANDARD WIRING PRACTICES MANUAL**SEALING OF ELECTRICAL CONNECTORS**

This Subject gives:

- The conditions that make the seal of an electrical connector necessary
- The procedures to seal an electrical connector.

1. GENERAL DATA**A. Environmentally Sealed Connectors**

An environmentally sealed connector has a resilient grommet with internal wire seal webs to seal the wires. Refer to Figure 1.

REAR END OF AN ENVIRONMENTALLY SEALED CONNECTOR

Figure 1

B. Applicable Conditions for the Seal of a Wire in a Contact Cavity

If it is specified for an environmentally sealed connector, and the O.D. of the wire is less than the minimum seal diameter of the grommet hole, the O.D. of the wire must be increased until the wire and the grommet make a seal.

Refer to the Subject that is applicable for the connector for the minimum O.D. for a satisfactory seal in the grommet hole.

C. Applicable Conditions for the Seal of an Empty Contact Cavity

Refer to:

- Table 1 for the type of seal that is applicable for the type of connector and the location of the installation of the connector on the airplane
- Table 2 for the service conditions that are applicable for the seal of a contact cavity.

20-60-08

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

EMPTY CONTACT CAVITY
Figure 2

Table 1
TYPES OF SEALS FOR AN EMPTY CONTACT CAVITY

Location of Installation	Connector Type	Type of Seal	Procedure
Firewall	Environmentally Sealed	A Temperature Grade D stub wire assembly in each empty contact cavity - The stub wire ends are protected, and the stub wires are held to prevent vibration damage to the adjacent wires.	Paragraph 3.E.
	Unsealed	None; unsealed connectors are not installed	-
Pressurized Area	Environmentally Sealed	A seal plug in each empty contact cavity	Paragraph 3.A.
		A seal rod in each empty contact cavity	Paragraph 3.B.
		An unwired contact and a seal plug in each empty contact cavity when it is specified in the connector assembly procedure	Paragraph 3.C.
	An unwired contact and a seal rod in each empty contact cavity when it is specified in the connector assembly procedure	Paragraph 3.D.	
Unsealed	None; an empty contact cavity can stay empty	-	
Unpressurized Area	Environmentally Sealed	A seal plug in each empty contact cavity	Paragraph 3.A.
	Unsealed	None; unsealed connectors are not installed	-

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

Table 2
APPLICABLE SERVICE CONDITIONS FOR THE SEAL OF A CONTACT CAVITY

Location of Installation	Type of Seal	Type of Damage	Service Condition
Unpressurized Area	An unwired contact and a seal plug with the head out	The seal plug is missing	A seal plug must be installed with the head in when the first subsequent scheduled airplane maintenance occurs; refer to Table 1
	An unwired contact and a seal rod	The seal rod is missing	A seal plug must be installed with the head in when the first subsequent scheduled airplane maintenance occurs; refer to Table 1

D. Applicable Conditions for the Replacement of a Connector That Is Sealed with Potting Compound

A replacement connector must be sealed with potting compound when the connector that must be replaced has one of these seals:

- A right angle cable backshell that is filled with potting compound
- A potting adapter that is filled with potting compound.

Refer to Paragraph 4.B.

2. SEAL OF A WIRE IN A CONTACT CAVITY

A. Wire with an O.D. Less than the Minimum Seal Diameter of the Grommet Hole

This paragraph gives the procedure to make the O.D. of the wire equal to or larger than the minimum seal diameter of the grommet hole.

Table 3
HEAT SHRINKABLE SLEEVES

Temperature Grade	Part Number	Supplier
B	MIL-LT	Raychem
D	TFE 4X	Chemplast

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE

Figure 3

Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

- (1) Make a selection of a heat shrinkable sleeve from Table 3.

NOTE: An alternative sleeve is satisfactory. Refer to Subject 20-00-11.

- (2) Put the necessary length of the sleeve on the wire.

Make sure that:

- The forward end of the sleeve is a maximum of 0.09 inch from the end of the contact
- The rear end of the sleeve is 0.1 inch to 0.5 inch from the end of the grommet.

NOTE: If the necessary length of sleeve is not possible because a shield ground wire is installed, cut the sleeve to make the distance from the end of the sleeve to the insulation sleeve of the shield ground wire equal to a maximum of 0.12 inch.

- (3) Shrink the sleeve into its position. Refer to Subject 20-00-14.

- (4) If it is necessary to install one more sleeve, do Step (1) through Step (3) again.

3. SEAL OF AN EMPTY CONTACT CAVITY

A. Installation of a Seal Plug - Head In

For the conditions that are applicable for this procedure, refer to Paragraph 1.C.

POSITION OF THE SEAL PLUG IN THE CONTACT CAVITY - HEAD IN
Figure 4

Refer to Figure 4.

- (1) Make a selection of a seal plug. Refer to Subject 20-00-11.
- (2) From the rear of the connector, put the head of the seal plug in the contact cavity.
- (3) Push the seal plug into the contact cavity until it stops.
Make sure that the seal plug is fully installed.
- (4) Remove the necessary length from the end of the seal plug to make the distance from the rear of the grommet to the end of the seal plug equal to approximately 0.1 inch.

CAUTION: MAKE SURE THAT THE SEAL PLUG DOES NOT CAUSE INTERFERENCE WITH THE CABLE CLAMP.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

B. Installation of a Seal Rod

For the conditions that are applicable for this procedure, refer to Paragraph 1.C.

**Table 4
SEAL ROD LENGTH**

Contact Cavity Size	Seal Rod Length (inch)	
	Target	Tolerance
22	0.75	± 0.05
20	0.75	± 0.05
16	0.75	± 0.05
12	0.75	± 0.05
08	0.75	± 0.05

**POSITION OF THE SEAL ROD IN THE CONTACT CAVITY
Figure 5**

Refer to Figure 5.

- (1) Make a selection of a seal rod. Refer to Subject 20-00-11.
- (2) Cut the necessary length of the seal rod. Refer to Table 4.
- (3) From the rear of the connector, put one end of the seal rod in the contact cavity.
- (4) Push the seal rod into the contact cavity until the distance from the rear of the grommet to the rear end of the seal rod is approximately 0.1 inch.

CAUTION: MAKE SURE THAT THE SEAL ROD DOES NOT CAUSE INTERFERENCE WITH THE CABLE CLAMP.

C. Installation of an Unwired Contact and a Seal Plug

For the conditions that are applicable for this procedure, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

POSITION OF THE SEAL PLUG IN A CONTACT CAVITY WITH AN UNWIRED CONTACT
Figure 6

Refer to Figure 6.

- (1) Install the unwired contact in the contact cavity. Refer to the Subject that is applicable for the assembly of the connector.

Make sure the contact is fully inserted in the contact cavity.

- (2) Make a selection of a seal plug. Refer to Subject 20-00-11.
- (3) From the rear of the connector, put the small end of the seal plug in the contact cavity.
- (4) Push the seal plug into the contact cavity until it stops.

Make sure that the forward edge of the head is against the rear of the grommet.

CAUTION: MAKE SURE THAT THE SEAL PLUG DOES NOT CAUSE AN INTERFERENCE WITH THE BACKSHELL.

- (5) If the forward edge of the head is not against the rear of the grommet, adjust the length of the seal plug.
 - (a) Measure the distance from the rear of the grommet to the forward edge of the head to find the unwanted length of the seal plug. Refer to Figure 7.

UNWANTED LENGTH OF THE SEAL PLUG
Figure 7

20-60-08

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

(b) Remove the unwanted length from the end of the seal plug. Refer to Figure 8.

Make sure that:

- The end of the seal plug is perpendicular to the longitudinal axis of the seal plug
- All the loose pieces are removed from the end of the seal plug.

CAUTION: LOOSE PIECES OF THE SEAL PLUG MUST NOT GO INTO THE CONTACT CAVITY. THE LOOSE PIECES CAN PREVENT THE SUBSEQUENT REMOVAL OF THE CONTACT.

REMOVAL OF THE UNWANTED LENGTH OF THE SEAL PLUG
Figure 8

(c) Do Step (3) and Step (4) again.

D. Installation of an Unwired Contact and a Seal Rod

For the conditions that are applicable for this procedure, refer to Paragraph 1.C.

Table 5
SEAL ROD LENGTH

Contact Cavity Size	Seal Rod Length (inch)	
	Target	Tolerance
22	0.75	± 0.05
20	0.75	± 0.05
16	0.75	± 0.05
12	0.75	± 0.05
08	0.75	± 0.05

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

POSITION OF THE SEAL ROD IN A CONTACT CAVITY WITH AN UNWIRED CONTACT
Figure 9

Refer to Figure 9.

- (1) Install the unwired contact in the contact cavity. Refer to the Subject that is applicable for the assembly of the connector.

Make sure the contact is fully inserted in the contact cavity.

- (2) Make a selection of a seal rod. Refer to Subject 20-00-11.
- (3) Cut the necessary length of the seal rod. Refer to Table 5.
- (4) From the rear of the connector, put one end of the seal rod in the contact cavity.
- (5) Push the seal rod into the contact cavity until one of these conditions occurs:
 - The distance from the rear of the grommet to the rear end of the seal rod is approximately 0.1 inch.
 - The seal rod stops before the rear end is approximately 0.1 inch from the rear of the grommet.

CAUTION: MAKE SURE THAT THE SEAL ROD DOES NOT CAUSE INTERFERENCE WITH THE CABLE CLAMP.

- (6) If the seal rod stops before the rear end is approximately 0.1 inch from the rear of the grommet, remove the necessary length from the end of the rod.

E. Installation of Stub Wire Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 1.C.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

**Table 6
STUB WIRE CONFIGURATIONS**

Contact Cavity Size	Stub Wire			
	Specification	Size (AWG)	Length (inch)	
			Minimum	Maximum
16	BMS13-31 Type 1 Class 1	16	5	10
	BMS13-58 Type 1 Class 1	16	5	10
	BMS13-60 Type 7 Class 1	16	5	10
20	BMS13-31 Type 1 Class 1	20	5	10
	BMS13-58 Type 1 Class 1	20	5	10
	BMS13-60 Type 7 Class 1	20	5	10

(1) Make a selection of a stub wire from Table 6.

NOTE: For a large number of stub wires, the wires can be cut at different lengths and put into small groups that can be attached to the wire harness.

- (2) Assemble a contact with the stub wire. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Install the contact in the contact cavity. Refer to the Subject that is applicable for the assembly of the connector.
- (4) Assemble a Temperature Grade D, crimp type end cap without insulation removal on the other end of the stub wire. Refer to Subject 20-30-16.
- (5) Do Step (1) through Step (4) again for each remaining empty contact cavity.
- (6) Attach the stub wires to the surface of the wire harness. Refer to Subject 20-10-11.

4. SEAL OF A CONNECTOR WITH POTTING COMPOUND

A. Necessary Materials

**Table 7
NECESSARY MATERIALS**

Material	Part Number	Supplier	Notes
Catalyst, RTV	F	Dow Corning	Only for 3110 RTV Potting Compound
	S	Dow Corning	Only for 3110 RTV Potting Compound
Naphtha, Aliphatic	TT-N-95	Any Source	-

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

**Table 8

POTTING COMPOUNDS PRIMERS**

Potting Compound	Part Number	Cure Time (hours)	Supplier
3110 RTV	1201 RTV	0.5	Dow Corning
3145 RTV	1200 RTV	1	Dow Corning
	1204 RTV	1	Dow Corning
BMS8-68	CS-3808	1	Flamemaster Chem Seal Division
	CS-9903	1	Flamemaster Chem Seal Division

B. Seal of a Connector

- (1) Make a selection of a potting compound from Table 8.
- (2) If a catalyst is specified, make a selection of a catalyst from Table 7.

CAUTION: IF A POT LIFE IS SPECIFIED, MAKE SURE THAT THE POTTING COMPOUND IS APPLIED BEFORE THE END OF THE POT LIFE. REFER TO TABLE 8.

- (3) Make a selection of a primer from Table 10.
- (4) Make a selection of an aliphatic naphtha from Table 7.
- (5) If the connector is assembled, remove the contacts. Refer to the applicable Subject for the connector.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

(6) Fully clean the inside of the right angle backshell or the potting adapter, the connector grommet, and the wires of the contact assemblies:

- (a) Hold the connector in the vertical position with the rear face of the connector pointed down.
- (b) Apply the necessary amount of naphtha with a soft brush to the rear face of the connector.

NOTE: Do not clean the coupling ring of the connector.

Make sure that the grey or white paint on the connector or the insert is not removed.

- (c) Immediately dry the connector with a wiper.

CAUTION: DO NOT LET NAPHTHA DRY ON THE CONNECTOR. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (d) Apply the necessary quantity of naphtha with a soft brush to the wires of the wired contacts.

Make sure that the cleaned area of the wires extends at least one inch farther than the area of the wires that will potted.

- (e) Immediately dry the wires with a wiper.

CAUTION: DO NOT LET NAPHTHA DRY ON THE WIRES. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (7) Clean the insertion tool tip with the naphtha.
- (8) Install the contact assemblies. Refer to the applicable Subject for the connector assembly.
- (9) Put a layer of the primer on the cleaned area of the wires and the surface of the connector grommet.
- (10) Let the primer cure for the specified time. Refer to Table 10.
- (11) For connector that has a right angle backshell, fill the backshell with potting compound.

SEAL OF A CONNECTOR AND A RIGHT ANGLE BACKSHELL

Figure 10

- (a) Put a layer of masking tape over the slot in the front of the backshell.
- (b) Fill the backshell with the potting compound until the compound is approximately level with the rear end of the backshell.

STANDARD WIRING PRACTICES MANUAL

SEALING OF ELECTRICAL CONNECTORS

CAUTION: IF A POT LIFE IS SPECIFIED, MAKE SURE THAT THE POTTING COMPOUND IS APPLIED BEFORE THE END OF THE POT LIFE. REFER TO TABLE 8.

- (12) For a connector that has a potting adapter, fill the adapter with potting compound until the compound is level with the bottom of the teeth. Refer to Figure 11.

SEAL OF A CONNECTOR AND A POTTING ADAPTER
Figure 11

- (13) Let the potting compound cure for the specified time. Refer to Table 8.

	ST2596C	Boeing
	TG-70	Glenair
Torque Driver	-	An available source

3. BACKSHELL DISASSEMBLY

A. Backshell Disassembly - Cable Clamp Strain Relief

- (1) If the backshell has safety wire, remove the safety wire from the cable clamp screws and the backshell coupling ring.
- (2) Remove the strain relief clamp screws.
- (3) Put the saddle bars, the screws, and the washers in a safe place.
- (4) Make a selection of a strap wrench from Table 7.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

(5) Disengage the threads of the backshell and the connector.

B. Backshell Disassembly - Single Leg Strain Relief

(1) Cut the heat shrinkable sleeve or the wire harness tie that holds the wire harness.

CAUTION: DO NOT CUT THE WIRE INSULATION. DAMAGE TO THE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE OR THE CABLE.

(2) Make a selection of a strap wrench from Table 7.

(3) Disengage the threads of the backshell and the connector.

4. BACKSHELL ASSEMBLY - SINGLE LEG STRAIN RELIEF

A. Applicable Conditions for Backshell Assembly

These conditions are applicable for a wire harness in a backshell with a single leg strain relief:

- Strain must not be put on the wires
- The wires must not have tension that pulls the seal webs of the grommet out of their shape
- The crimp barrel of a contact cannot be seen in the rear grommet of an environmental connector
- Thread lock compound must be applied on the threads of the backshell in some assembly or installation configurations; refer to Table 8.

Table 8

CONDITIONS FOR BACKSHELL ASSEMBLY WITH THREAD LOCK COMPOUND

Assembly or Installation Configuration	Backshell Assembly Condition
A backshell on a Temperature Grade C or Temperature Grade D wire harness	Thread lock compound is not necessary
A backshell that has anti-rotation teeth	Thread lock compound is not necessary
A backshell that has thread lock compound on the initial assembly	Thread lock compound must be applied
A right angle backshell on a Temperature Grade A or Temperature Grade B wire harness in the unpressurized area that does not have anti-rotation teeth or safety wire	Thread lock compound must be applied
The initial assembly of a backshell that is supplied with thread lock compound	Thread lock compound is not necessary

B. Necessary Materials

Table 9

NECESSARY MATERIALS

C. Backshell Assembly with a Heat Shrinkable Sleeve

- (1) Make a selection of a strap wrench from Table 7.
- (2) Make a selection of a heat shrinkable sleeve from Table 9.

Make sure that the sleeve has the smallest diameter that can be moved easily on the wire harness and the strain relief leg.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (3) If the backshell does not have a heat shrinkable sleeve installed on the strain relief leg:
 - (a) Make a selection of a heat shrinkable sleeve with a meltable inner liner from Table 9.
 - (b) Put a 0.75 inch length of heat shrinkable sleeve on the end of the strain relief leg. Refer to Figure 10.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 10

- (c) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (4) Put a length of heat shrinkable sleeve on the wire harness.
Make sure that the length of the sleeve is approximately equal to the length of the strain relief leg.
- (5) Put the backshell on the wire harness.
Make sure that the strain relief leg is pointed away from the end of the wire harness.
- (6) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (7) If thread lock compound is necessary, apply the thread lock compound. Refer to Table 8.
 - (a) Make a selection a thread lock compound from Table 9.
 - (b) Make a selection of a solvent from Table 10.
 - (c) Clean the thread surfaces with solvent.
 - (d) Dry the thread surfaces with an absorbent wiper.
 - (e) Put one or two drops of the thread lock compound on the threads of the backshell.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (8) Fully engage the threads of the backshell and the connector.
- (9) Tighten the backshell with the strap wrench.
Make sure that the backshell does not make more than 1/8 turn with the strap wrench.

CAUTION: DO NOT TIGHTEN THE BACKSHELL MORE THAN NECESSARY. DAMAGE TO THE BACKSHELL CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR OR THE BACKSHELL.

- (10) Try to loosen the backshell manually.

NOTE: The backshell is installed correctly when the backshell does not move in relation to the connector.

- (11) If the backshell is loose, do Step (9) and Step (10) again.
- (12) Put the wires into their positions.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

Make sure that:

- The wires do not go across each other where the wires are against the strain relief leg
 - Strain is not put on the wires.
- (13) Push the heat shrinkable sleeve forward on the wire harness and the leg of the clamp until the rear end of the sleeve aligned with the end of the leg.

Make sure that the sleeve does not extend farther than the end of the strain relief leg.

- (14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Backshell Assembly with a Wire Harness Tie

- (1) Make a selection of a strap wrench from Table 7.
- (2) Make a selection of a tape from Table 9.
- (3) If the backshell does not have a heat shrinkable sleeve installed on the strain relief leg:
 - (a) Make a selection of a heat shrinkable sleeve with a meltable inner liner from Table 9.
 - (b) Put a 0.75 inch length of heat shrinkable sleeve on the end of the strain relief leg. Refer to Figure 11.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 11

- (c) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (4) Put the backshell on the wire harness.
Make sure that the strain relief leg is pointed away from the end of the wire harness.
- (5) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (6) If thread lock compound is necessary, apply the thread lock compound. Refer to Table 8.
 - (a) Make a selection a thread lock compound from Table 9.
 - (b) Make a selection of a solvent from Table 10.
 - (c) Clean the thread surfaces with solvent.
 - (d) Dry the thread surfaces with an absorbent wiper.
 - (e) Put one or two drops of the thread lock compound on the threads of the backshell.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (7) Fully engage the threads of the backshell and the connector.
- (8) Tighten the backshell with the strap wrench.

Make sure that the backshell does not make more than 1/8 turn with the strap wrench.

CAUTION: DO NOT TIGHTEN THE BACKSHELL MORE THAN NECESSARY. DAMAGE TO THE BACKSHELL CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR OR THE BACKSHELL.

- (9) Try to loosen the backshell manually.

NOTE: The backshell is installed correctly when the backshell does not move in relation to the connector.

- (10) If the backshell is loose, do Step (8) and Step (9) again.
- (11) Put the wires into their positions.

Make sure that:

- The wires do not go across each other where the wires are against the strain relief leg
- Strain is not put on the wires.

- (12) Wind two or more layers of tape on the area of the wire harness that is against the strain relief leg.
- (13) Assemble a lacing tape wire harness tie or a plastic tie strap wire harness tie on the wire harness and the leg of the backshell. Refer to Subject 20-10-11.

5. BACKSHELL ASSEMBLY - CABLE CLAMP STRAIN RELIEF

For the procedures to assemble a strain relief backshell with a shield termination, refer to Subject 20-25-12.

A. Applicable Conditions for Backshell Assembly

These conditions are applicable for a wire harness in a backshell with a cable clamp:

- Strain must not be put on the wires
- The wires must not have tension that pulls the seal webs of the grommet out of their shape
- The crimp barrel of a contact cannot be seen in the rear grommet of an environmental connector
- When a wire makes an exit from the rear of the connector grommet at an angle that is less than 60 degrees; the distance from the rear of the grommet to the bend must be 0.10 inch minimum
- Safety wire must be installed on the coupling ring of the backshell if the applicable conditions occur; refer to Subject 20-60-07
- Thread lock compound must be applied on the threads of the backshell in some assembly or installation configurations; refer to Table 12.

**Table 12
CONDITIONS FOR BACKSHELL ASSEMBLY WITH THREAD LOCK COMPOUND**

Assembly or Installation Configuration	Backshell Assembly Condition
A backshell on a Temperature Grade C or Temperature Grade D wire harness	Thread lock compound is not necessary
A backshell that has anti-rotation teeth	Thread lock compound is not necessary
A backshell that has thread lock compound on the initial assembly	Thread lock compound must be applied

20-60-09

Figure 12

BEND OF THE WIRE IN A 90 DEGREE BACKSHELL

Figure 13

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

B. Applicable Conditions for Strain Relief Assembly

These conditions are applicable for the assembly of the strain relief:

- The wires must not go across each other in the cable clamp
- The wire harness must have a minimum of two layers of tape for protection
- The tape must not be between the saddle bar and the backshell leg
- The wire harness must be held tightly in the cable clamp
- The cable clamp must not crush the wire harness
- The cable clamp screws must be tight.

The diameter of a wire harness must be increased when these conditions occur:

- The cable clamp does not hold the wire harness tightly
- The wire harness has a small number of wires
- The contact assemblies are installed only near the outer edge of the connector grommet

These conditions are applicable for the layers of tape:

- The forward and rear edges of the tape must extend a minimum of 0.06 inch farther than the edges of the saddle bar
- The edge of one layer is a maximum of 0.05 inch from the edge of a different layer
- For U shaped tape, each layer makes a 100 percent overlap.

Spacers must be installed between the saddle bar and the backshell leg when these conditions occur:

- The diameter of the wire harness is much larger than the diameter of the clamp
- The clamp crushes the wire harness before the screws are fully tightened.

C. Necessary Materials

D. Backshell Assembly

- (1) Make a selection of a strap wrench from Table 7.
- (2) Put the necessary backshell components on the wire harness.
Make sure that the cable clamp of the backshell is pointed away from the end of the wire harness.
- (3) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (4) Put the wires into their positions.
Make sure that:
 - The wires do not go across each other
 - The wires do not have tension that pulls the seal web out of its shape
 - Strain is not put on the wires.
- (5) If thread lock compound is necessary or specified, apply the thread lock compound. Refer to Table 12.
 - (a) Make a selection a thread lock compound from Table 13.
 - (b) Make a selection of a solvent from Table 14.
 - (c) Clean the thread surfaces with solvent.
 - (d) Dry the thread surfaces with an absorbent wiper.
 - (e) For a connector that is on the engine side of a firewall, put a thin layer of the thread lock compound on:
 - One or two threads of the backshell around the full circumference of the backshell
 - One or two threads of the connector around the full circumference of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (f) For a connector that is not on the engine side of a firewall, put one or two drops of the thread lock compound on the threads of the backshell.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (g) Fully engage the threads of the backshell and the connector.
- (6) If the backshell has anti-rotation teeth, examine the teeth of the backshell through the inspection hole. Refer to Figure 14.

Make sure that the backshell teeth are engaged with the connector teeth. Refer to Figure 15.

BACKSHELL WITH ANTI-ROTATION TEETH
Figure 14

ENGAGEMENT OF THE CONNECTOR TEETH AND THE BACKSHELL TEETH
Figure 15

- (7) Tighten the backshell on the connector with the strap wrench.

Make sure that:

- The backshell does not make more than 1/8 turn with the strap wrench
- The backshell is in the correct clock position.

CAUTION: DO NOT TIGHTEN THE BACKSHELL MORE THAN NECESSARY. DAMAGE TO THE BACKSHELL CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR OR THE BACKSHELL.

- (8) If the backshell has set screws, tighten one of the set screws.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

(9) Try to loosen the backshell manually.

NOTE: The backshell is installed correctly when the backshell does not move in relation to the connector.

(10) If the backshell is loose, do Step (7) again.

(11) Assemble the strain relief. Refer to Paragraph 5.E.

E. Strain Relief Assembly - Straight Backshell

CONFIGURATION OF THE CABLE CLAMP

Figure 16

CONFIGURATION OF THE CABLE CLAMP WITH SPACERS

Figure 17

Refer to Figure 16 and Figure 17.

- (1) Align the screw holes in a saddle bar with the screw holes in the legs of the backshell.
- (2) Make a mark on the wire harness at the center of the width of the saddle bar.
- (3) Make a selection of a tape from Table 13.

Make sure that the tape is a minimum of 0.12 inch wider than the saddle bar.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

NOTE: A thicker tape is recommended when the difference between the initial diameter of the wire harness and the inner diameter of the strain relief is large.

- (4) If the assembled contacts are installed only near the outer edge of the connector grommet:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

- (a) Make a selection of a filler rod from Table 13.
- (b) Put the filler rod in the center of the group of wires where the saddle bar goes across the wire harness. Refer to Figure 18.

POSITION OF THE FILLER ROD
Figure 18

- (5) Put a minimum of two layers of tape on the wires or cables at the location of the mark.

Make sure that:

- The outer diameter of the wire harness with the layers of tape is larger than the inner diameter of the strain relief
- The center of the layers of tape is aligned with the center of the saddle bar
- The edge of the tape extends a minimum of 0.06 inch farther than each edge of the saddle bar
- The edge of one layer of the tape is a maximum of 0.05 inch from the edge of a different layer of tape
- For U shaped tape, each layer of tape makes a 100 percent overlap.

CONFIGURATION OF THE LAYERS OF U SHAPED TAPE
Figure 19

- (a) Wind the tape around one wire to hold it in its position. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

FIRST CONFIGURATION SECOND CONFIGURATION

CONFIGURATIONS OF THE LAYERS OF TAPE

Figure 20

- (b) Continue to wind the tape around the wire harness until the tape is fully installed.
- (6) If lockwashers are supplied with the backshell, put a lockwasher on each screw.
- (7) Align the screw holes in the saddle bars with the screw holes in the legs of the backshell.
- (8) Put a screw through a hole in the saddle bar.
From the rear of the backshell, make sure that the head of the screw on the right is pointed up and the head of the screw on the left is pointed down.
- (9) Put a screw through the hole in the saddle bar that is on the opposite side of the backshell legs.
- (10) If spacers are necessary, specified, or installed on the initial backshell assembly, install spacers:
 - (a) Make a selection of a spacer from Table 5.
Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the strain relief.
NOTE: A minimum of two spacers are necessary, one for each screw.
NOTE: The initial spacers can be installed again if they do not have damage.
 - (b) Put one spacer on each screw.
Make sure that the spacers are on the same side of the backshell legs.
- (11) Engage the threads of screws and the threads of the nuts.
- (12) Tighten the cable clamp screws.
Make sure that:
 - The cable clamp does not crush or pinch the wire harness
 - If the saddle bar and the backshell leg do not touch, the distance between the saddle bar and the backshell leg is approximately equal on each side of the cable clamp
 - The layers of tape are not pinched between the saddle bars and the backshell leg
 - The screws do not cause an interference with a wire harness or a component.**NOTE:** It is not necessary for the saddle bars to touch the legs of the backshell.
- (13) If the wire harness is not held tightly:
 - (a) Remove the cable clamp screws.
 - (b) Wind two layers of tape on the wire harness on the existing layers of tape.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION**

- (c) Do Step (11) through Step (12) again.
- (14) If screws are too long and screws with a shorter length are not available, cut off the unwanted length. Make sure that the end of the screw is smooth and has no rough edges.

CAUTION: DO NOT LET METAL SAWDUST OR THE UNWANTED LENGTH OF THE SCREW FALL ON OR INTO THE WIRE HARNESS OR ON THE REAR GROMMET OF THE CONNECTOR. SHARP METAL PIECES CAN CAUSE DAMAGE TO THE WIRES AND THE CONNECTOR.

- (15) If safety wire is necessary, install safety wire on each screw.

Refer to Subject 20-60-07 for:

- The applicable conditions that make the installation of the safety wire on the cable clamp screw necessary
- The procedures to install the safety wire.

F. Strain Relief Assembly - 45 Degree or 90 Degree Backshell

- (1) Align the screw holes in a saddle bar with the screw holes in the legs of the backshell.
- (2) Make a mark on the wire harness at the center of the width of the saddle bar.
- (3) Make a selection of a tape from Table 13.

Make sure that the tape is a minimum of 0.12 inch wider than the saddle bar.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

NOTE: A thicker tape is recommended when the difference between the initial diameter of the wire harness and the inner diameter of the strain relief is large.

- (4) If the assembled contacts are installed only near the outer edge of the connector grommet:
 - (a) Make a selection of a filler rod from Table 13.
 - (b) Put the filler rod in the center of the group of wires where the saddle bar goes across the wire harness. Refer to Figure 21.

POSITION OF THE FILLER ROD
Figure 21

- (5) Put a minimum of two layers of tape on the wires or cables at the location of the mark.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION

Make sure that:

- The outer diameter of the wire harness with the layers of tape is larger than the inner diameter of the strain relief
- The center of the layers of tape is aligned with the center of the saddle bar
- The edge of the tape extends a minimum of 0.06 inch farther than each edge of the saddle bar
- The edge of one layer of the tape is a maximum of 0.05 inch from the edge of a different layer of tape
- For U shaped tape, each layer of tape makes a 100 percent overlap.

CONFIGURATION OF THE LAYERS OF U SHAPED TAPE
Figure 22

(a) Wind the tape around one wire to hold it in its position. Refer to Figure 23.

FIRST CONFIGURATION SECOND CONFIGURATION

CONFIGURATIONS OF THE LAYERS OF TAPE
Figure 23

- (b) Continue to wind the tape around the wire harness until the tape is fully installed.
- (6) If lockwashers are supplied with the backshell, put a lockwasher on each screw.
 - (7) Align the screw holes in the saddle bars with the screw holes in the legs of the backshell.
 - (8) Put a screw through each hole in the saddle bar.
 - (9) If spacers are necessary, specified, or installed on the initial backshell assembly, install spacers:
 - (a) Make a selection of a spacer from Table 5.

Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the strain relief.

NOTE: A minimum of two spacers are necessary, one for each screw.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF STRAIN RELIEF BACKSHELLS WITHOUT A SHIELD TERMINATION**

NOTE: The initial spacers can be installed again if they do not have damage.

- (b) Put one spacer on each screw.
- (10) Engage the threads of screws and the threads of the nuts.
- (11) Tighten the cable clamp screws.

Make sure that:

- The cable clamp does not crush or pinch the wire harness
- If the saddle bar and the backshell leg do not touch, the distance between the saddle bar and the backshell leg is approximately equal on each side of the cable clamp
- The layers of tape are not pinched between the saddle bars and the backshell leg
- The screws do not cause an interference with a wire harness or a component.

NOTE: It is not necessary for the saddle bars to touch the legs of the backshell.

- (12) If the wire harness is not held tightly:
- (a) Remove the cable clamp screws.
- (b) Wind two layers of tape on the wire harness on the existing layers of tape.
- (c) Do Step (10) through Step (11) again.
- (13) If screws are too long and screws with a shorter length are not available, cut off the unwanted length. Make sure that the end of the screw is smooth and has no rough edges.

CAUTION: DO NOT LET METAL SAWDUST OR THE UNWANTED LENGTH OF THE SCREW FALL ON OR INTO THE WIRE HARNESS OR ON THE REAR GROMMET OF THE CONNECTOR. SHARP METAL PIECES CAN CAUSE DAMAGE TO THE WIRES AND THE CONNECTOR.

- (14) If safety wire is necessary, install safety wire on each screw.

Refer to Subject 20-60-07 for:

- The applicable conditions that make the installation of the safety wire on the cable clamp screw necessary
- The procedures to install the safety wire.

BACKSHELL ASSEMBLY TOOLS**

Tool	Part Number	Supplier
Strap Wrench	TG-70	Glenair
	AT 508K	Aircraft Tools, Inc.

B. Necessary Materials

**Table 3
NECESSARY MATERIALS**

Material	Part Number	Supplier
Thread Locking Compound	222	Loctite
	Vibratite	The Oakland Corporation

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS****2. CONNECTOR DISASSEMBLY****A. Disassembly of the Backshell Components**

Connector backshell components can be:

- A backshell adapter
- A cable clamp adapter
- A strain relief adapter
- A strain relief clamp
- A conduit adapter
- A convoluted tube adapter
- A convoluted tube.

- (1) Disconnect each component from the connector.
- (2) Push each component away from rear of the connector.

B. Contact Removal

- (1) Make a selection of a contact removal tool. Refer to the applicable Subject for the connector.

CAUTION: DO NOT USE PLIERS TO REMOVE A CONTACT. THE PLIERS CAN CAUSE DAMAGE TO THE CONTACT AND THE CONNECTOR GROMMET.

- (2) At the front of the connector, axially align the tool with the contact cavity.

Make sure that the plunger of the removal tool is fully retracted.

- (3) Push the tool into the contact cavity until it stops.

NOTE: The retention clips in the contact cavity begin to open when resistance is felt.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (4) Push the plunger of the tool so that the shoulder of the contact is pushed out beyond the retention clips.
- (5) Carefully remove the tool straight out of the contact cavity.
- (6) Pull the contact out of the grommet from the rear of the connector.

C. Removal of Seal Plugs and Seal Rods

- (1) Make a selection of a pair of pliers.

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If necessary, remove the plastic tie strap or the wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.

NOTE: If it is necessary, a seal rod can be pushed out of the contact cavity from the front of the connector with the engaging end of another contact.

- (4) Carefully pull the seal plug or seal rod straight out of the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS

3. CONNECTOR ASSEMBLY

A. Contact Assembly

- (1) Make a selection of the contact. Refer to:
 - The applicable Subject for the connector
 - The Wiring Diagram Manual.
- (2) Prepare the wire. Refer to:
 - The applicable Subject for the connector
 - Subject 20-00-15 for the insulation removal procedures.
- (3) Make a selection of a crimp tool. Refer to:
 - The applicable Subject for the connector
 - Subject 20-00-12 for alternative contact crimp tools.
- (4) For a contact without an insulation support barrel:
 - (a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 1.

Make sure that:

 - All of the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole
 - The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN A CONTACT WITHOUT AN INSULATION SUPPORT BARREL
Figure 1

- (b) Crimp the contact.
- (5) For a contact with an insulation support barrel and a wire that has an O.D. that is larger than the insulation support barrel:
 - (a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 2.

Make sure that:

 - All of the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole
 - The distance from the end of the insulation to the crimp barrel is not more than 0.06 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS

POSITION OF THE WIRE THAT HAS AN O.D. THAT IS LARGER THAN THE INSULATION SUPPORT BARREL
Figure 2

- (b) Crimp the contact.
- (6) For all other contacts with an insulation support barrel:
 - (a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 3.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The wire insulation is in the insulation support barrel.

POSITION OF THE WIRE IN A CONTACT WITH AN INSULATION SUPPORT BARREL
Figure 3

- (b) Crimp the contact.

B. Contact Insertion

This procedure can be used to insert either of these contacts in a contact cavity:

- A wired contact
 - An unwired contact.
- (1) Put the necessary connector assembly components on the wire harness.
 - (2) If the connector has a single-leg clamp, put either of these materials on the wire harness:
 - Heat shrinkable sleeve
 - Filler tape and a wire harness tie.

Refer to Subject 20-60-09.

- (3) Make a selection of a contact insertion tool. Refer to the applicable Subject for the connector.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS**

Make sure that the tip of the insertion tool:

- Is not bent
- Does not have any damage
- Does not have any sharp edges.

(4) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have any damage.

(5) Put the insertion tool on the contact so that the tool and the contact are axially aligned.

NOTE: For a size 20 contact, make sure that the insertion tool tip:

- Is against the insulation support barrel of the contact
- Is not against the rear edge of the support barrel of the contact.

(6) Axially align the contact with the contact cavity at the rear face of the grommet.

NOTE: For the contact cavities that are adjacent to the outer edge of the connector, make sure that the open side of the tool tip is pointed toward the outer edge of the grommet.

(7) Push the contact into the contact cavity until it stops.

(8) If it is necessary to make the insertion of the contact easier:

- (a) Make a selection of a lubricant. Refer to Subject 20-00-11.
- (b) Put a small quantity of lubricant on either or both of these surfaces:
 - The tip of the insertion tool
 - The rear face of the connector grommet.

CAUTION: DO NOT PUT LUBRICANT ON ANY OTHER SURFACE. DAMAGE TO THE CONDUCTOR OR TO THE WIRED CONTACT OR BOTH CAN CAUSE UNSATISFACTORY PERFORMANCE.

CAUTION: DO NOT PUT MORE THAN THE NECESSARY QUANTITY OF LUBRICANT ON THE SURFACE. DAMAGE TO THE CONDUCTOR OR TO THE WIRED CONTACT OR BOTH CAN CAUSE UNSATISFACTORY PERFORMANCE.

(9) Carefully pull the insertion tool straight out of the contact cavity.

(10) Pull lightly on the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

(11) If the contact is not locked in the contact cavity:

- (a) Pull the contact out of the contact cavity.
- (b) Do Step (5) through Step (10) again.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS****C. Seal of an Empty Contact Cavity**

Refer to Subject 20-60-08 for:

- The necessary conditions to seal an empty contact cavity
- The procedures to seal an empty contact cavity if applicable.

4. BACKSHELL ASSEMBLY

Refer to:

- Subject 20-25-12 for strain relief backshells
- Subject 20-25-13 for peripheral backshells
- Subject 20-25-14 for backshells with shield terminator bands.

A. Assembly of a Strain Relief Clamp

Refer to Subject 20-60-09.

B. Assembly of a Single Leg Strain Relief Clamp

Refer to Subject 20-60-09.

- (1) If it is necessary, install a safety wire. Refer to Subject 20-60-07.

C. Assembly of a Conduit Adapter

- (1) Make a selection of a conduit adapter from Table 1.
- (2) Make a selection of a thread locking compound from Table 3.
- (3) Put two drops of the thread locking compound on the adapter threads so that each drop of the thread locking compound is applied:
 - At opposite locations on the circumference of the adapter
 - To a minimum of two threads.
- (4) Engage the threads of the conduit adapter and the connector.
- (5) Manually tighten the adapter.

Make sure that the wires do not cause tension on the contacts.
- (6) Make a selection of a strap wrench from Table 2.
- (7) Hold the connector with a pair of soft jaw connector plug pliers.
- (8) Tighten the adapter a maximum of 1/8 turn.
- (9) Install a conduit fitting:
 - (a) Put one drop of the thread locking compound on the threads of the adapter.
 - (b) Put one drop of the thread locking compound on the threads of the removable cover.
 - (c) Dry the thread locking compound for a minimum of 30 minutes.
 - (d) Engage the threads of the conduit fitting and the adapter.

Make sure that the wires do not cause tension on the contacts.
 - (e) Manually tighten the fitting.

D. Installation of a Convolute Tube

- (1) Make a selection of a convolute tube from Table 1.
- (2) Prepare the tube. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS

PREPARATION OF THE CONVOLUTED TUBE

Figure 4

- (a) Cut the necessary length of tube so that each end of the tube is cut at the center of the flange at the maximum diameter of the tube.
- (b) Remove any burrs from the ends of the tube.
- (c) Make the necessary number of drain holes in the tube at the necessary locations.
Make sure that each drain hole:
 - Has a diameter of $\frac{3}{32}$ inch $+ \frac{1}{32}$ inch, -0 inch
 - Is in the center of the flange at the maximum diameter of the tube.
- (3) Make a selection of an convoluted tube adapter from Table 1.
- (4) Assemble the adapter. Refer to Figure 5.

ASSEMBLY OF THE CONVOLUTED TUBE ADAPTER

Figure 5

- (a) Put the gland nut on the tube.
- (b) Put the split bushing on the tube so that the end of the bushing with the larger diameter is aligned with the edge of the tube.
Make sure that the end of the tube is 0 inch to $+ \frac{1}{16}$ inch from the end of the split bushing.
- (c) Make a selection of a thread locking compound from Table 3.
- (d) Put two drops of the thread locking compound on the threads of the adapter.
- (e) Put the adapter on the tube.
Make sure that the position of the split bushing does not change.
- (f) Engage the threads of the gland nut and the adapter.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CONNECTORS WITH FRONT RELEASE CONTACTS

Make sure that the master key is in the correct position.

- (g) Manually tighten the gland nut.
- (5) Engage the threads of the adapter and the connector.
- (6) Tighten the gland nut until:
 - Not more than two threads of the gland nut are can be seen outside of the adapter
 - The thread locking plug in the gland nut cannot be seen.

CAUTION: DO NOT TIGHTEN THE GLAND NUT MORE THAN NECESSARY. DAMAGE TO THE TUBE, THE BUSHING, OR THE ADAPTER CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

This Subject gives the procedures for the selection and the assembly of MIL-C-26500 type connectors.

1. GENERAL DATA

A. Location of Connector Part Number Data

Table 1 gives:

- The supplier part number for a MIL-C-26500 type connector that is interchangeable and has the same performance as a connector with a Boeing Standard part number
- The Military Standard part number for a MIL-C-26500 type connector that is interchangeable and has the same performance as the connector with the Boeing Standard part number
- The supplier part number for a MIL-C-26500 type connector that is not equivalent to a Boeing Standard connector
- The location of connector part number data.

Table 2 gives a description of the MIL-C-26500 type connectors in this subject.

Table 18 gives the part number data of Boeing Standard connectors and the part number data for:

- The supplier connector that is interchangeable and has the same performance as the Boeing Standard connector
- The Military Standard connector that is interchangeable and has the same performance as the Boeing Standard connector.

Paragraph 3. gives the part number data of supplier connectors that are not equivalent to Boeing Standard connectors.

ZZL-R()	Thread Coupled Connector, Stainless Steel Shell
ZZW-R()	Bayonet Coupled Connector, Stainless Steel Shell
ZZY-R()	Thread Coupled Connector, Stainless Steel Shell

B. Selection of Connectors

This paragraph gives the decision sequence to make a selection of:

- A connector to replace a connector that is in service
- A connector for a new installation.

Refer to Paragraph 1.A. for the part numbers and description of the connectors.

- (1) Make a selection of a connector that has the Boeing Standard number.
- (2) If the connector with the Boeing Standard number is not available, make a selection of an alternative connector that:
 - Has the supplier's part number
 - Is interchangeable and has the same performance as the Boeing Standard connector.
- (3) If the connector with the supplier's part number is not available, make a selection of a a permitted alternative equivalent connector that:
 - Has the Military Standard part number
 - Is interchangeable and has the same performance as the Boeing Standard connector.

Refer to Table 3.

NOTE: The Equipment List or the connector container can specify a Boeing Standard BACC45F() number when the connector shell has a Military Standard part number mark.

Table 3

2. BOEING STANDARD CONNECTOR PART NUMBER AND DESCRIPTION

A. BACC45FL Thread Coupled Plug with RFI Shielding Capability

The BACC45FL plug connects to the BACC63BV stainless steel receptacle.

H. BACC63BV Thread Coupled, Vibration Resistant Receptacle

The BACC63BV receptacle:

- Is similar to the BACC45FM receptacle
- Engages with BACC63BP and other MIL-C-26500 type thread coupled plugs.

**Table 12
Connector Part Numbers**

Boeing Standard	Part Number	Supplier
BACC63CS16G24S7	R770G0001S7000	RMS

The BACC63CS connector is a connector that has these features:

- An extended length, shell size 16, MIL-C-26500 type, aluminum receptacle shell
- Keyway position 7
- Insert configuration 16-24
- Twenty four size 20 contact cavities
- Socket contacts
- Is intended to mate with a BACC63BP plug connector.

Refer to:

- Figure 62 for the 16-24 insert configuration
- Table 26 for the part numbers for the standard size 2020 BACC47CP socket contacts.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

L. Boeing 10-60479-() Bayonet Coupled Connector

The 10-60479-() connectors have:

- Two or ten size 16 standard contacts
- One size 2 shielded contact as a replacement for the standard size 8 contact or the M39029/54-343 size 2 shielded contact or the M39029/55-345 size 2 shielded contact.

The 10-60479-5 bulkhead feed through connector:

- Is hermetically sealed
- Has a size 14 shell
- Has two size 16 pin contacts
- Has one size 2 shielded pin contact
- Engages with Boeing 10-60479-1 plug connector.

Refer to:

- Table 13 for the connector configuration, and the contact part numbers and quantity
- Table 14 for the supplier part number for the connector.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

M. Boeing 280T10()-() Bayonet Coupled Connector

The 280T10()-() connector is a connector with one of these configurations:

- A BACC45FN or BACC45FT connector that has one or more size 1 shielded contacts as a replacement for the size 12 standard contacts
- A BACC45FN or BACC45FT connector that has one or more size 12 coax contacts as a replacement for the size 12 standard contacts
- A shorting plug assembly that is not repairable
- A shorting receptacle assembly that is not repairable.

Refer to Table 15 for the connector part number, and the shielded or coax contact part number and quantity.

For the configuration of standard contacts, refer to:

- Figure 8
- Table 38.

N. Boeing 280U001()-() Connector

The 280U001()-() connector is a BACC45() or BACC63() connector with one of these configurations:

- One or more size 1 shielded contacts as a replacement for the size 12 standard contacts
- One or more size 12 coax contacts as a replacement for the size 12 standard contacts
- Size 2 shielded contacts as a replacement for the size 8 standard contacts or the other size 2 shielded contacts.

Refer to Table 16 for the connector part number, and the shielded or coax contact part number and quantity.

For the configuration of the standard contacts, refer to:

- Table 38
- Figure 8 for BACC45FN and BACC45FT connectors
- Figure 36 for BACC63CB and BACC63CC connectors.

O. Boeing 280U2028-() Connector

The 280U2028-() connector is a BACC63CB or BACC63CC connector with one size 12 coax contact as a replacement for one size 12 standard contact.

Refer to Table 17 for the connector part number, and the shielded contact part number and quantity.

For the configuration of the standard contacts, refer to:

- Figure 36
- Table 38.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

P. Boeing 280W0002-1 Self Locking, Threaded Coupled Connector

NOTE: The 280W0002-1 connector is the subject of an FAA Airworthiness Directive and a Boeing Service Bulletin.

If you must apply the mark on this connector again, use the procedures in SOPM 20-50-10.

Make sure that you can read the mark.

The Boeing 280W0002-1 connector:

- Is a BACC63BP plug that has special contacts; refer to Table 18
- Has insert configuration 18-8; refer to Table 38 and Figure 63
- Has eight special size 12 contacts; refer to Table 31
- Has a backshell that is filled with potting compound.

NOTE: If a connector that has potting requires maintenance, the connector shell must be replaced, and new potting material must be applied to the new connector assembly; refer to Subject 20-60-08.

Q. Boeing 65B414()-() Bayonet Coupled Connector

The 65B414()-() connector is a BACC45FN or BACC45FT connector with one, two, three, or four size 1 shielded contacts as a replacement for the same number of size 12 standard contacts.

Refer to Table 19 for the connector part number, and the shielded contact part number and quantity.

For the configuration of the standard contacts, refer to:

- Figure 8
- Table 38.

R. Boeing 69B4181(-) Connector

The 69B4181(-) connector is a BACC45F() or BACC63() connector with one Boeing standard size 2 shielded contact as a replacement for one of these contacts:

- The standard size 8 contact
- The M39029/54-343 size 2 shielded contact
- The M39029/55-345 size 2 shielded contact.

Refer to:

- Table 20 for the part numbers of the connector and shielded contact.
- Table 21 for the 10-60479(-) connectors that are equivalent to the 69B41813(-) connectors
- Table 13 for the configuration of the 10-60479(-) connectors.

For the configuration of the standard contacts, refer to:

- Table 38
- Figure 2 for the BACCFM connectors
- Figure 8 for the BACCFN and BACCFT connectors
- Figure 31 for the BACC63BV connectors
- Figure 36 for the BACC63CB and BACC63CC connectors.

3. SUPPLIER CONTROLLED CONNECTOR PART NUMBERS AND DESCRIPTION

A. Amphenol 48-16V() Bayonet Coupled Plug

The 48-16V() connector has Viton elastomer grommets.

AMPHENOL 48-16V() CONNECTOR PART NUMBER STRUCTURE
Figure 41

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS****B. Amphenol 48-7164-() Connectors**

The Amphenol 48-7164-() connector part numbers are defined as:

- 48-7164-1S has socket contacts
- 48-7164-2P has pin contacts.

NOTE: Discard the size 2020 contacts that are supplied with these connectors. Use BACC47CN1 and BACC47CP1 contacts for AWG 20, AWG 22 and AWG 24 wire in these connectors.

Refer to Paragraph 13.B. for the installation of the 48-7164-1S connector.

C. Cinch CN0900-329 Bayonet Coupled Plug

The Cinch CN0900-329 connector is the same as the BACC45FT connector with:

- A lanyard release
- An Icore Plastics 6930-06-023-13 conflex fitting.

The connector has this configuration:

- Size 10 shell
- Insert configuration 10-5
- 5 size 20 standards socket contacts
- Normal polarization.

Refer to Figure 42.

G. Cinch 1167A() Thread Coupled Receptacle

The 1167A() connector is almost the same as the BACC63BV receptacle, with these features:

- The body of the connector is longer than the BACC63BV receptacle
- The front of the receptacle flange touches the back of the panel where the receptacle is attached
- Engages with the BACC63BP Plug
- Can be assembled with a BACC10HF backshell.

CINCH 1167A() CONNECTOR PART NUMBER STRUCTURE

4. CONTACT PART NUMBERS AND DESCRIPTION

A. General Data

The MIL-C-26500 connectors can accept these types of contacts:

- Standard contacts
- Special Purpose contacts
- Thermocouple contacts
- Shielded contacts
- Coax contacts.

The standard contacts have one of these finishes:

- Rhodium
- Gold
- Localized Gold.

NOTE: Contacts with these finishes are interchangeable and are applicable for all installations.

The special purpose contacts have crimp barrels that can accept a conductor that is one, two, or four wire gauge sizes larger than the size of the engaging end. For example, a contact with a size 20 engaging end and a size 18 crimp barrel.

The thermocouple contacts are made with one of these materials:

- Alumel
- Chromel
- Constantan.

B. Selection of Recommended and Alternative Contacts

This paragraph gives the decision sequence to make a selection of:

- A contact to replace a contact that is in service
- A contact for a new installation.

These conditions identify the necessary contact for the connector assembly:

- The electrical and mechanical performance of the contact
- The insert configuration of the connector
- The size of the contact cavity in the connector
- The type of contact, pin or socket
- The size of the wire.

**Table 25

Contact Group	Specification	Reference
Shielded	Boeing	Table 32
	Military	Table 35
	Supplier	Table 36
Shielded Potted	Boeing	Table 33
Coax	Supplier	Table 37

Refer to Table 25.

- (1) Make a selection of a contact that has the Boeing Standard number.
- (2) If the contact with the Boeing Standard number is not available, make a selection of an alternative contact that:
 - Has the supplier's part number
 - Is interchangeable with a contact that has the Boeing Standard number.

NOTE: The contact with the supplier's part number is a Boeing qualified contact that gives the same performance as the contact that has the Boeing Standard number.

- (3) If the contact with the supplier's part number is not available, make a selection of a permitted alternative equivalent contact that has the Military Standard number.

C. Standard Contacts

6. CONNECTOR DISASSEMBLY

A. Cinch CN0900-329 Connector Separation

- (1) Turn the coupling ring clockwise until the bayonet pins of the plug are disengaged from the receptacle.

NOTE: As an alternative for connector separation, pull the lanyard straight away from the rear of the connector.

B. Backshell Removal

- (1) Remove the backshell components from the connector.

Refer to:

- Subject 20-60-09 for a strain relief clamp
- Subject 20-25-12 for a strain relief backshell with a shield termination
- Subject 20-25-13 for a peripheral backshell
- Subject 20-25-14 for a backshell with a shield terminator band.

NOTE: A backshell is also known as a strain relief clamp.

Make sure that the rear grommet is not removed from the connector.

CAUTION: DAMAGE TO THE CONNECTOR OCCURS IF THE REAR GROMMET IS REMOVED.

C. Contact Removal

Refer to:

- Paragraph 6.D. for the removal of a shielded contact
- Paragraph 6.E. for the removal of a coax contact.

- (1) Make a selection of a recommended contact removal tool from Table 39.
- (2) Examine the removal tool.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) If it is necessary, remove the backshell components from the connector. Refer to Paragraph 6.B. Make sure that the rear grommet is not removed from the connector.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DAMAGE TO THE CONNECTOR WILL OCCUR IF THE REAR GROMMET IS REMOVED.

- (4) Push the backshell components away from the connector.
- (5) At the front face of the connector, axially align the tool with the contact cavity.
Make sure that the plunger of the removal tool is fully retracted.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR GROMMET OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (6) Push the tool into the contact cavity until it stops.

NOTE: The retention clips in the contact cavity begin to open when resistance is felt.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (7) Hold the tool against the connector, and at the same time, push the plunger of the tool until the contact moves rearward in the connector.
- (8) Carefully pull the tool out from the contact cavity.
Make sure that the removal tool stays axially aligned with the contact cavity.
- (9) Pull the contact out from the rear of the connector.

D. Shielded Contact Removal

**Table 40
SHIELDED CONTACT REMOVAL TOOLS**

Shielded Contact Size	Connector Cavity Size	Removal Tool
1	12	294-73
		M81969/19-02
		MS24256R12
2	8	294-127
		M81969/19-03

- (1) Make a selection of a shielded contact removal tool from Table 40.
- (2) Examine the removal tool.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) If it is necessary, remove the backshell components from the connector. Refer to Paragraph 6.B.
Make sure that the rear grommet is not removed from the connector.

CAUTION: DAMAGE TO THE CONNECTOR WILL OCCUR IF THE REAR GROMMET IS REMOVED.

- (4) Push the backshell components away from the connector.
- (5) If the contact is a size 2 shielded contact with a seal boot or an O-ring:
 - (a) Pull the seal boot or the O-ring until it is away from the rear grommet.
 - (b) Move the seal boot or the O-ring away from the connector.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (6) Remove the shielded contacts from the connector.

Make sure that the center contact is not removed from the shielded contact.

CAUTION: DAMAGE TO THE SHIELDED CONTACT AND THE CONNECTOR CAN OCCUR IF THE CENTER CONTACT IS REMOVED FROM THE SHIELD.

- (a) At the front face of the connector, axially align the tool with the contact cavity.

Make sure that the plunger of the removal tool is fully retracted.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR GROMMET OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (b) Push the tool into the contact cavity until it stops.

NOTE: The retention clips in the contact cavity begin to open when resistance is felt.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (c) Hold the tool against the connector, and at the same time, push the plunger of the tool until the contact moves rearward in the connector.

- (d) Carefully pull the tool out of the contact cavity.

Make sure that the removal tool stays axially aligned with the contact cavity.

- (e) Pull the contact out from the rear of the connector.

E. Coax Contact Removal

**Table 41
COAX CONTACT REMOVAL TOOLS**

Contact Size	Removal Tool
12	294-73
	M81969/19-02
	MS24256R12
8	294-127
	M81969/19-03

- (1) Make a selection of a coax contact removal tool from Table 41.

- (2) Examine the removal tool.

WARNING: DO NOT USE A REMOVAL TOOL THAT HAS A BENT TIP OR BIT. AN INJURY CAN OCCUR.

- (3) If it is necessary, remove the backshell components from the connector. Refer to Paragraph 6.B. Make sure that the rear grommet is not removed from the connector.

CAUTION: DAMAGE TO THE CONNECTOR WILL OCCUR IF THE REAR GROMMET IS REMOVED.

- (4) Push the backshell components away from the connector.

- (5) Remove the coax contact from the connector.

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS**

Make sure that the center contact is not removed from the coax contact.

CAUTION: DAMAGE TO THE COAX CONTACT AND THE CONNECTOR CAN OCCUR IF THE CENTER CONTACT IS REMOVED.

- (a) At the front face of the connector, axially align the tool with the contact cavity.

Make sure that the plunger of the removal tool is fully retracted.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR GROMMET OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (b) Push the tool into the contact cavity until it stops.

NOTE: The retention clips in the contact cavity begin to open when resistance is felt.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (c) Hold the tool against the connector, and at the same time, push the plunger of the tool until the contact moves rearward in the connector.

- (d) Carefully pull the tool out of the contact cavity.

Make sure that the removal tool stays axially aligned with the contact cavity.

- (e) Pull the contact out from the rear of the connector.

F. Seal Plug and Seal Rod Removal

- (1) If an unwired contact is in the contact cavity, refer to Paragraph 6.C. for the procedure to remove the contact.

NOTE: The seal plug or the seal rod is removed with the contact.

- (2) Make a selection of a pair of pliers.

CAUTION: MAKE SURE THAT THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (3) Tightly hold the end of the seal plug or the seal rod in the jaws of the pliers.

- (4) Carefully pull the seal plug or the seal rod straight out of the contact cavity.

7. WIRE PREPARATION**A. Wire Preparation**

For the assembly of MIL-C-26500 type connectors with triax cable, refer to Subject 20-53-05.

For the preparation of:

- Champlain 24-00033 and Champlain 24-00034 wire, refer to Paragraph 7.B.
- Rockbestos or Cerro H22-4000 wire, refer to Paragraph 7.C.
- Belden 8787 cable, refer to Paragraph 7.D.
- S280T007-1 coil cable, refer to Paragraph 7.E.
- Champlain 51-04569 and 51-04570 cables, refer to Paragraph 7.F.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

**Table 42
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Crimp Barrel Size	Removal Length (inch)		Special Instructions
		Target	Tolerance	
24	20	0.19	± 0.02	-
		0.28	± 0.02	For Pyle National ZZL-4()20-10() contacts only
	16	0.50	± 0.03	Fold the conductor back
22	20	0.19	± 0.02	-
		0.28	± 0.02	For Pyle National ZZL-4()20-10() contacts only
	16	0.50	± 0.03	Fold the conductor back
20	20	0.19	± 0.02	-
		0.28	± 0.02	For Pyle National ZZL-4()20-10() contacts only
	16	0.25	± 0.02	-
	12	0.50	± 0.03	Fold the conductor back
18	18	0.25	± 0.02	-
	16	0.25	± 0.02	-
	12	0.50	± 0.03	Fold the conductor back
16	16	0.25	± 0.02	-
	12	0.25	± 0.02	-
15	16	0.25	± 0.02	-
	12	0.25	± 0.02	-
14	14	0.25	± 0.02	-
	12	0.25	± 0.02	-
13	14	0.25	± 0.02	-
	12	0.25	± 0.02	-
12	12	0.25	± 0.02	-

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 68
- Table 42 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedure.

NOTE: Refer to Subject 20-60-00:

- If the wire size and a larger crimp barrel are not given in Table 42
- For alternatives to the assembly of a contact with a conductor that is folded back.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

INSULATION REMOVAL LENGTH

Figure 68

(2) If it is specified, fold the conductor back. Refer to Figure 69.

FOLDED BACK CONDUCTOR

Figure 69

(3) Measure the O.D. of the wire.

(4) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.C.

B. Preparation of Champlain 24-00033 and Champlain 24-00034 Wire

Table 43

NECESSARY MATERIALS

Material	Part Number	Description	Supplier
Sleeve, Heat Shrinkable	TFE 4X	3/16 inch diameter	Chemplast
			Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

PREPARATION OF CHAMPLAIN 24-00034 FIRE RESISTANT WIRE

Figure 70

Refer to Figure 70.

(1) Make a selection of a heat shrinkable sleeve from Table 43.

(2) Remove 1.00 inches ± 0.03 inch of the outer jacket from the end of the wire. Refer to Subject 20-00-15.

(3) Remove 1.00 inches ± 0.03 inch of the layer of braid from the end of the wire. Refer to Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER RUBBER LAYER. DAMAGE TO THE RUBBER LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.28 inch \pm 0.03 inch of the inner rubber layer from the end of the wire. Refer to Subject 20-00-15.
- (5) Remove 0.28 inch \pm 0.03 inch of the inner tape wrap from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) Put a 2.0 inch \pm 0.13 inch length of heat shrinkable sleeve on the wire.
- (7) Align the forward end of the sleeve and the end of the inner rubber layer.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the inner rubber layer
- The distance from the forward end of the sleeve to the end of the inner rubber layer is not more than 0.13 inch.

- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Preparation of Rockbestos or Cerro H22-4000 Wire

**Table 44
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Sleeve, Heat Shrinkable	TFE 4X	1/4 inch diameter	Chemplast
			Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

**PREPARATION OF ROCKBESTOS OR CERRO H22-4000 WIRE
Figure 71**

Refer to Figure 71.

- (1) Make a selection of a heat shrinkable sleeve from Table 44.
- (2) Remove 1.00 inches \pm 0.03 inch of the outer braid from the end of the wire. Refer to Figure 71 and Subject 20-00-15.
- (3) Remove 1.00 inches \pm 0.03 inch of the clear inner wrap from the end of the wire.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER INSULATION LAYER. DAMAGE TO THE INNER LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.25 inch \pm 0.02 inch of the inner insulation from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (5) Put a 1.5 inch to 2.5 inch length of heat shrinkable sleeve on the wire.
- (6) Align the forward end of the sleeve and the end of the inner insulation.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the inner insulation
- The distance from the forward end of the sleeve to the end of the inner insulation is not more than 0.13 inch.

- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Preparation of Belden 8787 Cable

**Table 45
NECESSARY MATERIALS**

Material	Part Number or Description	Supplier
Seal Sleeve, Heat Shrinkable	DWP-125	Raychem (Tyco)
Sleeve, Heat Shrinkable	Grade B, Class 1	Refer to Subject 20-00-11.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (1) Make a selection of a 3/8 inch diameter heat shrinkable seal sleeve from Table 45.
- (2) Put a 1.5 inch \pm 0.2 inch length of the heat shrinkable sleeve on the cable.
- (3) Remove 1.5 inches \pm 0.1 inch of the outer jacket from the end of the cable.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INSULATION OF THE INNER WIRE. DAMAGE TO THE INSULATION WILL CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

CAUTION: DO NOT CAUSE DAMAGE TO THE UNINSULATED SHIELD DRAIN WIRES. DAMAGE TO THE DRAIN WIRES CAN DECREASE THE STRENGTH OF THE DRAIN WIRES.

- (4) Remove the necessary length of the red foil tape and the green foil tape.
Make sure that the end of each foil tape is not more than 0.06 inch from the end of the outer jacket.

- (5) Remove the necessary length of the clear Mylar tape.
Make sure that the distance from the end of the tape to the end of the outer jacket is not more than 0.06 inch.

CAUTION: DO NOT CAUSE DAMAGE TO THE UNINSULATED SHIELD DRAIN WIRES. DAMAGE TO THE DRAIN WIRES CAN DECREASE THE STRENGTH OF THE DRAIN WIRES.

- (6) Put the heat shrinkable sleeve on the outer jacket.
- (7) If it is necessary to assemble a contact on the drain wire:
 - (a) Make a selection of a 1/16 inch diameter heat shrinkable sleeve from Table 45.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (b) Put a 1.20 inches ± 0.06 inch length of the heat shrinkable sleeve on the drain wire.
Make sure that the rear end of the sleeve is against the end of the outer jacket.
- (c) Shrink the sleeve on the drain wire into its position. Refer to Subject 20-10-14.
- (8) If it is not necessary to assemble a contact on the drain wire, cut the necessary length from the end of the drain wire.
Make sure that the distance from the end of the outer jacket to the end of the drain wire is not more than 0.06 inch.
- (9) Remove the necessary length of insulation from the end of the wires. Refer to Paragraph 7.A.

E. Preparation of S280T007-1 Coil Cable

**Table 46
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	MIL-LT	Raychem

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (1) Make a selection of a heat shrinkable sleeve from Table 46.
Make sure that the sleeve has the smallest possible diameter that will move easily on the cable.
- (2) Put a 1.00 inch ± 0.13 inch length of the heat shrinkable sleeve on the cable.
- (3) Remove the necessary length of insulation from the end of the wires. Refer to Paragraph 7.A.
- (4) Push the sleeve to the end of the cable until the forward end of the sleeve makes a 0.5 inch minimum overlap with the end of the cable jacket.
- (5) Shrink the sleeve into its position. Refer to Subject 20-10-14.

F. Preparation of Champlain 51-04569 and 51-04570 Cables

**Table 47
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	TFE 4X	Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (1) Assemble a shield ground wire.
NOTE: The shield ground wire can be assembled with one of these procedures:
 - A mechanical ferrule
 - A solder sleeve.
- (a) Make a selection of one of these:
 - A mechanical ferrule from Subject 20-10-15
 - A solder sleeve from Table 48.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

**Table 48
SOLDER SLEEVE PART NUMBERS**

Part Number	Supplier
D-108-02	Raychem
D-108-11	Raychem

- (b) Make a selection of a heat shrinkable sleeve from Table 47.
- (c) Assemble the shield ground wire. Refer to Subject 20-10-15.
- (2) Remove the necessary length of insulation from the end of the wires. Refer to Paragraph 7.A.

8. CONTACT ASSEMBLY

A. Selection of a Crimp Tool

**Table 49

(1) If the contact is to be terminated to one wire, make a selection of a recommended crimp tool from Table 49.

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS**

(2) If the recommended crimp tool is not available:

(a) Identify the code of the recommended crimp tool. Refer to Table 49.

NOTE: A crimp tool code is assigned to a crimp tool and is related to:

- The basic unit
- The setting of the basic unit
- The locator
- The color of the locator.

For example, for an AWG 24 wire in a contact that has a size 20 engaging end and a size 20 crimp barrel, the recommended crimp tool from Table 49 is:

- An M22520/1-01 basic unit at a setting of 2
- An M22520/1-02 locator at red.

This crimp tool has a crimp tool code of B.

(b) Make a selection of an alternative equivalent crimp tool from Table 50 that has the same crimp tool code for the same wire size and contact size.

NOTE: Crimp tools that have the same crimp tool code attach a contact to a wire in a way that is mechanically equivalent.

In the example for an AWG 24 wire in a contact that has a size 20 engaging end and a size 20 crimp barrel with a crimp tool code of B, the alternative equivalent crimp tool is:

- An 85-550 or a WA27F basic unit at a setting of 2
- An M22520/1-02 locator at red.

(3) If the alternative equivalent crimp tool is not available, make a selection of an alternative permitted crimp tool from Table 51.

(4) If the contact is to be terminated to two wires:

(a) Make a selection of a crimp tool from Table 52.

(b) If the contact part number is not shown in Table 52, refer to Table 53 for the reference to a crimp tool and a locator for the contact size.

(c) Use the contact size to make a selection of a crimp tool and locator from Table 49.

NOTE: A crimp tool and a locator selected from Table 50 or Table 51 is a satisfactory alternative.

(d) Use the wire size specified in Table 53 under Setting to find the crimp tool setting in Table 49 or Table 50 or Table 51.

B. Contact Assembly

This paragraph gives the procedure to assemble:

- A standard contact
- A thermocouple contact
- A special purpose contact.

For the procedure to assemble:

- A shielded contact, refer to Paragraph 9.
- A coax contact, refer to Paragraph 10.

(1) Make a selection of the contact. Refer to the Wiring Diagram Manual.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (2) Prepare the wire. Refer to:
 - Paragraph 7. for the wire preparation procedure
 - Subject 20-00-15 for the insulation removal procedures.
- (3) Make a selection of a crimp tool. Refer to Paragraph 8.A.
- (4) For a contact without an insulation support barrel:
 - (a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 72.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN A CONTACT WITHOUT AN INSULATION SUPPORT BARREL
Figure 72

- (b) Crimp the contact.
- (5) For a contact with an insulation support barrel and a wire that has an O.D. that is larger than the insulation support barrel:
 - (a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 73.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.06 inch.

POSITION OF THE WIRE THAT HAS AN O.D. THAT IS LARGER THAN THE INSULATION SUPPORT BARREL
Figure 73

- (b) Crimp the contact.
- (6) For all other contacts with an insulation support barrel:

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

(a) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 74.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The wire insulation is in the insulation support barrel.

POSITION OF THE WIRE IN A CONTACT WITH AN INSULATION SUPPORT BARREL

Figure 74

(b) Crimp the contact.

9. SHIELDED CONTACT ASSEMBLY

A. Assembly of a Size 1 Shielded Contact

For the procedure to assemble:

- MS39029/54-342 and MS27184-22P contacts, refer to Paragraph 9.B.
- 48-122()-02 and C48-122()-02 contacts with RG-174 or RG-179 coax cable, refer to Paragraph 9.C.

**Table 54
CENTER CONTACT CRIMP TOOLS**

Wire Size (AWG)	Center Contact Size	Crimp Tool		
		Basic Unit		Locator
		Part Number	Setting	
22	22	M22520/2-01	6	M22520/2-33
			6	K74S
			5	294-1631
		ST2220-1-Y	-	ST2220-1-47

**Table 55
FERRULE CRIMP TOOLS**

Basic Unit	Die
M22520/5-01	M22520/5-08
	M22520/5-35
WT-200	-

- (1) Make a selection of a center contact crimp tool from Table 54.
- (2) Make a selection of a ferrule crimp tool from Table 55.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

(3) Prepare the cable. Refer to Figure 75.

CABLE PREPARATION
Figure 75

(a) Put the seal sleeve on the cable.

NOTE: A one inch length of heat shrinkable sleeve with the smallest diameter that can move freely on the outer jacket is a satisfactory alternative to the seal sleeve.

(b) Put the outer ferrule on the cable.

(c) Remove a minimum of 0.47 inch of the jacket from the end of the cable.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

(d) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(e) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the inner dielectric equal to 0.08 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(f) Remove the necessary length of the center conductor to make the distance from the end of the dielectric to the end of the conductor equal to 0.11 inch \pm 0.02 inch.

(4) If the strands of the center conductor are apart, twist the strands together in their initial direction.

(5) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Refer to Figure 76.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE CENTER CONTACT ON THE CABLE
Figure 76

- (6) Crimp the center contact. Refer to Figure 77.
 Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.
- (7) Move the strands of the shield apart. Refer to Figure 77.

CONFIGURATION OF THE SHIELD STRANDS
Figure 77

- (8) Put the body assembly on the center contact. Refer to Figure 78.
 Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT
Figure 78

- (9) Push the center contact into the body assembly until it is locked in the body assembly.
- (10) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (11) If the center contact moves out of the body assembly, do Step (9) and Step (10) again.
- (12) Put the strands of the shield on the inner ferrule. Refer to Figure 79.
 Make sure that the strands of the shield are symmetrical around the inner ferrule.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE SHIELD ON THE INNER FERRULE

Figure 79

- (13) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 80.

POSITION OF THE OUTER FERRULE

Figure 80

- (14) Crimp the outer ferrule.
- (15) If the seal sleeve is on the cable, push the sleeve forward until the forward end of the sleeve is against the rear end of the outer ferrule. Refer to Figure 81.
Make sure that the distance between the forward end of the seal sleeve and the rear end of the outer ferrule is not more than 0.03 inch.

POSITION OF THE SLEEVE

Figure 81

- (16) If a heat shrinkable sleeve is on the cable:
 - (a) Push the sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule. Refer to Figure 81.
Make sure that the distance between the forward end of the sleeve and the rear end of the outer ferrule is not more than 0.03 inch.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.

B. Assembly of MS39029/54-342 and MS27184-22P Size 1 Shielded Contacts

**Table 56
NECESSARY MATERIALS**

Material	Part Number or Description	Supplier
Heat Shrinkable Sleeve	Grade B, Class 1	Refer to Subject 20-00-11.
Seal Sleeve	DWP-125	Raychem (Tyco)

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

NOTE: For alternative sleeve part numbers, refer to Subject 20-00-11.

**Table 57
CENTER CONTACT CRIMP TOOLS**

	Part Number	Cavity
612648	612661	-
M22520/5-01	M22520/5-39	-
ST965-1	-	-
WT-202-06-08	-	S

- (1) Make a selection of a center contact crimp tool from Table 57.
- (2) Make a selection of a ferrule crimp tool from Table 58.
- (3) Put the necessary components on the cable:

NOTE: The seal boot, the seal sleeve, and the outer ferrule in the contact kit are not applicable for this procedure. They can be discarded.

- (a) For a Raychem 55A6087 cable, or a Boeing 10-60816-61 cable, put these sleeves on the cable in this sequence:
 - A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve.

Refer to Table 56.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (b) For all other cables, put these sleeves on the cable in this sequence:
- A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve
 - A 1.12 inch \pm 0.12 inch length of 1/8 inch diameter heat shrinkable sleeve.

Refer to Table 56.

- (c) Put a BACS13S156C outer ferrule on the cable.
- (4) Prepare the cable. Refer to Figure 82.

CABLE PREPARATION
Figure 82

- (a) Remove a minimum of 0.59 inch of the jacket from the end of the cable.
- CAUTION:** DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.
- (b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.03 inch.
- CAUTION:** DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the inner dielectric equal to 0.10 inch \pm 0.03 inch.
- CAUTION:** DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (d) Remove the necessary length of the center conductor to make the distance from the end of the dielectric to the end of the conductor equal to 0.18 inch \pm 0.03 inch.
- (5) If the strands of the center conductor are apart, twist the strands together in their initial direction.
- (6) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Refer to Figure 83.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 83

- (7) Crimp the center contact.
Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.
- (8) Move the strands of the shield apart. Refer to Figure 84.

CONFIGURATION OF THE SHIELD STRANDS

Figure 84

- (9) Put the body assembly on the center contact. Refer to Figure 85.
Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 85

- (10) Push the center contact into the body assembly until it is locked in the body assembly.
- (11) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (12) If the center contact moves out of the body assembly, do Step (10) and Step (11) again.
- (13) Put the strands of the shield on the inner ferrule. Refer to Figure 86.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE

Figure 86

- (14) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 87.

POSITION OF THE OUTER FERRULE

Figure 87

- (15) Crimp the outer ferrule.
- (16) Assemble the heat shrinkable sleeves:
 - (a) If the 1.12 inch sleeve is specified, push the 1.12 inch sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (c) Push the 0.75 inch sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 88.

Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.

POSITION OF THE HEAT SHRINKABLE SLEEVES

Figure 88

- (d) Shrink the sleeve in its position. Refer Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (e) Push the 0.50 inch sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 88.

Make sure the distance between the forward end of the sleeve and the shoulder is a maximum of 0.06 inch.

- (f) Shrink the sleeve in its position. Refer Subject 20-10-14.

C. Assembly of Amphenol 48-12(-)-() and Cinch C48-12(-)-() Size 1 Shielded Contacts

**Table 59
CENTER CONTACT CRIMP TOOLS**

Basic Unit		Locator
Part Number	Setting	
M22520/2-01	1	M22520/2-33
	1	K74S

**Table 60
FERRULE CRIMP TOOLS**

Basic Unit	Die
M22520/5-01	M22520/5-08
ST965-5	-
WT-200	-

- (1) Make a selection of a center contact crimp tool from Table 59.
- (2) Make a selection of a ferrule crimp tool from Table 60.
- (3) Prepare the cable. Refer to Figure 89.

**CABLE PREPARATION
Figure 89**

- (a) Put the seal sleeve on the cable.

NOTE: A one inch length of heat shrinkable sleeve with the smallest diameter that can move freely on the outer jacket is a satisfactory alternative to the seal sleeve.

- (b) Put the outer ferrule on the cable.
- (c) Remove a minimum of 0.47 inch of the jacket from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

- (d) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (e) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the inner dielectric equal to 0.08 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (f) Remove the necessary length of the center conductor to make the distance from the end of the dielectric to the end of the conductor equal to 0.11 inch \pm 0.02 inch.
- (4) If the strands of the center conductor are apart, twist the strands together in their initial direction.
- (5) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Refer to Figure 90.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

POSITION OF THE CENTER CONTACT ON THE CABLE
Figure 90

- (6) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

- (7) Move the strands of the shield apart. Refer to Figure 91.

CONFIGURATION OF THE SHIELD STRANDS
Figure 91

- (8) Put the body assembly on the center contact. Refer to Figure 92.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT
Figure 92

- (9) Push the center contact into the body assembly until it is locked in the body assembly.
- (10) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (11) If the center contact moves out of the body assembly, do Step (9) and Step (10) again.
- (12) Put the strands of the shield on the inner ferrule. Refer to Figure 93.

Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 93

- (13) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 94.

POSITION OF THE OUTER FERRULE
Figure 94

- (14) Crimp the outer ferrule.
- (15) If the seal sleeve is on the cable, push the sleeve forward until the forward end of the sleeve is against the rear end of the outer ferrule. Refer to Figure 95.

Make sure that the distance between the seal sleeve and the outer ferrule is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE SLEEVE
Figure 95

- (16) If a heat shrinkable sleeve is on the cable:
- (a) Push the sleeve toward the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule. Refer to Figure 95.
Make sure that the distance between the forward end of the sleeve and the rear end of the outer ferrule is less than or equal to 0.03 inch.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.

D. Assembly of a Size 2 Shielded Contact

For the procedure to assemble:

- An Amphenol 48-2187-02 shielded contact, refer to Paragraph 9.E.
- A Cinch CN0940-41 or a CN0940-44 shielded contact, refer to Paragraph 9.E.
- A Cinch CN0900-336 shielded contact, refer to Paragraph 9.F.
- An S283U007-1 shielded contact, refer to Paragraph 9.G.
- A 10-60479-41 or a 10-60479-44 potted shielded contact, refer to Paragraph 9.H.
- A 60B40037-15 or a 60B40037-16 potted shielded contact, refer to Paragraph 9.I.
- A 60B40147-15 or a 60B40147-16 potted shielded contact, refer to Paragraph 9.I.
- A 10-60479-41 or a 10-60479-44 shielded contact with BMS13-65 Type 0F cable, refer to Paragraph 9.J.

Table 61
NECESSARY MATERIALS

Material	Part Number or Description	Supplier
Heat Shrinkable Sleeve	Grade B, Class 1	Refer to Subject 20-00-11.
Seal Sleeve	DWP-125	Raychem (Tyco)

NOTE: For alternative sleeve part numbers, refer to Subject 20-00-11.

Table 62
CENTER CONTACT CRIMP TOOLS

Wire Size (AWG)	Center Contact Size	Crimp Tool

	M22520/5-39	-
ST965-1	-	-
WT-202	-	-
WT-202-06-08	-	S

- (1) Make a selection of a center contact crimp tool from Table 62.
- (2) Make a selection of a ferrule crimp tool from Table 63.
- (3) If a seal boot must be installed, put the boot on the cable.
- (4) If a seal boot is not installed, put the heat shrinkable sleeves on the cable.
 - (a) For a Raychem 55A6087 cable or a Boeing 10-60816-61 cable, put these sleeves on the cable in this sequence:
 - A 0.5 inch \pm 0.1 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.20 inch length of 3/16 inch diameter seal sleeve.
 Refer to Table 61.
 - (b) For all other cables, put these sleeves on the cable in this sequence:
 - A 0.5 inch \pm 0.1 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.20 inch length of 3/16 inch diameter seal sleeve
 - A 1.3 inch \pm 0.1 inch length of 1/8 inch diameter heat shrinkable sleeve.
 Refer to Table 61.
- (5) Put the outer ferrule on the cable.

NOTE: The BACS13C156C ferrule is a satisfactory alternative to the Amphenol 48-1540-02 ferrule for the MS27184-20P or MS27185-20S contacts.
- (6) Prepare the cable. Refer to Figure 96.

**CABLE PREPARATION
Figure 96**

- (a) Remove a minimum of 0.53 inch of the jacket from the end of the cable.

20-61-11

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

- (b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the dielectric equal to 0.11 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (d) Remove the necessary length of the center conductor to make the distance from the end of the inner dielectric to the end of the conductor equal to 0.14 inch \pm 0.02 inch.

(7) Assemble the contact:

- (a) If the strands of the center conductor are apart, twist the strands together in their initial direction.
- (b) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 97.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 97

- (c) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

(8) Move the strands of the shield apart. Refer to Figure 98.

CONFIGURATION OF THE SHIELD STRANDS

Figure 98

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (9) Put the body assembly on the center contact. Refer to Figure 99.

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 99

- (10) Put the center contact in the inner ferrule of the body assembly.
 (11) Push the center contact into the body assembly until it is locked in the body assembly.
 (12) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (13) If the center contact moves out of the body assembly, do Step (11) and Step (12) again.
 (14) Put the strands of the shield on the inner ferrule. Refer to Figure 100.

Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE

Figure 100

- (15) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 101.

POSITION OF THE OUTER FERRULE

Figure 101

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (16) Crimp the outer ferrule.
- (17) If it is applicable, assemble the heat shrinkable sleeves:
 - (a) If the 1.3 inch sleeve is specified, push the 1.3 inch sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule. Refer to Figure 102.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (c) Push the 0.75 inch sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 102.

Make sure the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 102

- (d) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (e) Push the 0.5 inch sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 102.
- Make sure the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.
- (f) Shrink the sleeve in its position. Refer Subject 20-10-14.

E. Assembly of Cinch CN0940-41, CN0940-44 and Amphenol 48-2187-02 Size 2 Shielded Contacts

Table 64

WT-202-06-08	-	S

- (1) Make a selection of a center contact crimp tool from Table 65.
- (2) Make a selection of a ferrule crimp tool from Table 66.
- (3) Put the necessary components on the cable.

NOTE: The seal sleeve, the seal boot, and the outer ferrule in the contact kit are not applicable for this procedure. They can be discarded.

- (a) For a Raychem 55A6087 cable or a Boeing 10-60816-61 cable, put these sleeves on the cable in this sequence:
 - A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve.

Refer to Table 64.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (b) For all other cables, put these sleeves on the cable in this sequence:
 - A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve
 - A 1.12 inch \pm 0.12 inch length of 1/8 inch diameter heat shrinkable sleeve.

Refer to Table 64.

- (c) Put a BACS13S156C outer ferrule on the cable
- (4) Prepare the cable. Refer to Figure 103.

CABLE PREPARATION
Figure 103

- (a) Remove a minimum of 0.59 inch of the jacket from the end of the cable.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.
- (b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.03 inch.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the dielectric equal to 0.10 inch \pm 0.03 inch.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (d) Remove the necessary length of the center conductor to make the distance from the end of the inner dielectric to the end of the conductor equal to 0.18 inch \pm 0.03 inch.
- (5) Assemble the contact:
 - (a) If the strands of the center conductor are apart, twist the strands together in their initial direction.
 - (b) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 104.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 104

(c) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

(6) Move the strands of the shield apart. Refer to Figure 105.

CONFIGURATION OF THE SHIELD STRANDS

Figure 105

(7) Put the body assembly on the center contact. Refer to Figure 106.

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 106

(8) Push the center contact into the body assembly until it is locked in the body assembly.

(9) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (10) If the center contact moves out of the body assembly, do Step (8) and Step (9) again.
- (11) Put the strands of the shield on the inner ferrule. Refer to Figure 107.
Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 107

- (12) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 108.

POSITION OF THE OUTER FERRULE
Figure 108

- (13) Crimp the outer ferrule.
- (14) Assemble the heat shrinkable sleeves:
 - (a) If the 1.12 inch sleeve is specified, push the 1.12 inch sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (c) Push the 0.75 inch sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 109.

Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 109

- (d) Shrink the sleeve in its position. Refer Subject 20-10-14.
- (e) Push the 0.50 inch sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 109.
 Make sure that the distance between the forward end of the sleeve and the shoulder is a maximum of 0.06 inch.
- (f) Shrink the sleeve in its position. Refer Subject 20-10-14.

FERRULE CRIMP TOOLS

Basic Unit	Die
M22520/5-01	Y322

- (1) Make a selection of a center contact crimp tool from Table 67.
- (2) Make a selection of a ferrule crimp tool from Table 68.
- (3) Make a selection of a 1/8 inch diameter, or a 3/16 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (4) Put these components on the cable in this sequence:
 - A 1.5 inch length of the heat shrinkable sleeve
 - The O-ring
 - The outer ferrule.

NOTE: These components are supplied with the contact.

Refer to Figure 110.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE O-RING AND THE OUTER FERRULE ON THE CABLE
Figure 110

(5) Prepare the cable. Refer to Figure 111.

CABLE PREPARATION
Figure 111

(a) Remove a minimum of 0.53 inch of the jacket from the end of the cable.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the dielectric equal to 0.11 inch \pm 0.02 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(d) Remove the necessary length of the center conductor to make the distance from the end of the inner dielectric to the end of the conductor equal to 0.14 inch \pm 0.02 inch.

(6) Assemble the contact:

(a) If the strands of the center conductor are apart, twist the strands together in their initial direction.

(b) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 112.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 112

(c) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

(7) Move the strands of the shield apart. Refer to Figure 113.

CONFIGURATION OF THE SHIELD STRANDS

Figure 113

(8) Put the body assembly on the center contact. Refer to Figure 114.

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 114

(9) Push the center contact into the body assembly until it is locked in the body assembly.

(10) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (11) If the center contact moves out of the body assembly, do Step (9) and Step (10) again.
- (12) Put the strands of the shield on the inner ferrule. Refer to Figure 115.
Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 115

- (13) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 116.

POSITION OF THE OUTER FERRULE
Figure 116

- (14) Crimp the outer ferrule.
- (15) Push the O-ring forward to the end of the cable until the O-ring is against the rear end of the outer ferrule. Refer to Figure 116.
- (16) Push the heat shrinkable sleeve forward to the end of the cable until the forward end of the sleeve is against the O-ring.
- (17) Shrink the sleeve in its position. Refer to Subject 20-10-14.

G. Assembly of Boeing S283U007-7 and Cinch CN1036-7 Size 2 Shielded Contacts

This procedure is to assemble the contact with:

- A wire with one shield
- A wire with two shields.

STANDARD WIRING PRACTICES MANUAL

WT-202-06-08	-	S

(1) Make a selection of a center contact crimp tool from Table 71.

20-61-11

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (2) Make a selection of a ferrule crimp tool from Table 72.
- (3) Make a selection of these materials from Table 69:
 - A solvent
 - A potting compound.
- (4) Make a selection of a primer from Table 70.
- (5) For a wire with two shields:
 - Assemble a shield ground wire with the outer shield; refer to Subject 20-10-15
 - Assemble the contact with the inner shield and the center conductor.

Make sure that the location of the outer shield ground wire does not prevent the correct assembly of the shielded contact.

- (6) Discard the seal boot in the contact kit.
- (7) For a Boeing 10-60816-61 shielded wire, put these sleeves on the wire in this sequence:
 - A 0.50 inch \pm 0.06 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve.

Refer to Table 69 and Figure 120.

- (8) For all other wire type codes, put these sleeves on the wire in this sequence:
 - A 0.50 inch \pm 0.06 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 1/8 inch diameter heat shrinkable sleeve.

Refer to Table 69 and Figure 120.

- (9) Put the ferrule on the cable.
- (10) Prepare the cable. Refer to Figure 117.

CABLE PREPARATION
Figure 117

- (a) Remove 0.55 inch \pm 0.03 inch of the jacket from the end of the cable.
 - (b) Remove the necessary length of the shield to make the distance between the end of the shield and the end of the jacket equal to 0.25 inch \pm 0.03 inch.
 - (c) Remove the necessary length of the primary insulation to make the distance between the end of the insulation and the end of the conductor equal to 0.16 inch \pm 0.03 inch.
- (11) Assemble the center contact:
 - (a) If the strands of the conductor are apart, twist the strands together in their initial direction.
 - (b) Push the conductor into the crimp barrel of the center contact until the primary insulation is against the shoulder of the center contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 118.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 118

(c) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

- (12) Clean the primary insulation and the center contact with the solvent.
- (13) Let the solvent dry.
- (14) Apply a thin layer of primer to the primary insulation.
- (15) Apply a thin layer of primer to the center contact assembly.

Make sure that no primer is applied to the engaging end of the center contact.

CAUTION: PRIMER ON THE ENGAGING END OF CENTER CONTACT CAN CAUSE UNSATISFACTORY OPERATION OF THE CONTACT.

- (16) Let the primer dry.
- (17) Move the strands of the shield apart. Refer to Figure 119.

CONFIGURATION OF THE SHIELD STRANDS

Figure 119

- (18) Put the body assembly on the center contact.
- (19) Put the body assembly on the center contact. Refer to Figure 120.

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 120

- (20) Push the center contact into the body assembly until it is locked in the body assembly. Refer to Figure 120.

NOTE: The end of the center contact will be approximately 0.03 inch forward from the end of the contact body.

- (21) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL ON THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (22) If the center contact moves out of the body assembly, do Step (20) and Step (21) again.

- (23) Put the strands of the shield on the inner ferrule. Refer to Figure 121.

Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE

Figure 121

- (24) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly.

- (25) Remove the remaining shield strands that extend farther than the forward end of the ferrule.

- (26) Crimp the ferrule.

NOTE: A distance of 0.03 inch between the contact shoulder and the crimp ferrule is permitted.

- (27) Seal the contact with the potting compound. Refer to Figure 122.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE INJECTION TOOL IN THE FILLER HOLE OF THE SHIELDED CONTACT
Figure 122

- (a) Hold the shielded contact assembly in a vertical position.
 Make sure that the engaging end of the contact is pointed down.
- (b) Put the end of the injection tool into one of the potting filler holes in the contact body assembly.
- (c) Push the plunger of the injection tool.
 Make sure that the potting compound goes into the contact and starts to flow out of the other filler hole.
- (d) Cause a blockage of this hole to stop the flow of the potting material from the hole.
- (e) Continue to push the plunger of the injection tool until the potting material starts to flow out between the shield and the outer ferrule.
- (f) Remove the injection tool from the filler hole.
- (g) Remove the blockage from the other filler hole.
- (h) Cure the potting compound.

CAUTION: OBEY THE MANUFACTURER'S INSTRUCTIONS TO CURE THE POTTING COMPOUND. POTTING COMPOUND THAT IS NOT CURED CORRECTLY CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONTACT.

- (28) Push the 0.75 inch length of 1/8 inch diameter sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule.

Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Refer to Figure 123.

NOTE: This step is not applicable for Boeing 10-60816-61 shielded wire.

COMPLETED CONTACT ASSEMBLY

Figure 123

- (29) Shrink the sleeve in its position. Refer to Subject 20-10-14.
- (30) Push the 0.75 inch length of 3/16 inch diameter sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 123.
Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.
- (31) Shrink the sleeve in its position. Refer to Subject 20-10-14.
- (32) Push the 0.50 inch sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 123.
Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.
- (33) Shrink the sleeve in its position. Refer to Subject 20-10-14.

H. Assembly of Boeing 10-60479-() Size 2 Potted Shielded Contacts

**Table 73
NECESSARY MATERIALS**

Material	Part Number or Description	Supplier
Potting Compound	BMS8-68	QPL
	RTV 3110	Dow Corning
Sleeve, Heat Shrinkable	Grade B, Class 1	Refer to Subject 20-00-11.
Sleeve, Seal	DWP-125	Raychem (Tyco)
Solvent, Aliphatic Naphtha	TT-N-95 Type II	An available source
Injection Tool	-	An available source

NOTE: For alternative sleeve part numbers, refer to Subject 20-00-11.

WT-202-06-08	-	S

- (1) Make a selection of a center contact crimp tool from Table 75.
- (2) Make a selection of a ferrule crimp tool from Table 76.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

(3) Make a selection of these materials from Table 73:

- A solvent
- A potting compound.

(4) Make a selection of a primer from Table 74.

(5) Put the necessary components on the cable.

NOTE: The seal sleeve, the seal boot, and the outer ferrule in the contact kit are not applicable for this procedure. They can be discarded.

(a) For a Raychem 55A6087 cable or a Boeing 10-60816-61 cable, put these sleeves on the cable in this sequence:

- A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
- A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve.

Refer to Table 73.

(b) For all other cables, put these sleeves on the cable in this sequence:

- A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
- A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve
- A 1.12 inch \pm 0.12 inch length of 1/8 inch diameter heat shrinkable sleeve.

Refer to Table 73.

(c) Put a BACS13S156C outer ferrule on the cable.

(6) Prepare the cable. Refer to Figure 124.

CABLE PREPARATION

Figure 124

(a) Remove a minimum of 0.59 inch of the jacket from the end of the cable.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

(b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch \pm 0.03 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the dielectric equal to 0.10 inch \pm 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (d) Remove the necessary length of the center conductor to make the distance from the end of the inner dielectric to the end of the conductor equal to 0.18 inch \pm 0.03 inch.
- (7) Assemble the contact:
 - (a) If the strands of the center conductor are apart, twist the strands together in their initial direction.
 - (b) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 125.

POSITION OF THE CENTER CONTACT ON THE CABLE
Figure 125

- (c) Crimp the center contact.
 Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.
- (8) Clean the center contact assembly with the solvent.
- (9) Apply a thin layer of the primer to the center contact assembly.
 Make sure that no primer is applied to the engaging end of the center contact.

CAUTION: PRIMER ON THE CENTER CONTACT CAN CAUSE UNSATISFACTORY OPERATION OF THE CONTACT.

- (10) Let the primer dry.
- (11) Move the strands of the shield apart. Refer to Figure 126.

CONFIGURATION OF THE SHIELD STRANDS
Figure 126

20-61-11

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (12) Put the body assembly on the center contact. Refer to Figure 127.

Make sure that the inner ferrule of the body assembly is between the shield strands and the inner dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT
Figure 127

- (13) Push the center contact into the body assembly until it is locked in the body assembly.
 (14) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (15) If the center contact moves out of the body assembly, do Step (13) and Step (14) again.
 (16) Put the strands of the shield on the inner ferrule. Refer to Figure 128.

Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 128

- (17) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 129.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE OUTER FERRULE

Figure 129

- (18) Crimp the outer ferrule.
- (19) If the 1.12 inch sleeve is specified, push the 1.12 inch sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule.
- (20) Shrink the sleeve in its position. Refer Subject 20-10-14.
- (21) Seal the contact with the potting compound. Refer to Figure 130.

POSITION OF THE INJECTION TOOL IN THE FILLER HOLE OF THE SHIELDED CONTACT

Figure 130

- (a) Hold the shielded contact assembly in a vertical position.
Make sure that the engaging end of the contact is pointed down.
- (b) Put the end of the injection tool into one of the potting filler holes in the contact body assembly.
- (c) Push the plunger of the injection tool.
Make sure that the potting compound goes into the contact and starts to flow out of the other filler hole.

20-61-11

707, 727-787

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (d) Make a blockage of the other filler hole to stop the flow of the potting material.
- (e) Continue to push the plunger of the injection tool until the potting material starts to flow out between the shield and the outer ferrule.
- (f) Remove the injection tool from the filler hole.
- (g) Remove the blockage from the other filler hole.
- (h) Cure the potting compound.

CAUTION: OBEY THE MANUFACTURER'S INSTRUCTIONS TO CURE THE POTTING COMPOUND. POTTING COMPOUND THAT IS NOT CURED CORRECTLY CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONTACT.

- (22) Assemble the remaining heat shrinkable sleeves:
 - (a) Push the 0.75 inch sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly.
Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (c) Push the 0.50 length of sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly.
Make sure that the distance between the forward end of the sleeve and the shoulder is a maximum of 0.06 inch.
 - (d) Shrink the sleeve in its position. Refer Subject 20-10-14.

- (1) Make a selection of a center contact crimp tool from Table 78.
- (2) Make a selection of a ferrule crimp tool from Table 79.
- (3) Make a selection of these materials from Table 77:
 - A solvent
 - A primer
 - A potting compound.
- (4) Prepare the cable.
 - (a) Remove 0.57 inch \pm 0.06 inch of the jacket from the end of the cable.
 - (b) Remove 0.45 inch \pm 0.05 inch of the shield from the end of the cable.
 - (c) Remove 0.45 inch \pm 0.05 inch of the dielectric from the end of the conductor.
- (5) Assemble the contact.
 - (a) If the strands of the center conductor are apart, twist the strands together in their initial direction.
 - (b) Push the center conductor into the crimp barrel of the center contact until the dielectric is against the shoulder of the center contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The dielectric is against the shoulder of the center contact.

Refer to Figure 131.

**POSITION OF THE CENTER CONTACT ON THE CABLE
Figure 131**

- (c) Crimp the center contact.

20-61-11

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

- (d) Clean the center contact assembly with the solvent.
- (e) Apply a thin layer of the primer to the center contact assembly.

Make sure that no primer is applied to the engaging end of the center contact.

CAUTION: PRIMER ON THE CENTER CONTACT CAN CAUSE UNSATISFACTORY OPERATION OF THE CONTACT.

- (f) Let the primer dry.
- (g) Move the strands of the shield apart. Refer to Figure 132.

CONFIGURATION OF THE SHIELD STRANDS
Figure 132

- (h) Put the body assembly on the center contact. Refer to Figure 133.

Make sure that the inner ferrule of the body assembly is between the shield strands and the dielectric.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT
Figure 133

- (i) Push the center contact into the body assembly until it is locked in the body assembly.
- (j) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

CAUTION: DO NOT PULL ON THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (k) If the center contact moves out of the body assembly, do Step (i) and Step (j) again.
- (l) Put the strands of the shield on the inner ferrule. Refer to Figure 134.

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS**

Make sure that the strands of the shield are symmetrical around the inner ferrule.

**POSITION OF THE SHIELD ON THE INNER FERRULE****Figure 134**

- (m) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 135.

**POSITION OF THE OUTER FERRULE****Figure 135**

- (n) Crimp the outer ferrule.
- (6) Seal the contact with the potting compound. Refer to Figure 136.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE INJECTION TOOL IN THE FILLER HOLE OF THE SHIELDED CONTACT
Figure 136

- (a) Hold the shielded contact assembly in a vertical position.
Make sure that the engaging end of the contact is pointed down.
- (b) Put the end of the injection tool into one of the potting filler holes in the contact body assembly.
- (c) Push the plunger of the injection tool.
Make sure that the potting compound goes into the contact and starts to flow out of the other filler hole.
- (d) Cause a blockage of this hole to stop the flow of the potting material from the hole.
- (e) Continue to push the plunger of the injection tool until the potting material starts to flow out between the shield and the outer ferrule.
- (f) Remove the injection tool from the filler hole.
- (g) Remove the blockage from the other filler hole.
- (h) Cure the potting compound.

CAUTION: OBEY THE MANUFACTURER'S INSTRUCTIONS TO CURE THE POTTING COMPOUND. POTTING COMPOUND THAT IS NOT CURED CORRECTLY CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONTACT.

- (1) Make a selection of a center contact crimp tool from Table 81.
- (2) Make a selection of a ferrule crimp tool from Table 82.
- (3) Put the necessary components on the cable.

NOTE: The seal sleeve, the seal boot, and the outer ferrule in the contact kit are not applicable for this procedure. They can be discarded.

- (a) Put these sleeves on the cable in this sequence:
 - A 0.50 inch \pm 0.05 inch length of 1/4 inch diameter seal sleeve
 - A 0.75 inch \pm 0.06 inch length of 3/16 inch diameter seal sleeve
 - A 1.12 inch \pm 0.12 inch length of 1/8 inch diameter heat shrinkable sleeve.

Refer to Table 80.

- (b) Put a BACS13S156C outer ferrule on the cable
- (4) Prepare the cable. Refer to Figure 137.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CABLE PREPARATION

Figure 137

- (a) Remove a minimum of 0.59 inch of the jacket from the end of the cable.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.
- (b) Remove the necessary length of the shield to make the distance from the end of the cable jacket to the end of the shield equal to 0.22 inch ± 0.03 inch.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (c) Remove the necessary length of the inner dielectric to make the distance from the end of the shield to the end of the dielectric equal to 0.10 inch ± 0.03 inch.
 - CAUTION:** DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (d) Remove the necessary length of the center conductor to make the distance from the end of the inner dielectric to the end of the conductor equal to 0.18 inch ± 0.03 inch.
- (5) Assemble the contact:
 - (a) If the strands of the center conductor are apart, twist the strands together in their initial direction.
 - (b) Push the center conductor into the crimp barrel of the center contact until the inner dielectric is against the shoulder of the center contact.
 - Make sure that:
 - All of the strands of the conductor are in the crimp barrel
 - The strands of the conductor can be seen in the inspection hole
 - The dielectric is against the shoulder of the center contact.

Refer to Figure 138.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 138

- (c) Crimp the center contact.

Make sure that the distance from the end of the dielectric to the contact is not more than 0.03 inch.

- (6) Move the strands of the round conductor shield apart. Refer to Figure 139.

Make sure that the strands of the flat conductor shield stay against the dielectric.

CONFIGURATION OF THE SHIELD STRANDS

Figure 139

- (7) Put the body assembly on the center contact. Refer to Figure 140.

Make sure that the inner ferrule of the body assembly is between the round conductor shield and the flat conductor shield.

POSITION OF THE BODY ASSEMBLY ON THE CENTER CONTACT

Figure 140

- (8) Push the center contact into the body assembly until it is locked in the body assembly.
- (9) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (10) If the center contact moves out of the body assembly, do Step (8) and Step (9) again.
- (11) Put the strands of the shield on the inner ferrule. Refer to Figure 141.
Make sure that the strands of the shield are symmetrical around the inner ferrule.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 141

- (12) Push the outer ferrule forward to the end of the cable until the forward end of the outer ferrule is against the shoulder of the body assembly. Refer to Figure 142.

POSITION OF THE OUTER FERRULE
Figure 142

- (13) Crimp the outer ferrule.
- (14) Assemble the heat shrinkable sleeves:
 - (a) Push the 1.12 inch sleeve to the end of the cable until the forward end of the sleeve is against the rear end of the outer ferrule.
 - (b) Shrink the sleeve in its position. Refer Subject 20-10-14.
 - (c) Push the 0.75 inch sleeve on the outer ferrule until the forward end of the sleeve is against the shoulder of the body assembly. Refer to Figure 143.

Make sure that the distance between the forward end of the sleeve and the shoulder is not more than 0.06 inch.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 143

- (d) Shrink the sleeve in its position. Refer Subject 20-10-14.
- (e) Push the 0.5 inch sleeve on the 0.75 inch sleeve until the forward end of the sleeve is against the shoulder of the body assembly.
 Make sure that the distance between the end of the sleeve and the shoulder is not more than 0.06 inch.
- (f) Shrink the sleeve in its position. Refer Subject 20-10-14.

10. COAX CONTACT ASSEMBLY

A. Assembly of Cory CRC280-(), CRM280-(), and CRMEF-502 Coax Contacts

		Y197	B

- (1) Make a selection of a center contact crimp tool from Table 83.
- (2) Make a selection of a contact body crimp tool from Table 84.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (3) Cut the end of the cable.
Make sure that the end is perpendicular to the longitudinal axis.
- (4) Remove 0.30 inch \pm 0.03 inch of the outer jacket from the end of the cable. Refer to Figure 144.

OUTER JACKET REMOVAL LENGTH
Figure 144

- (5) Put the inner sleeve on the cable. Refer to Figure 145.
Make sure that:
 - The inner shoulder of the sleeve is against the end of the cable jacket
 - The distance from the forward end of the inner sleeve to the end of the cable is 0.28 inch \pm 0.03 inch.

POSITION OF THE INNER SLEEVE
Figure 145

- (6) Fold the outer shield with round strands back. Refer to Figure 146.
Make sure that strands of the outer shield are against the inner sleeve.

POSITION OF THE OUTER SHIELD
Figure 146

- (7) Remove the necessary length of the inner shield with flat strands.
Make sure that the end of the inner shield is aligned with the forward end of the inner sleeve.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE ROUND STRANDS OF THE OUTER SHIELD. DAMAGE TO THE OUTER SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OR RELIABILITY OF THE COAX CABLE.

- (8) Remove the necessary length of the dielectric.
Make sure that the distance from the forward end of the inner sleeve to the end of the dielectric is 0.05 inch \pm 0.03 inch.
- (9) Put the center contact on the center conductor.
- (10) Crimp the center contact.
- (11) Put the body of the contact on the cable.
Make sure that:
 - The barrel is on the shield
 - The center contact is fully inserted in the body.
- (12) To make sure that the center contact is locked, hold the body of the contact and lightly pull the cable.
- (13) If it is necessary, remove a short length of the shield to align the end of the shield with the rear end of the contact body.
- (14) Crimp the contact body. Refer to Figure 147.
Make sure that the distance between the flange of the inner sleeve and the rear end of the contact body is not more than 0.04 inch.

CRIMP OF THE CONTACT BODY
Figure 147

11. CONTACT INSERTION

A. Contact Insertion

Refer to:

- Paragraph 11.B. for the insertion of a shielded contact
- Paragraph 11.C. for the insertion of a coax contact.

This procedure can be used to insert these contacts in a contact cavity:

- A wired contact
- An unwired contact.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

- (1) Make a selection of a contact insertion tool from Table 85.
Refer to Subject 20-00-16 to find the O.D. of the wire.
- (2) Examine the tool.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE PERSON.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (3) Put the necessary connector assembly components on the wire harness.
- (4) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

- (5) Put the contact assembly in the insertion tool.

For a size 20 contact, refer to:

- Figure 148 for the correct position of the insertion tool tip on the contact assembly with a wire O.D. less than 0.06 inch
- Figure 149 for the correct position of the insertion tool tip on the contact assembly with a wire O.D. more than 0.06 inch.

POSITION OF THE INSERTION TOOL TIP INSIDE THE WIRE INSULATION BARREL FOR SIZE 20 CONTACTS AND A WIRE O.D. LESS THAN 0.06 INCH
Figure 148

POSITION OF THE INSERTION TOOL TIP OUTSIDE THE WIRE INSULATION BARREL FOR SIZE 20 CONTACTS AND A WIRE O.D. MORE THAN 0.06 INCH
Figure 149

- (6) From the rear of the connector, axially align the insertion tool and the contact cavity.

20-61-11

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DAMAGE TO THE CONNECTOR OCCURS IF A TOOL IS INSERTED INTO THE FRONT FACE OF THE CONNECTOR.

- (7) Carefully push the insertion tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE INSERTION TOOL AT THE SAME TIME THAT THE TOOL IS PUSHED IN THE GROMMET. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (8) If it is necessary to make the insertion of the contact easier:
 - (a) Put a small quantity of isopropyl alcohol or denatured alcohol on one of these surfaces or each of these surfaces:
 - The contact
 - The rear face of the connector grommet.

CAUTION: DO NOT PUT LUBRICANT ON ANOTHER SURFACE. DAMAGE TO THE CONDUCTOR OR TO THE WIRED CONTACT CAN CAUSE UNSATISFACTORY PERFORMANCE.

CAUTION: DO NOT PUT MORE THAN THE NECESSARY QUANTITY OF LUBRICANT ON THE SURFACE. DAMAGE TO THE CONDUCTOR OR TO THE WIRED CONTACT CAN CAUSE UNSATISFACTORY PERFORMANCE.

- (9) Carefully pull the insertion tool straight out of the contact cavity.
- (10) To make sure that the contact is locked in the contact cavity, lightly pull on the wire.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (11) If the contact is not locked in the contact cavity:
 - (a) Pull the contact out of the contact cavity.
 - (b) Do Step (4) through Step (10) again.

B. Shielded Contact Insertion

**Table 86
SHIELDED CONTACT INSERTION TOOLS**

Shielded Contact		Connector Cavity Size	Insertion Tool
Part Number	Size		
10-60479-41	2	8	DAK623
10-60479-44	2	8	DAK623
48-2187-02	2	8	DAK623
MS27184-22P	1	12	DAK623
MS39029/54-342	1	12	DAK623
S283U007-7	2	8	DAK623

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

**Table 87
SHIELDED CONTACT INSERTION TOOLS**

Shielded Contact Size	Connector Cavity Size	Insertion Tool
1	12	294-72
		M81969/17-05
		MS24256A12
2	8	294-128
		M81969/17-06

- (1) Make a selection of an insertion tool from:
 - Table 86 for a 10-60479-() shielded contact
 - Table 86 for a 48-2187-02 shielded contact
 - Table 86 for an MS27184-22P or an MS39029/54-342 shielded contact
 - Table 86 for an S283U007-7 shielded contact
 - Table 87 for all other shielded contacts.

- (2) Examine the tool.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE PERSON.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (3) Put the necessary connector assembly components on the wire harness.
- (4) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

- (5) Put the contact assembly in the insertion tool.
- (6) From the rear of the connector, axially align the insertion tool and the contact cavity.

CAUTION: DAMAGE TO THE CONNECTOR OCCURS IF A TOOL IS INSERTED INTO THE FRONT FACE OF THE CONNECTOR.

- (7) Carefully push the insertion tool into the contact cavity until it stops.

CAUTION: DO NOT TURN THE INSERTION TOOL AT THE SAME TIME THAT THE TOOL IS PUSHED IN THE GROMMET. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (8) Carefully remove the tool from the contact cavity.
- (9) To make sure that the contact is locked, lightly pull the wire.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (10) If the contact is not locked in the contact cavity, do Step (7) through Step (9) again.
- (11) For the Cinch CN0900-336 contacts:
 - (a) Make a selection of a blunt tool.
 - (b) Carefully push the O-ring into the rear grommet to make the O-ring go behind the outer sealing web of the grommet.
- (12) For all other size 2 shielded contacts, push the sealing boot into the contact cavity of the rear grommet. Refer to Figure 150.

Make sure that the sealing ring on the sealing boot is behind the outer sealing web in the rear grommet.

POSITION OF THE THE SEALING RING BEHIND THE OUTER SEALING WEB
Figure 150

C. Coax Contact Insertion

Table 88
COAX CONTACT INSERTION TOOLS

Contact Size	Insertion Tool
12	294-72
	M81969/17-05
	MS24256A12
8	294-128
	M81969/17-06

- (1) Make a selection of a coax contact insertion tool from Table 88.
- (2) Make a selection of a coax contact insertion tool from Table 88.

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS**

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE PERSON.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (3) Put the necessary connector assembly components on the wire harness.
- (4) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

- (5) Put the contact assembly in the insertion tool.
- (6) From the rear of the connector, axially align the insertion tool with the contact cavity.

CAUTION: DAMAGE TO THE CONNECTOR OCCURS IF A TOOL IS INSERTED INTO THE FRONT FACE OF THE CONNECTOR.

- (7) Carefully push the tool straight into the correct contact cavity until it stops.

CAUTION: DO NOT TURN THE INSERTION TOOL AT THE SAME TIME THAT THE TOOL IS PUSHED IN THE GROMMET. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (8) Carefully remove the tool from the contact cavity.
- (9) To make sure that the contact is locked, lightly pull the wire.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE CABLE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE CABLE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (10) If the contact is not locked in the contact cavity, do Step (7) through Step (9) again.

12. SEAL OF AN EMPTY CONTACT CAVITY**A. Seal of an Empty Contact Cavity**

All empty contact cavities must be sealed.

Refer to:

- Subject 20-60-08 to seal an empty standard contact cavity
- Paragraph 12.B. to seal an empty shielded contact cavity with a Boeing 10-60479-() potted shielded contact
- Paragraph 12.C. to seal an empty shielded contact cavity with an Amphenol 217-2026 seal plug.

B. Seal of an Empty Shielded Contact Cavity with a 10-60479-() Potted Shielded Contact

A satisfactory alternative to this procedure is the seal of an empty shielded contact cavity with an Amphenol 217-2026 seal plug. Refer to Paragraph 12.C.

20-61-11

STANDARD WIRING PRACTICES MANUAL**MIL-C-26500 FRONT RELEASE CONNECTORS**

- (1) Assemble a 10-60479-() potted shielded contact without a center contact. Refer to Paragraph 9.H.

Make sure that:

- The center contact is not installed
 - The potting compound is sufficiently dry.
- (2) Make a selection of an insertion tool from Table 86.
 - (3) Put the tip of the insertion tool over the end of the unwired shielded contact.
 - (4) From the rear of the connector, push the tool straight into the correct contact cavity until it stops.
 - (5) Carefully remove the tool from the contact cavity.
 - (6) Push the sealing boot into the grommet.
 - (7) Push a size 16 seal plug or seal rod into the wire hole of the boot until the seal plug is against the contact.

C. Seal of an Empty Shielded Contact Cavity with an Amphenol 217-2026 Seal Plug

A satisfactory alternative to this procedure is the seal of an empty shielded contact cavity with a Boeing 10-60479-() potted shielded contact. Refer to Paragraph 12.B.

- (1) Align the plug with the contact cavity.

Make sure that the end with the grooves is pointed to the contact cavity.

- (2) Push the plug into the contact cavity until it is locked in the cavity.

13. INSTALLATION OF COUPLING RING POLARITY ADAPTERS**A. Installation of Cinch Adapters**

Refer to Paragraph 3.M. for the adapter configurations and part numbers.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

COUPLING RING POLARITY ADAPTERS

Figure 151

- (1) To install the plug shell adapter:
 - (a) Put the adapter on the plug. Refer to Figure 151.
Make sure that the end with the external polarity keys is pointed to the engaging face of the plug.
 - (b) Push the adapter on the coupling ring or the plug until the retention device is locked.
- (2) To install the receptacle shell adapter:
 - (a) Put the adapter on the receptacle. Refer to Figure 151.
Make sure that the end with the internal polarity keyways is pointed to the engaging face of the receptacle.
 - (b) Push the adapter over the receptacle until one of these conditions occur:
 - The adapter retention device is locked
 - The adapter is against the panel of the mounted receptacle.

STANDARD WIRING PRACTICES MANUAL

MIL-C-26500 FRONT RELEASE CONNECTORS

B. Installation of the Amphenol 48-7164-1S connector

**Table 89
NECESSARY MATERIALS**

Description	Description	Part Number	Supplier
Alcohol	Isopropyl	-	An available source
Thread Lock Compound	-	222	Loctite
		271	Loctite

**Table 90
NECESSARY TOOLS**

Tool	Description	Part Number	Supplier
Wiper	Cloth	-	An available source
Torque Tool	-	-	An available source

- (1) Make a selection of an alcohol and a thread lock compound from Table 89.
- (2) Make a selection of a wiper and a torque tool from Table 90.
- (3) Clean the threads of the 48-7164-1S connector body and retainer nut with the wiper moist with isopropyl alcohol.
- (4) Apply two drops of the thread lock compound on the threads of the 48-7164-1S connector body and the threads of the retainer nut.
- (5) Install the connector.
- (6) Torque the retainer nut to 46 inch-pounds ± 10 inch-pounds.

D. Contact Description

TYPICAL CONTACT
Figure 2

2. CONNECTOR DISASSEMBLY

A. Safety Wire Removal

- (1) Remove the safety wire between the grommet nut and the grommet follower.
- (2) Loosen the grommet nut.
- (3) Push the nut over the wire.

CAUTION: DO NOT TRY TO REMOVE THE INTEGRAL GROMMET FROM THE SHELL.

B. Contact Removal

Table 3
CONTACT REMOVAL TOOLS

Engaging End Size	Contact Type	Removal Tool	
		Handle	Tip
20	Pin	294-152	294-1034

	Socket	294-152	294-1033
		ST-2220-2	ST-2220-3-17

- (1) Make a selection of a contact removal tool from Table 3.
- (2) Carefully put the tip of the tool on the engaging end of the contact so that the tool is against the front face of the connector insert.
- (3) Pull the wire and the tool from the contact cavity at the same time.

3. CONNECTOR ASSEMBLY

		WA22	8	K149

- (1) Remove 0.34 inch ±0.03 inch of wire insulation.
- (2) Make a selection of a crimp tool from Table 4 or Table 5.
- (3) Put the contact in the locator.
- (4) Put the wire in the crimp barrel of the contact until it hits the bottom.
Make sure that:
 - All of the conductor strands are in the crimp barrel
 - The wire is visible through the inspection hole.
- (5) Crimp the contact.
- (6) Remove the wired contact from the tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 67 SERIES AND CINCH CN0906 SERIES CONNECTORS

B. Contact Insertion

**Table 6
CONTACT INSERTION TOOLS**

Engaging End Size	Insertion Tool	
	Handle	Tip
20	294-152	294-1096
	ST-2220-2	ST-2220-2-15

- (1) Make a selection an insertion tool from Table 6.
- (2) Install spare contacts in all of the unused contact cavities.
- (3) Put the wired contact in the tool. Refer to Figure 3.

Make sure that:

- The tool tip is against the shoulder of the contact
- The inner shoulder of the tool is against the end of the contact.

**POSITION OF THE CONTACT IN THE INSERTION TOOL
Figure 3**

- (4) Push the contact into the connector.
- (5) Align the contact and the tool so that they are perpendicular to the rear face of the grommet.
- (6) Push the contact into the contact cavity until the stepped part of the tool tip is within 0.375 inch of the grommet.
- (7) Carefully pull the tool from the connector.
- (8) To make sure that each contact is completely inserted, hold the wire and pull slowly until the thumb and forefinger slip along the wire.

CAUTION: DO NOT PULL THE WIRE WITH A SUDDEN FORCE OR INDENT THE WIRES WITH THE FINGERNAILS.

- (9) Insert a filler rod in all spare contacts.

Make sure that the end of the filler rod is against the end of the crimp barrel.

- (10) Remove the unwanted length of the filler. Refer to Figure 4.

Make sure that the end of the filler is 1/16 inch to 3/16 inch from the face of the grommet.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 67 SERIES AND CINCH CN0906 SERIES CONNECTORS

FILLER ROD INSTALLATION
Figure 4

C. Connector Assembly

- (1) Push the grommet nut against the connector backshell.
- (2) Hold the grommet follower lugs and turn the follower to align the keyway in the grommet follower with the key in the shell.
- (3) Tighten the grommet nut with pliers until the nut stops.

D. Safety Wire Installation

SAFETY WIRE INSTALLATION
Figure 5

- (1) When it is necessary, install safety wire on the grommet nut and grommet follower lug. Refer to Figure 5.
- (2) If the grommet nut holes are more than 0.38 inch apart:
 - (a) Use the double twist method. Refer to Figure 5 and Subject 20-60-07.
 - (b) Install the safety wire between the grommet follower lug and the grommet nut.
 - (c) Install the safety wire in any one of the grommet nut holes.
- (3) If the grommet nut holes are less than 0.38 inch apart:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 67 SERIES AND CINCH CN0906 SERIES CONNECTORS

- (a) Use the single wire method. Refer to Subject 20-60-07.
- (b) Install the safety wire so that the wire is tightens when the grommet nut is loosened.
- (c) Twist the wires 3 to 5 turns at the end of the wire.
- (d) Bend the end of the wire back.

NOTE: The tool kits include the handle and the insertion and removal bits.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 69 SERIES CONNECTORS

NOTE: The backshell must be removed from the connector before the contacts can be removed.

- (1) Make a selection of a removal tool from Table 5.
- (2) At the front face of the connector, axially align the tool and the contact cavity.
- (3) Push the tool into the contact cavity until the contact moves out from the rear of the connector.
Make sure that the removal tool stays axially aligned with the contact cavity.
- (4) Carefully remove the tool from the contact cavity.
- (5) Pull the contact out of the contact cavity from the rear of the connector.

3. CONNECTOR ASSEMBLY

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 69 SERIES CONNECTORS

Table 11
SOCKET CONTACT INSERTION GUIDES

Crimp Barrel Size	Insertion Guide
16	ST2216-16A
12	ST2216-12A
4	200-908-136-02

- (1) Loosen the grommet clamp nut on the connector so that only two or three threads are engaged.
- (2) Install spare contacts in the unused contact cavities of the connector.

CAUTION: MAKE SURE THAT SIZE 16S (SHORT) CONTACTS ARE ONLY INSTALLED IN THE CONNECTORS WITH SHORT COUPLING SHELLS. THESE CONNECTORS HAVE THE LETTER S OR SL IN THE SHELL SIZE PORTION OF THE PART NUMBER.

- (3) Make a selection the correct insertion tool from Table 9.
- (4) If the contact is a socket, make a selection the correct insertion guide from Table 11.

CAUTION: TO PREVENT DAMAGE TO THE CONNECTOR, USE INSERTION GUIDES TO HELP WITH THE INSERTION OF SOCKET CONTACTS.

- (5) Place the wired or unwired contact in the insertion tool with the tip of the tool up against the contact shoulder.
- (6) Align the contact and the insertion tool perpendicular to the back face of the grommet.

CAUTION: KEEP THE CONTACT AND INSERTION TOOL PERPENDICULAR TO THE BACK FACE OF THE GROMMET DURING THE INSERTION.

NOTE: To make the contact easier to insert, both the contact and insertion tool may be lubricated with isopropyl alcohol.

- (7) If the contact is a socket, insert the flat side on the shank of the guide toward the indent in the engagement pressure spring.
- (8) Carefully guide the contact through the grommet hole.

CAUTION: AVOID INJURY TO THE HAND BY THE INSERTION GUIDE DURING THE INSERTION.

- (9) Push the contact into the contact cavity until it fully seats in the connector.

On the engaging face of the connector:

- The ends of the socket contacts should be approximately 0.10 inch below the surface of the insert
- The front shoulder of the pin contacts should be less than 0.12 inch below the surface of the insert.

- (10) Make sure that each contact is fully seated in the contact cavity:
 - (a) Gently grasp each wire between the thumb and the forefinger
 - (b) Slowly pull until the thumb and forefinger slip on the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 69 SERIES CONNECTORS

CAUTION: DO NOT INDENT THE WIRE INSULATION WITH THE FINGERNAILS.

4. AMPHENOL 69-0R32-17S(170) CONNECTOR ASSEMBLY

A. Contact Assembly

- (1) Put the grommet clamp nut over the wires so that the threaded end points with toward the connector.
- (2) Put the nylon grommet follower over the wires so that the open end points toward the connector.
Make sure that each wire is in its correct contact position.
- (3) Remove 11/16 inch \pm 1/16 inch of wire insulation.
- (4) Put a 1-3/4 inch \pm 1/8 inch length of 1/4 inch PD heat shrinkable sleeve over each wire and place the forward edge 0 inch to 1/16 inch from the edge of the insulation.
- (5) Shrink the sleeve into place. Refer to Subject 20-10-14.
- (6) Put a 2 inch \pm 1/8 inch length of 3/8 inch PD sleeve over the first sleeve and place the forward edge 0 inch to 1/16 inch from the edge of the insulation.
- (7) Shrink that sleeve into place. Refer to Subject 20-10-14.
- (8) For AWG 8 wire:
 - (a) Make a selection of a 0.5 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
 - (b) Put a 2-1/2 inch \pm 1/8 inch length of the sleeve on the two PD sleeves applied in Step (4) and Step (6) 0 inch to 1/16 inch from the edge of the insulation.
 - (c) Shrink that sleeve into place. Refer to Subject 20-10-14.
- (9) Install a filler sleeve. Refer to Figure 4.
 - (a) Make a selection of a filler sleeve from Table 4.
 - (b) Put a filler sleeve over each conductor with the flanged end against the wire insulation.
 - (c) Put a nylon locking ring over each sleeve.

203-10104-1 CONTACT ASSEMBLY
Figure 4

- (10) Put a Cannon 203-10104-1 contact on each wire with the end of the wire barrel against the nylon locking ring.
- (11) Make a selection of a crimp tool from Table 8.
- (12) Crimp the contact onto the wire.
Make sure that the edge of the crimp is 1/16 inch \pm 1/32 inch from the end of the wire barrel. Refer to Figure 4.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL 69 SERIES CONNECTORS

B. Contact Insertion

- (1) Insert the contacts into the connector by hand.

NOTE: To make the contact easier to insert, the grommet may be lightly lubricated with isopropyl alcohol.

C. Connector Assembly

- (1) Push the nylon grommet follower over the grommet.
- (2) Push the grommet clamp nut over the grommet follower.
- (3) Tighten the nut.

**Table 4
COAX CONTACT REMOVAL TOOLS**

Removal Tool	Supplier
M15513-25	Deutsch

- (1) Make a selection of a removal tool from Table 3 or Table 4.
- (2) Pull the extraction rod handle of the tool back to its full retracted position.
- (3) Carefully push the tip of the tool over the engaging end of the contact until the tip reaches a definite stop in the contact cavity.
- (4) To remove the contact from the connector, hold the tool firmly in position and push the extraction rod handle.

3. CONNECTOR ASSEMBLY

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF DEUTSCH DS SERIES CONNECTORS

NOTE: The ST940 is a 294-80 crimp tool with special Buchanan indentors.

- (1) Remove the wire insulation. Refer to Table 5.
- (2) Make a selection of a crimp tool from Table 6.
Make sure to use the Buchanan 11743 crimp tool for nickel plated wire.
- (3) Put the contact in the tool.
- (4) Put the wire in the crimp barrel of the contact.
Make sure that all the strands of the conductor are in the crimp barrel.
- (5) Crimp the contact.

B. Spare Contact Installation

- (1) Install spare contacts in all unused contact cavities. Refer to Paragraph 3.C.
Make sure to install the spare contacts before the wired contacts.

NOTE: Spare coax contacts are not required.

- (2) Install seal rods in all unwired contacts. Refer to Subject 20-60-08.

C. Contact Insertion

**Table 7

**Table 8
COAX CONTACT INSERTION TOOLS**

Insertion Tool	Supplier
M15513-25	Deutsch

- (1) Make a selection of an insertion tool from Table 7 or Table 8.
- (2) Put the contact in the tool.
- (3) Align the contact and the tool so they are perpendicular to the back face of the grommet.
- (4) Carefully push the contact into the grommet hole until it clicks.
- (5) Carefully pull the tool from the connector.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF DEUTSCH DS SERIES CONNECTORS

- (6) Examine the contacts from the engaging end of the connector to make sure that all the contacts are completely inserted.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

**Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL**

Connector	Description	Contact Cavity Size	Minimum Wire O.D. (inch)

3. INSERT CONFIGURATIONS

A. MIL-C-26482 Series I Connectors

NOTE: The insert configurations that are specified in Table 7 include the connector shell size as the first part of the configuration. Refer to Table 2 for the part number structure that is applicable for the connector.

NOTE: The contact cavity size that is specified in Table 7 is equivalent to the size of the engaging end of the contact.

4. CONNECTOR DISASSEMBLY

A. Seal Plug and Seal Rod Removal

Table 8
NECESSARY TOOLS

Tool	Type
Pliers	Needle Nose

(1) Make a selection of a pliers from Table 8.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

B. Contact Removal

**Table 9

	ZZL-R-9511-12

- (1) Make a selection of a contact removal tool from Table 9.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

- (2) If it is necessary, remove the backshell components from the connector.
- (3) Push the backshell components rearward away from the connector.
- (4) At the front of the connector, axially align the removal tool and the contact cavity.
Make sure that the plunger of the removal tool is fully retracted.
- (5) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT USE MORE FORCE THAN THE FORCE THAT IS NECESSARY TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Push the plunger of the tool until the contact starts to come out of the contact cavity.
- (7) Carefully pull the tool out from the contact cavity.
Make sure that the removal tool stays axially aligned with the contact cavity.
- (8) Pull the contact out of the contact cavity from the rear of the connector.

5. CONNECTOR ASSEMBLY

A. Wire Preparation

For the assembly of a MIL-C-26482 Series I connector with triax cable, refer to Subject 20-53-05.

For the preparation of RG108 twinax cable, refer to Paragraph 5.B.

**Table 10
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Crimp Barrel Size	Removal Length L (inch)		Special Instructions
		Target	Tolerance	
24	20	0.19	±0.03	-
	16	0.50	±0.03	Fold the conductor back on itself
22	20	0.19	±0.03	-
	16	0.50	±0.03	Fold the conductor back on itself
20	20	0.19	±0.03	-
	16	0.25	±0.03	-
	12	0.50	±0.03	Fold the conductor back on itself
18	16	0.25	±0.03	-
	12	0.50	±0.03	Fold the conductor back on itself
16	16	0.25	±0.03	-
	12	0.25	±0.03	-
14	12	0.25	±0.03	-
12	12	0.25	±0.03	-

- (1) Remove the necessary length of insulation from the end of the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

Refer to:

- Figure 16
- Table 10 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedure.

NOTE: Refer to Subject 20-60-00:

- If the wire size and a larger crimp barrel size are not given in Table 10
- For the alternatives to the assembly of a contact with a conductor that is folded back.

INSULATION REMOVAL LENGTH
Figure 16

- (2) Measure the O.D. of the wire.
- (3) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.
- (4) If it is specified, fold the conductor back. Refer to Figure 17.

FOLDED BACK CONDUCTOR
Figure 17

B. Preparation of RG108 Twinax Cable

RG108 TWINAX CABLE PREPARATION
Figure 18

Refer to Figure 18.

- (1) Remove 2.85 inches ± 0.15 inch of the jacket from the end of the cable.
- (2) Remove 2.55 inches ± 0.06 inch of the shield from the end of the cable.
- (3) Remove 0.31 inch ± 0.03 inch of the dielectric from the each conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

- (4) Assemble a shield ground wire. Refer to Subject 20-10-15.
Make sure that the size of the shield ground wire is AWG 20.

C. Contact Assembly

**Table 11

12	12	M22520/1-01	8	M22520/1-02	Yellow
		MS3191-1	-	MS3191-12	Yellow

- (1) Make a selection of a contact crimp tool from Table 11.
- (2) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 19.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 19

- (3) Crimp the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

D. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be put on the wire harness before the insertion of the contacts into the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

**Table 12
CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool
2020	294-88
	M81969/17-03
	MS24256A20
	ATA 1086

	RTM 12-5
	ZZL-R-9510-12

- (1) Make a selection of an insertion tool from Table 12.
- (2) Put the contact assembly in the insertion tool.
Make sure that the end of the tool is against the rear shoulder of the contact.
- (3) At the rear of the connector, axially align the insertion tool and the contact cavity.
- (4) Carefully push the insertion tool and the contact assembly into the contact cavity until it stops.
Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES I FRONT RELEASE CONNECTORS

(b) Do Step (2) through Step (6) again.

E. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

F. Backshell and Strain Relief Assembly

Refer to Subject 20-60-09.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

**Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL**

3. INSERT CONFIGURATIONS

A. MIL-C-26482 Series II Connectors

NOTE: The insert configurations that are specified in Table 5 include the connector shell size as the first part of the configuration. Refer to Table 2 for the part number structure that is applicable for the connector.

NOTE: The contact cavity size that is specified in Table 5 is equivalent to the size of the engaging end of the contact.

4. CONNECTOR DISASSEMBLY

A. Seal Plug and Seal Rod Removal

Table 6
NECESSARY TOOLS

Tool	Type
Pliers	Needle Nose

(1) Make a selection of a pliers from Table 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

B. Contact Removal

This paragraph gives the procedure to remove a contact assembly from the connector.

For the procedure to remove an unwired contact, refer to Paragraph 4.C.

**Table 7
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool	Color
20	CIET20-1	White
	M81969/14-02	White
	M83723/31-20	White

	M83723/31-12	White
	MS27534-12	White
	NAS1664-12	White

- (1) Make a selection of a removal tool from Table 7.
- (2) Put the removal tool on the wire.
- (3) Axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops.
Make sure that the tool stays aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out of the contact cavity.
Make sure that the tool stays aligned with the contact cavity.

C. Unwired Contact Removal

This paragraph gives the procedure to remove an unwired contact from the connector.

For the procedure to remove a contact assembly, refer to Paragraph 4.B.

**Table 8
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool
20	CET20-24
	M81969/30-02
16	CET16-21
	M81969/30-03
12	CET12-16
	M81969/30-04

- (1) Make a selection of a contact removal tool from Table 8.
- (2) Remove the seal plug from the contact cavity.
- (3) Axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops.

Make sure that:

- The end of the tool is between the contact cavity and the crimp barrel of the contact
- The tool stays aligned with the contact cavity
- Pressure is not applied on the plunger of the tool.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT APPLY PRESSURE ON THE PLUNGER OF THE TOOL WHEN THE TOOL IS IN THE CONTACT CAVITY. DAMAGE TO THE CONNECTOR CAN OCCUR.

- (5) Pull the tool and the contact out of the contact cavity.
Make sure that the tool stays aligned with the contact cavity.
- (6) Apply pressure on the plunger to eject the contact from the tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS

5. CONNECTOR ASSEMBLY

A. Wire Preparation

For the assembly of a MIL-C-26482 Series II connector with triax cable, refer to Subject 20-53-05.

**Table 9
INSULATION REMOVAL LENGTH**

Crimp Barrel Size	Removal Length L (inch)		Special Instructions
	Target	Tolerance	
20	0.15	+0.03, -0	-
16	0.25	+0.03, -0	-
12	0.25	+0.03, -0	-

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 12
- Table 9 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedure.

**INSULATION REMOVAL LENGTH
Figure 12**

- (2) Measure the O.D. of the wire.
- (3) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.

B. Contact Assembly

**Table 10
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool			
		Basic Unit		Locator	
		Part Number	Setting	Part Number	Color

12	12	M22520/1-01	8	M22520/1-02	Yellow

- (1) Make a selection of a crimp tool from Table 10.
- (2) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 13.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more that 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 13

- (3) Crimp the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more that 0.03 inch.

C. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.E.

- (1) Make a selection of an insertion tool from Table 11.
- (2) Put the contact assembly in the insertion tool.
- (3) Axially align the tool and the contact cavity.
- (4) Carefully push the contact into the contact cavity until it stops.
Make sure that the tool and the contact cavity stay axially aligned.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (6) Lightly pull the wire to make sure the contact is locked in the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-26482 SERIES II CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (6) again.

D. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

E. Backshell and Strain Relief Assembly

Refer to Subject 20-60-09.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL/BENDIX 10-244() SERIES CONNECTORS

This Subject gives the procedures to assemble Amphenol/Bendix 10-244() connectors and:

- Cerro H22-4000 fire resistant wire
- Vibro-Meter 60-116-00 cable
- Vibro-Meter 80-116-00 cable.

C. Contact Part Numbers

NOTE: If the connector insert arrangement has one or more size 16 contact cavities:

- Contact size 16L is used in connector shell size 8, 10, 12, 16, 18, 20, 22, 24, 28, 32, 36, 40, 44 or 48
- Contact size 16S is used in connector shell size 8S, 10S, 10SL, 12S, 14S, or 16S.

**Table 6
CONTACT PART NUMBERS**

Contact					
Size	Engaging End Size	Crimp Barrel Size	Type	Part Number	Supplier
16L	16	16	Pin	10-229192-166	Amphenol/Bendix
			Socket	10-229193-166	Amphenol/Bendix
16S	16	16	Pin	10-229192-156	Amphenol/Bendix
			Socket	10-229193-156	Amphenol/Bendix

3. CONNECTOR DISASSEMBLY

A. Contact Removal

**Table 9
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Contact Type	Removal Tool	
		Handle	Tip
16	Pin	11-6911	11-3697
		ST2220-2	ST2220-3-2
	Socket	11-6911	11-3698
		ST2220-2	ST2220-3-2
12	Pin	11-6911	11-3696
	Socket	11-6911	11-3698

- (1) If it is necessary, remove:
 - The conduit assembly
 - Any rear accessories.
- (2) If it is necessary, move these components away from the end of connector.
 - The ferrule
 - The nut
 - The grommet
 - The sleeve assembly.
- (3) Make a selection of a removal tool from Table 9.
- (4) Remove the contact. Refer to Subject 20-61-00.
- (5) If it is necessary, remove any seal rods or any seal plugs. Refer to Subject 20-61-00.

4. CONNECTOR ASSEMBLY

A. Wire Preparation

Refer to:

- Figure 2 for a plug connector
- Figure 3 for a 90 degrees plug connector
- Figure 4 for a receptacle connector.

- (1) Cut the end of each wire so that the end of the wire is perpendicular with longitudinal axis of the wire.

NOTE: To make the insertion of the wire through the grommet holes easier, the end of the wire can be cut at a 45 degree angle.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL/BENDIX 10-244() SERIES CONNECTORS

- (2) For a connector with a 90 degree endbell to conduit, put these components on the cable in this sequence:
- A grommet
 - The 90 degree endbell
 - A grommet
 - The coupling ring.

NOTE: The ferrule and the backshell are not used and can be discarded.

- (3) For the plug connector, put these components on the cable in this sequence:
- The sleeve assembly
 - The grommet
 - The nut
 - The coupling nut.
- (4) For the receptacle connector, put these components on the cable in this sequence:
- The sleeve assembly
 - The grommet
 - The nut.
- (5) If a wire was cut at a 45 degree angle, cut the wire so that the end of the wire is perpendicular to the longitudinal axis of the wire.
- (6) To assemble a contact with a Cerro H22-4000 fire resistant wire, refer to Paragraph 4.B.
- (7) To assemble a contact with a Vibro-Meter 60-116-00 or a Vibro-Meter 80-116-00 cable, refer to Paragraph 4.C.
- (8) To assemble a contact with any other wire refer to Paragraph 4.D.

B. Contact Assembly with Cerro H22-4000 Fire Resistant Wire

PREPARATION OF CERRO FIRE RESISTANT WIRE

Figure 12

Refer to Figure 12.

- (1) Prepare the wire:
- (a) Remove 1.5 inches ± 0.030 inch of the outer braid from the end of the wire.
 - (b) Remove 1.5 inches ± 0.030 inch of the inner layer of clear Teflon from the wire.
- CAUTION:** DO NOT CUT THE DIELECTRIC MATERIAL.
- (c) Remove 0.30 inch ± 0.015 inch of the inner insulation from the conductor.
 - (d) Put a 3.0 inch length of 1/4 inch diameter thinwall TFE 4X heat shrinkable sleeve on the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMPHENOL/BENDIX 10-244() SERIES CONNECTORS

- (2) Make a selection of a crimp tool from Table 10.
- (3) Insert the wire into the contact.
- (4) Crimp the contact.
- (5) Move the heat shrinkable sleeve so that the forward end of sleeve makes a 0.60 inch overlap with the end of the outer braid. Refer to Figure 12.
- (6) Shrink the sleeve into position. Refer to Subject 20-10-14.

C. Contact Assembly with Vibro-Meter 60-116-00 or Vibro-Meter 80-116-00 Cable

- (1) Remove 3 inches of:
 - The white outer jacket
 - The yellow layer of polyimide
 - The braided shield
 - The black outer graphite layer of tape
 - The fiberglass binder and filler
 - The black individual conductor graphite layer of tape.
- (2) To remove any remaining carbon from the primary insulation of conductors, either sandblast the cable or brush it with a fiberglass eraser.
- (3) Clean the wire with acetone or an equivalent solvent.
- (4) Remove 5/8 inch \pm 1/32 inch of the wire insulation.
- (5) Put a 2.0 inch \pm 0.1 inch length of 1/8 inch thinwall TFE 4X sleeve on each wire so that the end of the sleeve is aligned with the end of the outer jacket.
- (6) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (7) Assemble a shield dead end on the cable. Refer to Subject 20-10-15.
 Make sure that the sleeve of the shield dead end makes an overlap with the sleeves of the individual conductors.
- (8) Put the sleeve assembly on the cable.
- (9) Push the grommet over the conductors with the sleeves.
- (10) Make a selection of a crimp tool from Table 10.
- (11) Fold the conductor back.
- (12) Put the wire into the crimp barrel of the contact.
- (13) Crimp the contact.

D. Contact Assembly

**Table 10

12	Pin	11-7295	11-7771-4
	Socket	11-7295	11-7771-4

- (1) Remove 5/16 inch ± 1/32 inch of wire insulation.
- (2) Make a selection of a crimp tool from Table 10.
- (3) Crimp the contact.

E. Contact Insertion

**Table 11
CONTACT INSERTION TOOLS**

Crimp Barrel Size	Contact Type	Insertion Tool
16	Pin	11-7345
	Socket	
12	Pin	11-7082
	Socket	

- (1) Make a selection of an insertion tool from Table 11.

F. Seal of Empty Contact Cavities

- (1) It is necessary to install seal rods in contact cavities that are not used. Refer to Subject 20-61-00.

G. Assembly of an Endbell with a Conduit

- (1) Engage the threads of the endbell with the threads of the coupling ring of the conduit.
- (2) Tighten the coupling ring to the specified torque.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Paragraph 5.D. for the procedure to increase the O.D. of AWG 2 or AWG 4 wire to seal in a size 1/0 contact cavity
- Subject 20-60-08 for the procedure to increase the O.D. of the wire.

**Table 1

F. ITT Cannon FR()-() and FV()-() Connectors

ITT CANNON FR()-() AND FV()-() CONNECTOR PART NUMBER STRUCTURE

Figure 12

NOTE: Table 21 gives the backshell part numbers that are supplied with the ITT Cannon FR()(E) and FV()(E) connectors:

- A 90 Degree backshell and a grommet ferrule are supplied with the ITT Cannon FR()(E) and FV()(E) when the connector part number specifies modification codes 14 or 15. Refer to Figure 12.
- A straight backshell is supplied with the ITT Cannon FR()(E) and FV()(E) when the connector part number does not specify modification code 14 or 15. Refer to Figure 12.
- FVF()(E) and FVA()(E) connectors supplied with a straight backshell are supplied with a grommet ferrule.
- FRF()(E) and FRA()(E) connectors supplied with a straight backshell are not supplied with a grommet ferrule.

G. Sabritec 017832-3000 Connector

The Sabritec 017832-3000 connector:

- Is a plug with a threaded coupling
- Has an aluminum alloy shell with black chromate over a cadmium finish
- Has a 12S-3 insert configuration; refer to Table 28 and Figure 19
- Has 2 size 16, MIL-C-26500 connector type, standard socket contacts; refer to Subject 20-61-11.

The connector is the same as a BACC63CE12S-3S connector with these differences:

- It has a decreased length
- It has different contacts
- It does not have anti-rotational backshell teeth.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

H. Boeing 280W0002-2 Connector

The Boeing S280W0002-2 connector:

- Is a BACC63CE plug; refer to Table 9
- Has insert configuration 24-22; refer to Table 28 and Figure 25
- Has four special size 0808 contacts; refer to Table 15.

3. INSERT CONFIGURATIONS

A. MIL-C-5015 Type Connectors

NOTE: The insert configurations that are specified in Table 28 include the connector shell size as the first part of the configuration. Refer to Table 2 for the the part number structure that is applicable for the connector.

NOTE: The contact cavity size that is specified in Table 28 is equivalent to the size of the engaging end of the contact.

**Table 28

4. CONNECTOR DISASSEMBLY

A. Seal Plug and Seal Rod Removal

Table 29
NECESSARY TOOLS

Tool	Type
Pliers	Needle Nose

(1) Make a selection of a pliers from Table 29.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

B. Contact Removal

**Table 30

1/0	294-241
	CET-FRF-0
	M81969/19-05
	MS90456-5

- (1) Make a selection of a contact removal tool from Table 30.
- (2) If it is necessary, remove the backshell components from the connector.
- (3) Push the backshell components rearward away from the connector.
- (4) At the front face of the connector, axially align the tool and the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Make sure that the plunger of the removal tool is fully retracted.

- (5) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT USE MORE FORCE THAN THE FORCE THAT IS NECESSARY TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Push the plunger of the tool until the contact starts to come out of the contact cavity.
- (7) Carefully pull the tool out from the contact cavity.

Make sure that the removal tool stays axially aligned with the contact cavity.

- (8) Pull the contact out of the contact cavity from the rear of the connector.

5. CONNECTOR ASSEMBLY

A. Wire Preparation

For the preparation of:

- Champlain 24-00033 and Champlain 24-00034 wire, refer to Paragraph 5.B.
- Rockbestos or Cerro H22-4000 wire, refer to Paragraph 5.C.

**Table 31
INSULATION REMOVAL LENGTH**

		252-1230-001	-	0

CAUTION: KEEP THE SILVER PLATED ADAPTER SLEEVES IN THEIR INITIAL CONTAINER UNTIL THEY ARE USED. THIS HELPS PREVENT TARNISH.

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 29
- Table 31
- Subject 20-00-15 for the insulation removal procedure.

INSULATION REMOVAL
Figure 29

(2) If it is specified, fold the conductor back on itself. Refer to Figure 30.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

FOLDED BACK CONDUCTOR

Figure 30

- (3) If it is specified to increase the size of the conductor, make a selection of:
 - An adapter sleeve, or a filler wire, or an adapter sleeve and a filler wire, from Table 32 if the contact is to be crimped with a hex type crimp tool
 - A filler wire from Table 32 if the contact part number is BACC47FW(), or if the contact is be crimped with a pneumatic indenter crimp tool.
- (4) If a filler wire is specified, prepare the filler wire.
 - (a) Find the insulation removal length for the specified contact. Refer to the Table 31.
 - (b) Remove the necessary length of the insulation from the end of the filler wire.
 Refer to:
 - Figure 29
 - Subject 20-00-15 for the insulation removal procedure.
- (5) Measure the O.D. of the wire.
- (6) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.

B. Preparation of Champlain 24-00033 and Champlain 24-00034 Wire

**Table 33
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Sleeve, Heat Shrinkable	TFE 4X	3/16 inch diameter	Chemplast
			Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

CHAMPLAIN 24-00033 AND CHAMPLAIN 24-00034 WIRE PREPARATION

Figure 31

Refer to Figure 31.

- (1) Make a selection of a heat shrinkable sleeve from Table 33.
- (2) Remove 1.50 inch \pm 0.03 inch of the outer jacket from the end of the wire. Refer to Subject 20-00-15.
- (3) Remove 1.50 inch \pm 0.03 inch of the layer of braid from the end of the wire. Refer to Subject 20-00-15.

20-61-19

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE RUBBER INSULATION LAYER. DAMAGE TO THE RUBBER INSULATION LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.25 inch \pm 0.03 inch of the rubber insulation layer from the end of the wire. Refer to Subject 20-00-15.
- (5) Remove 0.25 inch \pm 0.03 inch of the inner tape wrap from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) Put a 2.0 inch \pm 0.13 inch length of heat shrinkable sleeve on the wire.
- (7) Align the forward end of the sleeve and the end of the inner rubber layer.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the rubber insulation layer
- The distance from the forward end of the sleeve to the end of the rubber insulation layer is not more than 0.13 inch.

- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Preparation of Rockbestos or Cerro H22-4000 Wire

**Table 34
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Sleeve, Heat Shrinkable	TFE 4X	1/4 inch diameter	Chemplast
			Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

**ROCKBESTOS OR CERRO H22-4000 WIRE PREPARATION
Figure 32**

Refer to Figure 32.

- (1) Make a selection of a heat shrinkable sleeve from Table 34.
- (2) Remove 1.00 inch \pm 0.03 inch of the outer braid from the end of the wire. Refer to Subject 20-00-15.
- (3) Remove 1.00 inch \pm 0.03 inch of the clear inner wrap from the end of the wire. Refer to Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER INSULATION LAYER. DAMAGE TO THE INNER LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.25 inch \pm 0.03 inch of the inner insulation from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (5) Put a 1.5 inch to 2.5 inch length of heat shrinkable sleeve on the wire.
- (6) Align the forward end of the sleeve and the end of the inner insulation.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the inner insulation
 - The distance from the forward end of the sleeve to the end of the inner insulation is not more than 0.13 inch.
- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Preparation of AWG 2 and AWG 4 Wire for Assembly of a Size 1/0 Engaging End Contact

**Table 35
TYPES OF INSULATION MATERIAL FOR SPECIFIED WIRES**

Wire		Insulation Material			
Type	Size (AWG)	Type	Part Number	Description	Supplier
BMS 13-31	2	Sleeve	8443-2	Cold Shrinkable	3M
BMS 13-58	2	Sleeve	8443-2	Cold Shrinkable	3M
BMS 13-58	4	Sleeve	8443-6.5	Cold Shrinkable	3M
		Tape	Scotch 70	1.0 inch width	3M
BMS 13-60	4	Sleeve	8443-6.5	Cold Shrinkable	3M
		Tape	Scotch 70	1.0 inch width	3M

- (1) Make a selection of an insulation material from Table 35.
For a connector with a Glenair 6652 backshell, make sure that the length of the build-up sleeve is 3.0 inches \pm 0.25 inch.
- (2) To increase the O.D. of the wire with cold shrinkable sleeve:
 - (a) Put the sleeve on the wire.
Make sure that the distance from the end of the sleeve to the end of the wire insulation is 0.06 inch maximum.
 - (b) Hold the sleeve in its position with one hand.
 - (c) Pull the core out of the sleeve with the other hand.
- (3) To increase the O.D. of the wire with tape, wind 3.5 to 4 layers of tape around the wire.

Make sure that:

- The distance from the forward edge of the tape to the end of the contact crimp barrel is 0.75 inch \pm 0.10 inch
- Each layer of tape has a 100 percent overlap.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

- (1) Select one 10 AWG filler wire to increase the size of the conductor for these contact assemblies:
 - A BACC47FW3 contact and a 12 AWG wire
 - A size 0808 contact and a 12 AWG wire.
- (2) Make a selection of a crimp tool from:
 - Table 36 for size 16 and 12 contacts
 - Table 37 for size 0404, 0808, and 1/0-1/0 contacts that have an adapter sleeve, or, do not have an adapter sleeve
 - Table 38 for BACC47FW3 and size 0808 contacts that do not have an adapter sleeve
 - Table 39 for size 0404, 0808, and 1/0-1/0 contacts that do not have an adapter sleeve.
- (3) For the assembly of a contact with an adapter sleeve only, put the adapter sleeve in the crimp barrel of the contact.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 8 or larger contact that has an adapter sleeve in the crimp barrel.

- (4) For the assembly of a contact with a filler wire only, put the filler wire in the crimp barrel of the contact.
- (5) For the assembly of a contact with an adapter sleeve and filler wire:
 - (a) Put the adapter sleeve in the crimp barrel of the contact.
 - (b) Put the filler wire in the adapter sleeve.
- (6) Put the conductor in the crimp barrel or in the adapter sleeve in the crimp barrel. Refer to Figure 33.

Make sure that:

- All of the strands of the conductor are in the crimp barrel or in the adapter sleeve
- If a filler wire is specified, all of the strands of the filler wire are in the crimp barrel or in the adapter sleeve
- If an adapter sleeve is not in the crimp barrel, the conductor can be seen in the inspection hole
- If an adapter sleeve is in the crimp barrel, the flange of the adapter sleeve stays against the rear end of the crimp barrel
- The distance from the end of the insulation to the end of the crimp barrel or to the end of the adapter sleeve is not more than 0.03 inch.

CONTACT ASSEMBLY WITH FILLER WIRE

Figure 33

- (7) If the crimp tool is an indenter type crimp tool, crimp the contact.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 8 or larger contact that has an adapter sleeve in the crimp barrel.

- (8) If the crimp tool is a hex type crimp tool:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

- (a) Put the contact in the primary crimp die. Refer to Figure 34.

Make sure that:

- The distance from the rear end of the crimp barrel to the rear edge of the die is between 0 inch and 0.03 inch
- If the crimp tool is the 13642 basic unit and the ST2354AB-1 die, the contact is put in Cavity 1.

POSITION OF THE CONTACT AND WIRE IN THE CRIMP TOOL DIE
Figure 34

- (b) Crimp the contact with the primary crimp die.
 (c) Turn the contact 60 degrees on the longitudinal axis of the contact.
 (d) Put the crimp barrel end of the contact in the secondary crimp die. Refer to Figure 34.

Make sure that:

- The distance from the rear end of the crimp barrel to the rear edge of the die is between 0 inch and 0.03 inch
- If the crimp tool is the 13642 basic unit and the ST2354AB-1 die, the contact is put in Cavity 2.

- (e) Crimp the contact with the secondary crimp die.
 (f) If the contact crimp barrel has flash, do Step (c) through Step (e) again.

NOTE: Copper that can be seen on the edges of the crimp barrel is permitted.

- (9) Examine the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Make sure that:

- All of the strands of the conductor are in the crimp barrel or in the adapter sleeve
 - If a filler wire is specified, all of the strands of the filler wire are in the crimp barrel or in the adapter sleeve
 - If an adapter sleeve is not in the crimp barrel, the conductor can be seen in the inspection hole
 - If an adapter sleeve is in the crimp barrel, the flange of the adapter sleeve stays against the rear end of the crimp barrel
 - The distance from the end of the insulation to the end of the crimp barrel or to the end of the adapter sleeve is not more than 0.03 inch.
- (10) If the contact has a filler wire, remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 35.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE

Figure 35

CAUTION: DO NOT CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

F. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.H.

**Table 40
CONTACT INSERTION TOOLS**

	M81969/17-08
	294-235

- (1) Make a selection of an insertion tool from Table 40.
- (2) Put the contact assembly in the insertion tool.
Make sure that the end of the tool is against the rear shoulder of the contact.
- (3) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (4) Carefully push the insertion tool and the contact assembly in the contact cavity until it stops.
Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (6) again.

G. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

If a stub wire is specified, the minimum length of the stub wire is 12.0 inches.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

H. Backshell and Strain Relief Assembly

If the connector and the applicable conditions are not specified in Table 41, refer to Paragraph 6.C. for the standard backshell assembly configuration.

**Table 41
SELECTION OF A SPECIAL BACKSHELL OR STRAIN RELIEF ASSEMBLY PROCEDURE**

Connector	Applicable Conditions			Assembly Procedure
	Insert Configuration	Backshell	Contact Assemblies	
280W0002-2	24-22	BACC10HV24 and Glenair 687-522 Wire Separator	Four AWG 8 or 12 Wires	Paragraph 6.K.
CA66()	28-22	Supplied with the connector	Three AWG 4 Wires	Paragraph 6.D.
		Glenair G6652	AWG 1/0 Wire	Paragraph 6.H.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Table 41 (continued)

Connector	Applicable Conditions			Assembly Procedure
	Insert Configuration	Backshell	Contact Assemblies	
FRF()36-5()	36-5	Glenair G6652	AWG 1/0 Wire	Paragraph 6.H.
		Glenair G63292	All	Paragraph 6.G.
		Supplied with the connector	AWG 2 Wire	Paragraph 6.E.
FRF()E36-5()	36-5	ITT Cannon 057-0873-000 supplied with the connector	AWG 4 Wire	Paragraph 6.F.

(1) Make a selection of a backshell assembly procedure from Table 41.

Use these to make the selection:

- The connector
- The insert configuration
- The backshell
- The contact assemblies.

NOTE: Refer to Table 19 for alternative backshell part numbers.

(2) Assemble the connector and backshell. Refer to the appropriate procedure from Table 41.

6. BACKSHELL ASSEMBLY CONFIGURATIONS

A. Applicable Conditions for Backshell Assembly

Thread lock compound on the threads at the rear of the connector is necessary if all of these conditions occur:

- The backshell does not have a coupling ring
- No shield ground wire terminal lugs must be attached to the cable clamp.

The installation of safety wire on the backshell coupling ring is necessary if one or more of these conditions occur:

- The initial backshell assembly configuration had safety wire on the backshell coupling ring
- The connector is in the engine or APU area and the backshell has a coupling ring that is not self-locking
- The connector is in the engine or APU area and one or more shield ground wire terminal lugs must be attached to the cable clamp.

For the conditions that are applicable for the assembly of the backshell strain relief, refer to Paragraph 7.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

B. Backshell Installation Torque

**Table 42
BACKSHELL INSTALLATION TORQUE VALUES**

Connector Shell Size	Torque (inch-pounds)	
	Target	Tolerance
10SL	32.5	± 2.5
12S	37.5	± 2.5
14S	37.5	± 2.5
16	37.5	± 2.5
16S	37.5	± 2.5
18	37.5	± 2.5
20	77.5	± 2.5
22	77.5	± 2.5
24	77.5	± 2.5
28	117.5	± 2.5
32	117.5	± 2.5
36	117.5	± 2.5

C. Standard Backshell Assembly Configuration

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 43
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Thread Lock Compound	222	-	Loctite
	242	-	Loctite

**Table 44
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) Put the necessary backshell components on the wire harness.
Make sure that the strain relief end of the backshell is pointed away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to Paragraph 5.F.
- (3) If thread lock compound is necessary, put one or two drops of thread lock compound on the threads at the rear of the connector.

20-61-19

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Refer to:

- Paragraph 6.A. for the applicable conditions that make thread lock compound necessary
- Table 43 for the selection of a thread lock compound.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (4) Engage the threads of the backshell and the connector.
- (5) Torque the backshell. Refer Table 42.
- (6) If safety wire is necessary, install the safety wire on the backshell coupling ring.

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
- Subject 20-60-07 for the procedure to install the safety wire.

- (7) Assemble the strain relief. Refer to Paragraph 7.B.

D. Backshell Assembly Configuration for a 28-22 Insert Configuration and Three AWG 4 Wires

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 45
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Tape	P-212HD	1.0 inch width	Permacel
	P-421	1.0 inch width	Permacel
	P-440	1.0 inch width	Permacel
Thread Lock Compound	222	-	Loctite
	242	-	Loctite

**Table 46
NECESSARY LAYERS OF TAPE**

Tape	Number of Layers
P-212HD	8
P-421	8
P-440	14

**Table 47
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) Make a selection of a tape from Table 45.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

- (2) Make a selection of a Nylon wire separator for 3 wires from Table 23.

NOTE: Two separators are necessary.

- (3) If a ferrule is necessary and is not supplied with the connector, make a selection of a ferrule from Table 22.

NOTE: A ferrule is necessary for the assembly of these connectors with a Sunbank S1347 backshell:

- A CA66() connector
- A CA80() connector
- An FR() connector
- An FV() connector.

- (4) Put the necessary backshell components on the wire harness.

Make sure that:

- The backshell is put on the wire harness before the ferrule is put on
- The strain relief end of the backshell is pointed away from the end of the wire harness
- The larger end of the ferrule is pointed forward to the end of the wire harness.

- (5) Install the contacts in the connector. Refer to Paragraph 5.F.

- (6) If a ferrule is on the harness, put the ferrule on the rear grommet of the connector.

NOTE: If it is necessary, a small amount of isopropyl alcohol can be put on the grommet to make it easier to put the ferrule on the grommet.

- (7) If thread lock compound is necessary, put one or two drops of thread lock compound on the threads at the rear of the connector.

Refer to:

- Paragraph 6.A. for the applicable conditions that make thread lock compound necessary
- Table 45 for the selection of a thread lock compound.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (8) Engage the threads of the backshell and the connector.

- (9) Torque the backshell. Refer to Table 42.

- (10) If safety wire is necessary, install the safety wire on the backshell coupling ring.

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
- Subject 20-60-07 for the procedure to install the safety wire.

- (11) Carefully put tape around the wire separator.

Make sure that the layers of tape follow the shape of the wire separator.

Refer to:

- Table 46 for the necessary layers of tape
- Figure 36.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

CONFIGURATION OF THE TAPE ON THE WIRE SEPARATOR
Figure 36

- (12) Put the wire separator between the wires and against the connector grommet.
- (13) Put the other wire separator between the wires at the location where the saddle bars of the cable clamp must be installed.
- (14) Wrap 2 to 3 layers of the tape around the wire harness and the wire separator at the location where the saddle bars of the cable clamp must be installed.
- (15) Assemble the strain relief. Refer to Paragraph 7.B.

E. Backshell Assembly Configuration for a 36-5 Insert Configuration and AWG 2 Wire

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

Table 48
NECESSARY MATERIALS

Material	Specification or Part Number	Description	Supplier
Rod, Seal	AMS 3656	PTFE, 0.5 inch diameter	A Qualified Source

Table 49
NECESSARY TOOLS

Tool	Description
Torque	Torque tool with strap wrench

- (1) Make a selection of a Teflon wire separator for 4 wires from Table 23.
- (2) Make a selection of a seal rod from Table 48.
- (3) If a ferrule is necessary and is not supplied with the connector, make a selection of a ferrule from Table 22.

NOTE: A ferrule is necessary for the assembly of these connectors with a Sunbank S1347 backshell:

- A CA66() connector
- A CA80() connector
- An FR() connector
- An FV() connector.

- (4) Put the necessary backshell components on the wire harness.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

Make sure that:

- The backshell is put on the wire harness before the ferrule is put on
 - The strain relief end of the backshell is pointed away from the end of the wire harness
 - The larger end of the ferrule is pointed forward to the end of the wire harness.
- (5) Install the contacts in the connector. Refer to Paragraph 5.F.
- (6) Install an unwired contact into each empty contact cavity.
- (7) Install a 2.25 inch \pm 0.10 inch length of seal rod in each contact cavity that has an unwired contact.

Make sure that:

- The forward end of the seal rod is against the rear end of the crimp barrel in the contact cavity
 - The ends of the rod do not have sharp edges.
- (8) If a ferrule is on the harness, put the ferrule on the rear grommet of the connector.
- NOTE:** If it is necessary, a small amount of isopropyl alcohol can be put on the grommet to make it easier to put the ferrule on the grommet.
- (9) If thread lock compound is necessary, put one or two drops of thread lock compound on the threads at the rear of the connector.

Refer to:

- Paragraph 6.A. for the applicable conditions that make thread lock compound necessary
- Table 43 for the selection of a thread lock compound.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (10) Engage the threads of the backshell and the connector.
- (11) Torque the backshell. Refer to Table 42.
- (12) If safety wire is necessary, install the safety wire on the backshell coupling ring.

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
 - Subject 20-60-07 for the procedure to install the safety wire.
- (13) Put the wire separator between the wires and the seal rod.

Make sure that:

- The larger end of the wire separator is pointed forward to the connector grommet
 - The smaller end of the wire separator is 0.25 inch maximum farther than the rear end of the cable clamp.
- (14) Assemble the strain relief. Refer to Paragraph 7.B.

F. Backshell Assembly Configuration for a 36-5 Insert Configuration and AWG 4 Wire

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

**Table 50
NECESSARY MATERIALS**

Material	Specification or Part Number	Description	Supplier
Rod, Seal	AMS 3656	PTFE, 3/8 inch diameter	A Qualified Source
		PTFE, 1/2 inch diameter	A Qualified Source
Tape	P-421	PTFE, 1.0 inch width	Permacel
	P-440	PTFE, 1.0 inch width	Permacel
Thread Lock Compound	222	-	Locktite
	242	-	Locktite

**Table 51
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) Make a selection of:
 - A Teflon wire separator for 4 wires from Table 23
 - A 3/8 inch diameter seal rod from Table 50
 - A 1/2 inch diameter seal rod from Table 50
 - A tape from Table 50
 - Two spacers from Table 26.
- (2) If a ferrule is necessary and is not supplied with the connector, make a selection of a ferrule from Table 22.

NOTE: A ferrule is necessary for the assembly of these connectors with a Sunbank S1347 backshell:

 - A CA66() connector
 - A CA80() connector
 - An FR() connector
 - An FV() connector.
- (3) Put the necessary backshell components on the wire harness.

Make sure that:

 - The backshell is put on the wire harness before the ferrule is put on
 - The strain relief end of the backshell is pointed away from the end of the wire harness
 - The larger end of the ferrule is pointed forward to the end of the wire harness.
- (4) Install the contacts in the connector. Refer to Paragraph 5.F.
- (5) Install an unwired contact into each empty contact cavity.
- (6) Install a 1.0 inch \pm 0.1 inch length of 1/2 inch diameter seal rod in each contact cavity that has an unwired contact.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

Make sure that:

- The forward end of the seal rod is against the rear end of the crimp barrel in the contact cavity
- The ends of the rod do not have sharp edges.

(7) If a ferrule is on the harness, put the ferrule on the rear grommet of the connector.

NOTE: A small amount of isopropyl alcohol can be put on the grommet to make it easier to put the ferrule on the grommet.

(8) Put the wire separator between the wires and seal rod against the connector grommet.

Make sure that the larger end of the wire separator is pointed forward to the connector grommet

(9) Put a 1.0 inch \pm 0.1 inch length of 3/8 inch diameter seal rod in the empty wire position in the wire separator.

Make sure that the ends of the rod do not have sharp edges.

(10) Put the saddle bars on the backshell.

- Make sure that the smaller end of the wire separator is 0.25 inch maximum farther than the rear edge of the saddle bars.

(11) Align the center of the seal rod with the center of the saddle bars.

(12) Remove the saddle bars.

Make sure that the wire separator and the seal rod stay in position.

(13) Wrap the tape around the wires, the seal rod, and the wire separator to increase the diameter of the wire harness.

Make sure that:

- The center of the layers of tape is where the saddle bars must be
- The layers of tape make a 100 percent overlap.

(14) If thread lock compound is necessary, put one or two drops of thread lock compound on the threads at the rear of the connector.

Refer to:

- Paragraph 6.A. for the applicable conditions that make thread lock compound necessary
- Table 50 for the selection of a thread lock compound.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

(15) Engage the threads of the backshell and the connector.

(16) Torque the backshell. Refer to Table 42.

(17) If safety wire is necessary, install the safety wire on the backshell coupling ring.

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
- Subject 20-60-07 for the procedure to install the safety wire.

(18) Discard the two lockwashers that are supplied with the backshell.

(19) Put a spacer on each cable clamp screw.

(20) Put the saddle bars in position.

20-61-19

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

- (21) Engage the threads of each cable clamp screw and the applicable screw hole.
- (22) Tighten the screws until the ends of the saddle bars are against the legs of the backshell.
- Make sure that:
- The saddle bars do not crush or pinch the wire harness
 - The wire harness is tight in the cable clamp
 - The cable clamp screws are tight.
- (23) If the clamp does not hold the wire harness tightly, increase the diameter of the wire harness with filler material. Refer to Subject 20-60-09.
- If the filler material is a Teflon rod, make sure that the ends of the rod do not have sharp edges.
- (a) Remove the saddle bars.
- (b) Wind 2 or 3 layers tape around the wire harness where the saddle bars must be.
- Make sure that:
- The center of the layers of tape is where the saddle bars must be
 - The layers of tape make a 100 percent overlap.
- (24) Engage the threads of the screws and the holes in the saddle bars again.
- (25) Tighten the screws again.
- Make sure that:
- The saddle bars do not crush or pinch the wire harness
 - The wire harness is tight in the cable clamp
 - The cable clamp screws are tight.
- (26) If the ends of the saddle bars are not against the legs of the backshell or the wire harness is too tight in the clamp:
- (a) Make a selection of a spacer from Table 26.
- NOTE: Two spacers are necessary.
- Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the cable clamp.
- (b) Remove the cable clamp screws.
- (c) Put one spacer on each screw between the saddle bar and the leg of the backshell.
- (d) Engage the threads of the screws and the holes in the saddle bars again.
- (e) Tighten the screws again.
- Make sure that:
- The saddle bars do not crush or pinch the wire harness
 - The wire harness is tight in the cable clamp
 - The cable clamp screws are tight.
- (27) Do Step (23) or Step (26) again until the fit of the wire harness in the cable clamp is correct and the cable clamp screws are tight.
- (28) If safety wire is necessary, install the safety wire on each cable clamp screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Refer to:

- Paragraph 7.A. for the applicable conditions that make the installation of safety wire on the cable clamp screws necessary
- Subject 20-60-07 for the procedure to install the safety wire.

Make sure that each safety wire goes through the hole in:

- The screw head
- The adjacent leg of the backshell.

G. Backshell Assembly Configuration for a 36-5 Insert Configuration and a Glenair G63292 Backshell

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 52
NECESSARY MATERIALS**

Material	Specification or Part Number	Description	Supplier
Tape	Scotch 70	1.25 inches width	3M
Thread Lock Compound	222	-	Locktite
	242	-	Locktite

**Table 53
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

**BACKSHELL ASSEMBLY
Figure 37**

- (1) Make a selection of:
 - A tape from Table 52
 - A thread lock compound from Table 52.
- (2) Put the necessary backshell components on the wire harness.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

Make sure that the strain relief end of the backshell is pointed away from the end of the wire harness.

- (3) Install the contacts in the connector. Refer to Paragraph 5.F.
- (4) Carefully put tape around the wire separator that is supplied with the backshell. Refer to Figure 38.

Make sure that:

- The layer of tape is located on the smaller diameter end of the wire separator
- The layer of tape follows the shape of the wire separator.

**CONFIGURATION OF THE TAPE ON THE WIRE SEPARATOR****Figure 38**

- (5) Put the wire separator between the wires.
Make sure that the larger diameter end of the wire separator is pointed away from the connector.
- (6) Put one or two drops of thread lock compound on the rear threads of the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.

- (7) Engage the threads of the backshell and the connector.
- (8) Torque the backshell. Refer to Table 42.
- (9) Put a lockwasher on each cable clamp screw.
- (10) Put the saddle bars in position.
Make sure that the larger end of the wire separator is in the groove inside the end of the cable clamp. Refer to Figure 37.
- (11) Engage the threads of each cable clamp screw and the applicable screw hole.
- (12) Tighten the cable clamp screws.
- (13) If safety wire is necessary, install the safety wire on each cable clamp screw.

Refer to:

- Paragraph 7.A. for the applicable conditions that make the installation of safety wire on the cable clamp screws necessary
- Subject 20-60-07 for the procedure to install the safety wire.

Make sure that each safety wire goes through the hole in:

- The screw head
- The adjacent leg of the backshell.

H. Backshell Assembly Configuration for AWG 1/0 Wire and a Glenair G6652 Backshell

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

20-61-19

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

**Table 54
NECESSARY MATERIALS**

Material	Specification or Part Number	Description	Supplier
Rod, Seal	AMS 3656	PTFE, 3/8 inch diameter	A Qualified Source
Tape	P-421	PTFE, 1.0 inch width	Permacel
	P-440	PTFE, 1.0 inch width	Permacel
Thread Lock Compound	222	-	Locktite
	242	-	Locktite

**Table 55
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) Make a selection of:
 - A thread lock compound from Table 54
 - A 3/8 inch diameter seal rod from Table 54
 - A tape from Table 54.
 - (2) Put the necessary backshell components on the wire harness.
Make sure that the strain relief end of the backshell is pointed away from the end of the wire harness.
 - (3) Install the contacts in the connector. Refer to Paragraph 5.F.
 - (4) Put the wire separator between the wires.
Make sure that the larger end of the wire separator is pointed forward to the connector.
 - (5) Push the wire separator forward until it is against the grommet.
 - (6) Put a 1.0 inch ± 0.10 inch length of seal rod between all the wires at the center of the rear end of the wire separator.
Make sure that the ends of the rod do not have sharp edges.
 - (7) Push the rod forward until the end is against the center of the rear end of the wire separator.
 - (8) Wrap 8 layers of tape around the wire harness, the wire separator, and the rod.
Make sure that:
 - The center of the layers of tape is aligned with the rear edge of the wire separator
 - The layers of tape make a 100 percent overlap.
 - (9) Put one or two drops of thread lock compound on the threads at the rear of the connector.
- CAUTION:** THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.
- (10) Engage the threads of the backshell and the connector.
 - (11) Torque the backshell. Refer to Table 42.
 - (12) Assemble the strain relief. Refer to Paragraph 7.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

I. Backshell Assembly Configuration for a Sunbank S3972-4 Extension Adapter and a BACC10K() Backshell

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 56
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Thread Lock Compound	222	-	Locktite
	242	-	Locktite

**Table 57
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) Make a selection of a thread lock compound from Table 56.
- (2) Put the necessary backshell components on the wire harness.
Make sure that:
 - The backshell is put on the wire harness before the extension adapter is put on
 - The strain relief end of the backshell is pointed away from the end of the wire harness
 - The end of the extension adapter with external threads is pointed away from the end of the wire harness.
- (3) Install the contacts in the connector. Refer to Paragraph 5.F.
- (4) Put one drop of thread lock compound on the threads at the rear of the connector on one side of the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.
- (5) Put one drop of thread lock compound on the threads at the rear of the connector on the other side of the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.
- (6) Engage the threads of the adapter and the connector.

CAUTION: THREAD LOCK COMPOUND MUST NOT BE APPLIED ON THE COUPLING MECHANISM OF THE CONNECTOR. UNSATISFACTORY OPERATION OF THE COUPLING MECHANISM CAN OCCUR.
- (7) Torque the adapter 190 inch-pounds ± 10 inch-pounds.
Make sure that the forward end of the adapter is not against the coupling ring of the connector.
- (8) Engage the threads of the backshell coupling ring and the adapter.
- (9) Torque the backshell coupling ring. Refer to Table 42.
- (10) If safety wire is necessary, install the safety wire on the backshell coupling ring.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
- Subject 20-60-07 for the procedure to install the safety wire.

(11) Assemble the strain relief. Refer to Paragraph 7.B.

J. Backshell Assembly Configuration for a Sunbank S1347 90 Degree Backshell

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 58
NECESSARY TOOLS**

Tool	Description
Torque	Torque tool with strap wrench

- (1) If a ferrule is not supplied with the connector, make a selection of a ferrule from Table 22.
- (2) Put the necessary backshell components on the wire harness.

Make sure that:

- The backshell is put on the wire harness before the ferrule is put on
- The strain relief end of the backshell is pointed away from the end of the wire harness
- The larger end of the ferrule is pointed forward to the end of the wire harness.

- (3) Install the contacts in the connector. Refer to Paragraph 5.F.
- (4) Put the ferrule on the rear grommet of the connector.

NOTE: A small amount of isopropyl alcohol can be put on the grommet to make it easier to put the ferrule on the grommet.

- (5) Engage the threads of the backshell coupling ring and the connector.
- (6) Put the backshell in the correct clock position.
- (7) Torque the backshell coupling ring. Refer to Table 42.
- (8) Tighten the three backshell coupling ring set screws.
- (9) If safety wire is necessary, install the safety wire on the backshell coupling ring.

Refer to:

- Paragraph 6.A. for the applicable conditions that make the installation of safety wire on the backshell coupling ring necessary
- Subject 20-60-07 for the procedure to install the safety wire.

(10) Assemble the strain relief. Refer to Paragraph 7.B.

K. Backshell Assembly Configuration for the 280W0002-2 Connector

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 59
BACKSHELL COMPONENTS**

Part Number	Description	Supplier
687-522	Wire Separator	Glenair
BACC10HV24	Backshell	QPL

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

**Table 60
NECESSARY MATERIALS**

Material	Description	Specification or Part Number	Supplier
Tape	0.45 inch ± 0.05 inch wide	A-A-59163	QPL
		Scotch 70	Scotch
	1.0 inch wide	P-421	Permacel
Thread Lock Compound	-	081	Loctite
		242	Loctite
		83	Loctite

**Table 61
NECESSARY TOOLS**

Tool	Supplier
1/4 inch drive torque tool	An available source
3/8 inch drive torque tool	An available source
Strap Wrench	An available source

(1) Make a selection of these components from Table 59:

- A backshell
- A wire separator.

(2) Make a selection of these materials from Table 60:

- A thread lock compound
- A 1.0 inch wide tape
- A 0.45 inch wide tape.

NOTE: An equivalent tape is a satisfactory alternative. Refer to Subject 20-00-11.

(3) Make a selection of these tools from Table 61:

- A strap wrench
- A torque tool from Table 61.

(4) Put the backshell on the wire harness.

Make sure that the strain relief end of the backshell is pointed away from the end of the wire harness.

(5) Install the contacts in the connector. Refer to Paragraph 5.F.

(6) Engage the threads of the backshell coupling ring and the connector.

(7) Wrap 2 to 4 layers of the 1.0 inch wide tape on each AWG 8 wire at the location where the saddle bars of the backshell will be on the wires.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

Make sure that:

- The center of the tape and the center of the saddle bars is aligned
- The layers of tape make a 100 percent overlap.

- (8) Wrap 6 to 8 layers of the 1.0 inch wide tape on each AWG 12 wire at the location where the saddle bars of the backshell will be on the wires.

Make sure that:

- The center of the tape and the center of the saddle bars is aligned
- The layers of tape make a 100 percent overlap.

- (9) Put the wire separator between the wires at the rear of the backshell.

Make sure that:

- Each wire is located in one of the four slots of the wire separator
- The four wires are parallel with each other
- The wires are aligned with the contact cavities in the connector.

- (10) Wind 2 layers of the 0.45 inch wide tape around the outside of the wire separator.

Make sure that:

- The layers of tape make a 100 percent overlap.

- (11) Move the wire separator to its position between the saddle bars of the backshell.

Make sure that:

- Each wire is located in one of the four slots of the wire separator
- The wires are aligned with the contact cavities of the connector.

- (12) Align the wire separator and the backshell. Refer to Figure 39.

POSITION OF THE WIRE SEPARATOR

Figure 39

- (13) Tighten the backshell coupling ring to the connector with the hand.

Make sure that the wire separator and the connector stay aligned. Refer to Figure 39.

- (14) Torque the backshell coupling ring to 105 inch-pounds + 5.0 inch pounds, -0.0 inch-pounds.

Make sure that the wire separator and the connector stay aligned. Refer to Figure 39.

- (15) Temporarily tighten the saddle bar screws.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Make sure that:

- The saddle bars hold the wire separator
- The saddle bars are against the legs of the backshell
- The saddle bar screws are tight.

(16) If the saddle bars are not against the legs of the backshell:

(a) Make a selection of spacers. Refer to Paragraph 2.J.

Make sure that the spacer is the smallest that can make a tight fit of the wire separator in the cable clamp.

(b) Remove the saddle bar screws.

(c) Put one spacer on each screw between the saddle bar and the leg of the backshell. Refer to Figure 39.

(d) Engage the threads of the screws and the holes in the saddle bars again.

(e) Tighten the screws again.

Make sure that:

- The saddle bars hold the wire separator
- The saddle bar screws are tight.

(17) Loosen the cable clamp screws.

(18) Apply one drop of thread lock compound on the screw threads and nut threads of the saddle bar screws.

(19) Tighten the screws again.

7. STRAIN RELIEF ASSEMBLY CONFIGURATIONS

A. Applicable Conditions for Strain Relief Assembly

Safety wire must be installed on each cable clamp screw if one or more of these conditions occur:

- The initial backshell assembly configuration had safety wire on the cable clamp screws
- The connector is in the engine or APU area and one or more shield ground wire terminal lugs must be attached to the cable clamp.

B. Standard Strain Relief Assembly

**Table 62
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Tape	P-440	PTFE, 1.0 inch width	Permacel

- (1) Make a selection of a tape from Table 62.
- (2) Align the screw holes of a saddle bar of the cable clamp and the screw holes in the legs of the backshell.
- (3) Make a mark on the wire harness at the center of the saddle bar.
- (4) Put the other saddle bar on the wire harness and the backshell.
- (5) Push the saddle bars of the cable clamp together.
- (6) If the clamp does not hold the wire harness tightly, increase the diameter of the wire harness with filler material. Refer to Subject 20-60-09.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS**

If the filler material is a Teflon rod, make sure that the ends of the rod do not have sharp edges.

- (a) Remove the saddle bars.
- (b) Wrap 2 or 3 layers tape around the wire harness at the mark on the wire harness.

Make sure that:

- The center of the layers of tape is aligned with the mark on the wire harness
- The layers of tape make a 100 percent overlap.

- (7) Put a lockwasher on each cable clamp screw.
- (8) If the wire harness has shield ground wire terminal lugs that must be attached to the cable clamp screws:
 - (a) Put approximately half of the terminal lugs on one cable clamp screw.
 - (b) Put the remaining terminal lugs on the other cable clamp screw.
- (9) Put the saddle bars in position.
- (10) Engage the threads of each cable clamp screw and the applicable screw hole.
- (11) Tighten the screws until the ends of the saddle bars are against the legs of the backshell.

Make sure that:

- The saddle bars do not crush or pinch the wire harness
- The wire harness is tight in the cable clamp
- The cable clamp screws are tight.

- (12) If the ends of the saddle bars are not against the legs of the backshell or the wire harness is too tight in the clamp:
 - (a) Make a selection of a spacer from Table 26.

NOTE: Two spacers are necessary.

Make sure that the spacer is the smallest that can make a tight fit of the wire harness in the cable clamp.

- (b) Remove the cable clamp screws.
- (c) Put one spacer on each screw between the saddle bar and the leg of the backshell.
- (d) Engage the threads of the screws and the holes in the saddle bars again.
- (e) Tighten the screws again.

Make sure that:

- The saddle bars do not crush or pinch the wire harness
- The wire harness is tight in the cable clamp
- The cable clamp screws are tight.

- (13) If the fit of the wire harness in the cable clamp is not correct, do Step (6) or Step (12) again.
- (14) If safety wire is necessary, install safety wire on each cable clamp screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

Refer to:

- Paragraph 7.A. for the applicable conditions that make the installation of safety wire on the cable clamp screws necessary
- Subject 20-60-07 for the procedure to install the safety wire.

Make sure that each safety wire goes through the hole in:

- The screw head
- The adjacent leg of the backshell.

C. Strain Relief Assembly Configuration for a 36-5 Insert Configuration and AWG 2 Wire

For the conditions that are applicable for this procedure, refer to Paragraph 5.H.

**Table 63
NECESSARY MATERIALS**

Material	Specification or Part Number	Description	Supplier
Rod, Seal	AMS 3656	PTFE, 0.5 inch diameter	A Qualified Source

- (1) Make a selection of:
 - A Teflon wire separator for 4 wires from Table 23
 - A seal rod from Table 63.
- (2) Install the contacts in the connector. Refer to Paragraph 5.F.
- (3) Install an unwired contact into each empty contact cavity.
- (4) Install a 2.25 inch \pm 0.10 inch length of seal rod in each contact cavity that has an unwired contact.

Make sure that:

- The forward end of the seal rod is against the rear end of the crimp barrel in the contact cavity
 - The ends of the rod do not have sharp edges.
- (5) Put the wire separator between the wires and the seal rod.
Make sure that the larger end of the wire separator is pointed forward to the connector grommet.
 - (6) Assemble a lacing tape wire harness tie around the wires and seal rod in the groove of the wire separator. Refer to Subject 20-10-11.

Make sure that the tie material is a Temperature Grade D material.

8. CONNECTOR INSTALLATION

A. Selection of a Connector Installation

If the connector is not specified in Table 64, refer to Subject 20-60-06 for the standard connector installation procedure.

**Table 64
SELECTION OF A SPECIAL CONNECTOR INSTALLATION**

Connector	Installation Procedure
CA66279-94	Paragraph 8.B.
CA66279-102	Paragraph 8.B.
CA66279-106	Paragraph 8.B.

Table 64 (continued)

Connector	Installation Procedure
CA66287-50	Paragraph 8.C.
CA66434-6	Paragraph 8.C.

B. Installation of the ITT Cannon CA66279-() Plug

For the conditions that are applicable for this procedure, refer to Paragraph 8.A.

**Table 65
NECESSARY TOOLS**

Tool	Type	Part Number
Adapter, Coupling Ring	Castellated	MT0011
Drive Extension	-	-
Wrench	Torque	-

- (1) Make a selection of these tools from Table 65:
 - A coupling ring adapter
 - A torque wrench
 - A drive extension.
- (2) Put the coupling ring adapter on the drive extension.
- (3) Align the keyway of the plug and the key of the receptacle.
 Make sure that the wire harness has sufficient slack for the plug:
 - To move forward
 - To make a satisfactory connection with the receptacle
 - To prevent tension on the contact assemblies in the plug.
- (4) Engage the threads of the plug and the receptacle.
- (5) Fully engage the coupling ring adapter with the coupling ring of the plug.
- (6) Torque the coupling ring 200 inch-pounds to 240 inch-pounds.

C. Installation of the ITT Cannon CA66287-50 and the ITT Cannon CA66434-6 Plug

For the conditions that are applicable for this procedure, refer to Paragraph 8.A.

**Table 66
NECESSARY TOOLS**

Tool	Type	Part Number
Drive Extension	-	-
Wrench	Torque	-
Wrench	2-9/16 inch Crowfoot Adapter	47482

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 FRONT RELEASE CONTACT TYPE CONNECTORS

- (1) Make a selection of these tools from Table 66:
 - A crowfoot wrench
 - A torque wrench
 - A drive extension.
- (2) Put the crowfoot wrench on the drive extension.
- (3) Align the keyway of the plug and the key of the receptacle.
 Make sure that the wire harness has sufficient slack for the plug:
 - To move forward
 - To make a satisfactory connection with the receptacle
 - To prevent tension on the contact assemblies in the plug.
- (4) Engage the threads of the plug and the receptacle.
- (5) Engage the flats of the crowfoot wrench with the flats of the coupling nut of the plug.
- (6) Torque the coupling nut 450 inch-pounds to 520 inch-pounds.

Table 4 (continued)

Contact		Removal Tool	
Engaging End Size	Type	Handle	Tip
16	Pin	11-6911	11-3697
	Socket		11-3698

- (1) Make a selection of a contact removal tool from Table 4.
- (2) From the front of the connector, axially align the tool with the contact. Refer to Figure 11.

CAUTION: Damage to the connector can occur if The removal tool is not ALIGNED WITH THE CONTACT cavity.

ALIGNMENT OF THE REMOVAL TOOL
Figure 11

- (3) Carefully push the tip of the tool straight into the contact cavity until the contact:
 - Is released from the connector
 - Starts to come out of the contact cavity from the rear of the connector.

CAUTION: DO NOT PUSH THE TOOL INTO THE CONTACT CAVITY FROM THE REAR OF THE CONNECTOR. DAMAGE TO THE CONNECTOR OR THE TOOL, OR BOTH CAN OCCUR.

- (4) Carefully pull the removal tool from the contact cavity.
- (5) From the rear of the connector, carefully pull the wired contact out of the contact cavity.

4. CONNECTOR ASSEMBLY

			ST2220-1-Y	-	ST2220-1-1	-
	16	16	M22520/1-01	6	TH254	Blue
			ST2220-1-Y	-	11-7771-6	-

NOTE: If the size of the wire is smaller than the size of the crimp barrel of the contact, it is necessary to increase the diameter of the conductor. Refer to Subject 20-60-00.

- (1) Remove the necessary length of insulation from the end of the wire so that the distance from the end of the insulation to the end of the conductor is 0.28 inch ± 0.03 inch.

Refer to Figure 12 and Subject 20-00-15.

WIRE PREPARATION
Figure 12

- (2) Make a selection of a crimp tool from Table 5.
- (3) Put the conductor in the crimp barrel of the contact so that the end of the conductor is against the bottom of the crimp barrel.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole.

- (4) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BENDIX PT()CE AND PC()CE SERIES CONNECTORS**

- (5) Examine the wired contact for these types of damage:
 - Any broken strands of the conductor
 - Any strands of the conductor on which the base metal can be seen
 - Any cracks in the crimp barrel of the contact.

B. Contact Insertion

Table 6
CONTACT INSERTION TOOLS

Crimp Barrel Size	Insertion Tool
20	11-6782
16	11-6781

- (1) Make a selection of a contact insertion tool from Table 6.
- (2) Put the wired contact in the end of the insertion tool.
- (3) Axially align the contact and the tool with the contact cavity.
- (4) Push the tool straight into the contact cavity until the tool stops.

CAUTION: THE TOOL AND CONTACT MUST BE PUSHED STRAIGHT INTO THE CONTACT CAVITY SO THAT DAMAGE TO THE CONNECTOR DOES NOT OCCUR.

- (5) Carefully remove the tool from the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the wired contact out of the cavity.
 - (b) Do Step (2) through Step (6) again.

C. Installation of Spare Contacts

Refer to Subject 20-60-08.

If it is necessary to install a spare contact in the contact cavities that are not used:

- (1) Make a selection of a contact insertion tool from Table 6.
- (2) Put the contact in the contact cavity.
- (3) Axially align the tool and the contact.
- (4) Push the tool straight into the contact cavity until the tool stops.
- (5) Carefully remove the tool from the contact cavity.

D. Installation of Seal Plugs or Seal Rods

Refer to Subject 20-60-08.

If it is necessary to install a seal plug or a seal rod in the contact cavities that are not used:

20-61-20

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BENDIX PT()CE AND PC()CE SERIES CONNECTORS**

- (1) Make a selection of a seal plug or a seal rod.
- (2) Push the plug or the rod into the contact cavity.

Make sure that the distance from the end of the plug or the rod to the grommet is less than 0.1 inch.

2. CONNECTOR DISASSEMBLY

A. Contact Removal

**Table 3
CONTACT REMOVAL TOOLS**

Engaging End Size	Removal Tool
20	RX16-D11
	RX16-D11-D1

(1) Make a selection of a removal tool from Table 3.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BURNDY MBG28 SERIES CONNECTORS

- (2) Remove the contacts from the engaging face of the connector.

3. CONNECTOR ASSEMBLY

A. Cable Preparation

Refer to Figure 1.

- (1) Put a 2 inch length of the smallest practical size of heat shrinkable sleeve on the cable.
- (2) Put the strain relief section of the connector on the cable so that the wide aperture of the section is toward the end of the cable.

If the cable diameter is larger than the aperture at the strain relief end of the section, remove the necessary trim rings so that the cable fits through the aperture.

- (3) Put the middle section of the connector on the cable so that the wide aperture of the section is toward the end of the cable.

If the cable diameter is larger than the small aperture at the end of the section, ream the aperture so that the cable fits through the aperture.

CAUTION: DO NOT CUT THE SMALL APERTURE. THE CONNECTOR SECTION WILL BE DAMAGED.

B. Contact Assembly

**Table 4
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Tool		
	Basic Unit	Die Set	Stop Bushing
20	M10S-1	S-10	SL-40

- (1) Remove 3/16 inch ± 1/32 inch of insulation.
- (2) Make a selection of a crimp tool from Table 4.
- (3) Put the contact and the conductor in the crimp tool.
- (4) Crimp the contact.

C. Contact Insertion

- (1) Push the contact into the contact cavity manually.

NOTE: The use of an insertion tool is not necessary.

- (2) Push the heat shrinkable sleeve over the contact until it touches the connector body.

Make sure that the end of the sleeve is no more that 1/16 inch from the connector body.

- (3) Shrink the sleeve in position. Refer to Subject 20-10-14.

D. Connector Assembly

Refer to Figure 1.

- (1) Push the middle section of the connector into the connector body.
Make sure to align the slots on the section with the slots on the connector.
- (2) Engage the threads of the middle section and the strain relief section.
- (3) Manually tighten the sections.

	ST2220-3-9	-

- (1) Remove the cable clamp and the tape (if tape is used) from the wire bundle.
- (2) Loosen the grommet clamp nut.
- (3) Make a selection of a removal tool from Table 3.
- (4) Put the tip of the removal tool on the engaging end of the contact.
- (5) Push the removal into the contact cavity until its stops.
- (6) Push on the removal tool, and at the same time, push on the extraction knob to remove the contact.

NOTE: This operation will also remove seal plugs or seal rods when spare contacts are removed.

3. CONNECTOR ASSEMBLY

18	16	11148	71-17148	Blue	-
18	16	MS3191-1	2520-3	-	-

NOTE: The MS3191-1 is a hand tool; the 11148 is a power tool.

- (1) Remove the applicable length of wire insulation. Refer to Table 4.
- (2) Install a heat shrinkable sleeve to all undersized wire to build up the wire O.D.
Refer to Table 5 and Subject 20-10-14.
- (3) For connector Deviation 101, solder the wire in the contact.
Refer to Subject 20-40-00.
- (4) For all connector deviations expect Deviation 101:
 - (a) Select a crimp tool from Table 6.
 - (b) Crimp the contact onto the wire.

	Nut	294-471-05
	Insertion Bit	294-953
		294-952

- (1) Loosen the grommet nut before contact insertion.
- (2) If the wires are not required in all contacts of the connector, install spare contacts in the unused contact cavities before the wired contacts are inserted.
Refer to Paragraph 3.C.
- (3) Make a selection of an insertion tool from Table 7.
- (4) Place the contact or wired contact in the insertion tool.
- (5) Align the contact and insertion tool perpendicular to the back face of the grommet.

CAUTION: TO PREVENT GROMMET DAMAGE, THE OPEN FACE OF THE INSERTION TOOL TIP MUST FACE OUTWARD WHEN THE CONTACTS ARE INSERTED INTO THE OUTER ROW OF GROMMET HOLES.

- (6) Carefully guide the contact through the grommet hole.
- (7) Push the tool straight in, perpendicular to the grommet surface, until the contact is fully seated.
The insertion is complete when the contact is seated firmly against the stop.
- (8) Keep the tool perpendicular to the grommet surface and carefully withdraw the tool.

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

This subject gives these procedures for the Viking Electronics AMC() series circular connectors:

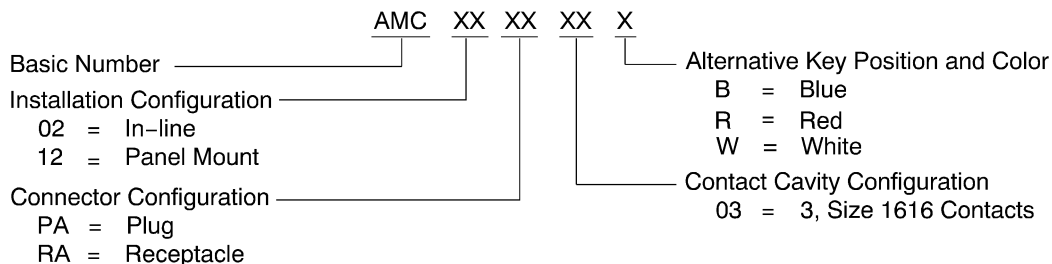

- Disassembly
- Assembly
- Installation.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Type	Supplier
AMC02PA03B	Plug	Viking Electronics
AMC02PA03R	Plug	Viking Electronics
AMC02PA03W	Plug	Viking Electronics
AMC02RA03B	Receptacle	Viking Electronics

AMC12RA03R	Receptacle	Viking Electronics
AMC12RA03W	Receptacle	Viking Electronics

**VIKING ELECTRONICS AMC() SERIES CONNECTOR PART NUMBER STRUCTURE
Figure 1**

The Viking Electronics AMC() circular connector has these technical features:

- It has a circular configuration
- The connector shell is plastic
- It is an in-line receptacle or a single hole panel mount receptacle
- It is a quick disconnect latch configuration
- It has one contact size
- The contacts are front release, rear removable
- The connector has a color code that shows the alternate key position.

Contact Insertion	16	16	Insertion	M81969/17-04

STANDARD WIRING PRACTICES MANUAL**VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS****2. CONNECTOR DISASSEMBLY****A. Separation of a Plug from a Receptacle****SEPARATION OF THE PLUG AND THE RECEPTACLE****Figure 6**

- (1) Hold the plug in one hand and the receptacle in the other hand. Refer to Figure 6.
- (2) To release the latches, apply pressure on the ribs of both connectors at the same time.
- (3) Pull the plug and receptacle apart.

B. Removal of a Receptacle from a Panel

- (1) Push on the lock ring at the front of the panel with a plastic awl or an equivalent tool. Refer to Figure 7 and Figure 8.

**POSITION OF PLASTIC AWL ON THE LOCK RING****Figure 7**

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

COMPRESSED POSITION OF THE LOCK RING
Figure 8

- (2) As the lock ring is compressed, push it into the hole in the panel.
- (3) Do Step (1) and Step (2) again until the outer surface of the lock ring is in the hole in the panel. Refer to Figure 9.

POSITION OF THE LOCK RING IN THE PANEL HOLE
Figure 9

- (4) Push the front of the receptacle into the panel until it is free from the panel. Refer to Figure 10.

RECEPTACLE REMOVED FROM THE PANEL
Figure 10

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

C. Contact Removal

**Table 5
CONTACT REMOVAL TOOLS**

Contact Size		Removal Tool
Engaging End	Crimp Barrel	
16	16	MS24256R16
		RRBX-16S

- (1) Make a selection of a contact removal tool from Table 5.
- (2) Put the tool plunger in the retracted position.
- (3) From the front of the connector, carefully push the tool axially straight into the contact cavity until it stops.

CAUTION: DO NOT PUSH THE TOOL INTO THE CONTACT CAVITY FROM THE REAR OF THE CONNECTOR. DAMAGE TO THE CONNECTOR AND THE TOOL CAN OCCUR.

- (4) Push the plunger into the tool.
- (5) If the plunger does not push the contact towards the rear of the connector:
 - (a) Carefully remove the tool from the contact cavity.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (3) and Step (4) again.
- (6) Pull the wire to remove the contact from the connector.
- (7) Examine the front of the connector for a crack or a chip that extends from:
 - One contact cavity to another contact cavity
 - A contact cavity to the shell of the connector.

D. Seal Plug Removal

- (1) Remove the backshell from the rear of the connector with a pair of needle nose pliers that have smooth surfaces and no sharp edges.

CAUTION: NEEDLE NOSE PLIERS WITH ROUGH SURFACES OR SHARP EDGES CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) Hold the end of the seal plug or seal rod tightly in the jaws of the pliers.
- (3) Pull the seal plug or seal rod out of the rear grommet in the direction that is perpendicular to the face of the grommet.

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

- (4) Examine the rear grommet for these types of damage:
- Gouges between two contact cavities
 - Cuts between two contact cavities
 - Cracks between two contact cavities
 - Cracks between cavities and the shell in the rear grommet.

3. CONNECTOR ASSEMBLY

A. Contact Assembly

- (1) Remove the necessary length L of the insulation from the end of the wire.
Refer to Table 6 and Figure 11.

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

INSULATION REMOVAL

Figure 11

- (2) If it is necessary, fold the conductor back on itself so that the length of the bare conductor is 1/4 inch. Refer to Table 6 and Figure 12.

A CONDUCTOR FOLDED BACK ON ITSELF

Figure 12

- (3) Make a selection of the crimp tool from Table 7 or Table 8.
 (4) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the bottom of the crimp barrel. Refer to Figure 13.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of crimp barrel is less than or equal to 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL

Figure 13

- (5) Crimp the contact.
 (6) Examine the wired contact for these types of damage:
- Any broken conductor strands
 - Any conductor strands on which the base metal can be seen
 - Any cracks in the crimp barrel of the contact.

B. Contact Insertion

**Table 9
AWG 16 WIRES WITH A LARGER OUTSIDE DIAMETER**

Wire Size (AWG)	Boeing Specification	Class
16	BMS 13-31	1
	BMS 13-55	1
	BMS 13-58	1

**Table 10
CONTACT INSERTION TOOLS**

Crimp Barrel Size	Insertion Tool		
	O.D. of the Cable	Handle	Bit
16	Less than 0.088 inch	294-96	-
		AT 1016	-
		ATBO1108	-
		ATBO1108-16	-
		ATBO1108-90	-
		M81969/17-04	-
		ZZL-R-9510-16	-
		ST2220-2	ST2220-2-4
16	Greater than 0.088 inch and less than 0.130 inch	ST2220-2	ST2220-2-4A

- (1) Find the O.D. of the wire.
Refer to Table 9 for the AWG 16 wires with an O.D. that is greater than 0.088 inch but less than 0.130 inch.
- (2) Make a selection of a contact insertion tool from Table 10.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT IS CRACKED
- A BIT THAT IS BENT.

WARNING: A DEFECTIVE TOOL CAN CAUSE INJURY TO THE OPERATOR.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE REAR GROMMET OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS, OR BOTH.

- (3) Put the wired contact into the tool so that the tip of the tool is against the end of the wire barrel of the contact. Refer to Figure 14.

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

POSITION OF THE WIRED CONTACT IN THE INSERTION TOOL
Figure 14

- (4) Axially align the tool and the contact with the contact cavity. Refer to Figure 15.

POSITION OF THE WIRED CONTACT IN RELATION TO THE CONTACT CAVITY
Figure 15

- (5) Push the tool straight into the contact cavity until the tool stops. Refer to Figure 16.

INSERTION OF THE CONTACT
Figure 16

- (6) Carefully remove the tool from the contact cavity.
 (7) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT, OR BOTH.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (8) If the contact does is not locked in the contact cavity:
 (a) Pull the wired contact out of the contact cavity.
 (b) Do Step (3) through Step (7) again.

C. Spare Contact Installation

Refer to Subject 20-60-08.

- (1) If it is necessary to install a spare contact in the contact cavities that are not used:

STANDARD WIRING PRACTICES MANUAL**VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS**

- (a) Make a selection of the contact from Table 2.
- (b) Make a selection of a contact insertion tool from Table 10.
- (c) Put the contact in the contact cavity.
- (d) Axially align the tool and the contact.
- (e) Push the tool straight into the contact cavity until the tool stops.
- (f) Carefully remove the tool from the contact cavity.

D. Seal Plug or Seal Rod Installation

Refer to Subject 20-60-08.

- (1) If it is necessary to install a seal plug or a seal rod in the contact cavities that are not used:

- (a) Make a selection of a seal plug or seal rod from Table 3.
- (b) Push the plug or the rod into the contact cavity.

Make sure that the distance from the end of the plug or the rod to the connector grommet is less than 0.1 inch.

4. CONNECTOR INSTALLATION**A. Installation of a Plug in the In-line Receptacle**

- (1) Align the keys of the receptacle with the keyways of the plug.

Refer to Figure 17.

POSITION OF THE KEYS AND THE KEYWAYS

Figure 17

- (2) Push the plug into the receptacle until it stops.

When the plug stops:

- A click can be heard
- The plug latches lock in the latch retainers.

- (3) Lightly pull the plug and the receptacle apart to make sure that the plug latches are locked. Refer to Figure 18.

STANDARD WIRING PRACTICES MANUAL**VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS****POSITION OF THE HANDS TO PULL AGAINST THE PLUG LATCHES****Figure 18**

- (4) If the plug moves away from the receptacle, do Step (2) and Step (3) again.
- (5) Examine the connector for these types of damage:
 - Cracks in the connector shell
 - Cracks or chips in the plug latches.

CAUTION: DO NOT INSTALL A WIRE HARNESS TIE OR A WIRE HARNESS CLAMP ON THE MATED CONNECTORS. THIS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE LATCH RETAINER AND CAUSE THE CONNECTORS TO BECOME DISCONNECTED IN SERVICE.

B. Installation of a Receptacle in a Panel

- (1) From the back of the panel, align the receptacle with the hole. Refer to Figure 19.

**POSITION OF THE RECEPTACLE IN RELATION TO THE HOLE IN THE PANEL****Figure 19**

- (2) Push the receptacle into the hole so that the lock ring becomes compressed. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

VIKING ELECTRONICS AMC() SERIES CIRCULAR CONNECTORS

LOCK RING COMPRESSED IN THE PANEL HOLE
Figure 20

- (3) Push the receptacle through the hole until:
- The lock ring extends and holds the receptacle in position on the panel
 - The rear surface of the lock ring is against the front of the panel
 - The forward end of the compression bellows is against the panel.

Refer to Figure 21.

POSITION OF THE RECEPTACLE IN THE PANEL
Figure 21

- (4) Push the receptacle from the front to make sure that it is locked in the panel.
 (5) If the receptacle moves, do Step (3) and Step (4) again.

(3) Pull the plug from the receptacle.

B. Contact Removal

Table 6
CONTACT REMOVAL TOOLS

Removal Tool	Color
DRK145	-
M81969/1-02	White

- (1) Make a selection of a contact removal tool from Table 6.
- (2) Put the tip of the tool on the wire.
- (3) At the rear of the connector, axially align the tool and the contact cavity.
- (4) Carefully push the tool into the contact cavity until it stops.

Make sure that the tool stays aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out from the contact cavity at the same time.
 Make sure that the tool stays aligned with the contact cavity.
- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (2) through Step (6) again.

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 4
- Table 7 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 4

(2) Make a selection of a crimp tool from Table 8.

(3) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the end of the crimp barrel. Refer to Figure 5.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

(4) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Contact Insertion

**Table 9
CONTACT INSERTION TOOLS**

Insertion Tool	Color
DAK145	-
M81969/1-02	Red

- (1) Make a selection of a contact removal tool from Table 9.
- (2) Put the contact assembly in the tool.
- (3) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (4) Carefully push the contact assembly into the contact cavity until it stops.
- (5) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (5) again.

4. CONNECTOR INSTALLATION

A. Plug and Receptacle Connection

- (1) Make a selection of a screwdriver.
- (2) Align the plug and the receptacle.
- (3) Push the plug into the receptacle until it stops.

STANDARD WIRING PRACTICES MANUAL

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

This subject gives the procedures to assemble Veam 115 Series connectors with:

- MIL-W-16878 Type EE or Class 2 cable
- ENDEVCO 16833 cable
- BMS 13-10 or BMS 13-16 cable.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

Amphenol no longer makes the 115 Series connectors. The connectors are made by Veam in Apese, Milano, Italy.

**Table 1

2. CONNECTOR DISASSEMBLY

A. Veam 115-5051 and 115-5051-1 Connectors with BMS 13-10 or BMS 13-16 Cable

This procedure applies to BMS 13-10 or BMS 13-16 Type III Class 2 AWG 20 cable.

- (1) Remove the lockwire and heat shrinkable sleeve.
- (2) Remove the backshell from the connector body.
- (3) Slide the ferrule assembly away from the connector body.
- (4) Cut the wire at the back of the connector.

Refer to Subject 20-61-00.

3. ASSEMBLY OF THE VEAM 115-5066 CONNECTOR WITH MIL-W-16878 CABLE

The MIL-W-16878 cable in this procedure is Type EE or Class 2 cable with AWG 20 wire.

A. Contact Assembly

Refer to Figure 1 and Table 3.

- (1) Slide the cable clamp down the cable.
- (2) Slide a 2-1/2 inch \pm 1/16 inch length of 1/4 inch diameter TFE sleeving down the cable.
- (3) Slide an additional 1-3/8 inch \pm 1/16 inch length of 3/16 inch diameter TFE sleeving down the cable.

20-62-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

- (4) Remove 2-1/8 inches + 1/8 inch, -0 inch of the cable jacket. Refer to Figure 3.
Make sure to avoid any nicks on the shield.
- (5) Remove approximately 3/8 inch of the shield from end of the cable.
- (6) Remove 1/4 inch + 1/32 inch, -0 inch of wire insulation.

PREPARATION OF THE MIL-W-16878 CABLE
Figure 3

- (7) Slide an outer ferrule over the shield.
- (8) Flare the end of the shield.
- (9) Slide an inner ferrule under the shield until the outer edge of the ferrule is flush with the end of the shield.
- (10) Position the outer ferrule over the shield.
- (11) Make a selection of a crimp tool from Table 5.
- (12) Crimp the outer ferrule.
- (13) Remove the excess end of the shield so that it is flush with the forward edge of outer ferrule.
- (14) Slide the spacer sleeve and wave washer over the end of the cable.
- (15) Push the shield back approximately 1 inch (as far as necessary to do the next step). Refer to Figure 4.
- (16) Slide the rear insert over the wires.

Make sure that:

- The lay of the conductor strands is not disturbed
- The shoulder of the spacer sleeve faces away from the end of the cable
- The face of the rear insert with the two small projections faces toward the end of the cable.

VEAM 115-5066 CONNECTOR ASSEMBLED WITH MIL-W-16878 CABLE
Figure 4

- (17) Make a selection of a crimp tool from Table 4.
- (18) Put each conductor completely into the crimp barrel of each contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

- (19) Crimp the contacts onto the wires.
- (20) Slide the rear insert forward and carefully seat the contacts in the cavities. Refer to Figure 5.
Make sure that the flats of the contact shoulders face each other.
- (21) Reform the shield over the wires so that end of the inner ferrule is as close as possible, approximately 1/8 inch, to the back face of the rear insert. Refer to Figure 5.
- (22) Put the short TFE sleeve over the cable so that the end away from the contacts is aligned with the end of the cable jacket.
- (23) Shrink the sleeve into place.
The maximum gap between the end of the sleeve and cable jacket is 1/16 inch.
- (24) Place the long TFE sleeve so that the forward end is flush with the exposed end of the inner ferrule. Refer to Figure 5.
- (25) Shrink the sleeve into place.

B. Contact Insertion

- (1) Insert the front end of the contacts into the cavities of the front insert.
- (2) Rotate the contacts so the flats on the contact shoulder enter the recess of the front insert. Refer to Figure 5.

CAUTION: DO NOT FORCE THE FRONT AND REAR INSERTS TOGETHER.

POSITION OF THE CONTACT AND THE TFE SLEEVE
Figure 5

C. Connector Assembly

- (1) Slide the insert assembly into the shell.
If necessary, rotate the assembly to engage the keyway and shell key.
- (2) Slide the wave washer and push it against the back face of the rear insert.
- (3) Slide the spacer sleeve into the shell so that the shoulder rests against the end of the shell.
- (4) Slide the cable clamp down and engage the threads of the clamp with the shell. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

POSITION OF THE CONNECTOR CABLE CLAMP
Figure 6

- (5) Tighten the clamp.
- (6) Remove the clamp bars or saddles.
- (7) Build up the cable diameter with filler tape.
- (8) Replace the clamp bars and tighten the screw.

4. ASSEMBLY OF THE VEAM 115-5066 CONNECTOR WITH ENDEVCO 16833 CABLE

A. Contact Assembly

- (1) Prepare the cable. Refer to Figure 7.
Make sure that all cuts are square.
 - (a) Remove 1.0 inch ± 0.03 inch of the cable jacket.
 - (b) Remove 1.0 inch ± 0.03 inch of the shield.
 - (c) Remove 0.25 inch ± 0.01 inch of wire insulation from each wire.

PREPARATION OF THE ENDEVCO 16833 CABLE
Figure 7

- (2) Untwist the two conductors in the outer carbon layer so that they are parallel. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF VEAM 115 SERIES CONNECTORS****CONFIGURATION OF THE ENDEVCO 16833 CABLE****Figure 8**

- (3) Cut the outer carbon layer along the groove between the two conductors and peel off the outer carbon layer.
- (4) Remove any excess carbon.
- (5) Remove the inner carbon layer.
- (6) To remove all residue of carbon from the primary insulation of the conductors:
 - (a) Sandblast the conductors or brush them with a fiberglass eraser
 - (b) Clean the conductors with acetone or another suitable solvent.
- (7) Remove 0.25 inch \pm 0.01 inch of insulation from each conductor. Refer to Figure 7.
- (8) To make sure there are no carbon tracks, check the insulation resistance at 500Vdc between:
 - The conductors
 - The shield and each conductor.
- (9) To make a 6917M19A cable:
 - (a) Discard the spacer sleeve and cable clamp supplied with the Veam 115-5066 connector
 - (b) Use the ENDEVCO spacer sleeve and the Bendix cable clamp that is supplied in the ENDEVCO 20279 Kit.
Refer to Table 3.
- (10) Push these components over the cable:
 - Two 2 inch lengths of 1/4 inch diameter Teflon 4X sleeve
 - The cable clamp
 - The spacer sleeve
 - The wave washer.Refer to Figure 1.
- (11) Push the rear insert over the conductors so that it is against the shield.
- (12) Make a selection of a crimp tool from Table 4.

20-62-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

- (13) Insert the bare conductors into the crimp barrel of each contact.
Make sure that:
 - The insulation is against the contact
 - The conductor strands are visible in the inspection hole.
- (14) Crimp the contacts onto each conductor.
- (15) Push the first Teflon sleeve against the rear insert and shrink it into place.
- (16) Push the second Teflon sleeve over the first and against the rear insert and shrink it into place.

B. Contact Insertion

- (1) Insert the socket contacts into the front insert.
- (2) Insert the wired contacts into the connector.

C. Connector Assembly

- (1) Engage the cable clamp threads on the connector body and tighten.

5. ASSEMBLY OF THE VEAM 115-5074 CONNECTOR WITH ENDEVCO 16833 CABLE (AVM)

A. Contact Assembly

- (1) Prepare the cable. Refer to Figure 9.
Make sure that all cuts are square.
 - (a) Remove 1.0 inch \pm 0.03 inch of the cable jacket.
 - (b) Remove 1.0 inch \pm 0.03 inch of the shield.
 - (c) Remove 0.25 inch \pm 0.01 inch of wire insulation from each wire.

PREPARATION OF THE ENDEVCO 16833 CABLE
Figure 9

- (2) Untwist the two conductors within the outer carbon layer so that they are parallel. Refer to Figure 10.
- (3) Cut the outer carbon layer along the groove between the two conductors and peel off the outer carbon layer.
- (4) Remove any excess carbon.
- (5) Remove the inner carbon layer.
- (6) To remove all residue of carbon from the primary insulation of the conductors:
 - (a) Sandblast the conductors or brush them with a fiberglass eraser
 - (b) Clean the conductors with acetone or another suitable solvent.
- (7) Remove 0.25 inch \pm 0.01 inch of insulation from each conductor. Refer to Figure 9.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF VEAM 115 SERIES CONNECTORS**

- (8) To make sure there are no carbon tracks, check the insulation resistance at 500Vdc between:
- The conductors
 - The shield and each conductor.
- (9) Put these components on the cable:
- Two 2 inch lengths of 1/4 inch diameter Teflon 4X sleeve
 - The cable clamp
 - The spacer sleeve
 - The wave washer.

Refer to Figure 1.

- (10) Push the rear insert over the conductors so that it is against the shield.

CONFIGURATION OF THE ENDEVCO 16833 CABLE

Figure 10

- (11) Make a selection of a crimp tool from Table 4.
- (12) Insert each of the bare conductors into the crimp barrel of each contact.
- Make sure that:
- The insulation is against the contact
 - The conductor strands are visible in the inspection hole.
- (13) Crimp the contacts onto each conductor.
- (14) Push the first Teflon sleeve against the rear insert and shrink it into place.
- (15) Push the second Teflon sleeve over the first and against the rear insert and shrink it into place.

B. Contact Insertion

- (1) Insert the socket contacts into front insert.
- (2) Insert the wired contacts into the connector.

C. Connector Assembly

- (1) Engage the cable clamp threads on the connector body and tighten.

20-62-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

6. ASSEMBLY OF THE VEAM 115-5051 AND 115-5051-1 CONNECTORS WITH BMS 13-10 OR BMS 13-16 CABLE

This procedure applies to BMS 13-10 or BMS 13-16 Type III Class 2 AWG 20 cable.

A. Contact Assembly

**Table 6
CONTACT CRIMP TOOLS**

Basic Unit		Locator

WT4410	Thomas & Betts	-	-	-

(1) Prepare the cable. Refer to Figure 11.

Make sure to:

- Make all cuts square
 - Avoid nicks on the shield or wire.
- (a) Remove 1.50 inches \pm 0.02 inch of cable jacket.
 - (b) Remove 0.437 inch \pm 0.015 inch of shield.
 - (c) Remove 0.166 inch \pm 0.020 inch of insulation from each wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

PREPARATION OF BMS 13-10 OR BMS 13-16 CABLE

Figure 11

(2) Insert the bare conductors into the crimp barrel of each contact. Refer to Figure 12.

Make sure that:

- The insulation is against the contact
- The conductor strands can be seen in the inspection hole.

POSITION OF THE CONTACTS ON THE WIRE

Figure 12

(3) Make a selection of a crimp tool from Table 6.

(4) Crimp the contacts onto each conductor.

(5) Push these components over the cable:

- A 3 inch length of heat shrinkable sleeve
- The backshell
- The outer ferrule.

(6) Slide the inner ferrule under the braid. Refer to Figure 2.

(7) Slide the outer ferrule over the shield against the inner ferrule. Refer to Figure 13.

POSITION OF THE OUTER FERRULE CRIMP

Figure 13

(8) Make a selection of a crimp tool from Table 7.

(9) Crimp the outer ferrule.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

B. Contact Insertion

**Table 8
CONTACT INSERTION TOOLS**

Insertion Tool	Supplier
294-245	Amphenol
ST2220-2-23	Boeing

- (1) Push the crimped ferrule away from the contacts.
- (2) Push the shield so it collapses and bend the wires approximately 90 degrees to provide clearance for the contact insertion tool. Refer to Figure 14.

**PREPARATION FOR CONTACT INSERTION
Figure 14**

- (3) Make a selection of an insertion tool from Table 8.
- (4) Insert the contact into each contact cavity.
To make sure that each contact is fully seated, lightly pull on each wire.

C. Connector Assembly

- (1) Insert the ferrule assembly into the connector body. Refer to Figure 15.

**INSERTION OF THE FERRULE
Figure 15**

- (2) Thread backshell onto plug shell and tighten into place.
- (3) Lockwire the assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF VEAM 115 SERIES CONNECTORS

- (4) Slide heat shrinkable sleeve over the outer ferrule and up against the backshell.
- (5) Shrink the sleeve into place. Refer to Figure 16.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 16

2. CONNECTOR DISASSEMBLY

A. Removal of Standard Contacts

NOTE: After a standard contact is installed in an MB6P-3 connector, it cannot be removed.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

**Table 8
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool
20	294-89
	AT 2020
	DRK20
	M81969/19-06
	MS24256R20
	RX20-24V5
	ST2220-3-13

- (1) Make a selection of a removal tool from Table 8.
- (2) If the connector has a strain relief leg, remove the wire harness tie that holds the wire harness.
- (3) Axially align the tool with the contact cavity at the front face of the connector.
Make sure that the plunger of the removal tool is fully retracted.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (4) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Push the plunger of the tool forward until it stops.
- (6) Carefully pull the tool out from the contact cavity.
Make sure that the tool stays axially aligned with the contact cavity.
- (7) Pull the contact out of the contact cavity from the rear of the connector.

B. Removal of Coax Contacts

NOTE: After a coax contact is installed in an MB6P-3 connector, it cannot be removed.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

**Table 9
COAX CONTACT REMOVAL TOOLS**

Contact Size	Removal Tool
12	294-73
	AT 2012
	DRK56-12
	M81969/19-02
	MS24256R12
	MS90456-12
	RX12-7
	ST2220-3-15

- (1) Make a selection of a coax contact removal tool from Table 9.
- (2) If the connector has a strain relief leg, remove the wire harness tie that holds the wire harness.
- (3) Remove the coax contact from the connector.

Make sure that the center contact is not removed from the coax contact.

CAUTION: DAMAGE TO THE COAX CONTACT AND THE CONNECTOR CAN OCCUR IF THE CENTER CONTACT IS REMOVED.

- (a) At the front face of the connector, axially align the tool with the contact cavity.
Make sure that the plunger of the removal tool is fully retracted.

CAUTION: DO NOT INSERT THE TOOL INTO THE REAR OF THE CONNECTOR. DAMAGE TO THE CONNECTOR WILL OCCUR.

- (b) Push the tool into the contact cavity until it stops.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (c) Push the plunger of the tool forward until it stops.
- (d) Carefully pull the tool out from the contact cavity.
Make sure that the tool stays axially aligned with contact cavity.
- (e) Pull the contact out of the contact cavity from the rear of the connector.

3. ASSEMBLY OF BURNDY MB10, MB12, MB13, AND MB24 SERIES CONNECTORS

A. Assembly of Standard Contacts

For the procedures to assemble a standard contact, refer to Paragraph 6.A.

B. Assembly of Coax Contacts

For the procedure to assemble a coax contact, refer to Paragraph 6.C.

C. Standard Contact Insertion

For the procedure to install a standard contact, refer to Paragraph 7.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

D. Coax Contact Insertion

For the procedure to install a coax contact, refer to Paragraph 7.B.

E. Seal of an Empty Contact Cavity

The seal of an empty contact cavity is not necessary.

F. Strain Relief Assembly

- (1) Attach the wire harness to the strain relief leg with a plastic tie strap or a wire harness tie material. Refer to Subject 20-10-11 for the procedure to assemble the wire harness tie.

Make sure that the knot or the head of the plastic tie strap is opposite the strain relief leg.

4. ASSEMBLY OF THE BURNDY MB6R-3 CONNECTORS

This paragraph gives the procedure to assemble the MB6R-3 connectors with these wires and cables:

- A BMS13-42 wire
- A BMS13-48 wire
- A Raychem 44A7418 multiconductor cable
- A Raychem 5026A1018 coax cable
- A Raychem 5026A1318 coax cable.

A. Cable Preparation for a Raychem 44A7418 Cable

- (1) Make a selection of a heat shrinkable boot from Table 6.
- (2) Put the heat shrinkable boot on the cable or the wire harness.
Make sure that the small end of the boot is pointed rearward, away from the connector.
- (3) Prepare the cable. Refer to Figure 1.

RAYCHEM 44A7418 CABLE PREPARATION
Figure 1

- (a) Remove 1.16 inches ± 0.03 inch of the outer layer of Dacron braid and Mylar tape.
 - (b) Remove necessary length of each component wire to make the distance from the end of the braid to the end of the wire equal to 0.88 inch ± 0.03 inch.
- (4) Prepare the component coax cable. Refer to Figure 1.
- (a) Remove the necessary length of jacket to make the distance from the end of the cable to the end of the jacket equal to 0.47 inch ± 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

- (b) Remove the necessary length of shield to make the distance from the end of the cable to the end of the shield equal to 0.25 inch ±0.03 inch.
- (c) Remove the necessary length of the dielectric to make the distance from the end of the conductor to the end of the dielectric equal to 0.16 inch ±0.03 inch.

B. Assembly of Standard Contacts

For the procedures to assemble a standard contact, refer to Paragraph 6.A.

C. Assembly of Coax Contacts

For the procedure to assemble a coax contact, refer to Paragraph 6.C.

D. Standard Contact Insertion

For the procedure to install a standard contact, refer to Paragraph 7.A.

E. Coax Contact Insertion

For the procedure to install a coax contact, refer to Paragraph 7.B.

F. Insertion of CRC280-4 Coax Contacts

**Table 10
COAX CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool
12	294-72
	M81969/17-05
	MS24256A12

- (1) Make a selection of a coax contact insertion tool from Table 10.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE THE CONTACT RETENTION CLIPS.

- (2) Put the necessary connector assembly components on the wire harness.
- (3) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

NOTE: A contact that has a bend or damage must be replaced.

- (4) Put the contact assembly in the insertion tool.
- (5) Axially align the insertion tool with the contact cavity at the rear of the connector.
- (6) Carefully push the tool straight into the correct contact cavity until it stops.

Make sure that the tool stays axially aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

CAUTION: DO NOT TURN THE INSERTION TOOL WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (7) Carefully pull the tool out from the contact cavity.
Make sure that the tool stays axially aligned with the contact cavity.
- (8) Lightly pull the wire to make sure that the contact is locked.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE CABLE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE CABLE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (9) If the contact is not locked in the contact cavity, do Step (5) through Step (8) again.

G. Bond Surface Preparation

BOND SURFACES
Figure 2

Refer to Figure 2.

- (1) Make a selection of a solvent from Table 7.
- (2) Prepare the surfaces of the boot that must make a bond with the connector.
 - (a) Wind a piece of emery cloth around an applicable rod or tool.
 - (b) Make the bond surfaces rough.
 - (c) Shake the loose particles out of the boot.
 - (d) Clean the bond surfaces with a clean wiper and solvent.
 - (e) Dry the boot with a wiper immediately.

CAUTION: DO NOT LET NAPHTHA DRY ON THE BOOT. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

- (3) Clean the receptacle connector surfaces that must make a bond with the adhesive.
 - (a) Clean the bond surfaces of the connector with a clean wiper and solvent.
 - (b) Dry the connector with a wiper immediately.

CAUTION: DO NOT LET NAPHTHA DRY ON THE CONNECTOR. WHEN NAPHTHA DRIES, AN UNWANTED FILM STAYS ON THE CLEAN SURFACES.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS****H. Boot Installation****POSITION OF THE HEAT SHRINKABLE BOOT****Figure 3**

- (1) Prepare the bond surfaces of the boot and the connector. Refer to Paragraph 4.G.
Make sure that the rear end of the boot that touches the wire harness is not prepared for a bond.
- (2) Apply the adhesive to the surfaces of receptacle flange and boot that make a bond.
Make sure that the rear end of the boot that touches the wire harness does not have adhesive.
- (3) Push the boot on the receptacle flange until the forward end of the boot is 0 inch to 0.03 inch from the snap ring groove.
- (4) Hold the boot until the adhesive cures.
Make sure that the forward edge of the boot is 0 inch to 0.03 inch from the rear edge of the snap ring groove.
- (5) Shrink only the rear end of the boot on the wire harness.

I. Seal of an Empty Contact Cavity

The seal of an empty contact cavity is not necessary.

J. Connector Installation

- (1) From the front of the panel, put the connector in hole in the panel.
- (2) Install the snap ring in the snap ring groove.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

5. ASSEMBLY OF THE BURNDY MB6P-3 CONNECTORS

This paragraph gives the procedure to assemble the MB6P-3 connector with these wires and cables:

- A BMS13-42 wire
- A BMS13-48 wire
- A Raychem 44A7418 multiconductor cable
- A Raychem 5026A1018 coax cable
- A Raychem 5026A1318 coax cable.

A. Cable Preparation for a Raychem 44A7418 Cable

RAYCHEM 44A7418 CABLE PREPARATION
Figure 4

Refer to Figure 4.

- (1) Make a selection of a heat shrinkable boot from Table 6.
- (2) Put the heat shrinkable boot on the cable or the wire harness.
 Make sure that the small end of the boot is pointed rearward, away from the connector.
- (3) Prepare the cable.
 - (a) Remove 1.16 inches ± 0.03 inch of the outer layer of Dacron braid and Mylar tape.
 - (b) Remove necessary length of each component wire to make the distance from the end of the braid to the end of the wire equal to 0.88 inch ± 0.03 inch.
- (4) Prepare the component coax cable. Refer to Figure 4.
 - (a) Remove the necessary length of jacket to make the distance from the end of the cable to the end of the jacket equal to 0.47 inch ± 0.03 inch.
 - (b) Remove the necessary length of shield to make the distance from the end of the cable to the end of the shield equal to 0.25 inch ± 0.03 inch.
 - (c) Remove the necessary length of the dielectric to make the distance from the end of the conductor to the end of the dielectric equal to 0.16 inch ± 0.03 inch.

B. Assembly of Standard Contacts

For the procedures to assemble a standard contact, refer to Paragraph 6.A.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

C. Assembly of Coax Contacts

**Table 11
CENTER CONTACT CRIMP TOOLS**

Crimp Barrel Size	Crimp Tool		
	Basic Unit	Locator	Die Set
26	ST2220-1-Y	ST2220-1-47	-
	M10S-1	SL-72	S-35

**Table 12
OUTER FERRULE CRIMP TOOL**

Coax Contact	Crimp Tool		
	Basic Unit	Die Set	Locator
KIT700-42	WT 202-06-08	WT 202	-
	M10S-1	S-39	SL-58

**POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 5**

Refer to Figure 5.

- (1) Make a selection of a center contact crimp tool from Table 11.
- (2) Make a selection of a ferrule crimp tool from Table 12.
- (3) Make a selection of a heat shrinkable sleeve from Table 7.
- (4) Put a 0.75 inch \pm 0.03 inch length of 3/32 inch diameter heat shrinkable sleeve on the cable.
Make sure that the end of the sleeve is 0 inch to 0.03 inch from the edge of the jacket.
- (5) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (6) Put a 0.68 inch \pm 0.03 inch length of 1/8 inch diameter heat shrinkable sleeve on the first sleeve.
Make sure that the end of the sleeve is 0 inch to 0.03 inch from the edge of the jacket.
- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Put the outer ferrule on the cable.
Make sure that the ferrule is not near the contact and the sleeves.
- (9) Crimp the inner contact.
- (10) Push the inner contact into the outer contact until it locks in position.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

Make sure that the crimp barrel of the outer contact is between the insulation and the shield.

- (11) Push the outer ferrule forward on the shield until it is fully against the shoulder of the outer contact.
- (12) Crimp the ferrule.
- (13) Put a 0.5 inch \pm 0.03 inch length of 3/16 inch diameter heat shrinkable sleeve on the outer sleeve.
Make sure that the forward end of the sleeve is against the ferrule.
- (14) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (15) Put a 0.38 inch \pm 0.03 inch length of 1/4 inch diameter heat shrinkable sleeve on the outer sleeve.
Make sure that the forward end of the sleeve is against the ferrule.
- (16) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Standard Contact Insertion

NOTE: After a standard contact is installed in an MB6P-3 connector, it cannot be removed.

- (1) Put the snap ring on the wire harness.
- (2) If the wire harness has less than five individual BMS 13-42 or BMS 13-48 wires, the put the necessary number of 1.5 inch lengths of heat shrinkable sleeves on the wire harness to make the outer diameter of the wire harness 0.19 inch to 0.21 inch.
- (3) Insert each standard contact, refer to Paragraph 7.A.

E. Coax Contact Insertion

For the procedure to install a coax contact, refer to Paragraph 7.B.

NOTE: After a coax contact is installed in an MB6P-3 connector, it cannot be removed.

F. Connector Assembly

**Table 13
HEAT SHRINKABLE SLEEVES**

Description	Part Number	Supplier
Inner Sleeve	CRN	Raychem
Outer Sleeve	DWP-125	Raychem

- (1) If the heat shrinkable sleeves are not supplied with the connector, make a selection of each of these sleeves from Table 13:
 - A 2.5 inch length of 3/8 inch diameter inner sleeve
 - A 1 inch length of 3/4 inch diameter outer sleeve.

NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (2) If sleeves are supplied with the connector, remove the identification marks from the sleeves:
 - (a) Make a selection of a lacquer thinner from Table 7.
 - (b) Apply a small quantity of lacquer thinner to the identification marks with a soft nylon bristle brush or an equivalent tool.
 - (c) Dry the sleeves with a wiper.
- (3) Push the longer inner sleeve forward on the cable until it is approximately 0.2 inch from the rear of the insert. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

POSITION OF THE INNER AND OUTER SLEEVES

Figure 6

- (4) Shrink the sleeve into its position. Subject 20-10-14.
- (5) Push the shorter outer sleeve forward until it is 0 inch to 0.06 inch from the shoulder of the insert.
- (6) Shrink the sleeve into its position. Subject 20-10-14.
- (7) Install the assembled insert into the plug body. Refer to Figure 7 and Figure 8.

Make sure that:

- The coax contact hole in the deadface is aligned with the top of the connector
- The contacts in the insert are aligned with the applicable contact holes in the deadface.

ASSEMBLED MB6P-3 PLUG

Figure 7

ALIGNMENT OF THE INSERT WITH THE DEADFACE

Figure 8

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

(8) Install the snap ring. Refer to Figure 7.

NOTE: After the snap ring is installed, it cannot be removed.

- (a) Put the connector on a hard surface with the face of the connector against the surface.
 - (b) Put the snap ring in the rear of the connector at an approximate 45 degree angle.
Make sure that one edge of the ring is in the keyway.
 - (c) Move the ring into the rear of the connector with the hand.
Make sure to move the side of the ring that is opposite the keyway first.
 - (d) When the ring is below the edge of the connector, press down on the insert until it hits the bottom.
 - (e) Push on the snap ring with a small screwdriver or an equivalent tool to move it into its position in the snap ring groove.
- (9) To make sure that the snap ring is fully installed, hold the plug tightly and at the same time, lightly pull on the cable.

G. Seal of an Empty Contact Cavity

Empty contact cavities must be sealed with an unwired contact. Refer to Subject 20-60-08.

6. CONTACT ASSEMBLY

A. Assembly of Standard Contacts

**Table 14
INSULATION REMOVAL LENGTH**

Crimp Barrel Size	Removal Length L (inch)	
	Target	Tolerance

		ST2220-1-Y	-	ST2220-1-1	-	-

- (1) Make a selection of a crimp tool from Table 16.
- (2) Remove the necessary length of insulation from the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

Refer to:

- Figure 9
- Table 15 for wire sizes of Raychem 44A7418 cable
- Table 14
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 9

(3) Push the conductor into the crimp barrel of the contact. Refer to Figure 10.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is a maximum of 0.03 inch.

THE POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 10

(4) Crimp the contact.

(5) Examine the wired contact for these types of damage:

- A strand of the conductor is broken
- The base metal of a strand of the conductor can be seen
- The crimp barrel of the contact has a crack.

(6) If the contact or the wire has damage, replace the contact.

B. Coax Cable Preparation

CABLE PREPARATION
Figure 11

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

Refer to Figure 11.

- (1) Remove the necessary length of the cable jacket to make the distance from the end of the jacket to the end of the shield equal to 0.50 inch \pm 0.03 inch.
- (2) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.25 inch \pm 0.03 inch.
- (3) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the center conductor equal to 0.15 inch \pm 0.03 inch.

C. Assembly of Coax Contacts

This Paragraph gives the procedure to assemble KIT700-() and 60B40052-() coax contacts.

For the procedure to assemble a CRC280-4 coax contact, refer to Paragraph 6.D.

**Table 17
CENTER CONTACT CRIMP TOOLS**

Crimp Barrel Size	Crimp Tool		
	Basic Unit	Locator	Die Set
26	ST2220-1-Y	ST2220-1-47	-
	M10S-1	SL-72	S-35

**Table 18
FERRULE CRIMP TOOLS**

Basic Unit	Die Set	Locator
WT 202-06-08	WT 202	-
M10S-1	S-30	SL-58

- (1) Make a selection of a center contact crimp tool from Table 17.
- (2) Make a selection of a ferrule crimp tool from Table 18.
- (3) Put the ferrule on the coax cable.
Make sure that the small end of the ferrule is pointed rearward, away from the end of the cable.
- (4) Prepare the coax cable. Refer to Paragraph 6.B.
- (5) Push the center conductor into the crimp barrel of the center contact until the end of the dielectric is against the end of the center contact. Refer to Figure 12.
Make sure that the strands of the conductor can be seen in the inspection hole.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

POSITION OF THE CENTER CONTACT ON THE CENTER CONDUCTOR
Figure 12

- (6) Crimp the center contact.
- (7) Put the body of the contact on the cable.
 Make sure that:
 - The crimp barrel of the contact body is between the insulation of the center conductor and the shield
 - The center contact is fully inserted in the body.
- (8) Push the outer ferrule forward on the shield until it is fully against the shoulder of the contact body.
- (9) Crimp the ferrule.

D. Assembly of CRC280-4 Coax Contacts with BMS13-65 Coax Cable

Table 19
CENTER CONTACT CRIMP TOOLS

Coax Contact	Basic Unit		Locator
	Part Number	Setting	
CRC280-4	M22520/2-01	5	640001
			K709

Table 20
COAX CONTACT BODY CRIMP TOOL

Coax Contact	Basic Unit	Die	
		Part Number	Cavity
CRC280-4	612648	612642	B
	KTH-1000	KTH-2007	A
	M22520/5-01	M22520/5-05	B
		M22520/5-41	B
		Y197	B

- (1) Make a selection of a center contact crimp tool from Table 19.
- (2) Make a selection of a contact body crimp tool from Table 20.
- (3) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
- (4) Remove 0.30 inch ± 0.05 inch of the outer jacket from the end of the cable. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

CAUTION: DAMAGE TO THE SHIELD, THE DIELECTRIC, OR THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

OUTER JACKET REMOVAL LENGTH

Figure 13

(5) Align the inner ferrule and the end of the cable. Refer to Figure 14.

ALIGNMENT OF THE INNER FERRULE AND THE END OF THE CABLE

Figure 14

(6) Push the inner ferrule rearward until the shoulder of the ferrule is against the end of the outer jacket.

(7) Cut the flat conductor shield at the forward edge of the inner ferrule.

(8) Fold the shield back on the outer surface of the inner ferrule.

Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.

(9) Cut the strands of the shield at the forward edge of the shoulder of the inner ferrule. Refer to Figure 15.

POSITION OF THE SHIELD ON THE INNER FERRULE

Figure 15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

- (10) Remove the necessary length of the dielectric to make the distance between the end of the forward end of the shield and the end of the dielectric equal to 0.05 inch \pm 0.01 inch. Refer to Figure 16.

DIELECTRIC REMOVAL
Figure 16

- (11) If all of the strands of the center conductor are not together, twist the strands together in their initial direction.
- (12) Push the center conductor into the crimp barrel of the center contact until the end of the dielectric is against the end of the center contact. Refer to Figure 17.

Make sure that the strands of the conductor can be seen in the inspection hole.

POSITION OF THE CENTER CONTACT ON THE CENTER CONDUCTOR
Figure 17

- (13) Crimp the center contact.
- (14) Put the contact body on the center contact.
- (15) Push the center contact into the contact body until it is locked in position.
- (16) Lightly pull the cable to make sure that the center contact is locked in the contact body.
- (17) If the center contact is not locked in the contact body, do Step (15) and Step (16) again.
- (18) Put the contact in the crimp die.

Make sure that the rear end of the contact body is aligned with the edge of the crimp die.

- (19) Crimp the contact body. Refer to Figure 18.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

Make sure that the distance from:

- The rear end of the contact body to the forward end of the crimp area is equal to 0.15 inch \pm 0.03 inch
- The rear end of the contact body to the shoulder of the inner ferrule is not more than 0.035 inch.

POSITION OF THE CONTACT BODY
Figure 18

(20) Remove the unwanted length of the strands of the shield.

Make sure that the end of the shield is aligned with the rear end of the contact body.

E. Assembly of the Burndy KIT700-() Coax Contacts with an In-Line Resistor

Table 21
IN-LINE RESISTORS

Part Number	Supplier
RLR07C51R1FR	Available Source

ASSEMBLY OF THE COAX CONTACT WITH AN IN-LINE RESISTOR
Figure 19

Refer to Figure 19.

- (1) Make a selection of a resistor from Table 21.
- (2) Remove 0.50 inch \pm 0.06 inch from one lead of the resistor.
Make sure that each lead is the same length before the 0.50 inch is removed.
- (3) Put a 0.63 inch \pm 0.06 inch length of 1/16 inch diameter heat shrinkable sleeve on the shortest lead.
- (4) Put the end of the shortest lead into the crimp barrel of the center contact.
- (5) Apply a small quantity of solder to the of the shortest lead and the crimp barrel of the center contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

- (6) Put a 1.13 inch \pm 0.06 inch length of 1/16 inch diameter heat shrinkable sleeve on the longest lead of the resistor.
- (7) Put a 1.00 \pm 0.06 inch length of 3/16 inch diameter heat shrinkable sleeve on the resistor.
- (8) Install the assembled center contact in the outer contact.
- (9) Bend the resistor lead until it touches the side of the outer contact.
- (10) Apply a small quantity of solder to the lead and the side of the outer contact.
- (11) Align the center of the 1.00 inch heat shrinkable sleeve with the center of the resistor.
- (12) Shrink the sleeve into its position. Subject 20-10-14.

7. CONTACT INSERTION

A. Standard Contact Insertion

**Table 22

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS**

- (1) Make a selection of a contact insertion tool from Table 22.
Refer to Subject 20-00-16 to find the O.D. of the wire.
- (2) Examine the tool.

CAUTION: DO NOT USE A TOOL WITH:

- A TIP THAT IS BENT
- A TIP THAT IS FLARED
- A TIP THAT IS BROKEN
- A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE INSERT OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (3) Put the necessary connector assembly components on the wire harness.
- (4) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

NOTE: A contact with a bend or damage must be replaced.

- (5) Put the contact assembly in the insertion tool.

Refer to:

- Figure 20 for the correct position of the insertion tool tip on the contact assembly with a wire O.D. less than 0.06 inch
- Figure 21 for the correct position of the insertion tool tip on the contact assembly with a wire O.D. more than 0.06 inch.

POSITION OF THE INSERTION TOOL TIP INSIDE THE WIRE INSULATION BARREL FOR SIZE 20 CONTACTS AND A WIRE O.D. LESS THAN 0.06 INCH

Figure 20

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

POSITION OF THE INSERTION TOOL TIP OUTSIDE THE WIRE INSULATION BARREL FOR SIZE 20 CONTACTS AND A WIRE O.D. MORE THAN 0.06 INCH

Figure 21

- (6) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (7) Carefully push the insertion tool and the contact assembly into the contact cavity until it stops. Make sure that the tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL WHEN THE TOOL IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (8) Carefully pull the tool out from the contact cavity. Make sure that the tool stays axially aligned with the contact cavity.
- (9) Lightly pull on the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (10) If the contact is not locked in the contact cavity:
 - (a) Pull the contact out of the contact cavity.
 - (b) Do Step (4) through Step (9) again.

B. Coax Contact Insertion

This Paragraph gives the procedure to install KIT700-() and 60B40052-() coax contacts. For the procedure to install a CRC280-4 coax contact, refer to Paragraph 4.F.

**Table 23
COAX CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool
12	RTM12-5
	RX12-5
	ST2220-2-29

- (1) Make a selection of a coax contact insertion tool from Table 10.

NOTE: As an alternative, the contact can be inserted with the hand.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 60B40052-() AND BURNDY MB6, MB10, MB12, MB13, AND MB24 CONNECTORS

- CAUTION:** DO NOT USE A TOOL WITH:
- A TIP THAT IS BENT
 - A TIP THAT IS FLARED
 - A TIP THAT IS BROKEN
 - A TIP THAT HAS A CRACK.

CAUTION: A DEFECTIVE TOOL CAN CAUSE DAMAGE TO THE INSERT OF THE CONNECTOR OR THE CONTACT RETENTION CLIPS.

- (2) Put the necessary connector assembly components on the wire harness.
- (3) Examine the contact.

Make sure that the contact:

- Is straight
- Does not have damage.

NOTE: A contact that has a bend or damage must be replaced.

- (4) Put the contact assembly in the insertion tool.
- (5) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (6) Carefully push the tool and the contact assembly into the contact cavity until it stops.

Make sure that the tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL WHEN THE TOOL IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (7) Carefully pull the tool out from the contact cavity.
Make sure that the tool stays axially aligned with the contact cavity.
- (8) Lightly pull the wire to make sure that the contact is locked.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE CABLE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE CABLE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (9) If the contact is not locked in the contact cavity, do Step (5) through Step (8) again.

- (1) Make a selection of a crimp tool from Table 7.
- (2) Remove the 0.38 inch \pm 0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 4
- Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

WIRE PREPARATION
Figure 4

- (3) Put the end cap on the wire.
Make sure that the end of the end cap that has threads is pointed to the end of the wire.
- (4) Put the insulation grip ferrule on the wire.
Make sure that the larger end is pointed to the end of the wire.
- (5) Increase the O.D. of the wire until the O.D. of the wire is approximately 0.120 inch.

Refer to:

- Paragraph 10.A. for the procedure to increase the O.D. of the wire with one or more heat shrinkable sleeves
- Paragraph 10.B. for the procedure to increase the O.D. of the wire with layers of tape.

- (6) Put the wire guide on the wire. Refer to Figure 5.

Make sure that:

- The inner shoulder of the wire guide is against the end of the wire insulation
- If a heat shrinkable sleeve or layer of tape is used to increase the wire O.D, the wire guide does not push the heat shrinkable sleeve or the layer of tape out of its shape.

POSITION OF THE CONTACT AND THE WIRE GUIDE ON THE WIRE
Figure 5

- (7) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the forward end of the crimp barrel. Refer to Figure 5.
Make sure that all of the conductors are in the crimp barrel.
- (8) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

Figure 6**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

FENWAL 35303-12 CONNECTOR ASSEMBLY

Figure 7

FENWAL 35303-73 CONNECTOR ASSEMBLY

Figure 8

Refer to Figure 6, Figure 7, or Figure 8.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 1/2 inch wrench
 - A 1/2 inch socket or a 1/2 inch crow foot adapter.
- (2) Make a selection of a cement from Table 3.
- (3) Make a selection of a ferrule crimp tool from Table 8.
- (4) Make a selection of a torque adapter from Table 9.

NOTE: The housing assembly of a plug connector is a satisfactory alternative for a torque adapter.

- (5) Make a selection of pliers or a vice from Table 9.
- (6) Put the insulator on the contact.

Make sure the rear end of the insulator is against the wire guide.

- (7) Put the pin shield on the contact.

NOTE: The 35303-12 connector does not have a pin shield.

Make sure that the rear end of the pin shield is against the insulator

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (8) Put the housing assembly on the contact assembly.
- (9) Push the insulation grip ferrule forward until the ferrule is fully against the wire guide.
- (10) Crimp the ferrule.
- (11) Apply a layer of cement on the first three threads of the housing assembly.
- (12) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (13) Fully engage the threads of the end cap and the threads of the housing assembly.
- (14) Torque the torque adapter and the housing assembly:
 - (a) Fully engage the threads of the torque adapter and the threads of the coupling nut.
 - (b) Put the torque wrench with the crow foot adapter or the socket on the torque adapter.
 - (c) Put the 1/2 inch wrench on the coupling nut.
 - (d) Torque the adapter 65 inch-pounds to 75 inch-pounds.
- (15) Torque the end cap:
 - (a) Hold the end cap tightly in the pliers or the vice.
 - (b) Put the torque wrench and the crow foot adapter or the socket on the torque adapter.
 - (c) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (16) Remove the unwanted cement from the surface of the housing assembly.
- (17) Hold the coupling nut with the 1/2 inch wrench.
- (18) Remove the torque adapter from the connector.
- (19) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GO INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

- (20) Cure the cement for the minimum cure time at 70 degrees F. Refer to Table 3.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The receptacle can be connected to the plug before the cement is fully cured.

4. ASSEMBLY OF FENWAL 35303-9 AND 35303-11 CONNECTORS

- (1) Make a selection of a crimp tool from Table 10.
- (2) Remove the 0.38 inch ±0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 10
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 10**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

(3) Put the end cap on the wire.

Make sure that the end of the end cap that has threads is pointed to the end of the wire.

(4) Put the insulation grip ferrule on the wire.

Make sure that the larger end is pointed to the end of the wire.

(5) Put the wire guide on the wire. Refer to Figure 11.

Make sure that:

- The inner shoulder of the wire guide is against the end of the wire insulation
- If a heat shrinkable sleeve or layer of tape is used to increase the wire O.D, the wire guide does not push the heat shrinkable sleeve or the layer of tape out of its shape.

POSITION OF THE CONTACT, THE WIRE GUIDE, AND THE FERRULE ON THE WIRE
Figure 11

(6) Increase the O.D. of the wire until the O.D. of the wire is approximately 0.120 inch.

Refer to:

- Paragraph 10.A. for the procedure to increase the O.D. of the wire with one or more heat shrinkable sleeves
- Paragraph 10.B. for the procedure to increase the O.D. of the wire with layers of tape.

(7) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the forward end of the crimp barrel. Refer to Figure 11.

Make sure that all of the conductors are in the crimp barrel.

(8) Crimp the contact.

C. Connector Assembly

Screw Press	ST2575C
Vice	ST2598C-201

FENWAL 35303-9 AND 35303-11 CONNECTOR ASSEMBLY

Figure 12

Refer to Figure 12.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 3/8 inch socket or a 3/8 inch crow foot adapter.
- (2) Make a selection of a cement from Table 3.
- (3) Make a selection of a ferrule crimp tool from Table 11.
- (4) Make a selection of pliers or a vice from Table 12.
- (5) Make a selection of a screw press from Table 12.
- (6) Put the insulator on the contact.
Make sure the rear end of the insulator is against the wire guide.
- (7) Put the pin shield on the contact.
Make sure that the rear end of the pin shield is against the insulator
- (8) Put the housing assembly on the contact assembly.
- (9) Push the insulation grip ferrule forward until it is fully against the wire guide.
- (10) Crimp the ferrule.
- (11) Apply a layer of cement on the first three threads of the housing assembly.
- (12) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (13) Tighten the end cap on the housing assembly:
 - (a) Fully engage the threads of the end cap and the threads of the housing assembly.
 - (b) Hold the end cap tightly in the pliers or the vice.
 - (c) Put the torque wrench with the crow foot adapter or the socket on the housing assembly.

20-62-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (d) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (14) Remove the unwanted cement from the surface of the housing assembly.
- (15) Install the socket sleeve with the screw press:
 - (a) Move the plunger of the screw press to the end of the slot.
 - (b) Put the end of the socket sleeve without a white dot in the end of the plunger. Refer to Figure 13.

POSITION OF THE SOCKET SLEEVE IN THE SCREW PRESS
Figure 13

- (c) Align the end of the screw press and the threads on the housing assembly.

ALIGNMENT OF THE SCREW PRESS AND THE CONNECTOR
Figure 14

- (d) Turn the screw press clockwise until the end of the screw press is against the hexagonal part of the housing assembly. Refer to Figure 15.

POSITION OF THE SCREW PRESS AGAINST THE HOUSING ASSEMBLY
Figure 15

- (e) Turn the wing screw clockwise until it stops. Refer to Figure 15.
- NOTE:** When the wing screw stops, the shoulder of the plunger is against the housing assembly.
- (f) Turn the screw press counter-clockwise to remove it from the housing assembly.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

(16) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GO INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

(17) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The plug can be connected to the receptacle before the cement is fully cured.

5. ASSEMBLY OF FENWAL 35303-64, 35303-66 AND 35303-68 CONNECTORS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

FENWAL 35303-64, 35303-66 AND 35303-68 CONNECTOR ASSEMBLY

Figure 19

Refer to Figure 19.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 1/2 inch wrench
 - A 1/2 inch socket or a 1/2 inch crow foot adapter.
 - (2) Make a selection of a cement from Table 3.
 - (3) Make a selection of a ferrule crimp tool from Table 14.
 - (4) Make a selection of a torque adapter from Table 15.
- NOTE:** The housing assembly of a plug connector is a satisfactory alternative for a torque adapter.
- (5) Make a selection of pliers or a vice from Table 15.
 - (6) Put the insulator on the pin contact.
Make sure the rear end of the insulator is against the wire guide.
 - (7) Put the pin shield on the contact.
Make sure that the rear end of the pin shield is against the insulator
 - (8) Put the housing assembly on the contact assembly.
 - (9) Apply a layer of cement to the first three threads of the housing assembly.
 - (10) Push the insulation grip ferrule forward until it is fully on the wire guide.
 - (11) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
 - (12) Fully engage the threads of the end cap and the threads of the housing assembly.
 - (13) Torque the torque adapter and the housing assembly:
 - (a) Fully engage the threads of the torque adapter and the threads of the coupling nut.
 - (b) Put the torque wrench and the crow foot adapter or the socket on the torque adapter.
 - (c) Put the 1/2 inch wrench on the coupling nut.
 - (d) Torque the adapter 65 inch-pounds to 75 inch-pounds.
 - (14) Torque the end cap:
 - (a) Hold the end cap tightly in the pliers or the vice.
 - (b) Put the torque wrench and the crow foot adapter or the socket on the torque adapter.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (c) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (15) Remove the unwanted cement from the surface of the housing assembly.
- (16) Hold the coupling nut with the 1/2 inch.
- (17) Remove the torque adapter from the connector.
- (18) Crimp the ferrule.
- (19) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GO INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

- (20) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The receptacle can be connected to the plug before the cement is fully cured.

6. ASSEMBLY OF FENWAL 35303-75 CONNECTORS

A. Connector Description

FENWAL 35303-75 CONNECTOR
Figure 20

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

B. Contact Assembly

**Table 16
CONTACT CRIMP TOOLS**

ST2220-1-Y		-	ST2220-1-7	-	
WA27F		6	TH338	Red	
			TP673	-	

- (1) Make a selection of a crimp tool from Table 16.
- (2) Remove the 0.38 inch ±0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 21
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 21**

- (3) Put the end cap on the wire.
Make sure that the end of the end cap that has threads is pointed to the end of the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (4) Put the insulation grip ferrule on the wire. Refer to Figure 20.
- (5) Increase the O.D. of the wire until the O.D. of the wire is approximately 0.120 inch.

Refer to:

- Paragraph 10.A. for the procedure to increase the O.D. of the wire with one or more heat shrinkable sleeves
- Paragraph 10.B. for the procedure to increase the O.D. of the wire with layers of tape.

- (6) Put the wire guide on the wire. Refer to Figure 22.

Make sure that:

- The inner shoulder of the wire guide is against the end of the wire insulation
- If a heat shrinkable sleeve or layer of tape is used to increase the wire O.D, the wire guide does not push the heat shrinkable sleeve or the layer of tape out of its shape.

POSITION OF THE CONTACT AND THE WIRE GUIDE ON THE WIRE
Figure 22

- (7) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the forward end of the crimp barrel. Refer to Figure 22.

Make sure that all of the conductors are in the crimp barrel.

- (8) Crimp the contact.

ASSEMBLY OF FENWAL CONNECTORS

FENWAL 35303-75 CONNECTOR ASSEMBLY
Figure 23

Refer to Figure 23.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 1/2 inch wrench
 - A 1/2 inch socket or a 1/2 inch crow foot adapter.
- (2) Make a selection of a cement from Table 3.
- (3) Make a selection of a torque adapter from Table 18.

NOTE: The housing of a plug connector is a satisfactory alternative for a torque adapter.
- (4) Make a selection of pliers or a vice from Table 18.
- (5) Make a selection of a ferrule crimp tool from Table 17.
- (6) Put the insulator on the pin contact.

Make sure the rear end of the insulator is against the wire guide.
- (7) Put the pin shield on the contact.

Make sure that the rear end of the pin shield is against the insulator
- (8) Put the housing assembly on the contact assembly.
- (9) Apply a layer of cement to the first three threads of the housing assembly.
- (10) Push the insulation grip ferrule forward until the is fully on the wire guide.
- (11) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (12) Fully engage the threads of the end cap and the threads of the housing assembly.
- (13) Torque the torque adapter and the coupling nut.
 - (a) Fully engage the threads of the torque adapter and the threads of the coupling nut.
 - (b) Put the torque wrench and the crow foot adapter or the socket on the torque adapter.
 - (c) Put the 1/2 inch wrench on the coupling nut.
 - (d) Torque the adapter 65 inch-pounds to 75 inch-pounds.
- (14) Torque the end cap.
 - (a) Hold the end cap tightly in the pliers or the vice.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF FENWAL CONNECTORS**

- (b) Put the torque wrench and the crow foot adapter or the socket on the torque adapter.
- (c) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (15) Remove the unwanted cement from the surface of the housing assembly.
- (16) Hold the coupling nut with the 1/2 inch wrench.
- (17) Remove the torque adapter from the connector.
- (18) Crimp the ferrule.
- (19) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GET INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

- (20) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The receptacle can be connected to the plug before the cement is fully cured.

- (1) Make a selection of a crimp tool from Table 19.
- (2) Remove the 0.38 inch ±0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 25
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 25

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (3) Put the end cap on the wire.
Make sure that the end of the end cap that has threads is pointed to the end of the wire.
- (4) Put the insulation grip ferrule on the wire. Refer to Figure 24.
- (5) Increase the O.D. of the wire until the O.D. of the wire is approximately 0.120 inch.

Refer to:

- Paragraph 10.A. for the procedure to increase the O.D. of the wire with one or more heat shrinkable sleeves
- Paragraph 10.B. for the procedure to increase the O.D. of the wire with layers of tape.

- (6) Put the wire guide on the wire. Refer to Figure 26.

Make sure that:

- The inner shoulder of the wire guide is against the end of the wire insulation
- If a heat shrinkable sleeve or layer of tape is used to increase the wire O.D, the wire guide does not push the heat shrinkable sleeve or the layer of tape out of its shape.

POSITION OF THE CONTACT, THE WIRE GUIDE, AND THE FERRULE ON THE WIRE
Figure 26

- (7) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the forward end of the crimp barrel. Refer to Figure 26.
Make sure that all of the conductors are in the crimp barrel.
- (8) Crimp the contact.

FENWAL 35303-67, 35303-77, 35303-87, AND 04-035303-087 CONNECTOR ASSEMBLY
Figure 27

Refer to Figure 27.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 3/8 inch socket or a 3/8 inch crow foot adapter.
- (2) Make a selection of a cement from Table 3.
- (3) Make a selection of a ferrule crimp tool from Table 20.
- (4) Make a selection of pliers or a vice to hold the end cap from Table 21.
- (5) Make a selection of a screw press from Table 21.
- (6) Put the insulator on the pin contact.
 Make sure the rear end of the insulator is against the wire guide.
- (7) Put the pin shield on the contact.
 Make sure that the rear end of the pin shield is against the insulator
- (8) Put the housing assembly on the contact assembly.
- (9) Apply a layer of cement to the first three threads of the housing assembly.
- (10) Push the ferrule forward until it is fully on the wire guide.
- (11) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (12) Tighten the end cap on the housing assembly:
 - (a) Fully engage the threads of the end cap and the threads of the housing assembly.
 - (b) Hold the end cap tightly in the pliers or the vice.
 - (c) Put the torque wrench with the crow foot adapter or the socket on the housing assembly.
 - (d) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (13) Remove the unwanted cement from the surface of the housing assembly.
- (14) Crimp the insulation grip ferrule.
- (15) Install the socket sleeve with the screw press:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (a) Move the plunger of the screw press to the end of the slot.
- (b) Put the end of the socket sleeve without a white dot in the plunger. Refer to Figure 28.

POSITION OF THE SOCKET SLEEVE IN THE SCREW PRESS
Figure 28

- (c) Align the end of the screw press with the threads on the housing assembly.

ALIGNMENT OF THE SCREW PRESS AND THE CONNECTOR
Figure 29

- (d) Turn the screw press clockwise until the end of the screw press is against the hexagonal part of the housing assembly.
- (e) Turn the wing screw clockwise until it stops. Refer to Figure 30.

NOTE: When the wing screw stops, the shoulder of the plunger is against the housing assembly.

POSITION OF THE SCREW PRESS AGAINST THE HOUSING ASSEMBLY
Figure 30

- (f) Turn the screw press counter-clockwise to remove it from the housing assembly.
- (16) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

CAUTION: DO NOT LET FLUID OR CONTAMINATION GET INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

(17) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The plug can be connected to the receptacle before the cement is fully cured.

8. ASSEMBLY OF FENWAL 35303-90, 35303-94, 35303-97, AND 35303-99 CONNECTORS

	WA27F	6	TH338	Red
			TP673	-

- (1) Make a selection of the crimp tool from Table 22.
- (2) Remove 1.07 inches \pm 0.03 inch of the outer jacket from the end of the wire.

Refer to:

- Figure 32
- Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE WIRE CAN OCCUR.

OUTER JACKET REMOVAL LENGTH
Figure 32

(3) Remove 0.60 inch ± 0.03 inch of the shield from the end of the wire. Refer to Figure 33.

CAUTION: DO NOT CAUSE DAMAGE TO THE DIELECTRIC. UNSATISFACTORY PERFORMANCE OF THE WIRE CAN OCCUR.

SHIELD REMOVAL LENGTH
Figure 33

(4) Remove 0.45 inch ± 0.03 inch of the dielectric from the end of the wire. Refer to Figure 34.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE WIRE CAN OCCUR.

DIELECTRIC REMOVAL LENGTH
Figure 34

(5) Put the jacket grip on the wire. Refer to Figure 35.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

POSITION OF THE JACKET GRIP, THE END CAP, AND THE OUTER FERRULE ON THE WIRE
Figure 35

- (6) Put the end cap on the wire. Refer to Figure 35.
 Make sure that the end of the end cap that has threads is pointed to the end of the wire.
- (7) Put the outer ferrule on the wire. Refer to Figure 35.
- (8) Put the wire guide on the wire between the dielectric and the shield. Refer to Figure 36.
 Make sure that the inner shoulder of the wire guide is against the end of the dielectric.

POSITION OF THE WIRE GUIDE BETWEEN THE DIELECTRIC AND THE SHIELD
Figure 36

- (9) If the shield makes an overlap with the outer shoulder of the wire guide, remove the necessary length of shield to make the shield go against the wire guide. Refer to Figure 36.
- (10) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the forward end of the crimp barrel. Refer to Figure 37.

Make sure that:

- All of the conductor strands are in the crimp barrel
- The distance from the forward end of the wire guide to the rear end of the contact is 0.03 inch maximum.

POSITION OF THE CONTACT ON THE WIRE
Figure 37

- (11) Crimp the contact.

Figure 38**

Refer to Figure 38.

- (1) Make a selection of these tools from Table 6:
 - A torque wrench
 - A 1/2 inch wrench
 - A 1/2 inch socket or a 1/2 inch crow foot adapter.

- (2) Make a selection of a ferrule crimp tool from Table 23.
- (3) Make a selection of a torque adapter from Table 24.

NOTE: The housing assembly of a plug connector is a satisfactory alternative for a torque adapter.

- (4) Make a selection of pliers or a vice from Table 24.
- (5) Make a selection of a cement from Table 3.
- (6) Put the insulator on the pin contact. Refer to Figure 39.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

Make sure that the rear end of the insulator is against the wire guide.

POSITION OF THE INSULATOR
Figure 39

- (7) Put the pin shield on the contact. Refer to Figure 40.
Make sure the end of the pin shield is against the insulator.

POSITION OF THE PIN SHIELD
Figure 40

- (8) Put the housing assembly on the contact assembly.
Make sure that the housing assembly is against the pin shield.
- (9) Apply a layer of cement to the first three threads of the housing assembly.
- (10) Push the outer ferrule forward until it is fully on the wire guide.
- (11) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (12) Fully engage the threads of the end cap and the housing assembly. Refer to Figure 41.

POSITION OF THE END CAP AND THE HOUSING ASSEMBLY
Figure 41

- (13) Torque the torque adapter and the coupling nut.
 - (a) Fully engage the threads of the torque adapter and the threads of the coupling nut.
 - (b) Put the torque wrench with the crow foot adapter or the socket on the torque adapter and hold it in its position.
 - (c) Put the 1/2 inch wrench on the coupling nut.
 - (d) Torque the adapter 65 inch-pounds to 75 inch-pounds.
- (14) Torque the end cap.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (a) Hold the end cap tightly in the pliers or the vice.
- (b) Hold the torque wrench in its position on the torque adapter.
- (c) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (15) Hold the coupling nut with the 1/2 inch wrench.
- (16) Remove the torque adapter from the connector.
- (17) Remove the unwanted cement from the surface of the housing assembly.
- (18) Push the jacket grip forward until it is fully against the ferrule.
- (19) Crimp the ferrule. Refer to Figure 42.

CRIMP AREA ON THE FERRULE

Figure 42

- (20) Examine the ferrule for these types of damage:
 - The base metal of the ferrule can be seen
 - The ferrule has a crack.
- NOTE:** These items are permitted:
 - Flash on the crimp area of the ferrule
 - A dimple on all sides of the crimp area
 - Deformation of the jacket grip.
- (21) If the ferrule has damage, replace the ferrule.
- (22) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GO INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

- (23) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The receptacle can be connected to the plug before the cement is fully cured.

POSITION OF THE PIN SHIELD
Figure 52

- (8) Put the housing assembly on the contact assembly.
Make sure that the housing assembly is against the pin shield.
- (9) Apply a layer of cement to the first three threads of the housing assembly.
- (10) Push the outer ferrule forward until it is fully on the wire guide.
- (11) Push the end cap forward on the ferrule until the end cap is against the housing assembly.
- (12) Tighten the end cap on the housing assembly.
 - (a) Fully engage the threads of the end cap and the housing assembly.
 - (b) Hold the end cap tightly in the pliers or the vice.
 - (c) Put the torque wrench with the crow foot adapter or the socket on the housing assembly.
 - (d) Torque the end cap 50 inch-pounds to 60 inch-pounds.
- (13) Remove the unwanted cement from the surface of the housing assembly.
- (14) Push the jacket grip forward until it is fully against the ferrule.
- (15) Crimp the ferrule. Refer to Figure 53.

CRIMP AREA ON THE OUTER FERRULE
Figure 53

- (16) Examine the ferrule for these types of damage:
 - The base metal of the ferrule can be seen
 - The ferrule has a crack.

NOTE: These items are permitted:

- Flash on the crimp area of the ferrule
 - A dimple on all sides of the crimp area
 - Deformation of the jacket grip.
- (17) If the ferrule has damage, replace the ferrule.
 - (18) Install the socket sleeve with the screw press:
 - (a) Move the plunger of the screw press to the end of the slot.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

- (b) Put the end of the socket sleeve without a black dot in the plunger. Refer to Figure 54.

POSITION OF THE SOCKET SLEEVE IN THE SCREW PRESS
Figure 54

- (c) Align the end of the screw press with the threads on the housing assembly. Refer to Figure 55.

ALIGNMENT OF THE SCREW PRESS AND THE CONNECTOR
Figure 55

- (d) Turn the screw press clockwise until the end of the screw press is against the hexagonal part of the housing assembly. Refer to Figure 56.

POSITION OF THE SCREW PRESS AGAINST THE HOUSING ASSEMBLY
Figure 56

- (e) Turn the wing screw clockwise until it stops. Refer to Figure 56.

NOTE: When the wing screw stops, the shoulder of the plunger is against the housing assembly.

- (f) Turn the screw press counter-clockwise to remove it from the housing assembly.

- (19) If the connector is not connected to a sensing element immediately, put a dust cap on the connector.

CAUTION: DO NOT LET FLUID OR CONTAMINATION GO INTO THE CONNECTOR. IF FLUID OR CONTAMINATION GOES INTO THE CONNECTOR, UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

- (20) Cure the cement a minimum of 18 hours at 70 degrees F before the connector is put in service.

20-62-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The plug can connected to the receptacle before the cement is fully cured.

10. ADJUSTMENT OF THE WIRE O.D.

A. Installation of a Heat Shrinkable Sleeve

This paragraph gives the procedure to increase the O.D. of a wire.

**Table 28
SLEEVE LENGTHS**

Layer	Length (inch)
First	2.25
Second	1.75
Third	1.50
Fourth	1.25

**POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE WIRE
Figure 57**

Refer to Figure 57.

- (1) Make a selection of a heat shrinkable sleeve from Table 4.
Make sure that the sleeve has an O.D. that can move easily on the wire.

- (2) Cut the necessary length of sleeve. Refer to Table 28.

NOTE: If more than four sleeves are installed, each subsequent sleeve should be approximately 0.25 inch shorter than the last sleeve that is installed.

- (3) Put the sleeve on the wire.
Make sure that the end of the sleeve is aligned with the end of the wire insulation.

- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.

- (5) Measure the O.D. of the wire.

- (6) If the O.D. of the wire is not approximately 0.120 inch, do Step (1) through Step (5) again.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF FENWAL CONNECTORS

B. Installation of a Layer of Tape

This paragraph gives the procedure to increase the O.D. of a wire.

POSITION OF THE LAYER OF TAPE ON THE WIRE
Figure 58

Refer to Figure 58.

- (1) Make a selection of a tape from Table 5.
- (2) Wind one layer of tape around the end of the wire insulation.

Make sure that:

- The forward end of the tape is aligned with the end of the insulation
- Each subsequent layer of tape make a 100 percent overlap with the last layer of tape that is installed.

- (3) Measure the O.D. of the wire.
- (4) If the O.D. of the wire is not approximately 0.120 inch, do Step (2) through Step (3) again.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

- (1) In this order, put these components on the wire:
 - The backnut
 - The ferrule sleeve
 - The spring spacer
 - The rear insulator.
- (2) Remove 9/32 inch ± 1/32 inch of insulation from the end of the wire.
- (3) Make a selection of a crimp tool from Table 4.
- (4) Put the contact in the crimp tool.
- (5) Put the conductor in crimp barrel of the contact.
- (6) Crimp the contact.
- (7) Put the wired contact in the large end of the front insulator.
- (8) Put the connector housing over front insulator and wired contact.
- (9) Push the rear insulator, the spring, and the ferrule into the connector housing.
- (10) Apply a light coat of Sauereisen 32 or Sauereisen 1 adhesive to the first two or three threads of the connector housing.
- (11) Push the nut against the connector housing.
- (12) Turn the nut so that the threads engage the threads of the housing.
- (13) Torque the nut 100 inch-pounds to 120 inch-pounds.
- (14) Make a selection of a ferrule crimp tool from Table 5.
- (15) Crimp the ferrule.

Make sure to use the small die opening on the locator.

3. CONNECTOR ASSEMBLY WITH BMS 13-31 AWG 18 WIRE

A. Assembly of Gravier 51444-129 and 51444-130 Connectors

Figure 2

ASSEMBLED CONNECTOR

Figure 3

- (1) Remove 0.30 inch \pm 0.03 inch of wire insulation.
- (2) In this order, put these components on the wire:
 - The spring (if supplied)
 - The backnut
 - The seal sleeve
 - The spring spacer
 - The insulator.

Refer to Figure 2.

- (3) Make a selection of a crimp tool from Table 6.
- (4) Push the wire into the crimp barrel of the contact until it touches the bottom.
- (5) Crimp the contact.
- (6) Remove these components from the end of the connector:
 - The seal cap
 - The seal cup
 - The washer.
- (7) Apply a light coat of a thread locking compound to the length of wire that the crimp seal sleeve covers when the sleeve is in position.

Refer to:

- Subject 20-00-11
 - Figure 3.
- (8) Apply a light coat of the thread locking compound to the first three external threads on the connector housing.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

- (9) Move the insulator over the contact.
- (10) Push the spring spacer and the sleeve against the insulator.
- (11) Push the backnut against the connector housing.
- (12) Turn the backnut so that the threads engage the threads of the housing.
- (13) Torque the backnut 110 inch-pounds \pm 10 inch-pounds.
- (14) Make a selection of a crimp tool from Table 7.
- (15) Crimp the seal sleeve.
Make sure that the locator is in position B.
- (16) If the spring is supplied with the connector:
 - (a) Push the spring forward until it is against the backnut.
 - (b) Turn the spring clockwise a minimum of one turn so that the end of the spring is attached to the backnut.
- (17) Cure the thread locking compound under either of these conditions:
 - 68 degrees F for 5 hours
 - 250 degrees F for 10 minutes.
- (18) Install these components:
 - The washer
 - The seal cup
 - The seal cap.

4. CONNECTOR ASSEMBLY WITH BMS 13-55 TYPE 1 AND TYPE 2 AWG 18 WIRE

Figure 5

- (1) Remove 0.30 inch \pm 0.03 inch of wire insulation.
- (2) In this order, put these components on the wire:
 - The spring (if supplied)
 - The backnut
 - The seal sleeve
 - The spring spacer
 - The insulator.
- Refer to Figure 4.
- (3) Make a selection of a crimp tool from Table 8.
- (4) Put the conductor in the crimp barrel of the contact.
- (5) Crimp the contact.
- (6) Remove these components from the end of the connector:
 - The seal cap
 - The seal cup
 - The washer.
- (7) Examine the connector housing.
Make sure that the shoulder of the bushing is against the circlip.
- (8) Apply a light coat of a thread locking compound to the length of wire that the crimp seal sleeve covers when the sleeve is in position.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

Refer to:

- Subject 20-00-11
- Figure 5.

- (9) Apply a light coat of the thread locking compound to the first three external threads on the connector housing.
- (10) Move the insulator over the contact.
- (11) Push the spring spacer and the sleeve against the insulator.
- (12) Push the backnut against the connector housing.
- (13) Turn the backnut so that the threads engage the threads of the housing.
- (14) Torque the backnut 110 inch-pounds ± 10 inch-pounds.
- (15) Make a selection of a crimp tool from Table 9.
- (16) Crimp the seal sleeve.
Make sure that the locator is in position B.
- (17) If the spring is supplied with the connector:
 - (a) Push the spring forward until it is against the backnut.
 - (b) Turn the spring clockwise a minimum of one turn so that the end of the spring is attached to the backnut.
- (18) Cure the thread locking compound under either of these conditions:
 - 68 degrees F for 5 hours
 - 250 degrees F for 10 minutes.
- (19) Install these components:
 - The washer
 - The seal cup
 - The seal cap.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

GRAVINER D5653-1 AND D5922-1 CONNECTORS
Figure 6

(1) In this order, put these components on the wire:

- The spring (if supplied)
- The backnut
- A 2-1/4 inch \pm 1/16 inch length of 1/4 inch diameter TFE 2X heat shrinkable sleeve
- A 6.0 inch \pm 1/16 inch length of 1/4 inch diameter TFE 4X heat shrinkable sleeve
- Two 1-1/2 inch lengths of 1/8 inch diameter TFE 4X heat shrinkable sleeve
- The ferrule sleeve
- The spring spacer
- The rear insulator.

Refer to Figure 6.

NOTE: The Scotch 1205 anti-friction tape that is supplied with connector is not used.

- (2) Remove 9/32 inch \pm 1/32 inch of insulation from the end of the wire.
- (3) Make a selection of a crimp tool from Table 10.
- (4) Put the conductor in the crimp barrel of the contact until it touches the bottom.
- (5) Crimp the contact.
- (6) Put the wired contact in the large end of the front insulator.
- (7) Push the connector housing over the front insulator until it is against the back of the wired contact.
- (8) Push the rear insulator and the spring spacer against the housing.
- (9) Increase the diameter of the wire.

Refer to:

- Subject 20-10-14
- Figure 7.

WIRE DIAMETER BUILDUP
Figure 7

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

- (a) Move the first 1-1/2 inch length of 1/8 inch diameter heat shrinkable sleeve so that the end of the sleeve is against the end of the crimp barrel of the contact.
- (b) Shrink the sleeve in position.
- (c) Move the second 1-1/2 inch length of 1/8 inch diameter heat shrinkable sleeve so that the end of the sleeve is against the end of the crimp barrel of the contact.
- (d) Shrink the sleeve in position.
- (10) Make a selection of a ferrule crimp tool from Table 11.
- (11) Push the ferrule over the sleeves against the spring spacer and the rear insulator.
- (12) Crimp the ferrule.
Make sure to use the small die opening on the locator.
- (13) Push the 6.0 inch length of heat shrinkable sleeve until the end of the sleeve is against the end of the crimp barrel of the ferrule.
- (14) Shrink the sleeve in position.
- (15) Push the 2-1/4 inch length of heat shrinkable sleeve until the end of the sleeve is against the flange end of the ferrule.
- (16) Shrink the sleeve in position.
- (17) Apply a light coat of Sauereisen 32 or Sauereisen 1 adhesive to the first two or three threads of the wire end of the connector housing.
- (18) Push the backnut against the connector housing.
- (19) Turn the backnut so that the threads engage the threads of the housing.
- (20) Torque the backnut 100 inch-pounds to 120 inch-pounds.
- (21) If the spring is supplied with the connector:
 - (a) Push the spring forward until it is against the backnut.
 - (b) Turn the spring clockwise a minimum of one turn so that the end of the spring is attached to the backnut.

5. CONNECTOR ASSEMBLY WITH CERRO H22-4000 AWG 18 WIRE

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

GRAVINER D5653 AND D5922 CONNECTORS
Figure 8

- (1) In this order, put these components on the wire:
 - A 1-1/2 inch length of 1/4 inch diameter TFE 4X heat shrinkable sleeve
 - The backnut
 - The ferrule sleeve
 - The spring spacer
 - The rear insulator.

Refer to Figure 8.

- (2) Prepare the wire. Refer to Figure 9.

CERRO H22-4000 WIRE TRIM DIMENSIONS
Figure 9

- (a) Remove 2 inches of the shield from the wire.
 - (b) Remove 2 inches of the clear teflon inner wrap from wire.
- CAUTION:** DO NOT CUT OR DAMAGE THE DIELECTRIC MATERIAL.
- (c) Remove 9/32 inch \pm 1/32 inch of insulation from the end of the wire.
- (3) Put a 1-1/2 inch length of 1/8 inch diameter TFE 4X heat shrinkable sleeve over the dielectric and against the shield.
 - (4) Shrink in the sleeve in position. Refer to Subject 20-10-14.
 - (5) Make a selection of a crimp tool from Table 12.
 - (6) Put the contact in the crimp tool.
 - (7) Put the conductor in crimp barrel of the contact.
 - (8) Crimp the contact.
 - (9) Put the wired contact in the large end of the front insulator.
 - (10) Put the connector housing over front insulator and wired contact.
 - (11) Push the rear insulator, the spring, and the ferrule into the connector housing.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

- (12) Apply a light coat of Sauereisen 32 or Sauereisen 1 adhesive to the first two or three threads of the connector housing.
- (13) Push the nut against the connector housing.
- (14) Turn the nut so that the threads engage the threads of the housing.
- (15) Torque the nut 100 inch-pounds to 120 inch-pounds.
- (16) Make a selection of a ferrule crimp tool from Table 13.
- (17) Crimp the ferrule.
Make sure to use the small die opening on the locator.
- (18) Move the 1-1/2 inch length of 1/4 inch diameter TFE 4X heat shrinkable sleeve so that the end of the sleeve is against the ferrule.
- (19) Shrink the sleeve in position.

B. Assembly of Gravier 51444-103, 51444-106, D5653-1, and D5922-1 Connectors

**Table 14

Figure 10**

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF GRAVINER CONNECTORS**

- (1) In this order, put these components on the wire:
 - The spring
 - The backnut
 - A 2-1/4 inch \pm 1/16 inch length of 1/4 inch diameter TFE 2X heat shrinkable sleeve
 - A 6.0 inch \pm 1/16 inch length of 1/4 inch diameter TFE 4X heat shrinkable sleeve
 - The ferrule sleeve
 - The spring spacer
 - The rear insulator.

Refer to Figure 10.

NOTE: The Scotch 1205 anti-friction tape that is supplied with connector is not used.

- (2) Remove 9/32 inch \pm 1/32 inch of insulation from the end of the wire.
- (3) Make a selection of a crimp tool from Table 14.
- (4) Put the conductor in the crimp barrel of the contact until it touches the bottom.
- (5) Crimp the contact.
- (6) Put the wired contact in the large end of the front insulator.
- (7) Push the connector housing over the front insulator until it is against the back of the wired contact.
- (8) Push the rear insulator and the spring spacer against the housing.
- (9) Make a selection of a ferrule crimp tool from Table 15.
- (10) Push the ferrule over the sleeves against the spring spacer and the rear insulator.
- (11) Crimp the ferrule.

Make sure to use the small die opening on the locator.
- (12) Push the 6.0 inch length of heat shrinkable sleeve until the end of the sleeve is against the end of the crimp barrel of the ferrule.
- (13) Shrink the sleeve in position.
- (14) Push the 2-1/4 inch length of heat shrinkable sleeve until the end of the sleeve is against the flange end of the ferrule.
- (15) Shrink the sleeve in position.
- (16) Apply a light coat of Sauereisen 32 or Sauereisen 1 adhesive to the first two or three threads of the wire end of the connector housing.
- (17) Push the backnut against the connector housing.
- (18) Turn the backnut so that the threads engage the threads of the housing.
- (19) Torque the backnut 100 inch-pounds to 120 inch-pounds.
- (20) Push the spring forward until it is against the backnut.
- (21) Turn the spring clockwise a minimum of one turn so that the end of the spring is attached to the backnut.

**GRAVINER D5653-2, D5922-2, AND 51444-118 CONNECTORS
Figure 11**

- (1) In this order, put these components on the wire:
 - The backnut
 - The ferrule sleeve
 - The spring spacer
 - The rear insulator.

Refer to Figure 11.

- (2) Remove 9/32 inch ± 1/32 inch of insulation from the end of the wire.
- (3) Make a selection of a crimp tool from Table 12.
- (4) Put the contact in the crimp tool.
- (5) Put the conductor in crimp barrel of the contact.
- (6) Crimp the contact.
- (7) Put the wired contact in the large end of the front insulator.
- (8) Put the connector housing over front insulator and wired contact.
- (9) Push the rear insulator, the spring, and the ferrule into the connector housing.
- (10) Apply a light coat of Sauereisen 32 or Sauereisen 1 adhesive to the first two or three threads of the connector housing.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

- (11) Push the nut against the connector housing.
- (12) Turn the nut so that the threads engage the threads of the housing.
- (13) Torque the nut 100 inch-pounds to 120 inch-pounds.
- (14) Make a selection of a ferrule crimp tool from Table 13.
- (15) Crimp the ferrule.

Make sure to use the small die opening on the locator.

6. CONNECTOR ASSEMBLY WITH CHAMPLAIN 24-00034 WIRE

A. Assembly of Graviner 51444-123-1D, 51444-124-1D, 51444-129-1D, and 51444-130-1D Connectors

NOTE: The data in this paragraph:

- Is applicable to the wire harnesses for the Rolls-Royce engines
- Is supplied to Boeing by Rolls-Royce.

**Table 18
CONTACT CRIMP TOOLS**

Figure 12**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

(1) In this order, put these components on the wire:

- The spring guard
- The backnut
- The ferrule sleeve
- The spring spacer
- The rear insulator.

Refer to Figure 12.

- (2) Remove 0.30 inch \pm 0.03 inch of insulation from the end of the wire.
- (3) Make a selection of a crimp tool from Table 12.
- (4) Put the ring socket assembly in the crimp tool.
- (5) Put the conductor in crimp barrel of the socket.
- (6) Crimp the contact.
- (7) Put the ring socket assembly in the insulator bushing of the connector housing.
- (8) Push the rear insulator, the spring, and the ferrule sleeve into the connector housing.
- (9) Push the nut against the connector housing.
- (10) Turn the nut so that the threads engage the threads of the housing.
- (11) Torque the nut 100 inch-pounds to 120 inch-pounds.
- (12) Make a selection of a ferrule crimp tool from Table 19.
- (13) Crimp the ferrule.
- (14) Push the spring guard forward until it is against the backnut.
- (15) Turn the spring clockwise a minimum of one turn so that the end of the spring is attached to the backnut.

B. Assembly of Gravier 51444-144 and 51444-145 Connectors

This paragraph gives the procedure to assemble the connectors with AWG 16 wire.

**Table 20
CONTACT CRIMP TOOLS**

Basic Unit		Locator

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF GRAVINER CONNECTORS****GRAVINER 51444-144 AND 51444-145 CONNECTORS****Figure 13**

- (1) Put these TFE 4X heat shrinkable sleeves on the wire:
 - A 2 inch length
 - A 3-1/2 inch length.

Make sure that the diameter of the sleeve is large enough so that the sleeve can be installed over the ferrule sleeve.

- (2) In this order, put these components on the wire:
 - The backnut
 - The ferrule sleeve
 - The spring spacer
 - The rear insulator.

Refer to Figure 13.

- (3) Remove 5/16 inch +0 inch, -1/16 inch of insulation from the end of the wire.
- (4) Make a selection of a crimp tool from Table 20.
- (5) Put the ring socket assembly in the crimp tool.
- (6) Put the conductor in crimp barrel of the socket.
- (7) Crimp the contact.
- (8) Put the ring socket assembly in the insulator bushing of the connector housing.
- (9) Push the rear insulator, the spring, and the ferrule sleeve into the connector housing.
- (10) Push the nut against the connector housing.
- (11) Turn the nut so that the threads engage the threads of the housing.
- (12) Torque the nut 100 inch-pounds to 120 inch-pounds.
- (13) Make a selection of a ferrule crimp tool from Table 21.
- (14) Crimp the ferrule.
- (15) Install the wire support sleeves. Refer to Figure 14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF GRAVINER CONNECTORS

SUPPORT SLEEVE INSTALLATION

Figure 14

- (a) Push the 3-1/2 inch TFE 4X sleeve over the ferrule sleeve until the end of the sleeve is approximately 2 inches from the end of the ferrule.
- (b) Shrink the sleeve in position.
- (c) Push the 2 inch TFE 4X sleeve over the first sleeve until the end of the sleeve is approximately 2 inches from the end of the ferrule.
- (d) Shrink the sleeve in position.

ASSEMBLY OF WALTER KIDDE CONNECTORS

B. Necessary Materials

**Table 4
NECESSARY MATERIALS**

Description	Part Number or Specification	Supplier
Cement	No. 1	Sauereisen
	No. 31	Sauereisen
Grease, Silicone	DC-4	Dow Corning
Washer, Brass	209592	Walter Kidde
Sleeve, Heat Shrinkable	MIL-DTL-23053/12 Class 5	Any Source
	SAE-AMS-23053/12 Class 5	Any Source
	TFE 4X	Chemplast Zeus
Tube, Heat Shrinkable with Meltable Inner Liner	MWSF Polyolefin	Remtek
	WTF Teflon	Penntube Plastics
		Saint-Gobain Performance Plastics

2. GENERAL DATA

A. Connector Cleaning

For the procedures to clean Walter Kidde connectors, refer to Subject 20-60-01.

B. Installation of Strain Relief

This paragraph gives the procedure to assemble more strain relief if the strain relief given by the grommet insert is not sufficient.

**INSTALLATION OF MORE STRAIN RELIEF
Figure 1**

Refer to Figure 1.

- (1) Put tape on the cable or wire at the rear of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

CAUTION: TAPE BY ITSELF DOES NOT GIVE THE NECESSARY STRAIN RELIEF. THE INSTALLATION OF A HEAT SHRINKABLE SLEEVE ON THE TAPE IS NECESSARY TO GIVE THE NECESSARY STRAIN RELIEF. IF THE STRAIN RELIEF IS NOT SUFFICIENT, DAMAGE TO THE WIRE HARNESS CAN OCCUR.

- (a) Make a selection of Temperature Grade D tape. Refer to Subject 20-00-11.
- (b) Put rear end of the first layer of tape on the cable or wire approximately 1-1/4 inches from the collar of the Teflon insert.
- (c) Put more layers of tape on the cable or wire to increase the diameter slowly and continuously from the end of the first layer of tape.

Make sure that:

- The tape is smooth and symmetrical around the wire or cable
- The diameter of the wire or cable at the end of the connector is almost as large as the collar of the Teflon insert.

- (2) Install the necessary quantity of sleeves.

NOTE: If the sleeve is TFE 4X, installation of 2 or 3 sleeves is necessary.

- (a) Make a selection of an approximately 0.5 inch diameter Teflon heat shrinkable sleeve. Refer to Subject 20-00-11.

Make sure that:

- The sleeve can move on the Teflon insert easily
- The length of the sleeve is sufficient to extend from the forward end of the Teflon insert to the rear end of the layers of tape.

- (b) Put the sleeve on the layers of tape and the Teflon insert.
- (c) Align the rear end of the sleeve with the rear end of the tape.
- (d) To prevent damage to the cable or wire caused by the application of heat, put sufficient layers of protection on 4 to 6 inches of the cable or wire that does not have tape on it.
- (e) Shrink the sleeve in its position. Refer to Subject 20-10-14.
- (f) Do Step (b) through Step (e) again for each sleeve.

3. ASSEMBLY OF WALTER KIDDE 875564 AND 876288 CONNECTORS WITH BMS 13-8A TYPE I CLASS A AWG 18 WIRE

A. Connector Description

WALTER KIDDE 875564 AND 876288 CONNECTORS
Figure 2

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

B. Contact Assembly

**Table 5
CONTACT CRIMP TOOLS**

Contact	Crimp Tool			
	Basic Unit		Locator	
	Part Number	Supplier	Part Number	Supplier
Pin	MS3191A	QPL	3630-2	Astro
			3630-2	Buchanan
	ST2220-1-Y	Boeing	ST2220-1-7	Boeing
Socket	MS3191A	QPL	3630-4	Astro
			3630-4	Buchanan
	ST2220-1-Y	Boeing	ST2220-1-58	Boeing

Refer to Figure 2.

- (1) Make a selection of a crimp tool from Table 5.
- (2) Remove 0.35 inch ±0.03 inch of insulation from the end of the wire.
- (3) In this sequence, put these components on the wire:
 - The slip spring
 - The gland nut
 - The crimp sleeve
 - The spacer.
- (4) Put the insulator on the wire.
Make sure that it is against the wire insulation.
- (5) Put the contact in the tool.
- (6) Hold the tool with the crimp barrel of the contact pointed up.
- (7) Push the wire into the crimp barrel of the contact until the end of the wire is against the bottom of the crimp barrel.
- (8) Crimp the contact.

C. Connector Assembly

**Table 6
NECESSARY TOOLS**

Tool	Part Number
Pliers	ST2598C
Torque Adapter	ST2575

Refer to Figure 2.

- (1) Make a selection of a torque adapter from Table 6.
- (2) Make a selection of a pair of pliers from Table 6.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF WALTER KIDDE CONNECTORS**

- (3) Make a selection of a cement from Table 4.
- (4) For protection for the pin to shell seal surface when the gland nut is torqued, make a selection of a washer from Table 4.

NOTE: An equivalent washer is a satisfactory alternative.

- (5) Put the coupling nut on the end of the shell that has threads.
- (6) Put a small quantity of cement on the first three threads of the shell.
- (7) Put the front insulator and the rear insulator into the shell.
Make sure that the flange of the contact is aligned correctly in the counterbore of the rear insulator.
- (8) Push the wired contact into the rear insulator.
- (9) Fill the space at the end of the insulator in the shell with the cement.
- (10) Move the spacer forward.
- (11) Push the gland nut on the sleeve.
Make sure it is against the shell.
- (12) Tighten the gland nut:
 - (a) Fully engage the threads of the gland nut with the threads of the shell.
 - (b) Put the washer on the shell.
 - (c) Fully engage the threads of the torque adapter with the threads of the shell.
 - (d) Torque the adapter to the shell 32 inch-pounds to 38 inch-pounds.
 - (e) Put the pliers on the gland nut.
 - (f) Torque the gland nut 12 inch-pounds to 18 inch-pounds.
- (13) Remove the washer and the unwanted cement.
- (14) Turn the spring on the crimp sleeve until it is against the gland nut.
- (15) Put a dust cap on the end of the shell.
- (16) Cure the Sauereisen cement a minimum of 18 hours at 70 degrees F.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The connector can be installed before the cement fully cures.

4. ASSEMBLY OF WALTER KIDDE 875564 AND 876288 CONNECTORS WITH ROCKBESTOS H22-4000 AWG 18 WIRE

NOTE: These alternatives are permitted:

- The 877535 connector for the 876288 connector
- The 877536 connector for the 875564 connector.

Refer to Paragraph 7. for the procedure to assemble the Walter Kidde 877535 and 877536 connectors with Rockbestos H22-4000 AWG 18 wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

A. Connector Description

WALTER KIDDE 875564 AND 876288 CONNECTORS
Figure 3

B. Contact Assembly

Table 7
CONTACT CRIMP TOOLS

Contact	Crimp Tool

	MS3191A	QPL	3630-4	Astro
	ST2220-1-Y	Boeing	3630-4	Buchanan
			ST2220-1-58	Boeing

Refer to Figure 3.

- (1) Make a selection of a 1/8 inch diameter heat shrinkable sleeve from Table 4.
- (2) Make a selection of a 1/4 inch diameter heat shrinkable sleeve from Table 4.
- (3) Make a selection of a crimp tool from Table 7.
- (4) Prepare the wire. Refer to Figure 4.

WIRE TRIM DIMENSIONS
Figure 4

- (a) Remove 1.38 inches ± 0.06 inch of the outer braid from the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

- (b) Remove 1.38 inches ± 0.06 inch of the Teflon tape from the wire.
 - CAUTION:** DO NOT CUT THE DIELECTRIC MATERIAL.
- (c) Remove 0.35 inch ± 0.03 inch of the dielectric from the end of the wire.
- (d) Put a 1 inch ± 0.06 inch length of 1/8 inch diameter heat shrinkable sleeve on the dielectric. Make sure that the end of the sleeve is against the end of the braid.
- (e) Shrink the sleeve in its position. Refer to Subject 20-10-14.
- (5) In this sequence, put these components on the wire:
 - A 1 inch ± 0.06 inch length of 1/4 inch diameter heat shrinkable sleeve
 - The slip spring
 - The gland nut
 - The crimp sleeve
 - The spacer.
- (6) Put the insulator on the wire. Make sure that it is against the wire insulation.
- (7) Put the contact in the tool.
- (8) Hold the tool with the crimp barrel of the contact pointed up.
- (9) Push the wire into the crimp barrel of the contact until the end of the wire is against the bottom of the crimp barrel.
- (10) Crimp the contact.

C. Connector Assembly

**Table 8
NECESSARY TOOLS**

Tool	Part Number
Pliers	ST2598C
Torque Adapter	ST2575

Refer to Figure 3.

- (1) Make a selection of a torque adapter from Table 8.
- (2) Make a selection of a pair of pliers from Table 6.
- (3) Make a selection of a cement from Table 4.
- (4) For protection for the pin to shell seal surface when the gland nut is torqued, make a selection of a washer from Table 4.

NOTE: An equivalent washer is a satisfactory alternative.

- (5) Put the coupling nut on the end of the shell that has threads.
- (6) Put a small quantity of cement on the first three threads of the shell.
- (7) Put the front insulator and the rear insulator into the shell. Make sure that the flange of the contact is aligned correctly in the counterbore of the rear insulator.
- (8) Push the wired contact into the rear insulator.
- (9) Fill the space at the end of the insulator in the shell with the cement.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

- (10) Move the spacer forward.
- (11) Push the gland nut on the sleeve.
Make sure that it is against the shell.
- (12) Tighten the gland nut:
 - (a) Fully engage the threads of the gland nut with the threads of the shell.
 - (b) Put the washer on the shell.
 - (c) Fully engage the threads of the torque adapter with the threads of the shell.
 - (d) Torque the adapter to the shell 32 inch-pounds to 38 inch-pounds.
 - (e) Put the pliers on the gland nut.
 - (f) Torque the gland nut 12 inch-pounds to 18 inch-pounds.
- (13) Remove the washer and unwanted cement.
- (14) Push the 1 inch length of 1/4 inch diameter heat shrinkable sleeve to the connector until the end of the sleeve is against the end of crimp sleeve.
- (15) Shrink the sleeve in its position. Refer to Subject 20-10-14.
- (16) Turn the spring on the crimp sleeve until it is against the gland nut.
- (17) Put a dust cap on the end of the shell.
- (18) Cure the Sauereisen cement a minimum of 18 hours at 70 degrees F.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The connector can be installed before the cement fully cures.

5. ASSEMBLY OF WALTER KIDDE 876633 AND 876635 CONNECTORS

This paragraph gives the procedures to assemble the connectors with these wires:

- Boeing 10-60816-17
- Filotex TMF
- Haveg 24-00033.

A. Connector Description

WALTER KIDDE 876633 AND 876635 CONNECTORS

Figure 5

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

B. Contact Assembly

**Table 9
CONTACT CRIMP TOOLS**

Contact	Crimp Tool					
	Basic Unit			Locator		
	Part Number	Setting	Supplier	Part Number	Color	Supplier
Pin	M22520-1-01	6	QPL	56-302	Red	Balmar
				TH302	Red	Daniels
	ST2220-1-Y	-	Boeing	3630-2	-	Astro
				3630-2	-	Buchanan
Socket	M22520-1-01	6	QPL	56-302	Red	Balmar
				TH302	Red	Daniels
	ST2220-1-Y	-	Boeing	3630-4	-	Astro
				3630-4	-	Buchanan

Refer to Figure 5.

- (1) Make a selection of heat shrinkable tube from Table 4.
- (2) Make a selection of a crimp tool from Table 9.
- (3) Prepare the wire.

CAUTION: DO NOT CUT OR CAUSE DAMAGE TO:

- THE RUBBER TAPE
- THE GLASS WRAPPED LAYER.

- (a) Remove 1.50 inches \pm 0.06 inch of the jacket from the wire.
 - (b) Remove 1.50 inches \pm 0.06 inch of the Teflon tapes from the wire.
 - (c) Remove 1.50 inches \pm 0.06 inch of the braid from the wire.
 - (d) Put a 1.13 inch \pm 0.06 inch length of 0.13 inch diameter heat shrinkable tube on the wire.
 - (e) Move the inner and the outer layers of the sleeve until the ends of the sleeve are against the end of outer jacket.
 - (f) Shrink the sleeve in its position. Refer to Subject 20-10-14.
Make sure to use a heat source of 750 degrees F to shrink the tube.
- (4) Remove 0.35 inch \pm 0.03 inch of insulation from the end of the wire.
 - (5) In this sequence, put these components on the wire:
 - A 0.75 inch \pm 0.10 inch length of 0.35 inch diameter heat shrinkable tube
 - A 0.75 inch \pm 0.10 inch length of 0.19 inch diameter heat shrinkable tube
 - A 1.25 inch \pm 0.10 inch length of 0.13 inch diameter heat shrinkable tube.
 - The sleeve
 - The insulator.

The spring can be discarded; it is not used.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF WALTER KIDDE CONNECTORS**

- (6) Push the wire into the crimp barrel of the contact until the end of the wire is against the bottom of the crimp barrel.
- (7) Crimp the contact.

C. Connector Assembly

Refer to Figure 5.

- (1) Make a selection of a cement from Table 4.
- (2) Apply a small quantity of cement around the bare wire where the wire goes in the crimp barrel of the contact.

CAUTION: DO NOT APPLY THE CEMENT TO THE CONTACT FARTHER THAN THE FLANGE OF THE CONTACT.

- (3) Hold the sleeve and the insulator away from the shell.
- (4) Push the contact into the shell until the contact is fully inserted.
- (5) Hold the contact in position.
- (6) Use a syringe to fill the rear of the shell with the cement.
- (7) Push the insulator into the shell.
- (8) Push the sleeve against the shell.
- (9) Turn the sleeve counterclockwise until the threads of the sleeve engage the threads of the shell.

Make sure that:

- The contact does not move backward
- The shell and the wire do not turn.

- (10) Tighten the sleeve with the hand.
Make sure that the center contact is centered in the connector shell.
- (11) Remove the unwanted cement.
- (12) Push the 0.13 inch diameter tube forward until the end of the tube is against the flare on connector sleeve.
- (13) Shrink the tube in its position. Refer to Subject 20-10-14.
- (14) Push the 0.19 inch diameter tube on the flare on the connector sleeve until the end of the tube is against the connector shell.
- (15) Shrink the tube in its position. Refer to Subject 20-10-14.
- (16) Push the 0.35 inch diameter tube on the connector shell until the end of the tube is against retainer ring of the coupling nut.
- (17) Shrink the tube in its position. Refer to Subject 20-10-14.
- (18) Put a dust cap on the end of the shell.
- (19) Attach the Walter Kidde 241833 envelope that contains the Walter Kidde 209592 seal gaskets to the connector with the tie material. Refer to Subject 20-10-11 for the procedure to assemble a wire harness tie.
- (20) Cure the Sauereisen cement a minimum of 18 hours at 70 degrees F.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The connector can be installed before the cement fully cures.

D. Connector Installation

- (1) Install one gasket when the plug is attached to the sensor element. Refer to the instructions on the Walter Kidde 241833 envelope.

NOTE: When the plug is disconnected from the receptacle, it is necessary to install a new gasket before the plug and the receptacle are attached again.

- (2) When it is necessary, attach more gaskets to the cable assembly with a Temperature Grade D tie material. Refer to Subject 20-10-11 for the procedure to assemble a wire harness tie.

Make sure that the tie material is Temperature Grade D material.

6. ASSEMBLY OF WALTER KIDDE 876633 AND 876635 CONNECTORS ON ROLLS-ROYCE WIRE HARNESSSES

NOTE: The data in this paragraph is supplied to Boeing by Rolls-Royce.

A. Connector Description

WALTER KIDDE 876633 AND 876635 CONNECTORS

Figure 6

B. Contact Assembly

	MS3191A	QPL	-	-	3630-4	Astro
			-	-	3630-4	Buchanan

Refer to Figure 6.

- (1) Make a selection of a crimp tool from Table 10.
- (2) Remove 0.25 inch \pm 0.03 inch of the insulation from the end of the wire.
- (3) In this sequence, put these components on the wire:
 - The spring
 - The crimp sleeve
 - The insulator.
- (4) Push the wire into the crimp barrel of the contact until the end of the wire is against the bottom of the crimp barrel.
- (5) Crimp the contact.

C. Connector Assembly

**Table 11
CRIMP SLEEVE CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	614499	Astro
612648	Buchanan	614499	Buchanan
M22520/5-01	QPL	M22520/5-37	QPL
HX4	Daniels	Y715	Daniels

Refer to Figure 6.

- (1) Make a selection of a cement from Table 4.
- (2) Make a selection of a crimp tool from Table 11.
- (3) Put a small quantity of cement on the first three threads of the crimp sleeve.
- (4) Push the contact into the shell.
Make sure that the flange of the contact is aligned correctly in the counterbore of the insulator.
- (5) Push the crimp sleeve forward into the shell.
- (6) Turn the sleeve counterclockwise until it is tight.

CAUTION: DO NOT USE A PAIR OF PLIERS TO TURN THE CRIMP SLEEVE.

- (7) Crimp the sleeve.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

- (8) Push the spring to the connector until it is against the flared end of the crimp sleeve.
- (9) Turn the spring counterclockwise on the end of the sleeve until the end of the spring is against the shell.

NOTE: Some force can be necessary to start the first coil of the spring on the flared end of the crimp sleeve.

- (10) Put a dust cap on the end of the shell.
- (11) Cure the Sauereisen cement a minimum of 18 hours at 70 degrees F.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The connector can be installed before the cement fully cures.

7. ASSEMBLY OF WALTER KIDDE 877535 AND 877536 CONNECTORS WITH ROCKBESTOS H22-4000 AND BMS 13-55 AWG 18 WIRE

A. Connector Description

WALTER KIDDE 877535 AND 877536 CONNECTORS
Figure 7

B. Contact Assembly

Table 12
CONTACT CRIMP TOOLS

Contact	Crimp Tool			
	Basic Unit		Locator	
	Part Number	Supplier	Part Number	Supplier
Pin	ST2220-1-Y	Boeing	ST2220-1-33	Boeing
Socket	ST2220-1-Y	Boeing	ST2220-1-58	Boeing
			ST2220-1-30	Boeing

NOTE: The ST2220-1-58 locator is a modified ST2220-1-30 locator. A metal stop is used in the bottom of the contact cavity. The metal stop has these dimensions:

- A diameter of 0.125 inch to 0.140 inch
- A thickness of 0.035 inch to 0.045 inch.

Refer to Figure 7.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

- (1) Make a selection of a 1/4 inch diameter heat shrinkable sleeve from Table 4.
- (2) Make a selection of a crimp tool from Table 7.
- (3) In this sequence, put these components on the wire:
 - The slip spring
 - The crimp sleeve.
- (4) Remove 0.35 inch \pm 0.03 inch of the insulation from the end of the wire.
- (5) For Rockbestos H22-4000 wire, put a 1.50 inch \pm 0.06 inch length of 1/4 inch diameter heat shrinkable sleeve on the wire.
- (6) For BMS 13-55 wire, put four 1.50 inch \pm 0.06 inch lengths of 1/4 inch diameter heat shrinkable sleeve on the wire.
- (7) Put the insulator on the wire.
Make sure that the end of the insulator is against the wire insulation.
- (8) Put the contact in the tool.
- (9) Hold the tool with the crimp barrel of the contact pointed up.
- (10) Push the wire into the crimp barrel of the contact until the end of the wire is against the bottom.
- (11) Crimp the contact.

C. Connector Assembly

**Table 13
CRIMP SLEEVE CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	616229	Astro
612648	Buchanan	616229	Buchanan
612648	Buchanan	ST965-4	Boeing

Refer to Figure 7.

- (1) Make a selection of a cement from Table 4.
- (2) Make a selection of a hex crimp tool from Table 13.
- (3) Put a small quantity of the cement around the wire where the wire goes into the insulator.
- (4) Push the contact into the shell.
Make sure that the flange of the contact is aligned correctly in the counterbore of the insulator.
- (5) Put a small quantity of the cement on the first three threads of the crimp sleeve.
- (6) Push the crimp sleeve forward into the shell.
- (7) Turn the sleeve counterclockwise until it is tight.

CAUTION: DO NOT USE A PAIR OF PLIERS TO TURN THE CRIMP SLEEVE.

Make sure that the end of the sleeve that has threads aligns correctly with the rear face of the shell.

- (8) Crimp the sleeve on the wire.

Make sure that the distance across the hex crimp flats is approximately 0.175 inch to 0.181 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

- (9) For Rockbestos H22-4000 wire:
 - (a) Move the 1.50 inch length of heat shrinkable sleeve until the end of the sleeve is against the edge of the crimp sleeve.
 - (b) Shrink the sleeve in its position. Refer to Subject 20-10-14.
 - (10) For BMS 13-55 wire:
 - (a) Move one of the 1.50 inch length of heat shrinkable sleeves until the end of the sleeve is against the edge of the crimp sleeve.
 - (b) Shrink the sleeve in its position. Refer to Subject 20-10-14.
 - (c) Do Step (a) and Step (b) for the remaining sleeves.
 - (11) Push the spring to the connector until it is against the flared end of the crimp sleeve.
 - (12) Turn the spring counterclockwise on the end of the sleeve until the end of the spring is against the shell.
- NOTE:** Some force can be necessary to start the first coil of the spring on the flared end of the crimp sleeve.
- (13) Put a dust cap on the end of the shell.
 - (14) Cure the Sauereisen cement a minimum of 18 hours at 70 degrees F.

CAUTION: THE CONNECTOR IS NOT SERVICEABLE UNTIL THE CEMENT FULLY CURES. IN FLIGHT, TEMPERATURES HIGHER THAN 180 DEGREES F AND HIGH VIBRATIONS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

NOTE: The connector can be installed before the cement fully cures.

8. ASSEMBLY OF WALTER KIDDE 878238-() AND 878239-() CONNECTORS

This paragraph give the procedures to assemble the connectors with AWG 18 and AWG 16 wire with an O.D. of:

- 0.096 inch minimum
- 0.160 inch maximum.

A. Connector Description

WALTER KIDDE 878238-() AND 878239-() CONNECTORS
Figure 8

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

B. Wire Preparation

- (1) Make a selection of a 1/8 inch diameter heat shrinkable sleeve from Table 4.
- (2) Remove 0.31 inch \pm 0.02 inch of insulation from the end of the wire.
- (3) For wire with an O.D. between 0.096 inch and 0.126 inch, increase the O.D. of the wire:
 - (a) Put a 1 inch length of 1/8 inch diameter heat shrinkable sleeve on the wire.
 - (b) Align the end of the sleeve with the end of the wire insulation.
 - (c) Shrink the sleeve in its position. Refer to Subject 20-10-14.

C. Contact Assembly

**Table 14
CONTACT CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	620770	Astro
612648	Buchanan	620770	Buchanan
HX4	Daniels	Y715	Daniels
M22520/5-01	QPL	Y715	Daniels

Refer to Figure 8.

- (1) Make a selection of a contact crimp tool from Table 14.
- (2) Put the grommet on the wire.
- (3) Put the nut on the header.
- (4) Push the wire into the contact until the wire insulation is against the crimp barrel.
- (5) Crimp the contact.

Make sure that the tool is against the ceramic face of the backshell.

NOTE: The contact is crimped through the slots in the backshell of the header.

D. Connector Assembly

**Table 15
BACKSHELL CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	620963	Astro
612648	Buchanan	620963	Buchanan
HX4	Daniels	Y715	Daniels
M22520/5-01	QPL	Y715	Daniels

Refer to Figure 8.

- (1) Make a selection of a crimp tool from Table 15.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF WALTER KIDDE CONNECTORS**

- (2) Push the grommet forward into the backshell of the header until the face of the grommet flange is against the end of the backshell.
- (3) Crimp the backshell down into the V groove of the grommet. Refer to Figure 9.

Make sure that:

- The flange of the grommet is fully against the end of the backshell
- The flange of the grommet is against the front face of the hex die
- A side of the backshell with a slot is pointed to the part of the die that moves.

POSITION THE BACKSHELL IN THE CRIMP TOOL
Figure 9

- (4) Put a dust cap on the end of the shell.

E. Connector Installation

- (1) Make a selection of a silicone grease from Table 4.
- (2) Put a light, smooth layer of the grease on the copper seal gasket that is in the coupling nut.

CAUTION: DO NOT APPLY GREASE ON THE CONTACT. THE GREASE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (3) Connect the plug with the receptacle.
- (4) Torque the coupling nut of the plug 50 inch-pounds to 60 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

9. ASSEMBLY OF WALTER KIDDE 878550-() AND 878551-() CONNECTORS

This paragraph give the procedures to assemble the connectors with AWG 18 and AWG 16 wire with an O.D. of:

- 0.15 inch minimum
- 0.17 inch maximum.

A. Connector Description

WALTER KIDDE 878550-() AND 878551-() CONNECTORS
Figure 10

B. Contact Assembly

Table 16
CONTACT CRIMP TOOLS

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	620770	Astro
612648	Buchanan	620770	Buchanan
HX4	Daniels	Y715	Daniels
M22520/5-01	QPL	Y715	Daniels

Refer to Figure 10.

- (1) Make a selection of a contact crimp tool from Table 16.
- (2) Remove 0.31 inch \pm 0.02 inch of insulation from the end of the wire.
- (3) Put the grommet on the wire.
- (4) Slide the nut forward on the connector assembly.
- (5) Push the wire into the contact until the wire insulation is against the contact crimp barrel.
- (6) Crimp the contact.

Make sure that the tool is against the ceramic face of the backshell.

NOTE: The contact is crimped through the slots in the backshell of the header.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

C. Connector Assembly

**Table 17
BACKSHELL CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
612648	Astro	620784	Astro
612648	Buchanan	620784	Buchanan
HX4	Daniels	Y715	Daniels
M22520/5-01	QPL	Y715	Daniels

Refer to Figure 10.

- (1) Make a selection of a crimp tool from Table 17.
- (2) Push the grommet forward into the backshell of the header until the face of the grommet flange is against the end of the backshell.
- (3) Crimp the backshell down into the V groove of the grommet. Refer to Figure 11.

Make sure that:

- The flange of the grommet is fully against the end of the backshell
- The flange of the grommet is against the front face of the hex die
- A side of the backshell with a slot is pointed to the part of the die that moves.

POSITION THE BACKSHELL IN THE CRIMP TOOL

Figure 11

- (4) Put a dust cap on the end of the shell.

D. Connector Installation

- (1) Make a selection of a silicone grease from Table 4.
- (2) Put a light, smooth layer of the grease on the copper seal gasket that is in the coupling nut.

CAUTION: DO NOT APPLY GREASE ON THE CONTACT. THE GREASE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (3) Connect the plug with the receptacle.
- (4) Torque the coupling nut of the plug 50 inch-pounds to 60 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

10. ASSEMBLY OF WALTER KIDDE 878581-01, 878582-01, AND 878598-01 CONNECTORS

This paragraph gives the procedures to assemble the connectors with these wires:

- BMS 13-8 Type 1 Class A AWG 18
- Champlain 24-00033
- Filotex TMF.

A. Contact Assembly

**Table 18
CONTACT CRIMP TOOLS**

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
M22910/7-1	QPL	620770	Astro
		620770	Buchanan
M22520/5-01	QPL	620770	Astro
		620770	Buchanan

- (1) Make a selection of a crimp tool from Table 18.
- (2) If the wire has a braided jacket, cut the end of the wire at an angle to make the installation of the Teflon grommet easier.
- (3) Put the Teflon grommet on the wire.
Make sure to put the large end of the grommet on the wire first.
- (4) If the wire was cut at an angle, cut the wire to make the end of the wire perpendicular to its longitudinal axis.
- (5) Remove 0.31 inch ±0.02 inch of the insulation from the end of the wire.
- (6) Put the coupling nut on the wire.
Make sure that the end of the nut that has threads points to the bare end of the wire.
- (7) Put the body of the connector in the die of the crimp tool. Refer to Figure 12.
Make sure that:
 - The point of each anvil goes into the slots in the backshell
 - The top of each anvil is against the ceramic body.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

POSITION OF THE CONNECTOR BODY IN THE CRIMP TOOL
Figure 12

- (8) Lightly close the handles of the tool to the distance that is sufficient to hold the connector in position. Make sure that the anvils start to close around the crimp barrel of the contact.
- (9) Push the bare end of the wire into the crimp barrel of the contact.
- (10) Crimp the contact.
 Make sure that all of the strands of the conductor are in the crimp barrel.

B. Connector Assembly

Table 19
BACKSHELL CRIMP TOOLS

Basic Unit		Die	
Part Number	Supplier	Part Number	Supplier
M22910/7-1	QPL	620963	Astro
		620963	Buchanan

- (1) Make a selection of a crimp tool from Table 19.
- (2) Push the coupling nut on the connector body.
- (3) Push the Teflon grommet into the connector shell.
- (4) Put the body of the connector in the die of the crimp tool. Refer to Figure 13.

Make sure that:

- The flange of the grommet is fully against the end of the backshell
- The flange of the grommet is against the front face of the hex die
- A side of the backshell with a slot is pointed to the part of the die that moves.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WALTER KIDDE CONNECTORS

CONNECTOR SHELL CRIMP
Figure 13

- (5) Crimp the backshell.
- (6) Put a dust cap on the end of the shell.

20-62-17 CONTENTS

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

This Subject gives the procedure to assemble the connectors with BMS 13-8 wire.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Supplier
1039	Lindberg
2564-3	Lindberg
2564-4	Lindberg

2. ASSEMBLY OF THE LINDBERG 1039 CONNECTOR

This paragraph gives the procedure to assemble the connector with BMS 13-8 Type 3 Class A AWG 18 wire.

A. Wire Preparation

- (1) Remove 7/16 inch -0 inch, + 1/32 inch of the outer jacket. Refer to Figure 1.

**OUTER JACKET REMOVAL LENGTH
Figure 1**

- (2) If the outer diameter of the wire is less than 0.165 inch:
 - (a) Make a selection of a 3/4 inch Grade D Class 2 tape. Refer to Subject 20-00-11.
 - (b) Put a layer of tape on the end of the outer jacket so that the diameter of the wire is increased to 0.175 inch.
- (3) Put the inner ferrule on the wire. Refer to Figure 2.
If the inner ferrule cannot be put on the wire, remove the length of the outer jacket that is equal to length of the inner ferrule.

**POSITION OF THE INNER FERRULE
Figure 2**

- (4) Move the ferrule on the wire so that the end of the ferrule is aligned with the end of the outer jacket or the end of the tape.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

- (5) Fold the shield back so that the folded end of the shield is 3/8 inch -0 inch, + 1/32 inch from the end of the wire. Refer to Figure 3.

Make sure that the strands of the shield are not fully moved apart.

SHIELD AND INSULATION REMOVAL LENGTH

Figure 3

- (6) Remove 1/4 inch -0 inch, + 1/32 inch of the primary insulation. Refer to Figure 3.

B. Contact Assembly

**Table 2
CONTACT CRIMP TOOLS**

Basic Unit		Locator	
Part Number	Supplier	Part Number	Supplier
MS3191-1	QPL	3242	Buchanan

CONTACT ASSEMBLY

Figure 4

- (1) Make a selection of a contact crimp tool from Table 2.
- (2) Put the contact in the crimp tool.
- (3) Put the wire in the crimp barrel of the contact so that the wire touches the bottom. Refer to Figure 4.
- (4) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

C. Connector Assembly

**Table 3
FERRULE CRIMP TOOLS**

Ferrule	Crimp Tool			
	Basic Unit		Die	
	Part Number	Supplier	Part Number	Supplier
Outer	WT201-03-10	Thomas & Betts	WT209	Thomas & Betts
			WT210	Thomas & Betts
	ST965-4	Boeing	WT209	Thomas & Betts
			WT210	Thomas & Betts
Inner	WT201-03-10	Thomas & Betts	WT203	Thomas & Betts
	ST965-4	Boeing		

- (1) Make a selection of an outer ferrule crimp tool from Table 3.
- (2) Make a selection of an inner ferrule crimp tool from Table 3.
- (3) Put the retainer nut on the wire so that:
 - The the large thread end of the retainer nut is pointed toward the end of the wire
 - The retainer nut is over the inner ferrule.

Refer to Figure 5.

**POSITION OF THE OUTER FERRULE
Figure 5**

- (4) Put the outer ferrule on the wire so that the end of the inner ferrule is 1/16 inch -0 inch, + 1/32 inch beyond the end of the outer ferrule.
- (5) Crimp the outer ferrule.
- (6) Crimp the inner ferrule on the end that points toward the end of the wire.
- (7) Assembly the remaining components of the connector. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

LINDBERG 1039 CONNECTOR
Figure 6

- (a) Put the socket contact in the end of the housing with the porcelain insulator and the shorter threads.
- (b) Put the wire retainer nut on the housing and tighten the nut.
- (c) Put the bushing in the housing.
- (d) Put the sensor retainer nut on the housing and tighten the nut.

D. Installation of the Lindberg Sensor

- (1) Remove these components from the connector assembly:
 - The sensor retainer nut
 - The bushing
 - The mounting nut.

Refer to Figure 6.

- (2) Put the connector housing in the mounting flange hole.
- (3) Put the mounting nut on the housing and tighten.
- (4) Install the sensor.
- (5) Put the sensor retainer nut on the sensor.
- (6) Open the slot in the bushing and push it over the Teflon insulated area of the sensor until the bushing is:
 - In the housing
 - Against the shoulder of the sensor.
- (7) Engage the threads of the sensor retainer nut and the housing and tighten.
- (8) Install lockwire on the connector.

3. ASSEMBLY OF THE LINDBERG 2564-3 AND 2564-4 CONNECTORS

This paragraph gives the procedure to assemble the connector with BMS 13-8 Type 1 Class A AWG 18 wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

A. Contact Assembly

**Table 4
CONTACT CRIMP TOOLS**

Basic Unit		Locator	
Part Number	Supplier	Part Number	Supplier
MS3191-1	QPL	5004-1	Buchanan
		11-7771-23	Bendix

- (1) Put the wire through the connector housing assembly.
- (2) Remove 9/32 inch \pm 1/32 inch of the wire insulation. Refer to Figure 7.

**INSULATION REMOVAL LENGTH
Figure 7**

- (3) Make a selection of a contact crimp tool from Table 4.
- (4) Put the contact in the crimp tool.
- (5) Put the wire in the crimp barrel of the contact so that the wire touches the bottom.
- (6) Crimp the contact.

B. Connector Assembly

Refer to Figure 8.

**Table 5
FERRULE CRIMP TOOLS**

Basic Unit		Locator	
Part Number	Supplier	Part Number	Supplier
WT201-03-10	Thomas & Betts	CTR	Thomas & Betts

**POSITION OF THE CONTACT AND LOCATION OF THE CRIMP
Figure 8**

- (1) Make a selection of a ferrule crimp tool from Table 5.
- (2) Pull the housing assembly toward the end of the wire until the end of the contact is 7/16 inch \pm 1/32 inch from the housing.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF LINDBERG 1039, 2564-3, AND 2564-4 CONNECTORS

- (3) Crimp the rear part of the housing assembly. Refer to Figure 8.

ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Supplier
169493	Wave Lab
400015	Wave Lab

2. ASSEMBLY OF THE WAVE LAB 169493 CONNECTOR

This paragraph gives the procedures to assemble the connector with BMS 13-18 Type 3 Class 2 AWG 20 wire.

A. Contact Assembly

**Table 2
CONTACT CRIMP TOOLS**

Basic Unit		Locator		
Part Number	Supplier	Part Number	Color	Supplier
MS3191-1	QPL	MS3191-20	Red	QPL

(1) Prepare the cable. Refer to Figure 1.

**CABLE PREPARATION
Figure 1**

- (a) Remove 9/16 inch ± 1/32 inch of the outer jacket from the end of the cable.
 - (b) Remove 3/8 inch ± 1/32 inch of the shield.
 - (c) Remove 1/4 inch ± 1/32 inch of the primary insulation from each wire.
- (2) Make a selection of a crimp tool from Table 2.
- (3) For each contact:
- (a) Put the wire in the crimp barrel of the contact.
 - (b) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS

B. Connector Assembly

WAVE LAB 169493 CONNECTOR
Figure 2

- (1) Put the fairlead on the cable so that the smaller end points toward the contacts. Refer to Figure 3.

POSITION OF THE FAIRLEAD AND THE COUPLING NUT
Figure 3

- (2) Put the coupling nut on the cable so that the threaded end points toward the contacts. Refer to Figure 3.
- (3) Put the front insulator on the contacts so that the flange of each contact is against the insulator. Refer to Figure 4.

POSITION OF THE INSULATORS
Figure 4

- (4) Put each half of the rear insulator on the crimp barrels of the contacts. Refer to Figure 2.
- (5) Push the shell onto the insulator so that the keyway of the shell is aligned with the key of the insulator. See Figure 5.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS

POSITION OF THE SHELL
Figure 5

- (6) Move the coupling nut toward the end of the wire so that the nut is against the shoulder of the shell.
- (7) Put the clamp on the shell so that:
 - The smaller end of the fairlead is held in the groove of the clamp
 - Each clamp pin is aligned with a hole of the shell.

Refer to Figure 6.

POSITION OF THE CLAMP
Figure 6

- (8) Engage the threads of the screws and the clamp.
- (9) Tighten the screws.
- (10) Install a lockwire on each screw.

3. ASSEMBLY OF THE WAVE LAB 400015 CONNECTOR

This paragraph gives the procedures to assemble the connector with a cable that has these properties:

- Shielded wire
- Twisted pair
- High temperature wire
- AWG 18 or AWG 20 wire.

A. Cable Preparation

- (1) Prepare the cable. Refer to Figure 7.

CABLE PREPARATION
Figure 7

- (a) Remove 9/16 inch \pm 1/32 inch of the outer jacket from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS

- (b) Remove 3/16 inch \pm 1/32 inch of the shield.
- (c) Remove 3/16 inch \pm 1/32 inch of the primary insulation from each wire.
- (2) In this order, put these components on the cable:
 - The nut
 - The washer.

Make sure that the end of the nut with the threads points toward the contacts. Refer to Figure 8.

POSITION OF THE NUT AND THE WASHER
Figure 8

B. Contact Assembly

Table 3
CONTACT CRIMP TOOLS

Basic Unit		Locator		
Part Number	Supplier	Part Number	Color	Supplier
MS3191-1	QPL	MS3191-20	Red	QPL

- (1) Make a selection of a crimp tool from Table 3.
- (2) For each contact:
 - (a) Put the wire in the crimp barrel of the contact.
 - (b) Crimp the contact.

C. Connector Assembly

WAVE LAB 400015 CONNECTOR
Figure 9

- (1) Put the clamp on the cable so that the forward edge of the clamp is 1/16 inch \pm 1/32 inch from the end of the shield. Refer to Figure 10.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF WAVE LAB 169493 AND 400015 CONNECTORS

POSITION OF THE SPLIT CLAMP

Figure 10

- (2) Hold the clamp in position with the washer.
- (3) At the end of the shield, move the strands of the shield apart.
- (4) Fold the strands of the shield back over the clamp so that they are even and symmetrical.
- (5) Put the second washer on the cable. Refer to Figure 9.
- (6) Put the insulator on the contact so that the flange of each contact is against the insulator.
- (7) Put each half of the split insulator on the crimp barrels of the contacts. Refer to Figure 11.

POSITION OF THE INSULATORS

Figure 11

- (8) Push the shell onto the insulator so that the keyway of the shell is aligned with the key of the insulator. Refer to Figure 12.

POSITION OF THE CONNECTOR SHELL

Figure 12

- (9) Engage the threads of the nut and the shell.
Make sure that the end of the shield is under the clamp.
- (10) Tighten the nut.
- (11) Install a lockwire on the nut and the shell.

2. CONNECTOR ASSEMBLY

A. Connector Assembly

**AN3115-1 PLUG CONNECTOR
Figure 1**

- (1) Assemble the contacts.
- (2) Put the wired contacts in one half of the connector body.
- (3) If a potting compound is specified:
 - (a) Make a selection of a potting compound from Table 2.
 - (b) Apply the necessary amount of potting compound to fill the cavity around the solder pot and wire insulation of each contact. Refer to Figure 1.

CAUTION: DO NOT PUT ANY POTTING COMPOUND BEYOND THE KNURLED AREA OF EACH CONTACT.

- (4) Install the other half of the connector body.
- (5) If necessary, add more potting compound fill the area around the wires at the body of the connector.

20-62-19

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3115 TYPE CONNECTORS

- (6) Let the potting compound cure.

2. CONNECTOR ASSEMBLY**A. Wire Harness Preparation**

- (1) Make a selection of a 0.75 inch diameter Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
- (2) Put a 30 inch \pm 1/4 inch length of the sleeve on the wire harness.
- (3) Put a 2 inch \pm 1/8 inch length of 1 inch diameter PD 70 heat shrinkable sleeve on the wire harness.
- (4) Put a 2 inch \pm 1/8 inch length of 1/2 inch diameter PD 70 heat shrinkable sleeve on the wire harness.
- (5) Put the specified adapter on the wire harness. Refer to Table 2.

B. Contact Assembly

Refer to Subject 20-61-11.

C. Spare Contact and Seal Plug Installation

Refer to Subject 20-61-11.

D. Connector Assembly

- (1) Engage the threads of the adapter and the connector.
- (2) Tighten the adapter.
- (3) Install the heat shrinkable sleeves. Refer to Figure 1.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AVIBANK AV667 AND AV697 CONNECTORS

POSITION OF THE HEAT SHRINKABLE SLEEVES

Figure 1

- (a) Push the length of the 1/2 inch diameter PD 70 sleeve forward until the end of the sleeve is against the rear of the adapter.
- (b) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (c) Push the length of the 1 inch diameter PD 70 sleeve forward until the end of the sleeve is aligned with the part of the adapter that has the largest diameter.
- (d) Shrink the sleeve into position. Refer to Subject 20-10-14.
- (e) Push the 30 inch sleeve on the PD 70 sleeves until the end of the sleeve is aligned with the end of the 1/2 inch diameter PD 70 sleeve.
- (f) Shrink only the end of the sleeve into position. Refer to Subject 20-10-14.
- (g) Assemble the necessary number of wire harness ties on the remaining length of the 30 inch sleeve to which no heat was applied.

NOTE: Drain holes in the 30 inch sleeve are not necessary.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE CINCH S345T002-156 CONNECTOR

This Subject gives the procedure to assemble the connector with Boeing 10-60875-8 cables with AWG 18 or AWG 20 wire.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

**Table 1
CONNECTOR PART NUMBERS**

Part Number	Supplier
S345T002-156	Cinch

B. Backshell Part Numbers

**Table 2
BACKSHELL PART NUMBERS**

Part Number	Supplier
50031004-001	Cinch

C. Necessary Materials

**Table 3
NECESSARY MATERIALS**

Material	Specification	Description	Supplier
Fuel Tank Sealant	BMS 5-26	Class B-2	Courtaulds Aerospace
Heat Shrinkable Sleeve	-	Grade B, Class 1	Refer to Subject 20-00-11.

2. CONNECTOR ASSEMBLY

A. Cable Preparation

- (1) Put the strain relief clamp on both cables.
- (2) Prepare each cable. Refer to Figure 1.

**CABLE PREPARATION
Figure 1**

- (a) Remove 3-3/8 inches \pm 5/16 inch of the outer jacket from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

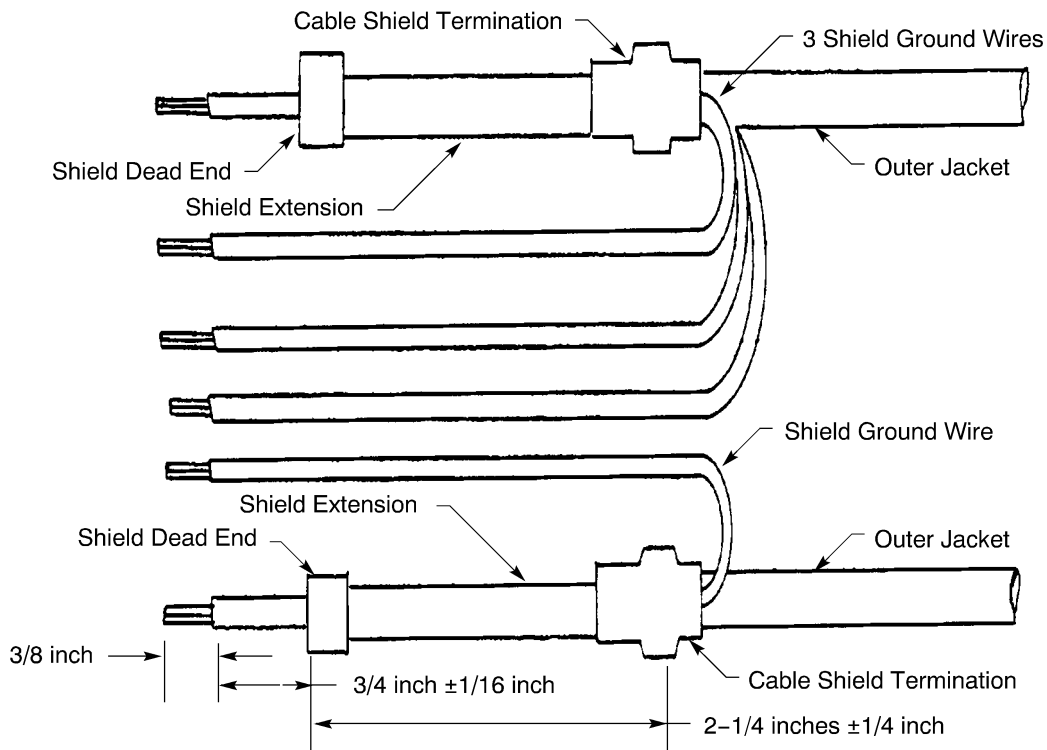

ASSEMBLY OF THE CINCH S345T002-156 CONNECTOR

- (b) Remove the necessary length of the shield so that the end of the shield is 5/8 inch or less from the end of the outer jacket.

CAUTION: MAKE SURE THAT DAMAGE TO THE PRIMARY INSULATION DOES NOT OCCUR.

- (c) Remove 3/8 inch of the primary insulation from the end of the cable.

B. Shield Ground Wire Assembly

CONFIGURATION OF THE SHIELD GROUND WIRES
Figure 2

- (1) Assemble a shield extension on each cable with:
 - 1 shield ground wire on one shield extension
 - 3 shield ground wires on the other shield extension.

Refer to Subject 20-10-15 and Figure 2.

Make sure that:

- The wires for the 4 ground wires are 8 inches in length
- The extension shields are 2-1/2 inches ± 1/4 inch in length
- The shield terminations are correctly insulated.

- (2) Assemble a shield dead end on the end of each cable.

Refer to Subject 20-10-15 and Figure 2.

Make sure that the shield dead end is correctly insulated.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE CINCH S345T002-156 CONNECTOR

C. Contact Assembly

- (1) Tin each conductor.
- (2) Solder each conductor in a connector pin. Refer to Subject 20-40-00.
- (3) Make a selection of a heat shrinkable sleeve from Table 3.
Make sure that the sleeve has the smallest diameter that can be moved over each cable.
- (4) Put a 1 inch \pm 1/8 inch length of the sleeve on each cable so that the center of the sleeve is aligned with the center of the soldered area.
- (5) Shrink each sleeve in position. Refer to Subject 20-10-14.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY TIME TO SHRINK THE SLEEVE.

D. Connector Assembly

CINCH S345T002-156 CONNECTOR ASSEMBLY
Figure 3

- (1) Make a selection of a heat shrinkable sleeve from Table 3.
Make sure that the sleeve has the smallest diameter that can be moved over each cable.
- (2) In this order, put these lengths of the sleeve on the two cables and all of the shielded ground wires:
 - Two 3/4 inch lengths
 - Two 1/2 inch lengths.
- (3) Put each contact into the applicable contact cavity of the connector.
- (4) Install the heat shrinkable sleeves at the installation location of the strain relief clamp:

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF THE CINCH S345T002-156 CONNECTOR

- (a) Move one 3/4 inch length of sleeve so that the center of the sleeve is aligned with the center of the clamp area on the bundle.
 - (b) Shrink the sleeve in position. Refer to Subject 20-00-14.
 - (c) Move the other 3/4 inch length of sleeve so that the center of the sleeve is aligned with the center of the clamp area on the bundle.
 - (d) Shrink the sleeve in position. Refer to Subject 20-00-14.
 - (e) Do Step (a) through Step (d) again for each 1/2 inch length of sleeve.
- (5) Make a selection of a fuel tank sealant from Table 3.
- (6) Fill the connector shell cavity with the sealant.
Make sure that the surface of the sealant is at or within 1/16 inch of the edge of the connector shell.
Refer to Figure 3.
- (7) Install the strain relief clamp.

2. ASSEMBLY OF AN3116-2 AND ITT CANNON CA270-8 CONNECTORS

A. Wire Preparation

- (1) Make a selection of a sleeve with a meltable inner liner from Table 2.
- (2) If the selection is the Raychem D415-00 sleeve, prepare the sleeve. Refer to Figure 6.

**PREPARATION OF A SLEEVE WITH A MELTABLE INNER LINER
Figure 6**

- (a) Remove the necessary length from one end of the outer sleeve to make the length of the sleeve equal to 1.56 inches ±0.06 inch.
- (b) Remove the necessary length from the end of the inner sleeve to make the length of the inner sleeve equal to 1.00 inch ±0.06 inch.
- (3) Put the sleeve on the wire.
Make sure that smaller end of the sleeve is pointed away from the end of the wire.
- (4) Prepare the wire. Refer to Figure 7.

**PREPARATION OF THE WIRE
Figure 7**

- (a) Remove 1.75 inches ±0.25 inch of the outer jacket from the end of the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

(b) Remove 0.13 inch \pm 0.03 inch of shield from the end of the wire.

B. Center Contact Assembly

- (1) Make a selection of an inner ferrule and an outer ferrule from Table 3.
- (2) Make a selection of a heat shrinkable sleeve from Table 2.
- (3) Make a selection of a solvent from Table 2.

NOTE: A satisfactory alternative is an equivalent solvent.

- (4) Remove the color band from each ferrule with solvent.
- (5) Install the ferrules. Refer to Figure 8.

**POSITION OF THE FERRULES AND HEAT SHRINKABLE SLEEVES
Figure 8**

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AN3116 TYPE CONNECTORS**

- (a) Make a selection of a ferrule crimp tool from Table 5.
- (b) Put the inner ferrule on the wire.
Make sure that:
 - The ferrule is on the shield
 - The forward end of the ferrule is 0.69 inch \pm 0.03 inch from the end of the wire.
- (c) Move the strands of the shield apart on the length of the shield that extends farther than the forward end of the inner ferrule.
- (d) Fold the strands back on the inner ferrule.
Make sure that the strands are even and symmetrical around the surface of the ferrule.
- (e) Put the outer ferrule on the inner ferrule.
Make sure that:
 - The strands of the shield are between the inner ferrule and the outer ferrule
 - The forward edge of the outer ferrule is aligned with the forward edge of the inner ferrule.
- (f) Crimp the outer ferrule.
- (g) Remove the unwanted strands of the shield at the rear end of the outer ferrule.
- (6) Install two 0.25 inch \pm 0.03 inch heat shrinkable sleeves on the wire. Refer to Figure 8.
 - (a) Put a heat shrinkable sleeve on the wire.
Make sure that:
 - The sleeve is on the wire insulation
 - The rear end of the sleeve is against the forward edge of the ferrules.
 - (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
 - (c) Do Step (a) and Step (b) again for the other sleeve.
- (7) Put the insert retainer tube on the wire.
Make sure that:
 - The tube is on the primary insulation and the heat shrinkable sleeves
 - The rear end of the tube is against the ferrules.
- (8) Apply a small amount of solder on the end of the conductor.
- (9) Apply a small amount of solder in the wire barrel of the contact.
- (10) Put the center contact on the conductor. Refer to Figure 9.

**POSITION OF THE CENTER CONTACT ON THE CONDUCTOR****Figure 9**

- (11) Solder the contact.

C. Connector Shell Installation

- (1) Push the contact insulator into the plug shell.
- (2) Engage the threads of the plug shell and the ferrule assembly nut.

20-62-22

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

- (3) Push the ferrule assembly forward until the rear end of the ferrule assembly is aligned with the rear end of the inner ferrule.
- (4) Solder the ends of:
 - The ferrule assembly
 - The inner ferrule
 - The shield.

Refer to Figure 10.

CAUTION: DO NOT APPLY SOLDER BETWEEN THE OUTER JACKET OF THE WIRE AND THE FERRULES.

LOCATION OF THE SOLDER ON THE FERRULE ASSEMBLY

Figure 10

- (5) Push the sleeve forward until the forward end of the sleeve extends 0.06 inch minimum farther than the end of the ferrule assembly. Refer to Figure 11.

POSITION OF THE SLEEVE ON THE FERRULE ASSEMBLY

Figure 11

- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (7) While the sleeve is hot, bend the wire near the rear end of the sleeve to make a 90 degree angle. Refer to Figure 12.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

LOCATION OF THE BEND OF THE WIRE
Figure 12

3. ASSEMBLY OF THE KINGS K-4932 CONNECTOR

A. Center Contact Assembly

Table 6
CENTER CONTACT CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
KTH-1000	KTH-2208	Small
KTM-3000	KTH-2208	Small

- (1) Make a selection of a contact crimp tool from Table 6.
- (2) Put the outer ferrule on the wire.
Make sure that the larger end of the outer ferrule is pointed forward to the end of the wire.
- (3) Prepare the wire.

Refer to:

- Figure 13
- Subject 20-00-15.

WIRE PREPARATION
Figure 13

- (a) Remove 0.60 inch \pm 0.02 inch of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield to make the distance from the end of the outer jacket to the end of the shield equal to 0.31 inch \pm 0.02 inch.

20-62-22

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

- (c) Remove 0.16 inch \pm 0.02 inch of the primary insulation from the end of the wire.
- (4) Move the strands of the shield apart.
- (5) Put the plastic insulation sleeve on the primary insulation.
Make sure that the rear end of the insulation sleeve is against the end of the outer jacket.
- (6) Put the end of the wire in the crimp barrel of the center contact. Refer to Figure 14.
Make sure that:
 - All the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole.

POSITION OF THE CENTER CONTACT ON THE WIRE
Figure 14

- (7) Crimp the contact.

B. Connector Shell Installation

Table 7
OUTER FERRULE CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
KTH-1000	KTH-2208	Large
KTM-3000	KTH-2208	Large

- (1) Make a selection of a ferrule crimp tool from Table 7.
- (2) Put the connector shell on the contact assembly. Refer to Figure 15.
Make sure that the inner ferrule is between the insulation sleeve and the shield.

ALIGNMENT OF THE INNER FERRULE AND THE SHIELD
Figure 15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

- (3) Push the connector shell rearward until the contact is locked in the shell.
- (4) Make the strands of the shield flat against the inner ferrule.
- (5) Push the outer ferrule forward until the forward end of the ferrule is against the shoulder of the connector shell. Refer to Figure 16.

POSITION OF THE OUTER FERRULE AGAINST THE CONNECTOR SHELL

Figure 16

- (6) Crimp the outer ferrule. Refer to Figure 16.

Make sure that:

- The larger part of the die cavity is on the larger end of the outer ferrule
- The smaller part of the die cavity is on the smaller end of the outer ferrule.

4. ASSEMBLY OF KINGS K-494() CONNECTORS

A. Center Contact Assembly

**Table 8
CENTER CONTACT CRIMP TOOLS**

Basic Unit	Die	
	Part Number	Cavity
KTH-1000	KTH-2223	Small
KTM-3000	KTH-2223	Small

- (1) Make a selection of a contact crimp tool from Table 8.
- (2) Make a selection of a heat shrinkable sleeve from Table 2.
- (3) Put a 1.50 inch \pm 0.30 inch length of heat shrinkable sleeve on the wire.
- (4) Put the outer ferrule on the wire.
Make sure that the larger end of the outer ferrule is pointed forward to the end of the wire.

- (5) Prepare the wire.

Refer to:

- Figure 17
- Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

WIRE PREPARATION

Figure 17

- (a) Remove 0.65 inch \pm 0.02 inch of the outer jacket from the end of the wire.
- (b) Remove the necessary length of the shield to make the distance from the end of the outer jacket to the end of the shield equal to 0.36 inch \pm 0.02 inch.
- (c) Remove 0.18 inch \pm 0.02 inch of the primary insulation from the end of the wire.
- (6) Move the strands of the shield apart.
- (7) Put the plastic insulation sleeve on the primary insulation.
Make sure that the rear end of the insulation sleeve is against the end of the outer jacket.
- (8) Put the end of the wire in the crimp barrel of the center contact. Refer to Figure 18.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole.

POSITION OF THE CENTER CONTACT ON THE WIRE

Figure 18

- (9) Crimp the contact.

B. Connector Shell Installation

**Table 9
OUTER FERRULE CRIMP TOOLS**

Basic Unit	Die	
	Part Number	Cavity
KTH-1000	KTH-2208	Large
KTM-3000	KTH-2208	Large

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AN3116 TYPE CONNECTORS

- (1) Make a selection of a ferrule crimp tool from Table 9.
- (2) Put the connector shell on the contact assembly. Refer to Figure 19.
Make sure that the inner ferrule is between the insulation sleeve and the shield.

ALIGNMENT OF THE INNER FERRULE AND THE SHIELD

Figure 19

- (3) Push the connector shell rearward until the contact is locked in the shell.
- (4) Make the strands of the shield flat against the inner ferrule.
- (5) Push the outer ferrule forward until the forward end of the ferrule is against the shoulder of the connector shell. Refer to Figure 20.

POSITION OF THE OUTER FERRULE AGAINST THE CONNECTOR SHELL

Figure 20

- (6) Crimp the outer ferrule. Refer to Figure 20.
Make sure that:
 - The larger part of the die cavity is on the larger end of the outer ferrule
 - The smaller part of the die cavity is on the smaller end of the outer ferrule.
- (7) Push the heat shrinkable sleeve forward until the forward end of the sleeve is against the ferrule shoulder. Refer to Figure 20.
- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

2. CONNECTOR DISASSEMBLY

A. Contact Removal

**CA-KR FIREWALL CONNECTOR DISASSEMBLY
Figure 2**

- (1) Loosen the cable clamp.
- (2) Unscrew the endbell.
- (3) Move the endbell and grommet follower back over the wires and, at the same time, push the insert assembly out of the shell. Refer to Figure 2.

NOTE: The endbell holds these parts in the connector shell:

- Grommet Follower
- Grommet
- Rear Insulator
- Front Insulator.

- (4) Remove the front insulator from the rear insulator.

NOTE: The front and the rear insulators hold the contacts.

- (5) Pull the contacts forward from the rear insulator.
- (6) Remove the ceramic retaining ring from the contact:
 - (a) Move the ring back against the silicone bushing.
 - (b) Pull the ring free when it is over the small diameter of the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON CA()KR FIREWALL CONNECTORS

(7) Pull the wired contact through these components:

- The rear insulator
- The grommet
- The grommet follower.

3. CONNECTOR ASSEMBLY

A. Contact Assembly

**Table 4
CONTACT CRIMP TOOLS**

Contact Size	Crimp Tool

CANNON CA-KR FIREWALL1 CONNECTOR ASSEMBLY

Figure 3

- (1) Put the cable clamp, the wire separator, the endbell, and the grommet follower on the wires.
- (2) Put the wires through the grommet and rear insulator.
Make sure the length is sufficient to allow the insulation removal and the crimp operations.
- (3) Remove a sufficient length of the wire insulation.
Make sure that:
 - The edge of the insulation is against the contact
 - The conductor is visible in the inspection hole.
- (4) Make a selection of the crimp tool from Table 4.
- (5) For AWG 2 wire:

STANDARD WIRING PRACTICES MANUAL

ITT CANNON CA()KR FIREWALL CONNECTORS

- (a) Put a 2-1/2 inch length of heat shrinkable sleeve over each wire.
- (b) Put the conductor into a crimp barrel adapter. Refer to Table 3.
- (c) Put the adapter and the conductor into the crimp barrel of the contact.
- (6) Crimp the contact.
- (7) For AWG 2 wire:
 - (a) Move the sleeve against the back of the contact.
 - (b) Shrink the sleeve in position.

B. Connector Assembly

- (1) Put the ceramic retaining ring on the small diameter of the contact.
- (2) Push the retaining ring forward until the ring is fully installed on the larger diameter of the contact.
- (3) Carefully pull each wire through the grommet so that:
 - The rear insulator is against the grommet
 - The retaining ring on the contact is fully inserted into the rear insulator.
- (4) Install the front insulator over the contacts:
 - (a) Align the keyways in the two insulators.
 - (b) Move the front insulator evenly over the contacts until it meets the rear insulator.
The front and the rear insulators hold the ceramic retaining rings on the contacts.
Align the slot in the grommet follower with the keyways of the front and the rear insulators.
- (5) Move the grommet follower over the grommet.
NOTE: The outer surface of the grommet follower can be lubricated with denatured alcohol to help move the grommet follower over the grommet.
- (6) Install the insulators in the shell:
 - (a) Align the keyways of the insulators with the key of the shell.
 - (b) Carefully push the assembly into the shell.
- (7) Connect the endbell to the shell.
- (8) Torque the endbell 90 inch-pounds ± 10 inch-pounds.
- (9) Move the cable clamp and wire separator forward.
- (10) Attach the cable clamp to the endbell.
- (11) Put approximately 12 layers of Scotch 61 tape under the clamp saddles.
- (12) Tighten the clamp screws.

C. Connector Installation

**Table 5
COUPLING RING TORQUE WRENCHES**

Part Number	Supplier
ST2580-148B	Boeing

- (1) Engage the plug connector threads with the receptacle connector threads.
- (2) Tighten the coupling ring with the hand.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

ITT CANNON CA()KR FIREWALL CONNECTORS

- (3) Make a selection of a torque wrench from Table 5.
- (4) For the shell size 36 connector, torque the coupling ring 190 inch-pounds \pm 10 inch-pounds.
- (5) Put a lockwire on the coupling ring. Refer to Subject 20-60-07.

20-62-26

ASSEMBLY OF CONNECTORS WITH REAR RELEASE CONTACTS

<u>Paragraph</u>	<u>Page</u>
1. <u>GENERAL DATA</u>	1
A. Connector Assembly	1
2. <u>CONNECTOR DISASSEMBLY</u>	1
A. Contact Removal	1
B. Contact Replacement	2

20-63-00 CONTENTS

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH REAR RELEASE CONTACTS**

This Subject gives the general maintenance data for the disassembly and assembly of connectors that have rear release contacts.

1. GENERAL DATA**A. Connector Assembly**

Most of the maintenance data for the assembly of connectors with front release contacts is satisfactory for the assembly of connectors with rear release contacts.

Refer to Subject 20-61-00.

2. CONNECTOR DISASSEMBLY**A. Contact Removal**

- (1) Make a selection of a contact removal tool. Refer to the applicable Subject for the connector.

WARNING: DO NOT USE A TOOL WITH A TIP THAT IS BENT OR BROKEN, OR THAT HAS A CRACK. A TOOL WITH DAMAGE CAN CAUSE INJURY TO PERSONNEL.

CAUTION: DO NOT USE A TOOL WITH A TIP THAT IS BENT OR BROKEN, OR THAT HAS A CRACK. A TOOL WITH DAMAGE CAN CAUSE DAMAGE TO THE GROMMET OR THE CONTACT RETENTION CLIPS OF THE CONNECTOR.

- (2) If it is necessary to make space for the removal of the contact:
 - (a) Loosen or remove the connector components.
 - (b) Remove wire harness ties or plastic straps near the rear end of the connector.
- (3) Put the wire into the slot of the tool.
- (4) Axially align the tool and the contact cavity.
- (5) Carefully push the tool into the contact cavity until it stops.

NOTE: If the O.D. of the wire is too large for the removal tool to go into the contact cavity, the contact must be replaced. Refer to Paragraph 2.B.

- (6) Carefully pull the wire and the tool out of the contact cavity at the same time.

CAUTION: THE WIRE AND THE REMOVAL TOOL MUST NOT BE PULLED WITH TOO MUCH FORCE. DAMAGE TO THE CONTACT RETENTION CLIPS IN THE CONTACT CAVITY CAN OCCUR.

- (7) If the removal tool does not release the contact from the contact cavity:
 - (a) Carefully pull the tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.

CAUTION: THE REMOVAL TOOL MUST BE REMOVED FROM THE CONTACT CAVITY WHEN THE TOOL IS TURNED. IF THE TOOL IS NOT REMOVED, DAMAGE TO THE RETENTION CLIPS IN THE CONTACT CAVITY CAN OCCUR.

- (c) Do Step (3) through Step (6) again.
- (d) If the removal tool does not release the contact from the contact cavity a second time, do Step (a) through Step (c) again.
- (e) If the removal tool does not release the contact from the contact cavity the third time, do Step (a) through Step (c) again.

20-63-00

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF CONNECTORS WITH REAR RELEASE CONTACTS**

- (f) If the removal tool does not release the contact from the contact cavity the fourth time, replace the contact. Refer to Paragraph 2.B.

B. Contact Replacement

This Paragraph gives the procedure to replace a contact that cannot be removed from a contact cavity.

- (1) Cut the wire approximately 0.25 inch from the rear face of the connector.
- (2) Remove the remaining insulation from the wire in the contact cavity with a pair of needle nose pliers.
- (3) Align the removal tool with the longitudinal axis of the contact cavity.
- (4) Carefully push the tool forward into the contact cavity until it stops.
- (5) Hold the end of the remaining wire with the needle nose pliers.
- (6) At the same time, pull the wire and the removal tool from the contact cavity.
- (7) If the removal tool does not release the contact from the contact cavity:
 - (a) Carefully pull the tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.

CAUTION: THE REMOVAL TOOL MUST BE REMOVED FROM THE CONTACT CAVITY WHEN THE TOOL IS TURNED. IF THE TOOL IS NOT REMOVED, DAMAGE TO THE RETENTION CLIPS IN THE CONTACT CAVITY CAN OCCUR.

- (c) Do Step (3) through Step (6) again.
- (8) Assemble a new contact on the end of the wire. Refer to the applicable Subject for the connector.

	NAS1664-12

- (1) Make a selection of a removal tool from Table 3.
- (2) Snap the tool onto the wire and slide the tool straight into the rear of the contact cavity over the rear of contact until the tool bottoms.

CAUTION: DO NOT ROTATE THE TOOL WHILE IT IS IN THE CONNECTOR GROMMET.

- (3) Hold the wire against the tool and pull both tool and wired contact straight out of the rear of the contact cavity.
- (4) If contact is not released:
 - (a) Remove the tool.
 - (b) Turn the tool a small amount.
 - (c) Do Step (2) and Step (3) again.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF DEUTSCH DL TYPE CONNECTORS

3. CONNECTOR ASSEMBLY

A. Contact Assembly

**Table 4
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool

12	12	M22520/1-01	8	M22520/1-02	Yellow

- (1) Remove the necessary length of insulation from the end of the wire:
 - (a) For size 20 contacts, remove $5/32 \pm 1/32$ inch of insulation.
 - (b) For size 16 and 12 contacts, remove $1/4 \pm 1/32$ inch of insulation.
- (2) Make a selection of a crimp tool from Table 4.
- (3) Insert the wire into the crimp barrel of the contact.
 Make sure that all of the conductor strands enter the barrel and that all of the strands are visible through the inspection hole.
- (4) With the contact shoulder seated in the locator and the wire bottomed in the contact, close the handles of the crimp tool until the ratchet releases.
- (5) Remove the wired contact from the crimp tool.

B. Contact Insertion

- (1) Before any contacts are inserted, thread the wire bundle through the rear end components of the connector.
- (2) Make a selection of an insertion tool from Table 5.
- (3) Place the insertion tool on the wire and slide the tool against the contact shoulder.
- (4) Insert the contact straight into the proper cavity until a slight click and resistance to further motion occur.

CAUTION: DO NOT ROTATE THE TOOL WHILE IT IS IN THE CONNECTOR GROMMET.

- (5) Carefully withdraw the tool straight out of the contact cavity.

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

3. INSERT CONFIGURATIONS

A. MIL-C-83723 Series III Type Connectors

NOTE: The insert configurations that are specified in Table 9 include the connector shell size as the first part of the configuration. Refer to Table 5 for the part number structure that is applicable for the connector.

NOTE: The contact cavity size that is specified in Table 9 is equivalent to the size of the engaging end of the contact.

**Table 9
CONNECTOR INSERT CONFIGURATIONS**

4. CONNECTOR DISASSEMBLY

A. Seal Plug and Seal Rod Removal

Table 10
NECESSARY TOOLS

Tool	Type
Pliers	Needle Nose

(1) Make a selection of a pliers from Table 10.

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

B. Contact Removal

This paragraph gives the procedure to remove a contact assembly from the connector. For the procedure to remove an unwired contact, refer to Paragraph 4.C.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

**Table 11
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool	Special Instructions
20	6500-001-20	-
	CIET-20	-
	M81969/14-11	-
	M83723/31-20	-

16	6500-001-16	-
	6500-037-016	-
	ATR 2112	For contacts assembled with Champlain 24-00034 wire
	CIET-16	Not applicable for contacts assembled with wire that has thick wall insulation
	M81969/14-03	-
	M83723/31-16	-
12	6500-001-12	-
	ATR 2112	For contacts assembled with Champlain 24-00034 wire
	CIET-12	-
	M81969/14-04	-
	M83723/31-12	-

- (1) Make a selection of the removal tool from Table 11.
- (2) Put the removal tool on the wire.
- (3) Axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops.

Make sure that the tool stays aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
 - (6) Pull the tool and the wire out from the contact cavity.
- Make sure that the tool stays aligned with the contact cavity.

C. Unwired Contact Removal

This paragraph gives the procedure to remove an unwired contact from the connector.

For the procedure to remove a contact assembly, refer to Paragraph 4.B.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS**

Table 12
CONTACT REMOVAL TOOLS

Crimp Barrel Size	Removal Tool
20	CET-20-24
16	CET-16-21
12	CET-12-16

- (1) Make a selection of a contact removal tool from Table 12.
- (2) Remove the seal plug from the contact cavity.
- (3) Axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops.

Make sure that:

- The end of the tool is between the contact cavity and the crimp barrel of the contact
- The tool stays aligned with the contact cavity
- Pressure is not applied on the plunger of the tool.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT APPLY PRESSURE ON THE PLUNGER OF THE TOOL WHEN THE TOOL IS IN THE CONTACT CAVITY. DAMAGE TO THE CONNECTOR CAN OCCUR.

- (5) Pull the tool and the contact out of the contact cavity.
Make sure that the tool stays aligned with the contact cavity.
- (6) Apply pressure on the plunger to eject the contact from the tool.

5. CONNECTOR ASSEMBLY

A. Wire Preparation

For the preparation of:

- Champlain 24-00033 and Champlain 24-00034 wire, refer to Paragraph 5.B.
 - Rockbestos or Cerro H22-4000 wire, refer to Paragraph 5.C.
 - Vibro-Meter 50-116-00 and Vibro-Meter 80-116-0() cable assembly wire, refer to Paragraph 5.D.
 - Specialty Cable 852-4985339 cable wire, refer to Paragraph 5.E.
- (1) Remove 0.25 inch \pm 0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 21
- Subject 20-00-15 for the insulation removal procedure.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

INSULATION REMOVAL LENGTH

Figure 21

- (2) Measure the O.D. of the wire.
- (3) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.

B. Preparation of Champlain 24-00033 and Champlain 24-00034 Wire

**Table 13
NECESSARY MATERIALS**

Material	Part Number	Size (inch)	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	3/16	Available source
	TFE 4X	3/16	Chemplast
	TFE 4X	3/16	Zeus Industrial Products

CHAMPLAIN 24-00033 AND CHAMPLAIN 24-00034 WIRE PREPARATION

Figure 22

Refer to Figure 22.

- (1) Make a selection of a heat shrinkable sleeve from Table 13.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Remove 1.50 inch \pm 0.03 inch of the outer jacket from the end of the wire. Refer to Subject 20-00-15.
- (3) Remove 1.50 inch \pm 0.03 inch of the layer of braid from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE RUBBER INSULATION LAYER. DAMAGE TO THE RUBBER INSULATION LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.25 inch \pm 0.03 inch of the rubber insulation layer from the end of the wire. Refer to Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

- (5) Remove 0.25 inch \pm 0.03 inch of the inner tape wrap from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) Put a 2.0 inch \pm 0.13 inch length of heat shrinkable sleeve on the wire.
- (7) Align the forward end of the sleeve and the end of the inner rubber layer.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the rubber insulation layer
- The distance from the forward end of the sleeve to the end of the rubber insulation layer is not more than 0.13 inch.

- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Preparation of Rockbestos or Cerro H22-4000 Wire

**Table 14
NECESSARY MATERIALS**

Material	Part Number	Size (inch)	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	1/4	Available source
	TFE 4X	1/4	Chemplast
	TFE 4X	1/4	Zeus Industrial Products

**ROCKBESTOS OR CERRO H22-4000 WIRE PREPARATION
Figure 23**

Refer to Figure 23.

- (1) Make a selection of a heat shrinkable sleeve from Table 14.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Remove 1.00 inch \pm 0.03 inch of the outer braid from the end of the wire. Refer to Subject 20-00-15.
- (3) Remove 1.00 inch \pm 0.03 inch of the clear inner wrap from the end of the wire. Refer to Subject 20-00-15.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

CAUTION: DO NOT CAUSE DAMAGE TO THE INNER INSULATION LAYER. DAMAGE TO THE INNER LAYER CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) Remove 0.25 inch \pm 0.03 inch of the inner insulation from the end of the wire. Refer to Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (5) Put a 1.5 inch to 2.5 inch length of heat shrinkable sleeve on the wire.
- (6) Align the forward end of the sleeve and the end of the inner insulation.

Make sure that:

- The forward end of the sleeve does not extend farther than the end of the inner insulation
 - The distance from the forward end of the sleeve to the end of the inner insulation is not more than 0.13 inch.
- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Preparation of Vibro-Meter 50-116-00 and Vibro-Meter 80-116-0() Cable Assembly Wire

**Table 15
NECESSARY MATERIALS**

Material	Part Number	Size (inch)	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	1/8	Available source
	TFE 4X	1/8	Chemplast
	TFE 4X	1/8	Zeus Industrial Products

- (1) Make a selection of a heat shrinkable sleeve from Table 15.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Remove a 1.5 inch \pm 0.03 inch length of these layers from the end of the cable:
 - The white outer jacket
 - The yellow polyimide layer
 - The shield
 - The outer layer of black graphite tape
 - The fiberglass binder and filler.
- (3) Remove 1.0 inch \pm 0.06 inch of the inner layer of black graphite tape from each wire.
- (4) Remove all of the carbon residue from the primary insulation of each wire with one or more of these cleaners:
 - A brush with a fiberglass eraser
 - A sandblaster
 - Acetone or an equivalent solvent; refer to Subject 20-00-11.
- (5) Assemble a shield dead end. Refer to Subject 20-10-15.
- (6) For each wire:
 - (a) Remove 0.5 inch \pm 0.03 inch of insulation from the end of the wire.
 - (b) Put the necessary length of heat shrinkable sleeve on the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

Make sure that:

- The rear end of the sleeve is aligned with the forward end of the shield dead end
- The forward end of the sleeve is aligned with the end of the insulation.

- (c) Shrink the sleeve into its position. Refer to Subject 20-10-14.
 (d) Fold the conductor back on itself.

NOTE: When the conductor is folded back on itself, the size of the conductor becomes AWG 18.

E. Preparation of Specialty Cable 852-4985339 Cable Wire

**Table 16
NECESSARY MATERIALS**

Material	Part Number	Size (inch)	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 2	1/8	Available source
	TFE 2X Standard Wall	1/8	Chemplast
	TFE 2X Standard Wall	1/8	Zeus Industrial Products

**SPECIALTY CABLE 852-4985339 WIRE PREPARATION
Figure 24**

Refer to Figure 24.

- (1) Make a selection of a heat shrinkable sleeve from Table 16.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (2) Remove 1.00 inch \pm 0.06 inch of the insulation from the end of the wire.
 (3) Put a 1.3 inch \pm 0.1 inch length of the heat shrinkable sleeve on the wire.

Make sure that:

- The distance from the forward end of the sleeve to the end of the conductor is 0.25 inch \pm 0.03 inch
- The sleeve makes an overlap of approximately 0.5 inch with the insulation.

- (4) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

F. Contact Assembly

**Table 17
CONTACT CRIMP TOOLS**

		MS3191-1	-	MS3191-16A	-
	12	M22520/1-01	6	M22520/1-02	Yellow
14	12	M22520/1-01	7	M22520/1-02	Yellow
12	12	M22520/1-01	8	M22520/1-02	Yellow
		MS3191-1	-	MS3191-12A	-

- (1) Make a selection a crimp tool from Table 17.
- (2) Put the end of the wire in the crimp barrel of the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- For a wire with thick wall insulation, the distance from the end of the insulation to the crimp barrel is approximately 0.13 inch
- For all other wire, the end of the insulation is against the end of the crimp barrel.

- (3) Crimp the contact.

G. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.I.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

**Table 18
CONTACT INSERTION TOOLS**

Crimp Barrel Size	Insertion Tool	Special Instructions
20	6500-001-20	-
	ATR 1105	Only applicable for Champlain 24-00034 wire

	CIET-12	-
	M81969/14-04	-
	M83723/31-12	-

- (1) Make a selection of an insertion tool from Table 18.
- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) Put the contact assembly in the insertion tool.
- (4) Axially align the tool and the contact cavity.
- (5) Carefully push the contact into the contact cavity until it stops.
Make sure that the tool and the contact cavity stay axially aligned.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (7) Lightly pull the wire to make sure the contact is locked in the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-83723 SERIES III TYPE CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

H. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

If a stub wire is specified, the minimum length of the stub wire is 12.0 inches.

I. Backshell and Strain Relief Assembly

Refer to Subject 20-60-09.

6. CONNECTOR INSTALLATION

A. Connector Installation

Refer to Subject 20-60-06.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 TYPE CONNECTORS WITH REAR RELEASE CONTACTS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

**Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL**

Connector	Description	Contact Cavity Size	Minimum Wire O.D. (inch)
MIL-C-5015	Rear release, rear removal contacts	16	0.066
		12	0.097
		8	0.132
		4	0.237
		0	0.360

2. PART NUMBERS AND DESCRIPTION

B. Contact Part Numbers

NOTE: If the connector insert arrangement has one or more size 16 contact cavities:

- Contact size 16 is used in connector shell size 8, 10, 12, 16, 18, 20, 22, 24, 28, 32, 36, 40, 44 or 48.
- Contact size 16S is used in connector shell size 8S, 10S, 10SL, 12S, 14S, or 16S.

NOTE: The Matrix 5100-179-16-1 contact has a high engaging force.

NOTE: Souriau 8950-5052A and 8950-5053A contacts are used in the Souriau 892 type connector.

5. CONNECTOR ASSEMBLY

A. Wire Preparation

**Table 5
INSULATION REMOVAL LENGTH**

Crimp Barrel Size	Removal Length (inch)		Special Instructions
	Target	Tolerance	
16	0.28	±0.03	-
12	0.28	±0.03	-
8	0.50	±0.06	-
4	0.50	±0.06	-
1/0	0.62	±0.06	-

- (1) To prepare BMS 13-8, BMS 13-55, Champlain 24-00033, or Champlain 24-00034 wire, the wire diameter must be decreased. Refer to Figure 5.

**REDUCTION OF THE DIAMETER OF THE WIRE
Figure 5**

- (a) Put a 2.0 inch ±0.1 inch length of 3/16 inch diameter TFE 4X heat shrinkable sleeve on the wire.
 - (b) Remove 1.50 inches ±0.03 inch of the outer Teflon jacket from the end of the wire.
 - (c) Remove 1.50 inches ±0.03 inch of the insulation yarn from the end of the wire.
- CAUTION:** DO NOT CUT THE EXTRUDED SILICONE RUBBER DIELECTRIC MATERIAL.
- (d) Remove 0.25 inch ±0.03 inch of extruded silicone rubber and Kapton tape insulation materials from the conductor.
- (2) To prepare the wire for the assembly of the Souriau 8950-5052A and 8950-5053A contacts, remove 0.40 inch ±0.03 inch of insulation from the end of the wire.
- (3) Measure the O.D. of the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 TYPE CONNECTORS WITH REAR RELEASE CONTACTS

- (4) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.
- (5) To prepare all other wire, remove the necessary length of insulation from the end of the wire. Refer to Table 5.
- (6) Measure the O.D. of the wire.
- (7) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet holes, increase the O.D. of the wire. Refer to Paragraph 1.A.

- (1) Make a selection of a crimp tool from Table 6.
- (2) Remove the necessary length of insulation from the end of the wire.
Refer to:
 - Table 5 for the insulation removal length
 - Subject 20-00-15 for the insulation removal procedures.
- (3) If a filler wire is specified:
 - (a) Remove 0.7 inch of insulation from the end of the filler wire.
Refer to Subject 20-00-15 for the insulation removal procedures.
 - (b) Put the filler wire in the crimp barrel of the contact.
- (4) Put the conductor in the crimp barrel. Refer to Figure 6.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 TYPE CONNECTORS WITH REAR RELEASE CONTACTS

Make sure that:

- All of the strands of the conductor are in the crimp barrel or in the adapter sleeve
- If a filler wire is specified, all of the strands of the filler wire are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

CONTACT ASSEMBLY WITH FILLER WIRE
Figure 6

- (5) Crimp the contact.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 8 or larger contact that has an adapter sleeve in the crimp barrel.

- (6) Examine the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- If a filler wire is specified, all of the strands of the filler wire are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

- (7) If the contact has a filler wire, remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 7.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 7

CAUTION: DO NOT CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the wire has a heat shrinkable sleeve on it:

- (a) Push the heat shrinkable sleeve forward on the wire. Refer to Figure 5.

Make sure that the end of the sleeve is 0.25 inch \pm 0.03 inch from the end of the insulation.

- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-5015 TYPE CONNECTORS WITH REAR RELEASE CONTACTS

C. Contact Insertion

- (1) If a cable clamp is installed, loosen the clamp screws.
- (2) Remove the cable clamp from the connector.
- (3) To unlock the rear nut, turn the nut counterclockwise approximately 2-1/2 turns. Refer to Figure 4.

NOTE: The rear nut assembly must be unlocked before any contacts can be inserted or removed.

After approximately 2-1/2 turns:

- Resistance to more turns can be felt
- The colored stripe can be seen fully.

REAR NUT OF THE CONNECTOR
Figure 4

- (4) To remove a pin contact:
 - (a) Make a selection of a contact removal tool from Table 4.
 - (b) From the front of the connector, put the removal tool over the pin.
 - (c) Push until the tool is fully against the face of the connector insert.
 - (d) Pull the contact out of the rear of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-81511 SERIES 1 AND SERIES 2 CONNECTORS

CAUTION: REMOVE ONE CONTACT AT A TIME TO PREVENT DAMAGE TO THE CONNECTOR GROMMET.

- (5) To remove a socket contact:
 - (a) Make a selection of a contact removal tool from Table 4.
 - (b) Push the tip of the removal tool into the insert and the socket contact.
 - (c) Push until the tool is fully against the face of the connector insert.
 - (d) Pull the contact out of the rear of the connector.

CAUTION: REMOVE ONE CONTACT AT A TIME TO PREVENT DAMAGE TO THE CONNECTOR GROMMET.

3. CONNECTOR ASSEMBLY

		MS3191-4	-	-

- (1) Remove the necessary length of insulation from the end of the wire. Refer to Table 5.
- (2) Make a selection of a contact crimp tool from Table 6.
- (3) Put the contact in the crimp tool locator.
- (4) Put the end of the wire into the crimp barrel of the contact.
- (5) Close the handles of the crimp tool until the ratchet releases.
- (6) Remove the wired contact from the tool.
- (7) Examine the contact to make sure that the wire can be seen in the inspection hole.

B. Contact Insertion

12	294-33
	MS3323-12

- (1) If a cable clamp is used, put the clamp on the wire bundle.
- (2) To unlock the rear nut, turn the nut counterclockwise approximately 2-1/2 turns. Refer to Figure 4.

NOTE: The rear nut assembly must be unlocked before any contacts can be inserted or removed.

After approximately 2-1/2 turns:

- Resistance to more turns can be felt
 - The colored stripe can be seen fully.
- (3) Manually put the wired contact in the applicable contact cavity until only the crimped portion of the contact extends from the connector grommet.
 - (4) Make a selection of an insertion tool from Table 7.
 - (5) Put tool around the rear of the contact so that it is against the contact shoulder.
 - (6) Push the contact into the connector until it is fully inserted.
 - (7) Carefully pull the tool from the connector grommet.

C. Seal Plug Installation

- (1) Install a seal plug into each contact cavity that is not used.

NOTE: As an alternative, an unwired contact can be inserted before the seal plug is installed.

D. Connector Assembly

- (1) To lock the rear nut, turn the nut until it is tight and the color stripe cannot be seen.
- (2) If a cable clamp is used, push the clamp until it is against the rear of the connector.
- (3) Tighten the cable clamp manually.
- (4) Tighten the clamp 1/8 of a turn more.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

1. GENERAL DATA

A. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. that is necessary for a satisfactory seal of a contact cavity hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL

Connector	Description	Contact Cavity Size	Minimum Wire O.D. (inch)
MIL-C-38999	Rear release, rear removal contacts	22M	0.030
		22D	0.030
		22	0.034
		20	0.040
		16	0.065
		12	0.097

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

Table 12 (continued)

Contact Size	Material	Part Number	Color
12	Metal	11-8675-12	-
		11-8795-12	
		M81969/8-10	
		MS27495R12	
		RX12-9	
	Plastic	M81969/14-04	White
		MS27534-12	
8	Metal	M81969/28-03	-

NOTE: For plastic tools, the color given in Table 12 is the color of the removal end of the combination tools that are both insertion and removal tools.

- (1) Make a selection of a contact removal tool from Table 12.

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. A REMOVAL TOOL THAT HAS A DEFECT CAN CAUSE DAMAGE TO THE GROMMET OR THE RETENTION CLIP.

- (2) At the rear of the connector, put the removal tool on the wire.
- (3) Axially align the removal tool and the contact cavity.
- (4) Carefully push the removal tool into the rear of the contact cavity until it stops.

CAUTION: DO NOT ROTATE THE TOOL OR SPREAD THE TOOL TIPS WHILE THE TOOL IS STILL IN THE GROMMET.

- (5) Carefully pull the wire and the removal tool from the contact cavity at the same time. Make sure that the removal tool and the contact cavity stay axially aligned.
- (6) If the contact does not release:
 - (a) Pull the removal tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.
 - (c) Do Step (2) through Step (5) again.

5. CONNECTOR ASSEMBLY

A. Standard Contact Crimp Tools

B. Cable Preparation for Shield Termination in the Connector Insert

Table 16
Cable Jacket Removal Length

Solder Sleeve	Removal Length L (inch)	
	Target	Tolerance
BACS13CT	2.05	0.06

20-63-19

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

Table 16 (continued)

Solder Sleeve	Removal Length L (inch)	
	Target	Tolerance
BACS13DG	2.05	0.06
D-104	2.15	0.06
D-108	2.22	0.06

(1) Remove the necessary length of the cable jacket from the end of the cable.

Refer to:

- Table 16
- Figure 19
- Subject 20-00-15 for the procedure to remove the cable jacket.

**Cable Jacket Removal
Figure 19**

(2) Assemble the insulated shield ground wire at the end of the cable jacket.

Refer to:

- Figure 20
- Subject 20-10-15 for the procedure to assemble a shield ground wire.

Make sure that the free end of the shield ground wire is pointed forward to the end of the cable.

**Length of the Shield Ground Wire and the Wires of the Cable
Figure 20**

(3) Remove the necessary length from the end of the shield ground wire to make the distance from the end of the shield to the end of the shield ground wire equal to 1.8 inches ± 0.1 inch. Refer to Figure 20.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

- (4) Remove the necessary length from the end of each wire of the cable to make the distance from the end of the shield to the end of the wire equal to 1.8 inches \pm 0.1 inch. Refer to Figure 20.

C. Cable Preparation for Shield Termination - Isolated Shields, Solder Sleeve and Dead End

Table 17
Cable Jacket Removal Length

Solder Sleeve	Removal Length L (inch)		
	Target	Minimum	Maximum
BACS13CT	2.55	2.45	2.65
BACS13DG	2.55	2.45	2.65
D-104	2.65	2.55	2.75
D-108	2.72	2.62	2.82

- (1) Remove the necessary length of the cable jacket from the end of the cable.

Refer to:

- Table 17
- Figure 21
- Subject 20-00-15

Outer Jacket Removal
Figure 21

- (2) Assemble the insulated shield ground wire at the end of the cable outer jacket.

Refer to:

- Figure 22
- Subject 20-10-15 for the shield ground wire assembly procedures.

Make sure that the free end of the shield ground wire is pointed in the direction that is specified for the shield ground wire connection.

Solder Sleeve Shield Ground Wire of the Outer Shield
Figure 22

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

- (3) Remove the necessary length of the inner jacket from the end of the cable to make the distance from the end of the outer shield to the end of the inner jacket equal to 0.75 inch \pm 0.03 inch.

Refer to:

- Figure 23.
- Subject 20-00-15 for the cable jacket removal procedures.

**Inner Jacket Removal
Figure 23**

- (4) Remove the length of the inner shield from the end of the cable to the end of the inner jacket.
 (5) Assemble the shield dead end of the inner shield.

Refer to:

- Figure 24
- Subject 20-10-15 for the procedure to assemble the shield dead end.

**Shield Dead End of the Inner Shield
Figure 24**

- (6) Remove the necessary length from the end of the wires of the cable to make the distance from the end of the inner jacket to the end of the wires equal to 1.8 inches \pm 0.1 inch. Refer to Figure 24.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

D. Standard Contact Assembly

**Table 18
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Contact Size	Removal Length L (inch)			Special Instructions
		Maximum	Target	Minimum	
28	22	0.17	0.14	0.14	-
26	22	0.17	0.14	0.14	-
24	22	0.17	0.14	0.14	-
	20	0.39	0.36	0.36	Fold the conductor back on itself
22	22	0.17	0.14	0.14	-
	20	0.21	0.18	0.18	-
	16	0.39	0.36	0.36	Fold the conductor back on itself
20	20	0.21	0.18	0.18	-
	16	0.39	0.36	0.36	Fold the conductor back on itself
18	16	0.21	0.18	0.18	-
16	16	0.21	0.18	0.18	-
	12	0.39	0.36	0.36	Fold the conductor back on itself
14	12	0.21	0.18	0.18	-
12	12	0.21	0.18	0.18	-

- (1) Make a selection of a crimp tool from Table 13, Table 14, or Table 15.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 25
- Table 18 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

Figure 25

- (3) Measure the O.D. of the wire.
- (4) If the O.D. of the wire is less than the minimum seal diameter of the connector grommet hole, increase the O.D. of the wire. Refer to Paragraph 1.A.
- (5) Put the end of the conductor in the crimp barrel of the contact. Refer to Figure 26.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

Make sure that:

- All the conductor strands are in the crimp barrel
- The conductor strands are visible in the inspection hole of the contact
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE CONDUCTOR IN THE CRIMP BARREL OF THE CONTACT

Figure 26

(6) Crimp the contact.

Make sure that:

- All the conductor strands are in the crimp barrel
- The conductor strands are visible in the inspection hole of the contact
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

E. Assembly of a Contact with Oversize Wire

This procedure is applicable if the outside diameter of the wire insulation is larger than the maximum wire O.D. specified in Table 19.

**Table 19
MAXIMUM WIRE OUTSIDE DIAMETER**

Connector	Description	Contact Cavity Size	Maximum Wire O.D. (inch)
MIL-C-3899	Rear release, rear removal contacts	22M	0.050
		22D	0.054
		22	0.060
		20	0.083
		16	0.109
		12	0.142

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

**Table 20
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	An available source
	RT850	Raychem
	RW175	
	TFE 4X	Chemplast
		Zeus

(1) Make a selection of a 1.75 inch \pm 0.06 inch length of heat shrinkable sleeve from Table 20.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

Make sure that the sleeve has the smallest diameter that can move easily on the wire.

(2) Remove 1.50 inch \pm 0.06 inch length of insulation from the end of the wire. Refer to Figure 27.

**INSULATION REMOVAL LENGTH
Figure 27**

(3) Put the sleeve on the wire.

(4) Put the conductor into the crimp barrel of the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

(5) Crimp the contact.

(6) Align the sleeve. Refer to Figure 28.

Make sure that:

- The sleeve makes a 0.3 inch to 1 inch overlap with the wire insulation
- The distance from the forward end of the sleeve to the rear end of the contact crimp barrel is not more than 0.03 inch.

**POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 28**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

- (7) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (8) Install two separate sleeves if a single sleeve will not shrink tightly against both the wire and the insulation of the wire.
 - (a) Push the inner sleeve forward until the forward end of the sleeve is 0.03 inch or less from the crimp barrel. Refer to Figure 29.

POSITION OF THE INNER HEAT SHRINKABLE SLEEVE
Figure 29

- (b) Shrink the sleeve into its position. Refer to .
Make sure that the distance between the forward end of the sleeve and the crimp barrel is not more than 0.03 inch.
- (c) Push the outer sleeve forward until the forward end of the sleeve extends 0.3 inch minimum from the end of the wire insulation. Refer to Figure 30 .

POSITION OF THE OUTER HEAT SHRINKABLE SLEEVE
Figure 30

- (9) Shrink the sleeve into its position. Refer to Subject 20-10-14
Make sure that:
 - The forward end of the outer sleeve extends 0.3 inch minimum from the end of the insulation of the wire.
 - The outer sleeve makes an overlap of 0.3 inch or more with the insulation of the wire.

F. Quadrax Contact Assembly

Table 21
QUADRAX CONTACT INNER CONTACT CRIMP TOOLS

Quadrax Contact	Crimp Tool		
	Basic Unit		Locator
	Part Number	Setting	Part Number
BACC47GM1	M22520/2-01	5	K709
BACC47GN1	M22520/2-01	5	K709

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

Table 22
QUADRAX CONTACT OUTER CONTACT CRIMP TOOLS

Quadrax Contact	Crimp Tool		
	Basic Unit	Die	
		Part Number	Cavity
BACC47GM1	M22520/5-01	M22520/5-45	B
BACC47GN1	M22520/5-01	M22520/5-45	B

- (1) Make a selection of an inner contact crimp tool from Table 21.
- (2) Make a selection of an outer contact crimp tool from Table 22.
- (3) Cut the cable perpendicular to its longitudinal axis.
- (4) Put the seal boot on the cable. Refer to Figure 31.

Make sure that the end of the seal boot that has the elastomer seal points rearward, away from the end of the cable.

THE SEAL BOOT ON THE CABLE
Figure 31

- (5) Move the seal boot away from the end of the cable.
- (6) Remove 0.53 inch ±0.02 inch of the outer jacket from the end of the cable. Refer to Figure 32.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

OUTER JACKET TRIM DIMENSIONS

Figure 32

- (7) Put the ferrule on the cable. Refer to Figure 33.

Make sure that the end of the ferrule that has the smaller diameter is pointed forward toward the end of the cable.

POSITION OF THE FERRULE ON THE CABLE

Figure 33

- (8) Push the ferrule rearward until it is against the end of the outer jacket. Refer to Figure 33.
- (9) Fold the outer round shield back on the ferrule. Refer to Figure 34.

INNER CONDUCTOR INSULATION REMOVAL DIMENSIONS AND SHIELD PREPARATION

Figure 34

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF MIL-C-38999 CONNECTORS**

- (10) Remove the necessary length of the outer round shield.
Make sure that the length of the round shield folded back is 0.16 inch \pm 0.02 inch. Refer to Figure 34.
- (11) Remove the necessary length of:
- The inner flat shield
 - The cable fillers
 - The tape wrap insulation.
- Make sure that the ends of the flat shield, the fillers, and the tape wrap are all approximately aligned with the front end of the ferrule.
- (12) Move the four inner conductors apart.
Make sure that:
- The inner conductors do not cross each other
 - The initial positions of the inner conductors in the cable is not changed.
- (13) Remove the necessary length of the fillers of the cable.
Make sure that the ends of the filler rods are approximately aligned with the front end of the ferrule.
- (14) Remove 0.14 inch \pm 0.02 inch of insulation from each of the four inner conductors.
Refer to:
- Refer to Figure 34.
 - Subject 20-00-15 for the procedure to remove the wire insulation.
- (15) Crimp an inner contact on each of the four inner conductors.
Make sure that:
- The distance between the wire insulation and the end of each inner contact crimp barrel is 0.02 inch maximum
 - The wire insulation is not in the crimp barrel
 - The conductor strands can be seen in the inspection hole
 - All conductor strands are in the crimp barrel
 - The conductor strands do not go out of the inspection hole
 - The plating of each inner contact is not removed
 - The inner contacts have no cracks.
- (16) Put the inner conductors into the channels of the spacer. Refer to Figures 35, 36, and 37.
Make sure that:
- The red conductor and the yellow conductor are adjacent to the wiring keyway of the spacer. Refer to Figure 36
 - The shoulders of the contacts are against the front of the spacer. Refer to Figure 37
 - The position of the conductors in the spacer is the same as the position of the conductors in the cable
 - The conductors do not cross each other.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

INSTALLATION OF THE INNER CONDUCTORS IN THE SPACER CHANNELS

Figure 35

FRONT END - CONTACTS SIDE

REAR END - WIRE SIDE

POSITION OF THE INNER CONDUCTORS IN THE SPACER

Figure 36

POSITION OF THE INNER CONTACTS ON THE SPACER

Figure 37

- (17) Align the insulator and the spacer. Refer to figure 38.
Make sure that the keyway of the insulator and the keyway of the spacer are aligned.
- (18) Install the insulator on the inner contacts. Refer to Figure 38.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

Make sure that:

- The shoulders of the contacts are against the spacer
- The insulator is against the spacer
- The keyway of the insulator and the keyway of the spacer are aligned.

POSITION OF THE INSULATOR AND THE SPACER

Figure 38

- (19) Align the wiring key of the outer contact and the wiring keyways of the insulator and spacer. Refer to Figure 39.
- (20) Push the insulator assembly into the outer contact until it stops. Refer to Figure 39.

Make sure that:

- The wiring key of the outer contact and the wiring keyways of the insulator and spacer are aligned
- The rear of the insulator is against the shield that is folded back on the ferrule
- The distance from the rear edge of the outer contact to the shoulder of the ferrule is not more than 0.02 inch
- The distance from the rear end of the ferrule to the end of the cable jacket is not more than 0.02 inch.

ALIGNMENT OF THE OUTER CONTACT AND THE INSULATOR AND SPACER

Figure 39

- (21) Crimp the outer contact. Refer to Figure 40.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

QUADRAX CONTACT ASSEMBLY

Figure 40

(22) Remove all of the strands of the shield that extend beyond the rear edge of the outer contact.

NOTE: For metal tools, the color given in Table 23 is the color code on the handle of the tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

NOTE: For plastic tools, the color given in Table 23 is the color of the insertion end of the combination tools that are both insertion and removal tools.

- (1) Make a selection of an insertion tool from Table 23.

CAUTION: DO NOT USE DAMAGED TOOLS.

NOTE: Contacts with AWG 20 or larger wire can be inserted by hand.

- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) Put the contact assembly in the insertion tool.
- (4) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (5) Carefully push the contact assembly into the contact cavity until it stops.

Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (7) Lightly pull the wire to make sure that the contact is locked in the connector.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

H. Quadrax Contact Insertion

**Table 24
LUBRICANTS**

Lubricant	Specification	Supplier
Alcohol, Isopropyl	TT-I-735	An available source

- (1) At the rear of the connector, align the contact polarization key and the keyway of the quadrax contact cavity.

Make sure that the longitudinal axis of the contact assembly is perpendicular to the rear face of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

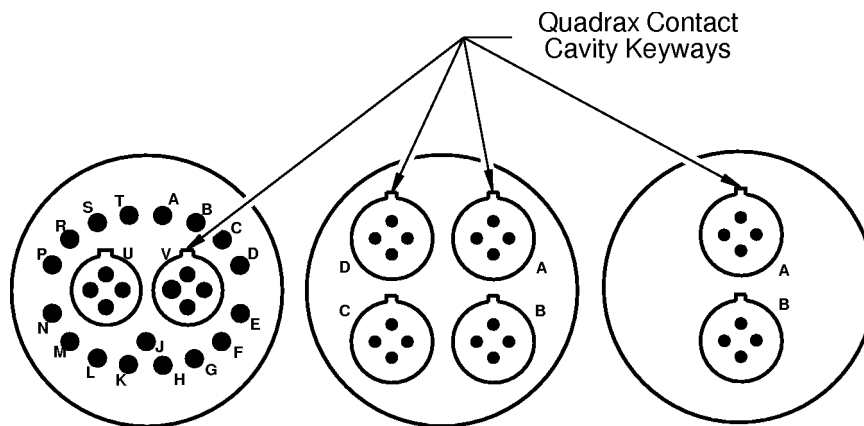

Refer to:

- Figure 41 for the polarization key of the quadrax contact
- Figure 42 for the keyway of the quadrax contact cavity.

POLARIZATION KEY OF THE QUADRAX CONTACT

Figure 41

QUADRAX CONTACT CAVITY KEYWAY

Figure 42

- (2) Push the contact into the contact cavity until the contact stops and is locked.

NOTE: A lubricant can be used to make it easier to push the contact into the contact cavity. Refer to Table 24

- (3) Align the seal boot key with the contact cavity keyway. Refer to Figure 42.
- (4) Push the seal boot into the contact cavity.

Make sure that the rear edge of the seal boot key is aligned with the rear face of the connector.

NOTE: A lubricant can be used to make it easier to push the seal boot into the contact cavity. Refer to Table 24.

- (5) Lightly pull on the cable.

Make sure that the contact is locked in the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF MIL-C-38999 CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (5) again.

I. Spare Contact and Seal Plug Installation

- (1) Install unwired contacts and seal plugs in all unused contact cavities. Refer to Subject 20-60-08.

Tape	70	Scotch
Tie Strap, Plastic	BACS38K-4	Boeing

2. CONNECTOR DISASSEMBLY

A. Strain Relief Removal

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE WIRES. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (1) Disconnect the plug from the receptacle.
- (2) If necessary, remove the modular jack assembly from the structure or panel.
Make sure to keep the installation hardware.
- (3) Remove the two plastic tie straps. Refer to Figure 1.
- (4) Remove the grommet or layers of tape.

B. Contact Removal

Table 4
CONTACT REMOVAL TOOLS

Part Number	Color	Supplier

22	M22520/7-01	4	QPL	M22520/7-11	QPL

- (1) Make a selection of a crimp tool from Table 5.
- (2) Remove 0.17 inch ±0.03 inch of insulation from the end of the wire.
- (3) Crimp the contact.

B. Connector Assembly

**Table 6
CONTACT INSERTION TOOLS**

Part Number	Color	Supplier
M81969/14-01	Green	QPL

**MODULAR JACK ASSEMBLY
Figure 1**

Refer to Figure 1.

- (1) Make a selection of an insertion tool from Table 6.
- (2) Make a selection of a plastic strap from Table 3.

NOTE: Two straps are necessary for each modular jack assembly.

707, 727-787

STANDARD WIRING PRACTICES MANUAL

CORY CTZ623-6CH MODULAR JACK ASSEMBLY

- (3) Make a selection of one of these wire protection materials from Table 3:
 - A grommet
 - A tape.
- (4) If the wire protection is a grommet:
 - (a) Put the grommet on the wires.
 - (b) Insert each contact into the correct contact cavity.
 - (c) Align the forward end of the grommet with the first slot.
 - (d) Install a tie strap around the grommet and in the second slot of the strain relief arm.
 - (e) Install the other tie strap around the grommet near the rear end of the grommet.
- (5) If the wire protection is tape:
 - (a) Insert each contact into the correct contact cavity.
 - (b) Put 2 layers of tape on the wires.

Make sure to align the forward end of the tape with the first slot of the strain relief arm.
 - (c) Install a tie strap around the tape and in the second slot of the strain relief arm.
 - (d) Install the other tie strap around the tape near the rear end of the tape.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON XLR-() AND AXR-()CONNECTORS

This subject gives these procedures to:

- Assemble and disassemble the XLR-() and AXR-() connectors
- Connect and disconnect the XLR-() and AXR-() connectors
- Install the XLR-() and AXR-() connectors.

1. PART NUMBERS AND DESCRIPTION

A. Connector Part Numbers

NOTE: The AXR-() and XLR-() connectors are interchangeable. The AXR-() is obsolete and was replaced by the XLR-() in 1992.

2. CONNECTOR DISASSEMBLY

A. Connector Separation

(1) If the plug has a latch:

- (a) Push down on the latch until it disengages from the latch retainer of the receptacle.
- (b) Continue to push on the latch, hold the plug by the shell, and pull the plug away from the receptacle in a direction perpendicular to the receptacle.

CAUTION: DO NOT HOLD THE PLUG AT THE FLEXIBLE STRAIN RELIEF OR HOLD THE CABLE WHEN THE CONNECTOR IS PULLED AWAY FROM THE RECEPTACLE. THE CONNECTION BETWEEN THE CABLE AND THE CONTACTS IN THE PLUG WILL BE DAMAGED.

(2) If the receptacle has a latch:

- (a) Push the latch in the direction of the receptacle.
Make sure to push the latch until it disengages from the latch retainer on the plug.
- (b) While you continue to push on the latch, hold the plug by the shell and pull the plug away from the receptacle, perpendicular to the receptacle.

CAUTION: DO NOT HOLD THE PLUG AT THE FLEXIBLE STRAIN RELIEF OR HOLD THE CABLE WHEN THE CONNECTOR IS PULLED AWAY FROM THE RECEPTACLE. THE CONNECTION BETWEEN THE CABLE AND THE CONTACTS IN THE PLUG WILL BE DAMAGED.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON XLR-() AND AXR-() CONNECTORS

B. XLR-() Connector Plug Disassembly

DISASSEMBLY OF THE XLR-() PLUG
Figure 9

- (1) Loosen the cable clamp screws.
- (2) Push the flexible strain relief along the cable away from the plug. Refer to Figure 9.
- (3) Loosen the insert retainer screw in the plug shell until the plug shell is free from the connector insert assembly.
- (4) Push the plug shell along the cable away from the connector insert assembly. Refer to Figure 9.
- (5) Push the insulation tube along the cable away from the connector insert assembly. Refer to Figure 9.
- (6) Use a soldering iron to remove the conductors from the contacts.
- (7) Pull the cable away from the connector insert assembly and through the insulation tube, the plug shell, and the flexible strain relief.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON XLR-() AND AXR-()CONNECTORS

C. AXR-() Connector Plug Disassembly

DISASSEMBLY OF THE ITT CANNON AXR-() PLUG
Figure 10

- (1) Push the flexible strain relief off the AXR-() plug shell along the cable away from the plug. Refer to Figure 10.
- (2) Loosen the large plastic cable retainer screw at the back of the plug.
- (3) Loosen the insert retainer screw in the plug shell until the plug shell is free from the connector insert assembly.
- (4) Push the AXR-() plug shell along the cable away from the connector insert assembly. Refer to Figure 10.
- (5) Push the insulation tube along the cable away from the connector insert assembly. Refer to Figure 10.
- (6) Use a soldering iron to remove the conductors from the contacts.
- (7) Pull the cable away from the connector insert assembly and through the insulation tube, the plug shell, and the flexible strain relief.

D. Receptacle Disassembly

- (1) Remove the receptacle from the panel:
 - (a) Loosen the two nuts that attach the receptacle to the panel.
 - (b) Continue to loosen the nuts until the nuts are free from the screws.
 - (c) Remove the two screws from the holes in the panel.
 - (d) From the back of the panel, push the receptacle through the hole in the panel.
- (2) Use a soldering iron to remove the conductors from the contacts in the receptacle.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON XLR-() AND AXR-()CONNECTORS

3. CONNECTOR ASSEMBLY

A. Cable Preparation

**Table 3
INSULATION REMOVAL LENGTH**

Insert Configuration	Removal Length (inch)	
	Target	Tolerance
2A	0.25	0.03
3	0.25	0.03
4	0.22	0.03
5	0.20	0.03
6	0.20	0.03
6A	0.20	0.03
7	0.13	0.03

- (1) Remove the flexible strain relief from the body of the connector.
- (2) Remove the connector shell from the connector insert assembly.
- (3) Put the flexible strain relief on the cable.
- (4) Push the flexible strain relief approximately 6 inches along the cable.
- (5) Put the connector shell on the cable.
- (6) Push the connector shell approximately 6 inches along the cable.
- (7) Put the insulation tube on the cable.
- (8) Push the insulation tube approximately 6 inches along the cable.
- (9) If the cable does not have a shield, remove 1.0 inch \pm 0.1 inch of the cable jacket. Refer to Subject 20-00-15.
- (10) If the cable has a shield:
 - (a) Put a 2.4 inch \pm 0.2 inch length of the heat shrinkable sleeve on the end of the cable.
 - (b) Push the sleeve along the cable in the direction of the connector shell.
 - (c) Remove 1.8 inches \pm 0.1 inch of the shield jacket. Refer to Subject 20-00-15.
 - (d) Install a solder sleeve and a shield ground wire on the shield. Refer to Subject 20-10-15.
 - (e) Move the sleeve so that the middle of the sleeve is directly over the middle of the solder sleeve. Refer to Figure 11.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON XLR-() AND AXR-()CONNECTORS

POSITION OF THE SLEEVE ON THE CABLE

Figure 11

- (f) Shrink the sleeve in position. Refer to Subject 20-10-14.
- (g) Cut the shield ground wire so that it is the same length as the other wires in the cable.
- (11) Remove the insulation from the end of each wire.
Refer to Table 3 and Subject 20-00-15.
- (12) Put a thin layer of solder on the conductors. Refer to Subject 20-40-00.
- (13) If the outer diameter of the cable and the heat shrinkable sleeve is less than 0.22 inches, increase the outer diameter of the cable so that it is 0.25 inch to 0.30 inch.
Refer to Figure 12.
- (a) Wind one or more layers of Scotch 70 insulation tape around the end of the cable.
- (b) Wind each layer in the opposite direction.
- (c) Make the distance from one end of the insulation tape layer and the other end of the insulation tape layer approximately 3.5 inches.

CABLE DIAMETER BUILDUP

Figure 12

B. Contact Assembly

- (1) Solder the conductors to the contacts in the connector insert. Refer to Subject 20-40-00.

Make sure that:

- The conductors are attached to the correct contacts
- The solder joints are satisfactory.

C. Connector Plug Assembly

- (1) Push the insulation tube until the end of the tube touches the connector insert assembly.
- (2) Align the screw hole in the plug shell with the screw hole in the connector insert assembly.
- (3) Align the slot in the plug shell with the latch in the connector insert assembly.

STANDARD WIRING PRACTICES MANUAL**ITT CANNON XLR-() AND AXR-()CONNECTORS**

- (4) Push the plug shell along the cable until the end of the connector insert assembly touches the flange in the plug shell.
- (5) Align the screw hole in the plug shell with the screw hole in the connector insert assembly.
- (6) Put the insert lock screw in the hole and tighten the screw so that the connector insert assembly locks in the plug shell.
- (7) For the XLR-() plug:
 - (a) Push the flexible strain relief along the cable and under the cable clamp until it touches the flange in the plug shell.
 - (b) Tighten the cable screws so that the cable clamp satisfactorily holds the cable in position.
- (8) For the AXR-() plug:
 - (a) Put the cable retainer screw in position in the plug shell.
 - (b) Tighten the cable retainer screw until it holds the cable in position in the shell.
 - (c) Push the flexible strain relief along the cable so that it engages the back of the plug shell.

D. Connection of a Plug To a Receptacle

- (1) Align the plug with the receptacle so that these conditions occur:
 - The alternate position key in the plug aligns with the alternate position groove in the receptacle
 - The longitudinal axis of the plug aligns with the longitudinal axis of the receptacle.
- (2) Put the plug in the receptacle.
- (3) Push the plug into the receptacle until the latch engages the latch retainer and locks in position. Make sure that the plug locks in the receptacle.

E. Installation of a Receptacle in a Panel

- (1) If it is necessary, remove the two 4-40 screws and the 4-40 nuts from the flanges on the connector
- (2) From the front of the panel, align the connector with the hole in the panel.
Make sure that the position of the top of the connector is correct in relation to the top of the hole.
- (3) If the connector has wires and cables attached, put the wires and cables through the hole from the front of the panel.
- (4) Push the connector through the hole until the back surface of the flange touches the front surface of the panel.
- (5) Align the two holes on the flange of the with the connector holes in the panel.
- (6) Align the screws with the holes in the front of the connector flange.
- (7) From the front of the panel, push the screws through the holes until the shoulder on the screws touches the front of the connector flange.
- (8) At the back of the panel, put the nuts on the screws.
- (9) Tighten the nuts.
Make sure that the receptacle will not move on the panel.

TELEPHONE JACK CONNECTOR PART NUMBERS

Military Specification	Telephone Jack Connector	
	Part Number	Supplier
MIL-J-641/8-1	JJ-055	Kings Electronics

2. CONNECTOR ASSEMBLY**A. Contact Assembly**

- (1) Remove 2-1/8 inches \pm 1/8 inch of the outer jacket from the cable.
- (2) Install a shield ground wire. Refer to Subject 20-10-15.
 - (a) Use a length of BMS 13-48 Type VIII Class 1 AWG 22 wire for the shield ground wire.
 - (b) Cut the shield ground wire so that it is the same length as the wires.
- (3) Put a 2 inch \pm 1/8 inch length of heat shrinkable sleeve over the cable.
Make sure to use a sleeve with the smallest diameter that will fit over the cable.
- (4) Remove 9/32 inch \pm 1/32 inch of insulation from each wire.
- (5) Solder a contact to each conductor. Refer to Subject 20-40-00.
Make sure the solder does not flow onto the upper surface of the contact.

B. Telephone Jack Assembly

- (1) Insert the two contacts into the jack recession.
Make sure the slots are exposed and face upwards.
- (2) Move the sleeve forward over wires.
- (3) Align the sleeve with the inner, leading edge of strain relief ribs on the body of the jack.
- (4) Shrink the sleeve into position.
- (5) If necessary, build the cable diameter up with filler tape in the strain relief area.

**Table 6
CONTACT CRIMP TOOLS**

Contact	Crimp Tool		
	Part Number	Die Cavity	Supplier
SHF-001T-0.8SS	YC-122R	B	J.S.T.

- (1) Make a selection of a crimp tool from Table 6.
- (2) Remove 0.10 inch \pm 0.05 inch of the insulation from the end of the wire.
- (3) Put the end of the wire in the contact. Refer to Figure 2.
- (4) Put the contact and the end of the wire in the die cavity.

Make sure that the face of the insulation grip die is aligned with the rear end of the contact. Refer to Figure 2.

STANDARD WIRING PRACTICES MANUAL

J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS

POSITION OF THE CONTACT IN THE CRIMP TOOL
Figure 2

(5) Crimp the contact. Refer to Figure 3.

NOTE: It is not necessary for the insulation grip to touch the wire insulation around the full outer surface of the wire.

CONTACT ASSEMBLY
Figure 3

C. Insertion of Contacts in SMP-()-BC Connectors

(1) Push the contact into the connector. Refer to Figure 4.

CONTACT INSERTION
Figure 4

(2) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

STANDARD WIRING PRACTICES MANUAL

J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

3. SMR-()-B CONNECTORS

A. Removal of Contacts from SMR-()-B Connectors

**Table 7
CONTACT REMOVAL TOOLS**

Tool	Supplier

STANDARD WIRING PRACTICES MANUAL

J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS

An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (3) Remove 0.10 inch \pm 0.05 inch of the insulation from the end of the wire.
- (4) Put a 0.5 inch minimum length of the heat shrinkable sleeve on the wire.
Make sure that the end of the sleeve is aligned with the end of the wire insulation.
- (5) Shrink the heat shrinkable sleeve in its position on the wire. Refer to Subject 20-10-14.
- (6) Put the end of the wire in the contact. Refer to Figure 6.
- (7) Put the contact and the end of the wire in the die cavity. Refer to Figure 6.

POSITION OF THE CONTACT IN THE CRIMP TOOL
Figure 6

- (8) Crimp the contact. Refer to Figure 7.

NOTE: It is not necessary for the insulation grip to touch the heat shrinkable sleeve around the full outer surface of the wire.

CONTACT ASSEMBLY
Figure 7

C. Insertion of Contacts in SMR-()-B Connectors

- (1) Put the contact into the connector. Refer to Figure 8.

STANDARD WIRING PRACTICES MANUAL

J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS

CONTACT INSTALLATION IN SMR-()-B CONNECTORS
Figure 8

(2) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

4. XHP-() CONNECTORS

A. Removal of Contacts from XHP-() Connectors

Table 10
CONTACT REMOVAL TOOLS

Tool	Supplier
Paper Clip	An available source

(1) Make a selection of a contact removal tool from Table 10.

(2) Push the contact retention latch with the paper clip, and at the same time, pull the contact out of the connector. Refer to Figure 9.

CONTACT REMOVAL FROM XHP-() CONNECTORS

Material	Specification	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/5 Class 1	An available source

**Table 12
CONTACT CRIMP TOOLS**

Contact	Crimp Tool		
	Part Number	Die Cavity	Supplier
SHX-001()-P0.6	YC-119R	B	J.S.T.

- (1) Make a selection of a crimp tool from Table 12.
- (2) Remove 0.10 inch \pm 0.05 inch of the insulation from the end of the wire.
- (3) Put the end of the wire in the contact. Refer to Figure 10.
- (4) Put the contact and the end of the wire in the die cavity. Refer to Figure 10.

**POSITION OF THE CONTACT IN THE CRIMP TOOL
Figure 10**

- (5) Crimp the contact. Refer to Figure 11.

NOTE: It is not necessary for the insulation grip to touch the wire insulation around the full outer surface of the wire.

**CONTACT ASSEMBLY
Figure 11**

STANDARD WIRING PRACTICES MANUAL**J.S.T. SMP-()-BC, SMR-()-B, AND XHP-() CONNECTORS****C. Contact Insertion and Backshell Assembly for XHP-() Connectors**

- (1) Make a selection of a heat shrinkable sleeve from Table 11.

An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

Make sure that the sleeve has the smallest diameter that can be moved freely on the wire harness.

- (2) Put a 0.5 inch minimum length of the heat shrinkable sleeve on the wire harness.
(3) Put a contact into the connector. Refer to Figure 12.

CONTACT INSERTION
Figure 12

- (4) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (5) Do Step (3) and Step (4) again for each contact in the connector.
(6) Push the heat shrinkable sleeve forward until the forward end of the sleeve is against the rear end of the connector.
(7) Shrink the sleeve in its position on the wire harness. Refer to Subject 20-10-14.
(8) Put the backshell on the connector.

Make sure that the backshell is in the correct clock position. Refer to Figure 13.

STANDARD WIRING PRACTICES MANUAL

J.S.T. SMP()-BC, SMR()-B, AND XHP()- CONNECTORS

CLOCK POSITIONS OF THE BACKSHELL

Figure 13

(9) Assemble a wire harness tie on the strain relief leg of the backshell and the heat shrinkable sleeve.

Refer to:

- Figure 14
- Subject 20-10-11 for the procedure assemble a wire harness tie.

POSITION OF THE WIRE HARNESS TIE

850-27-4	Solder	Rosemount

B. Connector Description

**CONNECTOR
Figure 1**

2. CONNECTOR DISASSEMBLY

A. Connector Disassembly

Refer to Figure 1.

- (1) Loosen the long assembly screw on the unwired connector half.
- (2) Remove the connector from the probe.
- (3) Remove the small assembly screw on the wired connector half.
- (4) Move the connector halves apart.
- (5) Push the wired connector half back away from the contacts.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ROSEMOUNT CERAMIC CONNECTORS

3. CONNECTOR ASSEMBLY

A. Assembly of Crimp Type Contacts

**Table 2
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Removal Length L (inch)	
	Target	Tolerance
22	0.25	± 0.03
20	0.25	± 0.03

**Table 3
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Tool

				TP960	Daniels
20	M22520/1-01	5	QPL	M22520/1-05	QPL
				TP960	Daniels

Refer to Figure 1.

- (1) Disassemble the ceramic connector.
- (2) Put one connector half on the two wires:
 - For the 00855-0488-0003 connector, the end of the connector half opposite the dowel pin must be put on the wire first; refer to Figure 2
 - For the 00855-1727-0001 connector, the end of the connector half with the dowel pin must be put on the wire first; refer to Figure 3.

**POSITION OF THE 00855-0488-0003 CONNECTOR HALF
Figure 2**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ROSEMOUNT CERAMIC CONNECTORS

POSITION OF THE 00855-1727-0001 CONNECTOR HALF
Figure 3

- (3) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-00-11.

The sleeve must have:

- A maximum wall thickness of 0.006 inch
 - The smallest diameter that can be put on the wire
 - The applicable temperature grade for the wire harness.
- (4) Put a 0.9 inch \pm 0.1 inch length of the sleeve on each wire.
- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 4
- Table 2 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 4

- (6) Make a selection of a crimp tool from Table 3.
- (7) Put the end of the wire in the crimp barrel of the contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole
 - The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.
- (8) Crimp each contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF ROSEMOUNT CERAMIC CONNECTORS

B. Assembly of Solder Type Contacts

**Table 4
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Removal Length L (inch)	
	Target	Tolerance
22	0.19	± 0.03
20	0.19	± 0.03

Refer to Figure 1.

- (1) Disassemble the ceramic connector.
- (2) Put one connector half on the two wires. Refer to Figure 5.

Make sure that the end of the connector half with the dowel pin goes on the wires first.

**POSITION OF THE CONNECTOR HALF
Figure 5**

- (3) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-00-11.

The sleeve must have:

- A maximum wall thickness of 0.006 inch
- The smallest diameter that can be put on the wire
- The applicable temperature grade for the wire harness.

- (4) Put a 0.9 inch ± 0.1 inch length of the sleeve on each wire.
- (5) Remove the necessary length of insulation from the end of each wire.

Refer to:

- Figure 6
- Table 4 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**INSULATION REMOVAL LENGTH
Figure 6**

20-64-15

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF ROSEMOUNT CERAMIC CONNECTORS**

- (6) Clean the solder cup of each contact.
- (7) Tin each solder cup.
- (8) Tin each wire.
- (9) Solder each wire in the applicable contact.

C. Connector Body Assembly

Refer to Figure 1.

- (1) Align the forward end of each sleeve with the rear edge of the inspection hole on each contact crimp barrel.
- (2) Shrink each sleeve in position. Refer to Subject 20-10-14.
- (3) Push the wired connector half forward until it stops.
Make sure that the shoulder of each contact is against the body of the connector.
- (4) Put the link plate on the unwired connector half.
Make sure that the dowel pin on the link plate is in the dowel pin hole of the unwired connector half.
- (5) Put the long assembly screw in the screw hole in the unwired connector half.
- (6) Engage the threads of the long assembly screw with the threads of the screw hole in the link plate.
- (7) Tighten the screw with a screwdriver.

CAUTION: DO NOT TIGHTEN THE SCREW TOO MUCH. THE SCREW MUST BE REMOVED AND INSTALLED AGAIN WHEN THE PITOT PROBE IS ATTACHED TO THE CONNECTOR.

- (8) Put the connector halves together.
Make sure that the screw hole in the link plate is aligned with the screw hole in the wired connector.
- (9) Put the short assembly screw in the screw hole in the wired connector half.
- (10) Engage the threads of the short assembly screw with the threads of the screw hole in the link plate.
- (11) Tighten the screw with a screwdriver.

ASSEMBLY OF TRI-STAR CWC(), CORY CWC(), AND WALLACE-BLACK WB() CONNECTORS

CONNECTION OF THE CONNECTOR AND THE TERMINAL BLOCK
Figure 3

Refer to Figure 3.

- (1) Make a selection of a screwdriver from Table 9.
- (2) Make a selection of a torque tool from Table 9.
- (3) Put a lockwasher on each screw.
- (4) Put the connector on the terminal block.
- (5) Engage the threads of each screw with the threads in the terminal block.
 Make sure that the O-ring is installed between the connector and the terminal block.
- (6) Hold the terminal block with the hand and at the same time, tighten each screw to the specified torque. Refer to Table 10.

CAUTION: THE TERMINAL BLOCK MUST BE HELD IN ITS POSITION WHEN THE SCREW IS TIGHTENED. IF THE TERMINAL BLOCK MOVES, DAMAGE TO THE TERMINAL BLOCK CAN OCCUR.

- (7) Install each cover on the connector.

CAUTION: THE COVER MUST BE INSTALLED BEFORE POWER IS APPLIED TO THE CONNECTOR. IF THE COVER IS NOT INSTALLED WHEN POWER IS APPLIED, ELECTRICAL SHOCK OR DAMAGE TO EQUIPMENT CAN OCCUR.

Table 8
OBSOLETE CONTACT REMOVAL TOOLS

Obsolete Removal Tool		Replacement Removal Tool	
Part Number	Supplier	Part Number	Supplier
HT-2285	Molex	11-03-0002	Molex

- (1) Make a selection of a contact removal tool from Table 7.
- (2) At the rear of the connector, push the wire of the contact assembly forward into the connector.
- (3) Hold the contact assembly forward in the contact cavity.
- (4) Axially align the removal tool with the contact cavity at the engaging face of the connector.
- (5) At the engaging face of the connector, push the tool into the contact cavity until the contact moves out from the rear of the connector. Refer to Figure 4.

NOTE: The retractable spring-loaded tube of the removal tool must compress the retention clips on the sides of the contact before the solid center pin of the tool can push the contact from the connector.

CONTACT REMOVAL
Figure 4

STANDARD WIRING PRACTICES MANUAL

MOLEX 03-06-(), 1625-(), AND AIRFONE AFP30-005()-AA CONNECTORS

(6) Carefully remove the tool from the contact cavity.

3. WIRE PREPARATION

A. Preparation of GTE Airfone Coaxial Cable

PREPARATION OF GTE AIRFONE COAXIAL CABLE
Figure 5

Refer to Figure 5.

- (1) Remove 1.00 inch ± 0.05 inch of the jacket from the end of the cable.
- (2) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the jacket equal to 0.38 inch ± 0.03 inch.
- (3) Remove 0.13 inch ± 0.03 inch of the dielectric from the end of the cable.
- (4) Make a selection of an AWG 20 wire for a shield ground wire. Refer to Subject 20-10-15 for the type of wire.
- (5) Cut a 3.0 inch ± 0.1 inch length of the shield ground wire.
- (6) Assemble the shield ground wire on the shield of the coax cable with a solder sleeve. Refer to Subject 20-10-15.
Make sure that the shield ground wire makes an exit from the solder sleeve away from the end of the coax cable.
- (7) Assemble a contact on the end of the shield ground wire. Refer to Paragraph 4.A.
- (8) Assemble a contact on the conductor of the coax cable. Refer to Paragraph 4.A.

4. CONNECTOR ASSEMBLY

(1) Make a selection of a crimp tool from Table 10.

20-64-17

STANDARD WIRING PRACTICES MANUAL

MOLEX 03-06-(), 1625-(), AND AIRFONE AFP30-005()-AA CONNECTORS

(2) For AWG 20, 22 and 24 wire, make a selection of a heat shrinkable sleeve from Table 9.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

Make sure that the sleeve has the smallest diameter that can be moved freely on the wire.

(3) Align the forward end of the sleeve with the end of the wire insulation. Refer to Figure 6.

POSITION OF THE HEAT SHRINKABLE SLEEVE

Figure 6

(4) Remove 0.15 inch \pm 0.01 inch of the insulation from the end of the wire.

(5) Shrink the sleeve in its position on the wire. Refer to Subject 20-10-14.

(6) Put the contact into the correct die cavity of the tool.

Refer to:

- Table 10 for the correct die cavity
- Figure 7 for the position of the contact in the tool.

POSITION OF THE CONTACT IN THE DIE OF THE CRIMP TOOL

Figure 7

(7) Close the jaws of the tool until the pressure on the contact is only sufficient to hold the contact in its position in the tool.

(8) Put the end of the wire in the contact. Refer to Figure 8.

Make sure that:

- The conductor is between the conductor tabs
- The insulation is between the insulation grip tabs
- The forward end of the insulation is against the edge of the wire crimp die.

STANDARD WIRING PRACTICES MANUAL

MOLEX 03-06-(), 1625-(), AND AIRFONE AFP30-005()-AA CONNECTORS

POSITION OF THE END OF THE WIRE IN THE CONTACT
Figure 8

- (9) Crimp the contact.
- (10) If it is necessary, while the contact assembly is in the crimp tool, and after the crimp operation is completed, make the terminal straight.
- (11) Remove the contact from the tool.
- (12) Examine the contact. Refer to Figure 9.

COMPLETED CONTACT ASSEMBLY
Figure 9

NOTE: Cuts of the wire insulation in the insulation grip area of the contact assembly are permitted.

	Plastic	M81969/14-04	White
		MS27534-12	White

NOTE: For plastic tools, the color given in Table 3 is the color of the removal end of the combination tools that are both insertion and removal tools.

- (1) Make a selection of a contact removal tool from Table 2.

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. A REMOVAL TOOL THAT HAS A DEFECT CAN CAUSE DAMAGE TO THE GROMMET OR THE RETENTION CLIP.

NOTE: The tools specified in Table 3 are satisfactory alternative.

- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) At the rear of the connector, put the removal tool on the wire.
- (4) Axially align the removal tool and the contact cavity.
- (5) Carefully push the removal tool into the rear of the contact cavity until it stops.

CAUTION: DO NOT ROTATE THE TOOL OR SPREAD THE TOOL TIPS WHILE THE TOOL IS STILL IN THE GROMMET.

- (6) Carefully pull the wire and the removal tool from the contact cavity at the same time.

Make sure that the removal tool and the contact cavity stay axially aligned.

- (7) If the contact does not release:
 - (a) Pull the removal tool out of the contact cavity.
 - (b) Turn the removal tool approximately 90 degrees.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF M39029/57-() SOCKET CONTACTS FOR WINDOW HEAT CONNECTORS

(c) Do Step (3) through Step (6) again.

3. CONNECTOR ASSEMBLY

A. Contact Assembly

**Table 4
INSULATION REMOVAL LENGTH**

Wire Size (AWG)	Contact Size	Removal Length L (inch)		
		Maximum	Target	Minimum

		MS3191-1	-	11-7771-43	-	-
		ST2220-1-Y	-	ST2220-1-3	-	-

- (1) Make a selection of a crimp tool from Table 5.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 2
- Table 4 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF M39029/57-() SOCKET CONTACTS FOR WINDOW HEAT CONNECTORS

INSULATION REMOVAL LENGTH

Figure 2

(3) Put the end of the conductor in the crimp barrel of the contact. Refer to Figure 3.

Make sure that:

- All the conductor strands are in the crimp barrel
- The conductor strands are visible in the inspection hole of the contact
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE CONDUCTOR IN THE CRIMP BARREL OF THE CONTACT

Figure 3

(4) Crimp the contact.

Make sure that:

- All the conductor strands are in the crimp barrel
- The conductor strands are visible in the inspection hole of the contact
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

B. Contact Insertion

		MS27495A12	Yellow
		RX12-8	Yellow
	Plastic	M81969/14-04	Yellow
		MS27534-12	Yellow

NOTE: For metal tools, the color given in Table 7 is the color code on the handle of the tool.

NOTE: For plastic tools, the color given in Table 7 is the color of the insertion end of the combination tools that are both insertion and removal tools.

- (1) Make a selection of an insertion tool from Table 6.

CAUTION: DO NOT USE DAMAGED TOOLS.

NOTE: The tools specified in Table 7 are satisfactory alternative.

- (2) Lubricate the rear grommet of the connector with isopropyl alcohol.

CAUTION: DO NOT PUT THE CONNECTOR GROMMET OR CONTACT ASSEMBLY FULLY INTO THE ALCOHOL. TOO MUCH LUBRICANT CAN CAUSE DAMAGE TO THE CONNECTOR.

- (3) Put the contact assembly in the insertion tool.
- (4) Axially align the insertion tool and the contact cavity at the rear of the connector.
- (5) Carefully push the contact assembly into the contact cavity until it stops.

Make sure that the insertion tool stays axially aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF M39029/57-() SOCKET CONTACTS FOR WINDOW HEAT CONNECTORS

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the tool out of the contact cavity.
Make sure that the tool and the contact cavity stay axially aligned.
- (7) Lightly pull the wire to make sure that the contact is locked in the connector.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

NOTE: The part of the part number within the parentheses in Table 7 must be the same for the specified connector and the alternative connector.

NOTE: The coax contacts for the connectors from the different manufacturers in Table 7 are not interchangeable.

B. Connector Shell Styles

DPXB()34() AND DPXB()33() - SINGLE INSERT CONNECTOR SHELLS WITH POLARIZATION
Figure 8

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

DPX2()34B() AND DPX2()33B() - TWO INSERT CONNECTOR SHELLS WITH POLARIZATION
Figure 9

DPXA()34() AND DPXA()33() - SINGLE INSERT CONNECTOR SHELLS WITHOUT POLARIZATION
Figure 10

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

DPX3()34B() AND DPX3()33B() - THREE INSERT CONNECTOR SHELLS WITH POLARIZATION
Figure 11

C. Contact Part Numbers

This paragraph gives the part numbers for rear release, rear removable, crimp type contacts.

EXAMPLE OF CONTACT SIZE
Figure 12

NOTE: The size 2020HD high density contact has a size 20 engaging end and a size 20 crimp barrel.

2. PROTECTIVE CAP PART NUMBERS AND DESCRIPTION

A. General Data

Protective caps are used on DPA, DPD, and DPX connectors:

- To keep contamination from the contacts
- To prevent damage that can be caused by electrostatic discharge (ESD)
- To prevent mechanical damage.

B. Protective Cap Part Numbers

**Table 17
CONDUCTIVE PROTECTIVE CAP PART NUMBERS**

Connector		Protective Cap

249-5027-004	3	Mechanical Assembly	-	-
249-9104-000	-	-	CET-C11	-

NOTE: Some coax contacts, and contacts in solder type connectors are not removable from some connectors. Refer to:

- Table 1 for the connector part number
- Table 13 for the coax contact part number
- Table 20 for the DPA insert configuration
- Table 22 for the DPD insert configuration
- Table 24 for the DPX insert configuration.

- (1) If the contact is in a DPX AC3 insert, refer to Paragraph 4.C. for the procedure to remove the contacts from the insert.
- (2) If the contact is a snap-in, non-removable contact, refer to Paragraph 4.D. for the procedure to replace the contact.
- (3) If a contact removal tool is specified, make a selection of a removal tool from:
 - Table 25 for the removal of standard contacts
 - Table 26 for the removal of coax contacts.
- (4) If the contact removal tool specified in Table 26 is the CET-C4 front release, impact extraction tool, refer to Paragraph 4.B. for the procedure to remove a Ring-Loc contact.
- (5) At the rear of the connector, put tip of the rear release removal tool on the wire. Refer to Figure 48.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

POSITION OF THE WIRE IN THE REMOVAL TOOL
Figure 48

- (6) Put the wire through the forward part of the tool. Refer to Figure 49.

POSITION OF THE WIRE IN THE FORWARD PART OF THE REMOVAL TOOL
Figure 49

- (7) Align the removal tool and the contact cavity.
(8) Push the tool into the contact cavity until it stops. Refer to Figure 50.
Make sure to keep the tool aligned with the contact cavity.

REMOVAL TOOL FULLY INSERTED IN THE CONTACT CAVITY
Figure 50

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN THE TOOL IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (9) Carefully pull the wire and the tool from the contact cavity at the same time. Refer to Figure 51.
Make sure to keep the tool aligned with the contact cavity.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

TOOL AND CONTACT REMOVED FROM THE CONTACT CAVITY
Figure 51

- (10) If the contact is not released:
- (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees on its axis.
 - (c) Do Step (6) through Step (9) again.

B. Removal of Front Release Ring-Loc Coax Contacts

NOTE: This procedure is applicable for the removal of size 5 Ring-Loc coax contacts in the 32W2 or the 40W1 contact configurations in DPX connectors. Refer to:

- Table 13 for the coax contact
- Table 24 for the DPX insert configuration.

Table 27
NECESSARY TOOLS

Description	Supplier
CET-C4 Impact Extraction Tool	ITT Cannon
Hammer or Mallet	an available source

- (1) Push the seal sleeve and the support bushing back on the cable away from the connector.
- (2) At the front face of the connector, put the CET-C4 contact removal tool on the engaging end of the contact.
- (3) Push the tool into the connector until it stops.
- (4) Tap the end of the tool with a hammer until the contact is released.

CAUTION: APPLY ONLY THE SUFFICIENT AMOUNT OF FORCE NECESSARY TO RELEASE THE CONTACT.

- (5) Carefully pull the contact assembly from the rear of the connector.

C. Removal of Coax Contacts from the DPX AC3 Insert

Table 28
NECESSARY TOOLS

Description	Supplier
Snap Ring Pliers	An available source
Screwdriver	An available source

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CONTACT REMOVAL FROM THE DPX AC3 INSERT

Figure 52

Refer to Figure 52:

- (1) Remove the retainer plate screws and washers.
Make sure to keep the screws and washers for the reassembly of the connector.
- (2) Move the retainer plate away from the connector and rearward on the cables.
- (3) Push on the engaging end of the contacts to move the contacts rearward in the connector.
- (4) Pull the insert rear and the three coax contacts rearward from the connector.
- (5) Remove the small coax contacts from the slots in the insert rear.
- (6) Remove the small coax contacts from the retainer plate.
- (7) Make a selection of a snap-ring pliers from Table 28.
- (8) Use the snap-ring pliers to remove the C-clip from the large coax contact.
- (9) Remove the spring from the front of the large coax contact.
- (10) Push the large coax contact rearward through the insert rear.
- (11) Remove the large coax contact from the retainer plate.

D. Replacement of Snap-In, Non-Removable Contacts

NOTE: Some contacts are identified as snap-in, non-removable. Refer to:

- Table 13 for the coax contact part number
- Table 20 for the DPA insert configuration
- Table 22 for the DPD insert configuration
- Table 24 for the DPX insert configuration.

- (1) If a snap-in, non-removable contact has damage, the connector must be replaced:
 - (a) Cut the cable at the rear of the connector as close to the non-removable contact as possible.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (b) Assemble a new contact on the end of the cable.
- (c) Install the new contact assembly in the correct cavity of the new connector.
- (d) Do Step (a) through Step (c) for the remainder of the snap-in, non-removable contacts in the connector.
- (e) Remove a removable contact from the old connector.
- (f) Install the contact in the correct cavity in the new connector.
- (g) Do Step (e) and Step (f) for the remainder of the removable contacts in the old connector.

5. CONTACT ASSEMBLY

A. Contact Assembly

This paragraph gives the procedures to assemble crimp type contacts to stranded wire. Refer to:

- Paragraph 5.B. for the procedures to assemble crimp contacts to solid conductor wire
- Subject 20-40-00 for the procedures to assemble connectors that have non-removable solder type contacts.

**Table 29
NECESSARY MATERIALS**

Material	Part Number	Description	Supplier
Sleeve, Heat Shrinkable	TFE 4X	3/16 inch diameter	Chemplast
			Zeus Industrial Products
		1/4 inch diameter	Chemplast
			Zeus Industrial Products

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

HEX TYPE CONTACT CRIMP TOOLS

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool		
		Basic Unit	Primary Die	Secondary Die
8	8	13642	ST2354-5	11732

- (1) Remove the necessary length of insulation from the end of the wire or wires.

Refer to:

- Figure 53
- Table 30 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

NOTE: If the wire size and a larger crimp barrel are not given in Table 30, refer to Subject 20-60-00.

INSULATION REMOVAL LENGTH
Figure 53

- (2) If it is specified, fold the conductor back. Refer to Figure 54.

CONDUCTOR FOLDED BACK
Figure 54

- (3) Make a selection of the applicable contact from Table 8 or Table 9.
(4) If filler wire is specified, put the conductor of the filler wire in the crimp barrel of the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (5) Make a selection of a crimp tool from:
 - Table 34 for DPA 031-9174-003 contacts that have two wires in the crimp barrel
 - Table 32 for DPD and DPX contacts that have two wires in the crimp barrel
 - Table 31 or Table 34 for size 0808 contacts
 - Table 31 for contacts that have one wire in the crimp barrel.
- (6) Put the end of the wire or wires in the crimp barrel of the contact. Refer to Figure 55.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- If two wires are to be terminated in the same contact, all of the strands of the conductors from both wires are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CONTACT

Figure 55

- (7) If the contact size is 0808, and the crimp tool is a hex type crimp tool:
 - (a) Put the contact and the wire into the primary die of the crimp tool.
Make sure that the end of the crimp barrel that is adjacent to the insulation of the wire is 0.02 to 0.03 inch past the edge of the die. Refer to Figure 56.

POSITION OF THE CONTACT AND WIRE IN THE HEX CRIMP TOOL DIE

Figure 56

- (b) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (c) Turn the contact approximately 60 degrees.
 - (d) Do Step (a) and Step (b) with the secondary die.
 - (e) Remove the contact assembly from the crimp tool.
 - (f) Turn the contact approximately 60 degrees.
 - (g) Put the contact in the crimp tool.
 - (h) Crimp the contact with the secondary die again to remove the unwanted metal from the outer surface of the crimp barrel of the contact.
- (8) If the crimp tool is an indenter type tool, crimp the contact.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 0808 or larger contact that has an adapter sleeve in the crimp barrel.

- (9) If the contact has a filler wire, carefully remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 57.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE

Figure 57

CAUTION: DO NOT CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR OF THE PRIMARY WIRE. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (10) If the pin or socket contact is size 0406 or 0808, install the heat shrinkable sleeve:
- (a) Make a selection of a heat shrinkable sleeve from Table 29.
Make sure that the sleeve has the smallest diameter that will let the sleeve move easily on the cable jacket and on the contact crimp barrel.
 - (b) Put a 1.00 inch \pm 0.13 inch length of the sleeve on the wire and on the rear of the contact. Refer to Figure 58.
Make sure that:
 - The sleeve is on the wire insulation and on the crimp barrel of the contact
 - The forward end of the sleeve is 0.20 inch \pm 0.03 inch from the rear edge of the shoulder of the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE SIZE 0808 OR SIZE 0406 CONTACT
Figure 58

(c) Shrink the sleeve into its position. Refer to Subject 20-10-14.

B. Assembly of a Contact with Solid Conductor Wire

This paragraph gives the procedure to assemble size 2020 and size 2020HD contacts with solid conductor wire and, if necessary, stranded filler wire.

NOTE: Only stranded wire can be used for the filler wire.

- (1) Make a selection of a filler wire size from Table 36.
- (2) Make a selection of a crimp tool from Table 37.
- (3) Remove the necessary length of insulation from the end of the solid conductor wire.
Refer to:
 - Table 35 for the insulation removal length
 - Subject 20-00-15 for the insulation removal procedures.
- (4) If a filler wire is specified, remove 0.5 inch of insulation from the end of the filler wire.
Refer to Subject 20-00-15 for the insulation removal procedures.
- (5) Put the conductor in the crimp barrel of the contact.
 - (a) If filler wire is not specified, put the end of the solid conductor wire in the crimp barrel of the contact.
 - (b) If filler wire is specified, put the end of the solid conductor wire and the filler wire in the crimp barrel of the contact.
Make sure that:
 - All of the strands of the filler wire and the solid conductor are in the crimp barrel of the contact
 - The strands of the conductors are visible in the inspection hole of the contact
 - The distance between the end of the crimp barrel and the insulation of the wire is a maximum of 0.03 inch.
- (6) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (7) If the contact has a filler wire, remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 59.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 59

C. Assembly of an AWG 24 to AWG 18 Wire in a Size 12 or Larger Solder Contact

This paragraph gives the procedure to terminate one AWG 16, 18, 20, 22, or 24 wire in a non-removable, size 12 or larger solder contact.

	WA22HPB	Power	D30	-
	WA27XF	Power	TP904	-
	WA27FAP	Power	AP27SA	-

- (1) Make a selection of a BACC47DE contact from Table 40.
Use the wire AWG size and the wire insulation diameter to make the selection.
- (2) Make a selection of a crimp tool from Table 42.
- (3) Make a selection of a heat shrinkable sleeve from Table 38.
Make sure that the sleeve has the smallest diameter that will let the sleeve move easily on the solder cup of the large gage non-removable contact.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Put a 2.5 inch ± 0.25 inch length of the heat shrinkable sleeve on the wire.
- (5) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 60
- Table 39 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH

Figure 60

- (6) Put the end of the wire into the crimp barrel of the BACC47DE contact.
Make sure that:

- All of the conductor strands are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact
- The wire insulation is in the insulation grip area of the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 61

(7) Crimp the contact.

Make sure that:

- The contact crimp barrel has four crimp indents
- The insulation grip has four crimp indents.

BACC47DE CONTACT ASSEMBLY
Figure 62

(8) Solder the engaging end of the BACC47DE contact in the solder cup of the large gage solder contact. Refer to Figure 63 and Figure 64.

Make sure that a solder fillet is fully around the engaging end of the contact.

TERMINATION COMPONENTS
Figure 63

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CONFIGURATION OF THE SOLDER TERMINATION
Figure 64

- (9) Push the heat shrinkable sleeve forward on the wire and on the solder cup until the sleeve is against the rear surface of the connector. Refer to Figure 65.

Make sure that the distance between the forward end of the heat shrinkable sleeve and the rear surface of the connector is 0.06 inch maximum.

- (10) Shrink the sleeve into its position.

Refer to:

- Figure 65.
- Subject 20-10-14.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 65

6. ASSEMBLY OF COAX CONTACTS

A. Assembly of 249-0268-000 and 249-0750-000 Contacts for DPX Connectors

- (1) Make a selection of the inner and outer ferrules from Table 15.
- (2) Remove the identification color dye from the outer ferrule.
- (3) Tin the external surface of the outer ferrule.

Make sure that the solder:

- Is applied to 1/3 the length of the ferrule from one end
- Extends around the circumference of the ferrule.

- (4) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.

Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.

- (5) Put a 1.13 inch ±0.05 inch length of the sleeve on the cable jacket.
- (6) Put the outer ferrule on the cable. Refer to Figure 67.

Make sure that the tinned end points to the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

PREPARATION OF THE FERRULE
Figure 67

- (7) Prepare the cable:
Refer to Figure 68 and Table 44.

CABLE PREPARATION
Figure 68

- (a) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.
- CAUTION:** MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.
- (b) Push the end of the shield back.
- (c) Put the inner ferrule on the cable so that the ferrule is:
- Under the shield
 - Against the end of the jacket.
- (d) Put the shield on the inner ferrule.
Make sure that the shield strands are even and symmetrical around the ferrule.
- (e) Cut the shield at the end of the ferrule.
- (f) Remove the necessary length of the dielectric to make the distance from the end of the inner ferrule to the end of the dielectric equal to Dimension B.
- (g) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (8) Tin the conductor.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (9) Put the conductor in the solder barrel of the inner contact.
Make sure the rear end of the contact is against the dielectric.

COAX CONTACT ASSEMBLY
Figure 69

- (10) Solder the contact.

CAUTION: DO NOT PUT MORE THAN THE NECESSARY QUANTITY OF SOLDER ON THE CONTACT AND CONDUCTOR. UNWANTED SOLDER ON THE INNER CONTACT CAN PREVENT THE INSERTION OF THE CONTACT INTO THE INSULATOR.

- (11) Make a selection of a ferrule crimp tool from Table 45.
- (12) Push the wired inner contact into the coax contact. Refer to Figure 69.
Make sure that the end of the coax contact is against the inner ferrule.
- (13) Push the outer ferrule against the shoulder of coax contact.
- (14) Remove the coax contact from the inner contact.
Make sure that the position of outer ferrule is not changed.
- (15) Crimp the outer ferrule.
- (16) Tin the external surface of the smaller end of the coax contact.
- (17) Push the inner contact into the coax contact until the areas that have solder touch. Refer to Figure 69.
- (18) Apply heat to melt the solder.

CAUTION: DO NOT ADD MORE SOLDER.

- (19) Move the heat shrinkable sleeve on the contact assembly.
Make sure that the end of the sleeve is aligned with the engaging end of the coax contact.
- (20) Shrink the sleeve into its position. Refer to Subject 20-10-14.
Make sure that the distance between the end of the sleeve and the end of the coax contact is less than 0.06 inch.

B. Assembly of 249-0366-000 and 249-0398-000 Contacts for DPD Connectors

- (1) Make a selection of Teflon heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure to use a sleeve that has the smallest diameter that can be moved on the cable jacket and below the inner ferrule.
- (2) Put a 0.56 inch \pm 0.06 inch length of the sleeve on the cable jacket. Refer to Figure 67.
- (3) Make a selection of the inner and outer ferrules from Table 15.
- (4) Remove the identification color dye from the outer ferrule.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (5) Tin the external surface to the outer ferrule.
Make sure that the solder:
 - Is applied to 1/3 the length of the ferrule from one end
 - Extends around the circumference of the ferrule.
- (6) Put the outer ferrule on the cable.
- (7) Prepare the cable.
Refer to Figure 70 and Table 44.

CABLE PREPARATION
Figure 70

- (a) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.
- (b) Push the end of the shield back on the cable.
- (c) Put the inner ferrule on the cable.
- (d) Push the inner ferrule on the heat shrinkable sleeve and below the shield until the ferrule is against the cable jacket.
- (e) Put the shield on the inner ferrule.
Make sure that the shield strands are even and symmetrical around the ferrule.
- (f) Remove the unwanted length of the shield strands that extend beyond the forward end of the inner ferrule.
- (g) Remove the necessary length of the dielectric to make the distance from the end of the inner ferrule to the end of the dielectric equal to Dimension B.
- (h) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (8) Tin the center conductor. Refer to Figure 71.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

COAX CONTACT CONFIGURATION
Figure 71

- (9) Make a selection of a ferrule crimp tool from Table 45.
- (10) Remove the solder cup access cover from the coax contact type R adapter.
- (11) Discard the type R adapter.
- (12) Put the contact on the coax cable.
- (13) Push the contact solder cup against the dielectric.
- (14) Push the outer ferrule against the shoulder of the outer coax contact.
- (15) Remove the coax cable and the outer ferrule from the coax contact.
 Make sure that the position of outer ferrule does not change.
- (16) Crimp the outer ferrule. Refer to Figure 72.

POSITION OF THE OUTER FERRULE
Figure 72

- (17) Put the heat shrinkable sleeve on the dielectric and below the inner ferrule.
- (18) Tin the smaller end of the contact.
- (19) Put the cable conductor into the solder barrel of the inner contact.
 Make sure that the dielectric is against the inner contact.
- (20) Solder the conductor to the inner contact.
- (21) Put the solder cup access cover on the contact.
- (22) Push the outer ferrule against the smaller end of coax contact.
- (23) Apply heat and melt the solder.

CAUTION: DO NOT ADD MORE SOLDER. IT IS POSSIBLE THAT THE COMPONENTS WILL NOT FIT TOGETHER.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

C. Assembly of 249-1390-000 and 249-9104-000 Contacts with BA-5903 Cable

This paragraph give the procedure to assemble the contacts for these connectors:

- The DPA() and DPAMA() connectors with the 249-9104-000 contact
- The DPX() and DPXAMA() connectors with the 249-1390-000 contact.

249-1390-000 CONTACT CONFIGURATION
Figure 73

249-9104-000 CONTACT CONFIGURATION
Figure 74

- (1) Put the outer ferrule on the cable. Refer to Figure 73 and Figure 74.
Make sure that the end without the hole points forward to the end of the cable.
- (2) Prepare the cable:
Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

 - (c) Push the end of the shield back on the cable.
 - (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (3) Tin the conductor.
- (4) Put a 0.50 inch ±0.03 inch length of 1/8 inch diameter TFE-R heat shrinkable sleeve on the cable.
Make sure that the sleeve is on the dielectric and below the shield.

CAUTION: DO NOT USE THE SLEEVE THAT IS SUPPLIED WITH THE CONTACT.

- (5) Put the conductor in the solder cup of the contact.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

Make sure that the mill cut area on the solder cup is adjacent to the open side of the contact.

- (6) Solder the conductor to the solder cup.
- (7) Push the heat shrinkable sleeve on the contact until the end of the sleeve is against the shoulder of the contact.
- (8) Put the shield on the contact.

Make sure that the shield strands are even and symmetrical around the contact.

- (9) Push the outer ferrule forward on the shield until the ferrule is against the contact shoulder.
- (10) Remove the unwanted length of the shield strands that extend beyond the contact shoulder.
- (11) Solder the outer ferrule to contact through the hole in the ferrule.
- (12) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.

Make sure to use a sleeve that has the smallest diameter that can be moved on the cable jacket.

- (13) Put a sufficient length of the heat shrinkable sleeve on the cable.

Make sure that:

- The forward end of the heat shrinkable sleeve is against the shoulder of the contact
- The distance from the rear end of the heat shrinkable sleeve to the rear end of the outer ferrule is 0.50 inch minimum.

- (14) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. Assembly of 249-1398-000 and 249-1608-000 Contacts for DPX Connectors

COAX CONTACT CONFIGURATION
Figure 75

- (1) Tin the external surface of the rear barrel of the contact from the end of the contact to the shoulder.
- (2) Make a selection of the inner and outer ferrules from Table 15.
- (3) Remove the identification color dye from the inner ferrule.
- (4) Put the inner ferrule on the rear barrel of the coax contact.
- (5) Push the inner ferrule forward until it is against the contact shoulder.
- (6) Apply heat to the inner ferrule to melt the solder.

CAUTION: DO NOT ADD MORE SOLDER. IT IS POSSIBLE THAT THE COMPONENTS WILL NOT HAVE THE CORRECT FIT.

- (7) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.
- (8) Put a 1.13 inch minimum length of the heat shrinkable sleeve on the cable jacket.
- (9) Put the outer ferrule on the cable.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (10) Prepare the cable:

Refer to Figure 66 and Table 44.

- (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
- (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Push the end of the shield back on the cable.
- (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.

- (11) Tin the center conductor of the cable.

- (12) Put the conductor in the solder barrel of center contact.

Make sure that the distance between the rear end of the contact and the dielectric is 0.03 inch maximum.

- (13) Solder the contact and the conductor.

CAUTION: DO NOT LET THE END OF THE CONTACT TO TOUCH THE DIELECTRIC AT THE SAME TIME THAT THE SOLDER IS APPLIED.

- (14) Make a selection of a ferrule crimp tool from Table 45.

- (15) Push the conductor and center contact into the outer contact until the end of the conductor is against the contact.

- (16) Put the shield on the inner ferrule.

Make sure that the shield strands are even and symmetrical around the inner ferrule.

- (17) Push the outer ferrule forward on the shield. Refer to Figure 76.

Make sure that distance from the forward end of the inner ferrule to the forward edge of the outer ferrule is 0.06 inch maximum.

COAX CONTACT ASSEMBLY
Figure 76

- (18) Crimp the outer ferrule.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (19) Remove the unwanted length of the shield strands that extend beyond the forward end of the outer ferrule.
- (20) Push the heat shrinkable sleeve on the contact until the forward end of the sleeve is aligned with the forward end of the outer ferrule.
- (21) Shrink the sleeve into its position.
Refer to Figure 76 and Subject 20-10-14.

E. Assembly of 249-1400-000 and 249-1400-003 Contacts for DPX Connectors

- (1) Make a selection of inner and outer ferrules from Table 15.
- (2) Remove the identification color dye from the ferrules.
- (3) Tin the external surface of the inner ferrule.

Make sure that the solder:

- Is applied to 1/3 of the length of the ferrule from one end
- Extends around the circumference of the ferrule.

- (4) Tin the external surface of the larger end of the outer ferrule.

Make sure that the solder:

- Is applied to 1/3 of the length of the ferrule from the larger end
- Extends around the circumference of the ferrule.

- (5) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.

Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.

- (6) Put a 1.13 inch minimum length of heat shrinkable sleeve on the cable.
- (7) Put the outer ferrule on the cable Refer to Figure 77.

Make sure that the end of the ferrule that has the solder points forward to the end of the cable.

CENTER CONTACT ASSEMBLY
Figure 77

- (8) Make a selection of a ferrule crimp tool from Table 45.
- (9) Prepare the cable:
Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS**

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (10) Push the end of the shield away from the end of the cable.
- (11) Put the inner ferrule on the cable.
Make sure that end of the ferrule that has solder points forward to the end of the cable.
- (12) Push the inner ferrule under the shield until the inner ferrule is against the end of the cable jacket.
- (13) Remove the unwanted length of the shield strands that extend beyond the forward end of the inner ferrule.
- (14) Move the outer ferrule on the shield and the inner ferrule until 1/2 the length of the outer ferrule extends beyond the edge of the inner ferrule.
- (15) Crimp the 0.5 inch of the outer ferrule in the area that is on the inner ferrule.
- (16) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
Refer to Figure 66 and Table 44.
- (17) Push the Teflon insulator on the dielectric and the conductor until the end of the insulator is against the end of the ferrules.
Make sure that the end that has the larger diameter points to the ferrules.
- (18) Tin the center conductor.
- (19) Push the conductor into the solder barrel of the inner contact until the contact is against the Teflon insulator.
Make sure that the conductor can be seen in the contact inspection hole.
- (20) Solder the contact to the conductor. Refer to Figure 77.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY QUANTITY OF SOLDER. THE INNER CONTACT CANNOT BE INSTALLED IN THE OUTER CONTACT IF THERE IS TOO MUCH SOLDER ON THE INNER CONTACT.

- (21) Tin the rear surface of the rear barrel of the contact. Refer to Figure 78.
Make sure that the solder:
 - Is applied to one third of the length of the rear barrel at the rear
 - Extends around the circumference of the rear barrel.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

SOLDER AREA OF THE CONTACT
Figure 78

- (22) Put the inner contact into the outer contact.
 Make sure that the forward area of the outer ferrule that has solder is on the area of the rear barrel that has solder.
- (23) Apply heat and melt the solder. Refer to Figure 78.
CAUTION: DO NOT ADD MORE SOLDER. IT IS POSSIBLE THAT THE COMPONENTS WILL NOT HAVE THE CORRECT FIT.
- (24) Push the heat shrinkable sleeve on the rear barrel of the contact until the end of the sleeve is against the shoulder of the contact.
- (25) Shrink the sleeve into its position. Refer to Subject 20-10-14.
 Make sure that the distance between the forward end of the sleeve and the shoulder of the contact is 0.06 inch maximum.

F. Assembly of 249-1521-000 and 249-1522-000 Contacts

Table 46
SEAL RING PART NUMBERS

Coax Contact	Seal Ring	
	Part Number	Supplier
249-1521-000	075-90001-000	ITT Cannon
249-1522-000	075-90001-000	ITT Cannon

- (1) In this sequence, put these components on the cable:
 - The nut
 - The compression ring
 - The seal ring.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CAUTION: THE SEAL RING MUST BE REPLACED EACH TIME THE CONTACT IS ASSEMBLED; IT IS PERMANENTLY CHANGED WHEN THE COAX BODY AND NUT ARE TIGHTENED.

NOTE: If is necessary to replace a seal ring, make a selection from Table 46.

Refer to Figure 79.

POSITION OF THE COMPRESSION RING IN RELATION TO THE SEAL RING AND THE NUT
Figure 79

(2) Prepare the cable:

Refer to Figure 66 and Table 44.

- (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
- (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

(3) Put the braid ring on the cable. Refer to Figure 80.

Make sure that the end that has the smaller diameter points forward to the end of the cable.

LENGTH OF THE DIELECTRIC AND THE CONDUCTOR
Figure 80

- (4) Push the braid ring on the shield until it is against the cable jacket.
- (5) Move the strands of the shield apart.
- (6) Fold the strands shield back on the braid ring.

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS**

Make sure that the shield strands are even and symmetrical around the ring.

- (7) Remove the unwanted length of the shield strands that extend beyond the end of the braid ring. Refer to Figure 80.
- (8) Move the bushing on the dielectric until the bushing is against the shield.
- (9) Remove the necessary length of the dielectric to make the distance from the end of the bushing to the end of the dielectric equal to 0.03 inch \pm 0.02 inch.

CAUTION: MAKE SURE THAT NO DAMAGE OCCURS TO THE CONDUCTOR WHEN THE DIELECTRIC IS REMOVED. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (10) Remove the necessary length of conductor to make the distance from the end of the conductor to the end of the dielectric equal to 0.13 inch \pm 0.03 inch. Refer to Figure 80.
- (11) Remove the retention washer from the center contact.
- (12) Push the center conductor into the solder barrel of the center contact until the end of the contact is against the dielectric.

Make sure that all of the strands of the center conductor:

- Are in the solder barrel of the contact
- Can be seen in the inspection hole.

- (13) Solder the center conductor to the center contact through the inspection hole.

Make sure that the solder is even.

CAUTION: DAMAGE OCCURS WHEN THE BUSHING OR THE DIELECTRIC BECOME TOO HOT. DAMAGE CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (14) Push the insulator on the center contact until the insulator is against the bushing. Refer to Figure 81.

POSITION OF THE INSULATOR AND THE CONTACT RETENTION WASHER

Figure 81

- (15) Push the contact retention washer on the center contact until the washer moves into the groove on the center contact.

Make sure that the end of the seal ring is flat against the sharp edge of the compression ring.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

G. Assembly of 249-1598-000 Contacts for DPX Connectors

249-1598-000 CONTACT CONFIGURATION
Figure 82

- (1) Make a selection of the inner and outer ferrules from Table 15.
- (2) Remove the identification color dye from the inner ferrule.
- (3) Tin the contact from the end of the rear barrel of the contact to the shoulder. Refer to Figure 82.
- (4) Put the inner ferrule on the rear barrel.
 Make sure that the ferrule is against the shoulder.
- (5) Apply heat and melt the solder.

CAUTION: DO NOT ADD MORE SOLDER. IT IS POSSIBLE THAT THE COMPONENTS WILL NOT HAVE THE CORRECT FIT.

- (6) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
 Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.
- (7) Put a 1.13 inch minimum length of a heat shrinkable sleeve on the cable.
- (8) Put the outer ferrule on the cable.
- (9) Prepare the cable:
 Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Push the end of the shield back on the cable.
- (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (10) Solder the contact to the conductor:
 - (a) Apply heat to the solder cup to melt solder in the solder cup.
 - (b) Put the conductor into the solder cup.
 - (c) Remove the source of the heat to let the solder cup become solid.
- (11) Make a selection of a ferrule crimp tool from Table 45.
- (12) Put the shield on the inner ferrule.
 Make sure that the shield strands are even and symmetrical around the ferrule.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (13) Move the outer ferrule on the shield to make the distance from the forward edge of the outer ferrule to the forward edge of the inner ferrule equal to 0.06 inch maximum. Refer to Figure 83.

POSITION OF THE OUTER FERRULE ON THE INNER FERRULE

Figure 83

- (14) Crimp the outer ferrule.
- (15) Remove the unwanted length of the shield strands that extend beyond the forward edge of the outer ferrule.
- (16) Put the heat shrinkable sleeve on the ferrule and the center contact. Refer to Figure 83. Make sure that the end of the sleeve extends rearward farther than the contact.
- (17) Shrink the sleeve into its position. Refer to Subject 20-10-14.

H. Assembly of 249-1632-000 and 249-1634-000 Shielded Contacts

249-1634-000 CONTACT CONFIGURATION

Figure 84

- (1) Put the crimp ring on the cable. Refer to Figure 84.
- (2) Prepare the cable:
Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.
- (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CAUTION: MAKE SURE THAT DAMAGE TO THE CONDUCTOR DOES NOT OCCUR. IF THE CONDUCTOR IS CUT SO THAT THE BASE METAL CAN BE SEEN, THE CONDUCTOR CAN GIVE UNSATISFACTORY PERFORMANCE.

- (3) Tin the conductor.
- (4) Fold the shield back on the cable jacket.
- (5) Push the rear insulator on the dielectric until the end of the insulator is against the shield.
- (6) Put the conductor in the solder barrel of the center contact.
Make sure that contact is against the dielectric.
- (7) Solder the center contact to the conductor through the inspection hole. Refer to Subject 20-40-00.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT FOR LONGER THAN THE NECESSARY AMOUNT OF TIME TO MELT THE SOLDER.

- (8) Make a selection of a crimp tool from Table 45.
- (9) Push the center contact assembly into the outer contact.
- (10) Fold the shield forward on the rear insulator.
Make sure that the shield is even and symmetrical around the contact.
- (11) Push the crimp ring on the shield until the ring is against the contact.
- (12) Crimp the crimp ring.

I. Assembly of 249-1634-000 Contacts with BMS 13-65 Type OE or S280W503-1 Cable

249-1634-000 CONTACT CONFIGURATION
Figure 85

- (1) Put the outer ferrule on the cable. Refer to Figure 85.
Make sure that the end of the ferrule that has the larger hole points forward to the end of the cable.
- (2) Prepare the cable:
Refer to Table 44 for the trim dimensions.
 - (a) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

JACKET REMOVAL LENGTH

Figure 86

- (b) Open the end of each shield.
- (c) Move the strands of the flat shield apart.
- (d) Make the strands of the flat shield straight.
- (e) Fold each shield away from the end of the cable jacket.
- (f) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.

DIELECTRIC REMOVAL LENGTH

Figure 87

- (3) Put the rear insulator on the cable.

Make sure that:

- The smaller end of the insulator points to the end of the cable
- The larger end is against the shield.

Refer to Figure 88.

POSITION OF THE REAR INSULATOR AGAINST THE SHIELD

Figure 88

- (4) Put the conductor in the solder barrel of the center contact so that the conductor touches the bottom of the solder barrel.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

Make sure that all of the strands of the conductor:

- Are in the contact solder barrel
 - Can be seen in the inspection hole of the contact.
- (5) Push the center contact until it is against the rear insulator.
- (6) Solder the center contact to the conductor through the inspection hole. Refer to Subject 20-40-00.

CENTER CONTACT SOLDERED TO THE CONDUCTOR

Figure 89

- (7) Make a selection of a ferrule crimp tool from Table 45.
- (8) Find the crimp tool settings in Table 47.
- Make sure that the die opening is 0.202 inch between the flat sides of the closed hex crimp die.

**Table 47
CRIMP TOOL SETTINGS**

Crimp Tool	Setting
CCTDM	C
M22520/5-01	A

- (9) Put the center contact assembly into the outer contact. Refer to Figure 90.
- Make sure that the rear insulator is against the outer contact.

POSITION OF THE OUTER CONTACT

Figure 90

- (10) Put the flat shield on the round shield.
- Make sure that the shield is even and symmetrical around the rear barrel of the outer contact.
- (11) Put the round shield on the rear barrel of the outer contact.
- Make sure that the shield is even and symmetrical around the rear barrel of the outer contact.
- (12) Cut the strands of the shield to make the distance from the end of the shield strands to the rear end of the outer contact equal to 0.03 inch maximum. Refer to Figure 91.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

LENGTH OF SHIELD
Figure 91

- (13) Push the outer ferrule on the shield and the rear barrel of the outer contact until it is against the body of the outer contact.
- (14) Crimp the outer ferrule. Refer to Figure 92.
Make sure that the distance between the forward end of the ferrule and the outer contact is 0.05 inch maximum.

POSITION OF THE OUTER FERRULE
Figure 92

- (15) Remove the unwanted length of the shield strands that can be seen.

J. Assembly of 249-1634-000 Contacts with 10-60875-() AWG 20 Shielded Cable

This paragraph give the procedure to assemble the contact for:

- The DPXM() connectors
- The DPX2M() connectors.

249-1634-000 CONTACT CONFIGURATION
Figure 93

- (1) Put the outer ferrule on the cable. Refer to Figure 93.
Make sure that the end of the ferrule that has the larger hole points to the end of the cable.
- (2) Prepare the cable:
Refer to Figure 66 and Table 44.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (a) Remove the necessary length of the cable jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (b) Push the end of the shield back on the cable.
(c) Remove a 0.38 inch \pm 0.06 inch length from the end of the cable.
(d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (3) Tin the conductor.
(4) Make a selection of a crimp tool from Table 45.
(5) Move the strands of the shield apart.
(6) Put the rear insulator on the dielectric. Refer to Figure 94.

Make sure that:

- The smaller end of the insulator points forward to the end of the cable
- The shield is on the rear insulator.

POSITION OF THE REAR INSULATOR
Figure 94

- (7) Put the conductor in the solder barrel of the center contact.
(8) Solder the center contact to the conductor.
(9) Push the center contact assembly into the outer contact until it stops.
Make sure that the end of the insulator is against the contact.
(10) Put the shield on the rear barrel of the outer contact.
Make sure that the shield is even and symmetrical around the rear barrel.
(11) Cut the ends of the shield strands to make the distance from the end of the shield strands to the beveled edge of the outer contact equal to or less than 0.03 inch. Refer to Figure 95.

LOCATION OF THE END OF THE SHIELD
Figure 95

- (12) Push the outer ferrule on the shield.
Make sure that the ferrule is against the beveled edge of the outer contact.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (13) Crimp the outer ferrule.
- (14) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.
Make that the sleeve has the smallest diameter that can be moved on the cable jacket.
- (15) Put a 1.50 inch \pm 0.25 inch length of heat shrinkable sleeve on the assembly. Refer to Figure 96.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 96

- (16) Shrink the sleeve into its position. Refer to Subject 20-10-14.
Make sure that the distance from the forward end of the sleeve to the forward edge of the ferrule is 0.06 inch maximum.

K. Assembly of 249-1634-000 Contacts with BMS 13-42 and BMS 13-48 Wire

This paragraph gives the procedure to assemble the contacts with AWG 20 wire.

249-1634-000 CONTACT CONFIGURATION
Figure 97

Table 48
INSULATION REMOVAL LENGTH

Contact	Wire	Length L (inch)	
		Target	Tolerance
249-1634-000	BMS 13-42	0.16	\pm 0.03
	BMS 13-48	0.16	\pm 0.03

- (1) Put the outer ferrule on the wire.
Make sure that the end of the ferrule that has the larger hole points forward to the end of the wire.
- (2) Put the rear insulator on the wire.
Make sure that the end of the insulator that has the smaller hole points forward to the end of the wire.
- (3) Remove the necessary length of the insulation.
Make sure that the distance from the end of the insulation to the end of the wire is Length L.
Refer to Figure 98 and Table 48.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

INSULATION REMOVAL LENGTH

Figure 98

- (4) Put the conductor of the wire into the solder barrel of the center contact.
- (5) Solder the center contact to the wire.
- (6) Make a selection of a crimp tool from Table 45.
- (7) Put the center contact into the outer contact.
- (8) Push the rear insulator into the outer contact until the insulator is against the center contact.
- (9) Put the outer ferrule on the outer contact.
Make sure that the end of the ferrule is against the shoulder of the contact.
- (10) Crimp the outer ferrule.

L. Assembly of 249-1830-000 Size 7 Coax Contacts for the DPX AC3 Insert

**Table 49
NECESSARY MATERIALS**

Description	Part Number	Supplier
Thread Lock Compound	222	Loctite

**Table 50
NECESSARY TOOLS**

Description	Supplier
Torque tool	An available source

249-1830-000 CONTACT CONFIGURATION

Figure 99

- (1) Make a selection of a ferrule crimp tool from Table 45.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (2) Put these components on the cable in this sequence:
- The clamp nut
 - The outer ferrule.

Refer to Figure 99.

COMPONENTS ON THE CABLE
Figure 100

- (3) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable. Keep the discarded end of the cable for Step (4).
- (4) If the fit between the outside of the cable and the inside of the clamp nut can be improved with a layer of heat shrinkable sleeve on the cable:

NOTE: The clamp nut must be able to move and turn easily on a cable that has an increased diameter. It can be necessary to determine the fit between the clamp nut and a cable with an increased diameter on a short length of discarded cable.

- (a) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14. Make sure that the sleeve has the smallest diameter that can be moved on the cable.
- (b) Put a 2.00 inch \pm 0.13 inch length of the heat shrinkable sleeve on the cable.
- (5) Prepare the cable.

Refer to:

- Figure 66
- Table 44
- Figure 101.

CABLE PREPARATION
Figure 101

- (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
- (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.

20-71-11

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS**

- (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (6) Put the inner ferrule on the cable. Refer to Figure 102.

Make sure that no strands of the shield are between the dielectric and the inner ferrule.

Make sure that the inner ferrule is:

- On the dielectric
- Under the shield
- Against the end of the cable jacket.

**INNER FERRULE ON THE CABLE****Figure 102**

- (7) Put the strands of the shield on the inner ferrule.
- (8) Remove the unwanted length of the shield strands that extend beyond the rear edge of the shoulder of the inner ferrule.
- (9) Put the rear insulator on the cable. Refer to Figure 103.

Make sure that the rear insulator is against the cable dielectric.

**REAR INSULATOR ON THE CABLE****Figure 103**

- (10) Tin the conductor.
- (11) Put the conductor into the solder barrel of the center contact. Refer to Figure 104.
- Make sure that the conductor can be seen in the inspection hole of the contact.

**POSITION OF THE CENTER CONTACT****Figure 104**

- (12) Solder the contact to the conductor.
- (13) Push the outer ferrule forward on the shield and the inner ferrule until it is against the forward shoulder of the inner ferrule. Refer to Figure 105.

20-71-11

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS****OUTER FERRULE AGAINST THE SHOULDER OF THE INNER FERRULE****Figure 105**

- (14) Crimp the outer ferrule.
Make sure that 0.13 inch of the jacket is below the outer ferrule.
- (15) If the heat shrinkable sleeve is on the cable:
 - (a) Move the sleeve forward until the forward end of the heat shrinkable sleeve is against the rear end of the outer ferrule.
 - (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (16) Put the front insulator on the front of the center contact. Refer to Figure 106.
Make sure that the front insulator is against the rear insulator.

**FRONT INSULATOR ON THE CENTER CONTACT****Figure 106**

- (17) Make a selection of a thread lock compound from Table 49.
- (18) Apply a drop of thread lock compound to the threads of the clamp nut.
- (19) Engage the threads of the contact body and the clamp nut. Refer to Figure 107.

**POSITION OF THE CLAMP NUT IN THE COMPLETED CONTACT ASSEMBLY****Figure 107**

- (20) Hold the body of the contact and torque the clamp nut to 45 inch-pounds \pm 5 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

M. Assembly of 249-1858-000 Contacts with RG-115 Cable

249-1858-000 CONTACT CONFIGURATION

Figure 108

- (1) Remove the solder cup access cover from contact. Refer to Figure 108.
- (2) Put solder into the solder cup.
- (3) Tin the contact from the small end of the contact to the shoulder.
- (4) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.
- (5) Put a 2.00 inch ± 0.06 inch length of heat shrinkable sleeve on the cable.
- (6) Make a selection of the inner and outer ferrules from Table 15.
- (7) Put the outer ferrule on the cable.
- (8) Prepare the cable.
Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

 - (c) Push the end of the shield back on the cable.
 - (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (9) Remove the identification color dye from the inner ferrule.
- (10) Tin one end and the internal surface of the inner ferrule.
- (11) Make a selection of a ferrule crimp tool from Table 45.
- (12) Push the inner ferrule on the dielectric and below the shield braid.
Make sure that:
 - The tinned end is pointed forward to the end of the cable
 - The dielectric extends 0.25 inch ± 0.03 inch farther than the end of the ferrule.
- (13) Push the outer ferrule on the shield and the inner ferrule.
Make sure that 0.06 inch to 0.13 inch of the inner ferrule extends farther than the outer ferrule.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

Refer to Figure 108.

- (14) Crimp the outer ferrule.
- (15) Remove the unwanted length of the shield strands that extend beyond the end of the outer ferrule.
- (16) Solder the center contact:
 - (a) Hold the conductor on the solder cup of the contact.
 - (b) Apply heat to the inner contact and push the conductor into the contact at the same time.
 - (c) Remove the heat and hold the conductor in the contact until the solder becomes solid.

Make sure that the distance between the end of the dielectric and solder cup is less than 0.06 inch.
- (17) At the same time, apply heat to the inner ferrule and push the smaller end of the contact into the inner ferrule.
- (18) Remove the heat and hold the inner ferrule and the contact until solder becomes solid.
- (19) Put the solder cup access cover on the contact.
- (20) Push the sleeve on the ferrule and contact.

Make sure that the distance between the forward end of the sleeve and the surface of the connector insert is 0.06 inch maximum.
- (21) Shrink the sleeve into its position. Refer to Subject 20-10-14.

N. Assembly of 249-1959-000 Contacts with RG-223 Cable

249-1959-000 CONTACT CONFIGURATION
Figure 109

- (1) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.

Make sure that the sleeve has the smallest diameter that can be moved on the cable jacket.
- (2) Put a 1.13 inch ± 0.06 inch length of the heat shrinkable sleeve on the cable.
- (3) Prepare the cable.

Refer to Figure 66 and Table 44.

 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.
- (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (4) Tin the center conductor.
- (5) Put the conductor in the solder barrel of the inner contact.
Make sure that the conductor is against the bottom of the solder barrel.
- (6) Solder the conductor to the inner contact.

CAUTION: DO NOT PUT MORE THAN THE NECESSARY QUANTITY OF SOLDER ON THE CONTACT AND CONDUCTOR. UNWANTED SOLDER ON THE INNER CONTACT CAN PREVENT THE INSERTION OF THE CONTACT INTO THE FERRULE.

- (7) Tin the inner wall of the ferrule.
- (8) Put the ferrule on the cable.
- (9) Tin the outer contact from the back edge to the shoulder.
- (10) Move the shield away from the dielectric.
- (11) Push inner contact assembly into the outer contact until it stops. Refer to Figure 109.
- (12) Put the shield strands on the outer contact.
Make sure that the shield strands are even and symmetrical around the outer contact.
- (13) Push the ferrule forward on the shield until the forward end of the ferrule is against the shoulder of the outer contact. Refer to Figure 109.
- (14) Solder the ferrule.

CAUTION: DAMAGE TO THE CABLE CAN OCCUR WHEN HEAT IS APPLIED TO THE FERRULE FOR A LONGER TIME THAN NECESSARY TO MELT THE SOLDER.

- (15) Push the heat shrinkable sleeve on the ferrule until the end of the sleeve is aligned with the center of the ferrule. Refer to Figure 109.
- (16) Shrink the sleeve into its position. Refer to Subject 20-10-14.

O. Assembly of 249-1982-000, 249-1983-000 and 249-2020-001 Coax Contacts

**Table 51
COAX CENTER CONTACT CRIMP TOOLS**

Coax Contact Part Number	Center Contact Attachment Procedure	Crimp Tool		
		Basic Unit	Locator	
			Part Number	Setting

ITT CANNON 249-1982-000, 249-1983-000 AND 249-2020-001 COAX CONTACT COMPONENTS
Figure 110

- (1) Put the outer ferrule on the cable.
Make sure that the larger end of the ferrule points rearward, away from the end of the cable.
- (2) Prepare the cable. Refer to Figure 111.

COAX CABLE TRIM DIMENSIONS
Figure 111

- (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to 0.60 inch \pm 0.03 inch.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to 0.26 inch \pm 0.03 inch.
- (3) Push the inner ferrule on the cable between the dielectric and the shield strands. Refer to Figure 112. Make sure that the inner ferrule is under the shield.

POSITION OF THE INNER FERRULE AND THE LENGTH OF THE SHIELD
Figure 112

- (4) Remove the strands of the flat shield from the end of the jacket forward to the end of the cable.
- (5) Remove the unwanted length of the shield strands that extend forward beyond the rear edge of the shoulder of the inner ferrule. Refer to Figure 112.
- (6) Put the strands of the shield against the inner ferrule. Refer to Figure 113. Make sure that the shield strand ends are aligned with the rear edge of the shoulder of the inner ferrule.

POSITION OF THE SHIELD STRANDS REARWARD OF THE INNER FERRULE SHOULDER
Figure 113

- (7) Hold the inner ferrule in its location and, at the same time, push the outer ferrule forward until it is against the shoulder of the inner ferrule.
- (8) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the forward end of the inner ferrule equal to 0.03 inch \pm 0.02 inch. Refer to Figure 113.
- (9) Put the rear insulator on the center conductor. Refer to Figure 114. Make sure that the smaller end of the insulator points forward.

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS**

POSITION OF THE REAR INSULATOR AND THE CENTER CONTACT
Figure 114

(10) Put the center conductor into the wire barrel of the center contact. Refer to Figure 114.

(11) Attach the center contact to the center conductor.

Refer to:

- Table 51 for the attachment procedure and tools
- Figure 114 for the position of the center contact
- Subject 20-40-00 for the solder procedures, if solder is specified.

(12) Put the front insulator on the center contact. Refer to Figure 115.

Make sure that the smaller end of the insulator points forward.

POSITION OF THE FRONT INSULATOR
Figure 115

(13) Push the center contact assembly into the outer contact.

(14) Make a selection of an outer contact crimp tool from Table 52.

(15) Crimp the outer contact. Refer to Figure 116.

Make sure that:

- The edge of the crimp die is aligned with the rear end of the outer ferrule
- The distance between the shoulder of the outer ferrule and the rear edge of the outer contact is not more than 0.05 inch.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

CONFIGURATION OF THE COMPLETED COAX CONTACT ASSEMBLY
Figure 116

P. Assembly of 249-5008-000 Contacts with BA-5903 Cable

249-5008-000 CONTACT CONFIGURATION
Figure 117

- (1) Put the outer ferrule on the cable. Refer to Figure 117.
 Make sure that the end of the ferrule that has the hole points rearward, away from the end of the cable.
- (2) Prepare the cable.
 Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

 - (c) Push the end of the shield back on the cable.
 - (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (3) Tin the conductor.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (4) Put a 0.50 inch \pm 0.03 inch length of 1/8 inch diameter TFE-R heat shrinkable sleeve on the cable. Make sure that the sleeve is on the dielectric and below the shield.

CAUTION: DO NOT USE THE SLEEVE THAT IS SUPPLIED WITH THE CONTACT.

- (5) Push the inner ferrule on the heat shrinkable sleeve and below the shield strands. Make sure that:
 - The end of the inner ferrule that has the hole points rearward, away from the end of the cable
 - The inner ferrule is between the heat shrinkable sleeve and the shield strands.
- (6) Put the conductor in the solder cup of the contact.
- (7) Solder the conductor to the contact.
- (8) Push the heat shrinkable sleeve on the soldered contact until end of the sleeve is against the dielectric.
- (9) Put the inner ferrule on the contact. Make sure that the hole in the ferrule is aligned with the mill cut side of the contact.
- (10) Solder the inner ferrule to the contact through the hole.
- (11) Put the shield strands on the inner sleeve. Make sure that the shield strands are even and symmetrical around the sleeve.
- (12) Push the outer ferrule forward on the shield and the contact until the forward edge of the outer ferrule is against the shoulder of the contact.
- (13) Solder the outer ferrule to the contact through the hole in the outer ferrule.
- (14) Make a selection of heat shrinkable sleeve. Refer to Subject 20-10-14. Make sure that the heat shrinkable sleeve has the smallest diameter that can be moved on the cable jacket.
- (15) Put the necessary length of heat shrinkable sleeve on the cable. Make sure that:
 - The forward end of the sleeve is aligned with the rear edge of the shoulder of the contact
 - The distance from the rear end of the sleeve to the rear of the end of the outer ferrule is 0.50 inch minimum.
- (16) Shrink the sleeve into its position. Refer to Subject 20-10-14.

Q. Assembly of 249-5008-000 Contacts with Unshielded Wire

249-5008-000 CONTACT CONFIGURATION
Figure 118

- (1) Discard the inner ferrule and the outer ferrule. Refer to Figure 118.
- (2) Remove the necessary length of the wire insulation to make the distance from the end of the insulation to the end of the conductor equal to Dimension C.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (3) Tin the conductor.
- (4) Put the wire into the solder cup of the contact.
- (5) Solder the wire to the contact.
- (6) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
- (7) Install the heat shrinkable sleeves. Refer to Figure 119.

POSITION OF THE HEAT SHRINKABLE SLEEVES
Figure 119

- (a) Put a 1.13 inch ± 0.13 inch length of heat shrinkable sleeve on the solder cup and the wire.
- (b) Shrink the sleeve in position. Refer to Subject 20-10-14.
- (c) Put a 0.63 inch ± 0.06 inch length of heat shrinkable sleeve on the assembly.
- (d) Shrink the sleeve in position. Refer to Subject 20-10-14.

R. Assembly of 249-5027-004 Size 3 Coax Contacts for the DPX AC3 Insert

Table 53
NECESSARY MATERIALS

Description	Part Number	Supplier
Thread Lock Compound	222	Loctite

Table 54
NECESSARY TOOLS

Description	Supplier
Torque tool	An available source

- (1) Make a selection of a ferrule crimp tool from Table 45.
- (2) In sequence, put these components on the cable:
 - The clamp nut
 - The outer ferrule.

Refer to Figure 120.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

COMPONENTS ON THE CABLE

Figure 120

- (3) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable. Keep the discarded end of the cable for Step (4).
- (4) If the fit between the outside of the cable and the inside of the clamp nut can be improved with a layer of heat shrinkable sleeve on the cable:

NOTE: The clamp nut must be able to move and turn easily on a cable that has an increased diameter. It can be necessary to determine the fit between the clamp nut and a cable with an increased diameter on a short length of discarded cable.

- (a) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14. Make sure that the sleeve has the smallest diameter that can be moved on the cable.
 - (b) Put a 2.00 inch \pm 0.13 inch length of the heat shrinkable sleeve on the cable.
- (5) Prepare the cable.

Refer to:

- Figure 66
- Table 44
- Figure 121.

COMPONENTS ON THE PREPARED CABLE

Figure 121

- (a) Remove the necessary length of the cable jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.
CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.
 - (b) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.
CAUTION: MAKE SURE THAT DAMAGE TO THE DIELECTRIC DOES NOT OCCUR. IF THE DIELECTRIC HAS DAMAGE, THE DIELECTRIC CAN GIVE UNSATISFACTORY PERFORMANCE.
 - (c) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (6) Tin the center conductor.

STANDARD WIRING PRACTICES MANUAL**ITT CANNON DPX, DPD, AND DPA CONNECTORS**

- (7) Put the center contact assembly on the cable:

Refer to Figure 122.

Make sure that:

- All of the strands of the conductor are in the solder barrel of the center contact
- The inner ferrule is on the dielectric and below the shield
- The rear end of the inner ferrule is against the cable jacket
- The strands of the conductor can be seen in the inspection hole of the center contact
- No strands of the shield are between the dielectric and the center contact.

CENTER CONTACT ASSEMBLY ON THE CABLE

Figure 122

- (8) Solder the center contact through the inspection hole.

- (9) Push the outer ferrule forward on the shield and the inner ferrule until it stops. Refer to Figure 123.

OUTER FERRULE AGAINST THE CENTER CONTACT

Figure 123

- (10) If necessary, remove the unwanted length of the shield strands that extend beyond the forward end of the outer ferrule.

- (11) Crimp the outer ferrule. Refer to Figure 124.

Make sure that:

- The gap between the forward end of the outer ferrule and the center contact is less than or equal to 0.07 inch
- The edge of the dies of the crimp tool are aligned with the forward edge of the outer ferrule

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

POSITION OF THE CRIMP DIES FOR THE FIRST OUTER FERRULE CRIMP
Figure 124

(12) Crimp the outer ferrule again. Refer to Figure 125.

Make sure that:

- The edge of the dies of the crimp tool are aligned with the rear edge of the outer ferrule.
- The dies of the crimp tool will crimp the bend in the outer ferrule made by the first crimp.

POSITION OF THE CRIMP DIES FOR THE SECOND OUTER FERRULE CRIMP
Figure 125

(13) If the heat shrinkable sleeve is on the cable:

Refer to Figure 126.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 126

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (a) Move the sleeve forward until the forward end of the heat shrinkable sleeve is against the rear end of the outer ferrule.
- (b) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (14) Push the center contact assembly into the outer contact body.
- (15) Make a selection of a thread lock compound from Table 53.
- (16) Apply a drop of thread lock compound to the threads of the clamp nut.
- (17) Engage the threads of the outer contact body and the clamp nut. Refer to Figure 127.

POSITION OF THE CLAMP NUT IN THE COMPLETED CONTACT ASSEMBLY
Figure 127

- (18) Hold the body of the contact and torque the clamp nut to 95 inch-pounds \pm 5 inch-pounds.

S. Assembly of 249-9104-000 Contacts with RG-223 Cable

This paragraph gives the procedure to assemble the contacts for the DPAMA() connectors.

249-9104-000 CONTACT CONFIGURATION
Figure 128

- (1) Prepare the cable.
 - Refer to Figure 66 and Table 44.
 - (a) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (b) Remove the necessary length of the outer jacket to make the distance from the end of the jacket to the end of the cable equal to Dimension A.

CAUTION: MAKE SURE THAT DAMAGE TO THE SHIELD DOES NOT OCCUR. IF THE SHIELD IS CUT TO MAKE IT POSSIBLE TO SEE THE BASE METAL OF THE SHIELD STRANDS, THE SHIELD CAN GIVE UNSATISFACTORY PERFORMANCE.

- (c) Put the outer ferrule on the cable. Refer to Figure 128.
 - Make sure that the end of the ferrule that has the hole points away from the end of the cable.
- (d) Push the end of the shield back on the cable.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

- (e) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (2) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be moved on the outer ferrule.
- (3) Put a 2.00 inch \pm 0.13 inch length of 1/4 inch diameter heat shrinkable sleeve on the cable.
- (4) Tin the conductor.
- (5) Put the cable in the contact. Refer to Figure 128.
Make sure that the mill end of the solder cup points to the end of the cable.
- (6) Solder the conductor to the contact.
- (7) Move the strands of the shield apart.
- (8) Put the shield on the contact.
Make sure that the shield is even and symmetrical around the contact.
- (9) Push the outer ferrule forward on the shield until the end of the outer ferrule is against the shoulder of the contact.
- (10) Solder the outer ferrule to the contact through the hole in the outer ferrule.
- (11) Put the 2.00 inch \pm 0.13 inch length of 1/4 inch diameter heat shrinkable sleeve on the outer ferrule.
Make sure that the end of the heat shrinkable sleeve is against the contact shoulder.
- (12) Shrink the sleeve into its position. Refer to Subject 20-10-14.

7. CONNECTOR ASSEMBLY

A. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector.

**Table 55

0406	-	-

- (1) Make a selection of an insertion tool from Table 55.
It is not necessary to use a tool to insert contacts that are larger than size 20.
- (2) Put the contact assembly in the insert tool.
Make sure that the end of the tool is against the rear shoulder of the contact.
- (3) Axially align the insertion tool, the contact, and the contact cavity at the rear of the connector.
- (4) Carefully push the contact into the contact cavity until it stops. Refer to Figure 129.
Make sure that the contact and the insertion tool stay axially aligned with contact cavity.

CAUTION: DO NOT TURN THE INSERT TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

MANUAL CONTACT INSERTION
Figure 129

- (5) Carefully pull the tool out of the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (6) again.

B. Installation of Coax Contacts in the DPX AC3 Insert

Table 56
NECESSARY TOOLS

Description	Supplier
Snap Ring Pliers	An available source
Screwdriver	An available source

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

DPX AC3 INSERT ASSEMBLY

Figure 130

Refer to Figure 130:

- (1) Put the large coax contact through the retainer plate.
- (2) Push the large coax contact into the large cavity in the insert rear.
Make sure that the side of the insert rear that has the contact identification numbers points rearward.
- (3) Put the spring on the front of the large coax contact forward of the insert rear.
- (4) Make a selection of a snap-ring pliers from Table 56.
- (5) Use the snap-ring pliers to put the C-clip on the large coax contact rearward of the contact shoulder and forward of the spring.
Make sure that:
 - The C-clip is located between the spring and the rear edge of the contact shoulder.
 - The ground face side of the C-clip that has the sharp corners points forward against the rear edge of the contact shoulder.
- (6) Release the C-clip from the pliers.
Make sure that the C-clip is in its correct position on the contact.
- (7) Put the small coax contacts through the retainer plate.
- (8) Put the small coax contacts into the slots in the insert rear.
Make sure that the insert rear is on the small coax contacts between the ferrule shoulder and the contact shoulder.
- (9) At the rear of the connector, hold the insert rear assembly with the hand and align the ends of the contacts with the holes in the insert front.
- (10) Push the insert rear assembly forward into the connector until the insert rear is against the insert front.
- (11) Move the retainer plate forward on the cables and into its position on the rear of the connector.

20-71-11

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

Make sure that the retainer plate is flat against the connector shell.

- (12) Attach the retainer plate to the connector shell with the four screws and washers that are supplied with the connector.
- (13) Tighten the retainer plate screws.

C. Seal Plug or Spare Contact Installation

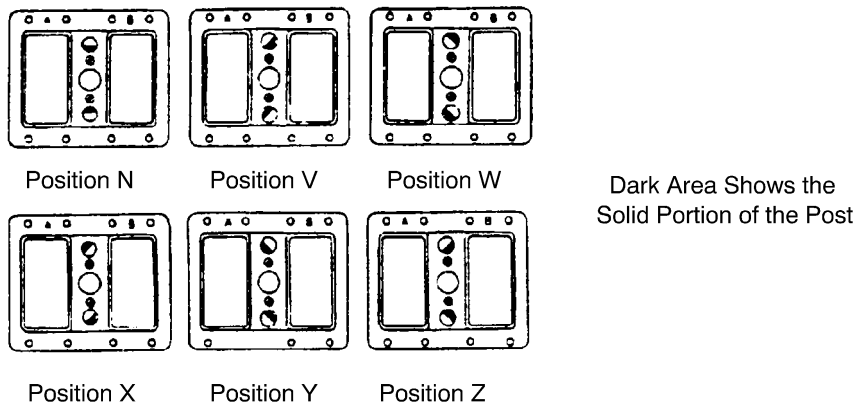

- (1) Install a spare contact or a seal plug into each contact cavity that does not have a wired contact.
Refer to Subject 20-60-08.

8. CONNECTOR POLARIZATION AND THE CONNECTOR PART NUMBER

A. DPD Connectors

POLARIZATION OF A SINGLE GANG DPD PLUG CONNECTOR

99	2	2	2	3	3	3

C. Change of the Polarization Posts and Keys

(1) Posts:

- (a) Remove the nut and washer from the threaded end of the post.
- (b) Remove the post from the hexagonal hole in the connector shell.
- (c) Align the post with the correct position.
- (d) Put the post back into the hexagonal hole.
Make sure that the post is in the correct position.
- (e) Put the washer and nut on the threaded end of the post.
- (f) Tighten the nut.

(2) Keys:

- (a) Remove the screws from the retainer plate.
- (b) Remove the retainer plate from the connector shell.
- (c) Remove the key from the hexagonal hole.
- (d) Align the key with the correct position.
- (e) Put the key back into the hexagonal hole.
Make sure that the post or key is in the correct position.
- (f) Put the retainer plate over the keys.
- (g) Install and tighten the screws.

STANDARD WIRING PRACTICES MANUAL

ITT CANNON DPX, DPD, AND DPA CONNECTORS

D. Change of the Polarization Code, Any Part of the Connector Part Number, or the Complete Part Number on the Connector Shell

**Table 58
NECESSARY MATERIALS**

Material	Part Number	Supplier
Ink	No. 68 Fast Dry	Independent
	No. 73X NW Opaque	Independent
	No. 73X Opaque	Independent
Paint, Clear	683-3-2	Akzo
	Clear Lacquer	Tartan
	EC-776	3M
	EC-776SR	3M
Pen	Permanent Ink Pen, Ultra Fine Point	Sanford Sharpie

- (1) Make a selection of these necessary materials from Table 58:
 - An ink or a permanent ink pen
 - A clear paint.
- (2) If the connector does not have a part number or a polarization code, write the part number and the polarization code in the correct position on the connector shell.
Refer to Paragraph 1.C. for the details of the applicable connector part number.
- (3) If the part number or the polarization code on the connector is incorrect:
 - (a) Apply a layer of ink on the incorrect part number and polarization code on the connector shell.
Make sure that the incorrect part number and polarization code cannot be read.
 - (b) Write the new part number or polarization code on the connector shell:
 - Adjacent to the location of the incorrect part number and polarization code
 - In the correct position on the connector shell.
 Refer to Paragraph 1.C. for the details of the applicable connector part number.
- (4) Let the ink dry for a minimum of 10 minutes.
- (5) Apply a layer of clear paint on the part number on the connector shell.

CAUTION: DO NOT APPLY PAINT ON THE CONTACTS. PAINT ON THE SURFACE OF A CONTACT CAN CAUSE UNSATISFACTORY ELECTRICAL PERFORMANCE OF THE CONTACT.

- (6) Let the paint dry before the connector shell is touched or moved.

3. CONNECTOR DISASSEMBLY

A. Seal Plug and Seal Rod Removal

**Table 12
NECESSARY TOOLS**

Tool	Type
Pliers	Needle Nose

(1) Make a selection of a pliers from Table 12.

CAUTION: MAKE SURE THE PLIERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. PLIERS WITH A ROUGH SURFACE OR A SHARP EDGE CAN CAUSE DAMAGE TO THE REAR GROMMET.

- (2) If it is necessary, remove a plastic tie strap or a wire harness tie that is less than 6 inches from the connector.
- (3) Hold the end of the seal plug or the seal rod tightly in the jaws of the pliers.
- (4) Pull the seal plug or the seal rod from the contact cavity.

B. Contact Removal

This Paragraph gives the procedure to remove standard contacts. For the procedure to remove coax contacts, refer to Paragraph 3.C.

**Table 13
CONTACT REMOVAL TOOLS**

Engaging End Size	Removal Tool		
	Basic Unit	Tip	Color
20	ATA2079	-	-
	ATSE2070	-	-
	294-280	-	Red

	DRK56-16	-	-
	294-219	-	Blue
	91040-3	126118-3	Blue

- (1) Make a selection of a contact removal tool from Table 13.
- (2) Axially align the tool and the contact cavity at the front face of the connector. Refer to Figure 13. Make sure that the plunger of the removal tool is fully retracted.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS**

ALIGNMENT OF THE CONTACT REMOVAL TOOL AND THE CONTACT CAVITY
Figure 13

- (3) Push the tool into the contact cavity until it stops. Refer to Figure 14.

CAUTION: DO NOT USE MORE FORCE THAN THE FORCE THAT IS NECESSARY TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

POSITION OF THE CONTACT REMOVAL TOOL IN THE CONTACT CAVITY
Figure 14

- (4) Push the plunger of the tool until the contact starts to come out of the contact cavity. Refer to Figure 15.

Make sure that the removal tool stays in the contact cavity until the contact starts to come out of the cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

POSITION OF THE CONTACT REMOVAL TOOL
Figure 15

- (5) Carefully pull the tool out from the contact cavity.
Make sure that the removal tool stays axially aligned with the contact cavity.
- (6) Pull the contact out of the contact cavity from the rear of the connector.

C. Coax Contact Removal

This Paragraph gives the procedure to remove coax contacts. For the procedure to remove standard contacts, refer to Paragraph 3.B.

Table 14
COAX CONTACT REMOVAL TOOLS

Engaging End Size	Removal Tool	
	Basic Unit	Tip
1	91040-7	126118-7

- (1) Make a selection of a contact removal tool from Table 14.
- (2) Axially align the tool and the contact cavity at the front face of the connector. Refer to Figure 16.
Make sure that the plunger of the removal tool is fully retracted.

ALIGNMENT OF THE CONTACT REMOVAL TOOL AND THE CONTACT CAVITY
Figure 16

20-71-12

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS**

- (3) Push the tool into the contact cavity until it stops. Refer to Figure 17.

CAUTION: DO NOT USE MORE FORCE THAN THE FORCE THAT IS NECESSARY TO PUSH THE REMOVAL TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

POSITION OF THE CONTACT REMOVAL TOOL IN THE CONTACT CAVITY
Figure 17

- (4) Push the plunger of the tool until the contact starts to come out of the contact cavity. Refer to Figure 18.

Make sure that the removal tool stays in the contact cavity until the contact starts to come out of the cavity.

POSITION OF THE CONTACT REMOVAL TOOL
Figure 18

- (5) Carefully pull the tool out from the contact cavity.
Make sure that the removal tool stays axially aligned with the contact cavity.
- (6) Pull the contact out of the contact cavity from the rear of the connector.

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

(2) If necessary, fold the conductor back.

Refer to Figure 20.

CONDUCTOR FOLDED BACK

Figure 20

(3) Make a selection of a crimp tool from Table 16.

(4) Put the contact in the locator and the crimp tool.

NOTE: As an alternative procedure, the wire can be put in the contact crimp barrel before the contact is inserted in the locator.

(5) Put end of the wire in the crimp barrel. Refer to Figure 21.

Make sure that:

- All of the conductor strands are in the crimp barrel
- The conductor is seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CONTACT

Figure 21

(6) Crimp the contact.

B. Coax Contact Assembly

Table 17

COAX CONTACT CENTER CONTACT CRIMP TOOLS

Basic Unit	Die
69646	Cavity B

Table 18

COAX CONTACT FERRULE CRIMP TOOLS

Basic Unit	Die
69646	Cavity A

(1) Put the ferrule on the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

Make sure that the end of the ferrule that has a gasket points rearward.

- (2) Prepare the cable. Refer to Figure 22.

CABLE PREPARATION
Figure 22

- (a) Remove 1.10 inches ± 0.01 inch of the jacket from the end of the cable.
- (b) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the jacket equal to 0.62 inches ± 0.01 inch.
- (c) Remove 0.20 inches ± 0.01 inch of the dielectric from the end of the cable.
- (3) Make a selection of a center contact crimp tool from Table 17.
- (4) Put the center conductor into the crimp barrel of the contact.
Make sure that all of the strands of the conductor are in the crimp barrel of the contact.
Make sure that the distance between the dielectric and the end of the crimp barrel is not more than 0.03 inch.
- (5) Crimp the center contact.
Make sure that the contact is against the rear surface of the tool.
- (6) Make a selection of a ferrule crimp tool from Table 18.
- (7) Push the contact body onto the center contact until it stops.
Make sure that:
 - The small end of the contact body is between the shield and the dielectric
 - The dielectric is against the contact body.
- (8) Push the ferrule forward over the shield until the ferrule is against the contact body.
- (9) Put the assembly in the crimp tool. Refer to Figure 23.

POSITION OF THE CONTACT IN THE FERRULE CRIMP TOOL
Figure 23

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

(10) Crimp the ferrule.

C. Contact Insertion

This Paragraph gives the procedure to insert standard contacts. For the procedure to insert coax contacts, refer to Paragraph 4.D.

**Table 19
CONTACT INSERTION TOOLS**

Engaging End Size	Insertion Tool		
	Handle	Tip	Color
20	294-279	-	Red
	91039-1	126117-1	Green
Sub-20	91039-1	126117-1	Green
16	294-192	-	Blue
	91039-3	126117-3	Blue

- (1) Make a selection of an insertion tool from Table 19.
- (2) Put the contact assembly in the insertion tool. Refer to Figure 24.
Make sure that the end of the tool is against the rear edge of the shoulder of the contact.

**POSITION OF THE CONTACT IN THE INSERTION TOOL
Figure 24**

- (3) Axially align the insertion tool and the contact cavity at the rear of the connector.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS****ALIGNMENT OF THE CONTACT AND THE CAVITY****Figure 25**

- (4) Carefully push the insertion tool and the contact assembly into the contact cavity until it stops. Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.
(6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
(a) Pull the contact assembly out of the contact cavity.
(b) Do Step (3) through Step (6) again.

D. Coax Contact Insertion

This Paragraph gives the procedure to insert coax contacts. For the procedure to insert standard contacts, refer to Paragraph 4.C.

NOTE: A tool is not necessary for the insertion of a coax contact assembly.

- (1) Axially align the coax contact assembly and the contact cavity at the rear of the connector.
(2) Carefully push the coax contact assembly into the contact cavity until it stops.
(3) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (1) through Step (3) again.

E. Seal of an Empty Contact Cavity

All empty contact cavities must be sealed. Refer to Subject 20-60-08.

5. CONNECTOR POLARIZATION AND CONNECTOR PART NUMBER

A. Connector Polarization and the Connector Part Number

NOTE: The polarization code in the connector part number identifies the polarization position of the posts and keys.

- (1) Find the polarization code in the connector part number from the equipment list.
- (2) For that code, find the correct connector polarization for the:
 - Post positions on the plug
 - Key positions on the receptacle.

Refer to Figure 26 and Table 20.

- (3) If the polarization position of the posts and keys on the connector do not agree with the polarization code, put the posts and the keys in the correct position.

Refer to Paragraph 5.C.

- (4) If the polarization code in the part number on the connector does not agree with the polarization positions, change the part number on the connector.

Refer to Paragraph 5.D.

B. Polarization Post and Key Positions

For the Plug, the Dark Area Shows the Polarization Post

For the Receptacle, the Dark Area Shows the Solid Part of the Polarization Key

POLARIZATION POSITIONS

C. Change of the Polarization Posts and Keys

- (1) To change the polarization of a post:
 - (a) Remove the nut and washer from the threaded end of the post.
 - (b) Remove the post from the hexagonal hole in the connector shell.
 - (c) Align the post with the correct position.
 - (d) Put the post back into the hexagonal hole.
Make sure that the post is in the correct position.
 - (e) Put the washer and the nut on the threaded end of the post.
 - (f) Tighten the nut.
- (2) To change the polarization of a key:
 - (a) Remove the necessary screws from the connector shell.
 - (b) Remove the key from the hexagonal hole.
 - (c) Align the key with the correct position.
 - (d) Put the key back into the hexagonal hole.
Make sure the key is in the correct position.
 - (e) Install and tighten the screws.

D. Change of the Polarization Code, Any Part of the Connector Part Number, or the Complete Part Number, on the Connector Shell

**Table 21
NECESSARY MATERIALS**

Material	Part Number	Supplier
Ink	No. 68 Fast Dry	Independent
	No. 73X NW Opaque	
	No. 73X Opaque	
Paint, Clear	683-3-2	Akzo
	Clear Lacquer	Tartan
	EC-776	3M
	EC-776SR	
Pen	Permanent Ink Pen, Ultra Fine Point	Sanford Sharpie

20-71-12

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF AMP AA, AD, AM, AND BD CONNECTORS AND AMPHENOL 213 CONNECTORS

- (1) Make a selection of these materials from Table 21.
 - An ink or a permanent ink pen
 - A clear paint.
- (2) If the connector does not have a part number or a polarization code, write the part number and polarization code in the correct position on the connector shell.

Refer to the details of the applicable connector part number:

- Figure 1 for the Amp AA series
- Figure 2 for the Amp AD, AM, and BD series
- Figure 3 for the Amphenol 213 series.

- (3) If the connector has an incorrect part number or polarization code:
 - (a) Apply a layer of ink on the incorrect part number or polarization code.
Make sure that the incorrect part number or code cannot be read.
 - (b) Write the new part number or polarization code on the connector shell:
 - Adjacent to the location of the incorrect code
 - In the correct position in the part number.

Refer to the details of the applicable connector part number:

- Figure 1 for the Amp AA series
- Figure 2 for the Amp AD, AM, and BD series
- Figure 3 for the Amphenol 213 series.

- (4) Let the ink dry for a minimum of 10 minutes.
- (5) Apply a layer of the clear paint on the part number on the connector shell.

CAUTION: DO NOT APPLY PAINT ON THE CONTACTS. PAINT ON THE SURFACE OF A CONTACT CAN CAUSE UNSATISFACTORY ELECTRICAL PERFORMANCE OF THE CONTACT.

- (6) Let the paint dry before the connector shell is touched or moved.

A. Contact Removal

**Table 3
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool
20	CIET-20
16	CIET-16
12	CIET-12

(1) Make a selection of a contact removal tool from Table 3.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF CANNON DPE-MA SERIES CONNECTORS

- (2) Put the white tip of the tool on the wire near the contact cavity.
- (3) Carefully push the tool tip into the contact cavity until it stops.
- (4) Pull the wire and the tool out of the contact cavity at the same time.

3. CONTACT ASSEMBLY

A. Contact Assembly

**Table 4
INSULATION REMOVAL LENGTH**

Crimp Barrel Size	Removal Length (inch)	
	Target	Tolerance
20	3/16	± 1/32
16	9/32	± 1/32
12	9/32	± 1/32

**Table 5
CONTACT CRIMP TOOLS**

Crimp Barrel Size	Crimp Tool

B. Contact Insertion

**Table 6
CONTACT INSERTION TOOLS**

Crimp Barrel Size	Insertion Tool
20	CIET-20
16	CIET-16
12	CIET-12

- (1) Make a selection of a contact insertion tool from Table 6.
- (2) Put the wired contact into the colored end of the insertion tool.
- (3) From the rear of the connector, axially align the contact and the tool with the contact cavity.
- (4) Push the tool straight in the contact cavity until the tool stops.
- (5) Carefully remove the tool from the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the wired contact out of the cavity.
 - (b) Do Step (2) through Step (6) again.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

This Subject gives the disassembly and assembly procedures for:

- The Boeing ARINC 600 connectors
- The Boeing S280W551 connectors.

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

The insert must be replaced when one or more of these conditions occur that make the cable assembly unserviceable:

- The depth of the damage extends farther than the bottom of the outer seal web; refer to Figure 1
- The damage extends from one contact cavity to a different contact cavity; refer to Figure 2
- The damage extends from one contact terminus cavity to a different contact terminus cavity; refer to Figure 3.

Damage from One Contact Terminus Cavity to a Different Contact Terminus Cavity

REAR FACE OF THE CONTACT TERMINUS INSERT - LENGTH OF DAMAGE

Figure 3

B. Damage Conditions - Front Face of the Insert

The insert for electrical contacts must be replaced when one or more of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity; refer to Figure 4
- The damage extends from one contact cavity to the outer edge of the insert; refer to Figure 4.

The insert for fiber optic contact termini must be replaced when one or more of these conditions occur that make the cable assembly unserviceable:

- The damage extends from one contact terminus cavity to a different contact terminus cavity; refer to Figure 5
- The damage extends from one contact terminus cavity to the outer edge of the insert; refer to Figure 5.

FRONT FACE OF THE CONTACT TERMINUS INSERT - LENGTH OF DAMAGE

Figure 5

C. Damage Conditions - EMI/RFI Ground Spring

From the ground spring of any one insert cavity of the connector shell:

- As many as 5 adjacent ground spring fingers can be missing
- More than one group of a maximum of 5 adjacent ground spring fingers can be missing as long as a group of a minimum of 5 adjacent fingers is between the groups of missing fingers.

The connector shell must be replaced if any of the ground springs are in an unserviceable condition.

Refer to:

- Figure 6 for the initial configuration of the ground springs
- Figure 7 for the serviceable conditions of damage to the ground spring
- Figure 8 for the unserviceable conditions of damage to the ground spring.

GROUND SPRING DAMAGE - SERVICEABLE CONDITIONS
Figure 7

GROUND SPRING DAMAGE - UNSERVICEABLE CONDITIONS
Figure 8

If the connector shell is replaced, these general conditions are applicable:

- The connector part number must be marked on the shell
- The replacement shell must be of the same Class as the initial connector shell.

CAUTION: AN INSERT OF AN ARINC 600 CONNECTOR FROM ONE SUPPLIER MUST BE NOT USED IN A CONNECTOR SHELL FROM AN DIFFERENT SUPPLIER. IF THE SUPPLIER OF THE INSERT AND THE SHELL ARE NOT THE SAME, THE CONNECTOR PLUG AND RECEPTACLE DO NOT SATISFACTORILY ENGAGE.

NOTE: Connector shell part numbers are not specified. Refer to the connector supplier for replacement connector shells.

D. Damage Conditions - Connector Shell

If the connector shell has a bend, the connector shell must be replaced.

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

If the connector shell is replaced, these general conditions are applicable:

- The connector part number must be marked on the shell
- The replacement shell must be of the same Class as the initial connector shell.

CAUTION: AN INSERT OF AN ARINC 600 CONNECTOR FROM ONE SUPPLIER MUST BE NOT USED IN A CONNECTOR SHELL FROM AN DIFFERENT SUPPLIER. IF THE SUPPLIER OF THE INSERT AND THE SHELL ARE NOT THE SAME, THE CONNECTOR PLUG AND RECEPTACLE DO NOT SATISFACTORILY ENGAGE.

NOTE: Connector shell part numbers are not specified. Refer to the connector supplier for replacement connector shells.

E. Damage Conditions - BACC69A Fiber Optic Cable Assembly

The cable assembly must be replaced when one of these conditions occur:

- The fiber optic cable has damage that makes the cable assembly unserviceable; refer to Subject 20-12-20
- The fiber optic terminus has damage; refer to Subject 20-12-20.

F. Minimum Wire O.D. for an Environmentally Sealed Connector

Refer to:

- Subject 20-60-08 for the identification of an environmentally sealed connector
- Table 1 for the minimum wire O.D. for the satisfactory seal in the grommet hole
- Subject 20-60-08 for the procedure to increase the diameter of the wire.

**Table 1
MINIMUM WIRE O.D. FOR A SATISFACTORY SEAL**

Contact Cavity Size	Minimum Wire O.D. (inch)
20	0.040
16	0.068
12	0.097
8	0.183

2. CONNECTOR PART NUMBERS AND DESCRIPTION

A. Connector Description

The ARINC 600 and S280W551 connectors are the interface between avionics equipment boxes and the airplane wiring and have these features:

- Rectangular metal shells
- Size 22, 20, 16, 12, 8, and 5 rear release, rear removable contacts
- ARINC 600 connectors have 3 or 6 inserts
- S280W551 connectors have 2, 4, or 5 inserts
- Receptacle connectors are mounted on the avionics equipment boxes
- Plug connectors are mounted on the rack or the tray backplates
- Plug connectors are assembled to the airplane wiring.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

ARINC 600 CONNECTOR PROFILES
Figure 9

CAUTION: PROTECTIVE CAPS ARE RECOMMENDED FOR CONNECTORS WITH GROUND SPRINGS WHEN THEY ARE REMOVED FROM THE RACK. IF GROUND SPRINGS DO NOT HAVE PROTECTION, DAMAGE TO THE GROUND SPRINGS CAN OCCUR.

B. Connector Part Numbers

The details for the:

- Boeing ARINC 600 connector part numbers are given in Paragraph 2.C.
- ITT Cannon ARINC 600 connector part numbers are given in Paragraph 2.D.
- Souriau ARINC 600 connector part numbers are given in Paragraph 2.E.
- AMP ARINC 600 connector part numbers are given in Paragraph 2.F.
- Radiall ARINC 600 connector part numbers are given in Paragraph 2.G.
- Tri-Star ARINC 600 connector part numbers are given in Paragraph 2.H.
- Boeing S280W551 connector part numbers are given in Paragraph 2.I.

C. Boeing ARINC 600 Connectors

BOEING BACC66() SERIES CONNECTOR PART NUMBER STRUCTURE

Figure 10

For the Boeing connector part number:

- Insert configuration codes, refer to Table 5
- Polarization codes and positions, refer to Table 141 and Figure 222
- The coax contact designation codes for BACC66F connectors, refer to Table 8
- The coax contact designation codes for BACC66H connectors, refer to Table 9
- The coax contact designation codes for BACC66K connectors, refer to Table 10
- The contact procurement option codes, refer to Table 11.

NOTE: The coax contact designation code is used on purchase orders and does not appear on connectors as part of the part number.

NOTE: The contact procurement option code is used on purchase orders and does not appear on connectors as part of the part number.

K. Size 1 Coax Contacts for the BACI10AH05, 08, 09 and 25 Inserts

The size 1 contacts in this paragraph have a mounting block and are applicable for these connector insert configurations:

- BACI10AH05
- BACI10AH08
- BACI10AH09
- BACI10AH25

Refer to Paragraph 3.L. for the size 1 contacts for the BACI10AH11 insert.

NOTE: Refer to Table 66 for the relation between the insert configurations and the applicable contacts.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

NOTE: Refer to Table 12 for the relation between the insert configuration code in the ITT Cannon connector part number and the applicable contacts in the inserts of the ITT Cannon connector.

5. PROTECTIVE CAP PART NUMBERS AND DESCRIPTION

A. General Data

Protective caps are used on ARINC 600 and S280W551 connectors:

- To keep contamination off the contacts
- To prevent damage that can be caused by electrostatic discharge (ESD)
- To prevent mechanical damage.

B. Protective Caps for ARINC 600 Class A, Class B, and Class C Plug Connectors

- (1) Make a selection of a removal tool from Table 67.
- (2) At the rear of the connector, put the removal tool on the wire. Refer to Figure 67.

POSITION OF THE WIRE IN THE REMOVAL TOOL
Figure 67

- (3) Put the wire through the forward part of the tool. Refer to Figure 68.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS****POSITION OF THE WIRE IN THE FORWARD PART OF THE REMOVAL TOOL****Figure 68**

- (4) Align the removal tool the with the contact cavity.
- (5) Push the tool into the contact cavity until it stops. Refer to Figure 69.

**REMOVAL TOOL FULLY INSERTED IN THE CONTACT CAVITY****Figure 69**

- (6) Carefully pull the wire and the tool from the contact cavity at the same time. Refer to Figure 70.

**TOOL AND CONTACT REMOVED FROM THE CAVITY****Figure 70**

- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (3) through Step (6) again.

**Table 70
LUBRICANTS**

Lubricant	Specification	Supplier
Alcohol, Isopropyl	TT-I-735	An available source

- (1) Make a selection of a removal tool from Table 69.
- (2) If there is a seal boot on the cable, pull the boot away from the insert to prevent interference with the removal tool..
- (3) At the rear of the connector, put the bit of the removal tool on the wire near the connector insert.
- (4) Align the bit of the removal tool with the contact cavity.
- (5) Push the tool into the contact cavity until it stops and the contact retention clip unlocks the contact.

NOTE: A lubricant can be used to make it easier to push the tool into the contact cavity. Refer to Table 70.

- (6) Carefully pull the tool and the wire from the contact cavity at the same time.

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (3) through Step (6) again.
- (8) Push the seal boot forward on the contact to protect the contact from damage.

D. Removal of Size 5 Coax Contacts

**Table 71
CONTACT REMOVAL TOOLS FOR SIZE 5 COAX CONTACTS**

Contact		Removal Tool		
Size	Type	Part Number	Size	Type
5	Coax	91174-1	5	Rear Release
		CET-C8		
		MS3178-001		
		SET-C8		

- (1) Make a selection of a size 5 removal tool from Table 71.
- (2) Push the sealing sleeve back away from the connector insert. Refer to Figure 71.

**POSITION OF THE SEAL SLEEVE ON THE COAX CABLE
Figure 71**

- (3) Push the seal bushing or the seal boot back away from the connector insert. Refer to Figure 72.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS****POSITION OF THE SEAL BOOT ON THE COAX CABLE****Figure 72**

- (4) Put the removal tool on the cable.
- (5) Align the tool and the contact cavity.
- (6) Push the tool into the insert cavity until it stops.
- (7) Carefully pull the wire and the tool from the contact cavity at the same time.

E. Removal of Size 1 Coax Contacts from the BACI10AH05, 08, 09 and 25 Inserts

This paragraph gives the procedure to remove a size 1 coax contact or a TNC adapter that has a mounting block from these inserts:

- BACI10AH05
- BACI10AH08
- BACI10AH09
- BACI10AH25

Refer to Paragraph 7.F. for the procedure to remove a size 1 coax termination kit contact from the BACI10AH11 insert.

- (1) If the coax cable is connected to the ARINC connector with a TNC connector, turn the coupling ring of the TNC plug in the counterclockwise direction until the TNC plug separates from the TNC adapter.

NOTE: It is not necessary to remove the TNC adapter from the ARINC connector to disconnect the coax cable from the ARINC connector.

- (2) For Boeing connector part numbers that have an obsolete insert configuration code 22, 23 or 25, remove the retainer plates on the rear of the connector.

NOTE: If the Boeing connector part number has insert configuration code 122, 123 or 125, it is not necessary to remove the retainer plates from the connector to remove the size 1 coax contact.

- (a) From the rear side of the connector shell, remove the screws that hold the insert retainer plates.
 - (b) Remove the insert retainer plates.
- (3) Remove the four screws from the front face of the connector insert.
 - (4) Remove the contact from the rear of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

F. Removal of ITT Cannon Size 1 Coax Termination Kit Contacts from the BACI10AH11 insert

This procedure is applicable for the removal of ITT Cannon size 1 coax termination kit contacts 320-1066-006 and 320-1066-015.

NOTE: The coax contact termination kit contains the center contact assembly.

- (1) At the rear of the connector, turn the clamp nut in the counterclockwise direction to loosen it. Refer to Figure 73 and Figure 74.

LOCATION OF THE CLAMP NUTS ON THE BACI10AH11 INSERT
Figure 73

CENTER CONTACT ASSEMBLY INSTALLED IN THE OUTER CONTACT BODY
Figure 74

- (2) Disengage the threads of the clamp nut and the outer contact body.
- (3) Pull the center contact assembly out of the outer contact body.

G. Removal of the BACA19BK1 TNC Adapters or the Outer Coax Bodies from the BACI10AH11 Insert

- (1) Remove the screws from the engaging face of the insert. Refer to Figure 75.

NOTE: It is possible that these screws are captivated and cannot be completely removed from the insert.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

BACA19BK1 TNC ADAPTERS IN THE BAC110AH11 INSERT

Figure 75

- (2) Pull the rear plate that holds the four TNC adapters or outer coax bodies rearward from the insert.
NOTE: It can be necessary to push on the engaging ends of the contacts at the same time to help move the plate rearward.
- (3) If the connector insert retainer plates prevent the movement of the rear plate from the connector, remove the connector insert retainer plates:
 - (a) From the rear side of the connector shell, remove the screws that hold the insert retainer plates.
 - (b) Remove the insert retainer plates from the connector.
- (4) Pull the rear plate that holds the four TNC adapters or outer coax bodies rearward from the insert.
NOTE: It can be necessary to push on the engaging ends of the contacts at the same time to help move the plate rearward.
- (5) Remove the TNC adapters or the outer coax bodies from the plate.

H. Removal of Fiber Optic Contact Termini

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A SEALED CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**Table 72
CONTACT TERMINUS REMOVAL TOOLS**

Terminus Size	Removal Tool	
	Part Number	Color
16	M81969/14-03	White

- (1) Make a selection of a contact terminus removal tool from Table 72.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

CAUTION: DO NOT USE A REMOVAL TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (2) Remove the plastic tie straps or the wire harness ties that are less than 6 inches from the connector.
- (3) At the rear of the connector, put the tip of the removal tool on the cable.
- (4) Axially align the removal tool and contact terminus cavity.
- (5) Push the removal tool into the contact terminus cavity until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

**POSITION OF THE REMOVAL TOOL IN THE CONTACT TERMINUS CAVITY****Figure 76**

- (6) Hold the cable against the tool and, at the same time, carefully pull the tool and the contact terminus out of the cavity.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: IF THE REMOVAL TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

- (7) If the contact terminus is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees on the cable assembly.
 - (c) Do Step (3) through Step (6) again.
- (8) If it is necessary, examine the contact terminus. Refer to Subject 20-12-20.
- (9) If the inspection is not necessary, put a clean protection cap on the contact terminus. Refer to Subject 20-12-20 for the protection cap part numbers.

NOTE: A clean plastic bag is a satisfactory alternative for the protection cap.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

I. Removal of the Fiber Optic Alignment Sleeve Insert

CAUTION: DO NOT PULL, SHAKE, OR TWIST THE ALIGNMENT SLEEVE INSERT FROM THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

**Table 73
NECESSARY TOOLS**

Tool	Type	Size (inch)
Driver	Allen Wrench	5/64
	Screwdriver, Hex	5/64

- (1) Make a selection of a driver from Table 73.

NOTE: The driver can have a ball type end.

- (2) Turn the installation screw in a counterclockwise direction until the screw is disengaged from the face of the connector.

CAUTION: DO NOT SHAKE OR TWIST THE ALIGNMENT SLEEVE INSERT TO REMOVE IT FROM THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

**FRONT FACE OF THE ALIGNMENT SLEEVE INSERT
Figure 77**

- (3) Put the alignment sleeve insert in a clean plastic bag.

CAUTION: KEEP THE ALIGNMENT SLEEVE INSERT IN A CLEAN PLASTIC BAG UNTIL IT IS INSTALLED IN THE CONNECTOR. CONTAMINATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

J. Seal Plug Removal

This paragraph gives the procedure to remove a MS27488 type seal plug from a contact cavity. Refer to Paragraph 7.K. for the procedure to remove a S280W552-109 conductive seal plug from a grounded size 8 contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

**Table 74
NECESSARY TOOLS**

Tool	Type
Pliers	Needle Nose
Tweezers	-

- (1) Make a selection of a tool from Table 74.

CAUTION: MAKE SURE THAT THE PLIERS OR TWEEZERS HAVE SMOOTH SURFACES AND NO SHARP EDGES. TOOLS WITH A ROUGH SURFACE OR SHARP EDGES CAN CAUSE DAMAGE TO THE REAR GROMMET.

NOTE: An acceptable alternative is to use the fingers.

- (2) Remove the plastic tie straps or the wire harness ties, that are less than 6 inches from the connector, from the wire harness.
- (3) Tightly hold the end of the seal plug or the seal rod.
- (4) Pull the seal plug or the seal rod out of the contact cavity.

K. Removal of a Conductive Seal Plug From a Grounded Size 8 Contact Cavity

This paragraph gives the procedure to remove a S280W552-109 conductive seal plug from a grounded size 8 contact cavity.

**Table 75
SIZE 8 SEAL PLUG REMOVAL TOOLS**

Contact Cavity Size	Removal Tool	
	Part Number	Supplier
8	M81969/28-03	QPL
	RRX-04-C-1	Russtech

- (1) Make a selection of a seal plug removal tool from Table 75.
- (2) From the rear of the insert, put the end of the tool on the end of the seal plug.
- (3) Push the tool into the contact cavity until it stops.
- (4) From the front of the connector, put the end of a plastic rod against the end of the seal plug.

Make sure that:

- The rod has a flat end
- The diameter of the rod is 0.20 inch minimum to 0.22 inch maximum.

- (5) Push the seal plug and the removal tool out of the rear of the cavity with the rod.
- (6) If the seal plug is not released:
 - (a) Carefully remove the removal tool from the contact cavity.

CAUTION: DO NOT TURN THE REMOVAL TOOL. IF THE TOOL IS TURNED, DAMAGE TO THE CONTACT RETENTION MECHANISM OCCURS.

- (b) Do Step (3) through Step (5) again.
- (7) Pull the tool and the seal plug from the contact cavity.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS****L. Removal of a Connector Insert**

To get access to a connector that is installed on a shelf in the electronic rack, either of these alternatives are acceptable:

- The shelf can be removed
- The connector can be disconnected from the shelf.

NOTE: Sufficient clearance around the connector is necessary to let both hands do the work. Access to both the front and rear of the connector is necessary.

- (1) Remove the necessary wire harness ties and clamps that are necessary to make the removal of the connector contacts easier.
- (2) Remove the screws, washers, and retainer plates from the rear of the connector.
- (3) Put the screws in a safe place.

NOTE: The initial connectors from Souriau are installed with metric screws; replacements screws can be difficult to find.

- (4) If the insert is installed in a BACC66()B() environmental connector, cut the resilient seal material around the rear of the insert with a sharp knife. Refer to Figure 78.

CAUTION: DO NOT CUT THE SEALANT AROUND THE OTHER INSERTS.

**REMOVAL OF THE SEALANT LINE AROUND THE INSERT****Figure 78**

- (5) From the front face of the connector, push the insert out of the connector shell with both thumbs. Make sure that:

- The force is applied equally to each end of the insert
- One end of the insert does not catch on the connector shell, or on an adjacent insert.

NOTE: If the end of an adjacent insert makes an overlap with the insert, remove the adjacent insert, then remove the insert.

- (6) If the insert does not move from the connector shell, hold the connector shell in a fixture and push the front face of the insert with a larger force.

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The force is applied equally to each end of the insert
- One end of the insert does not catch on the connector shell
- One end of the insert does not catch on an adjacent insert.

CAUTION: DO NOT CAUSE A BEND OR OTHER DAMAGE TO THE CONNECTOR SHELL DURING THE FORCE.

8. CONTACT ASSEMBLY

A. Assembly of Standard Contacts

NOTE: Refer to Subject 20-60-00 for contact assembly with filler wire as an alternative to the assembly of a contact with a folded back conductor and an eyelet.

(1) If the contact is a size 12 and it must be installed in a size 5 cavity, install the sealing boot on the wire. Refer to Paragraph 15.D.

(2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 79
- Table 76 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

NOTE: If the wire size and a larger crimp barrel size are not specified in Table 76, refer to Subject 20-60-00 for the alternate procedure to prepare the wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

INSULATION REMOVAL LENGTH

Figure 79

- (3) If the contact cavity is larger than size 22 and the O.D. of the wire is less than the minimum seal diameter of the grommet holes, increase the O.D. of the wire. Refer to Paragraph 1.F.
- (4) If it is necessary, put the eyelet in the crimp barrel of the contact. Refer to Table 76.
- (5) If it is necessary, fold the conductor back on itself.

Refer to:

- Table 76
- Figure 80.

FOLDED BACK CONDUCTOR

Figure 80

- (6) Make a selection of a crimp tool from Table 77.
- (7) Put the end of the wire in the crimp barrel or in the eyelet in the crimp barrel. Refer to Figure 81.

Make sure that:

- All of the strands of the conductor are in the crimp barrel or in the eyelet
- If an eyelet is not in the crimp barrel, the conductor can be seen in the inspection hole.
- If an eyelet is in the crimp barrel, the flange of the eyelet stays against the rear end of the crimp barrel
- The distance from the end of the insulation to the crimp barrel or to the end of the eyelet is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CONTACT CRIMP BARREL

Figure 81

- (8) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

B. Assembly of a Contact with Oversize Wire

This procedure is applicable if the outside diameter of the wire insulation is larger than the maximum wire O.D. specified in Table 78.

**Table 78
MAXIMUM WIRE OUTSIDE DIAMETER**

Contact Cavity Size	Wire Size (AWG)	Maximum Wire O.D. (inch)
22	22	0.054

**Table 79
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	AMS-DTL-23053/12 Class 5	An available source
	RT850	Raychem
	RW175	
	TFE 4X	Chemplast
		Zeus

- (1) Make a selection of a 1.50 inch ± 0.06 inch length of heat shrinkable sleeve from Table 79.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

Make sure that the sleeve has the smallest diameter that can move easily on the wire.

- (2) Remove 1.25 inch ± 0.06 inch length of insulation from the end of the wire. Refer to Figure 82.

**INSULATION REMOVAL LENGTH
Figure 82**

- (3) Put the sleeve on the wire.
- (4) Put the conductor into the crimp barrel of the contact.
Make sure that:
 - All of the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole of the contact.
- (5) Crimp the contact. Refer to Paragraph 8.A.
- (6) Align the sleeve. Refer to Figure 83.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The sleeve makes a 0.3 inch to 1 inch overlap with the wire insulation
- The distance from the forward end of the sleeve to the rear end of the contact crimp barrel is not more than 0.03 inch.

POSITION OF THE HEAT SHRINKABLE SLEEVE
Figure 83

(7) Shrink the sleeve into its position. Refer to Subject 20-10-14.

C. Assembly of a Contact with Solid Conductor Wire

This paragraph gives the procedure to assemble BACC47EF and BACC47EG contacts with solid conductor wire and, if necessary, stranded filler wire.

NOTE: Only stranded wire can be used for the filler wire.

- (1) Make a selection of a filler wire size from Table 81.
- (2) Make a selection of a crimp tool from Table 82.
- (3) Remove the necessary length of insulation from the end of the solid conductor wire.

Refer to:

- Table 80 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

- (4) If a filler wire is specified, remove 0.5 inch of insulation from the end of the filler wire.

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Refer to Subject 20-00-15 for the insulation removal procedures.

- (5) Put the conductor in the crimp barrel of the contact.
 - (a) If filler wire is not specified, put the end of the solid conductor wire in the crimp barrel of the contact.
 - (b) If filler wire is specified, put the end of the solid conductor wire and the filler wire in the crimp barrel of the contact.

Make sure that:

- All of the strands of the filler wire and the solid conductor are in the crimp barrel of the contact
- The strands of the conductors are visible in the inspection hole of the contact
- The distance between the end of the crimp barrel and the insulation of the wire is a maximum of 0.03 inch.

- (6) Crimp the contact.
- (7) If the contact has a filler wire, remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 84.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 84

D. Assembly of S280W553-() Size 0808 Power and Ground Contacts

This paragraph gives the procedure to assemble these contacts:

- S280W553-2 power contact socket
- S280W553-4 ground contact socket.

		M22520/23-01			M22520/23-09	M22520/23-02	-

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 0808 or larger contact that has an adapter sleeve in the crimp barrel.

- (1) Make a selection of a crimp tool from Table 84.
- (2) Remove 0.50 inch ± 0.03 inch of insulation from the end of the wire.

Refer to:

- Figure 85
- Subject 20-00-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 85

- (3) If the wire size is 12 AWG:
 - (a) Cut a 2.00 inch ± 0.25 inch length of AWG 14 filler wire.
 - (b) Remove the insulation from the AWG 14 filler wire.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (c) Put the filler wire into the crimp barrel of the contact.
- (4) If the wire size is 10 AWG or 12 AWG:
 - (a) Make a selection of a crimp barrel adapter sleeve from Table 83.
- (b) Push the adapter sleeve into the crimp barrel of the contact until it stops.
- (5) Put the conductor into the crimp barrel of the contact. Refer to Figure 86.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 0808 or larger contact that has an adapter sleeve in the crimp barrel.

Make sure that:

- All of the strands of the conductor are in the contact crimp barrel
- If a filler wire is used, all of the strands of the filler wire are in the crimp barrel of the contact
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CONTACT CRIMP BARREL
Figure 86

- (6) If the crimp tool is an indenter type, crimp the contact.

NOTE: A pneumatic indenter crimp tool cannot be used to assemble a size 0808 or larger contact that has an adapter sleeve in the crimp barrel.
- (7) If the crimp tool is a hex crimp type:
 - (a) Put the primary die in the crimp tool.
 - (b) Put the contact and the conductor in the crimp tool.
 - (c) Crimp the contact.
 - (d) Remove the primary die from the crimp tool.
 - (e) Put the secondary die in the crimp tool.
 - (f) Turn the contact approximately 60 degrees around the longitudinal axis.
 - (g) Crimp the contact.
 - (h) If the crimp area of the contact has flash, turn the contact approximately 60 degrees around the longitudinal axis and crimp the contact again with the secondary die.
- (8) If the contact has a filler wire, carefully remove the unwanted length of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 87.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE

Figure 87

CAUTION: DO NOT CAUSE DAMAGE TO THE STRANDS OF THE CONDUCTOR OF THE PRIMARY WIRE. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 88
- Table 85
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 88

- (2) If it is specified, fold the conductor back. Refer to Figure 89.

CONDUCTOR FOLDED BACK
Figure 89

- (3) Make a selection of a crimp tool from Table 86.
- (4) Put the end of the wire into the crimp barrel of the contact. Refer to Figure 90.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The strands of the conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is a maximum of 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL
Figure 90

- (5) Crimp the contact.
- (6) Examine the contact assembly for these types of damage:
 - Broken strands of the conductor
 - Strands of the conductor on which the base metal can be seen
 - Cracks in the crimp barrel of the contact.
- (7) If the contact or the wire has damage, replace the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

F. Assembly of a Shield Ground Wire with a Ground Block Contact

- (1) Make a selection of a contact from Table 29.
- (2) Remove 2.0 inches \pm 0.2 inch of the outer jacket from the end of the shielded wire or coax cable.
- (3) Cut a 2.75 inch \pm 0.25 inch length of wire that has the applicable AWG size.
- (4) Assemble a shield ground wire. Refer to Subject 20-10-15.
- (5) Assemble the contact on the end of the shield ground wire. Refer to Paragraph 8.E.

9. ASSEMBLY OF SIZE 12 COAX AND SIZE 12 SHIELDED CONTACTS

A. Assembly of ITT Cannon 249-1768-000 and 249-2203-000 Size 12 Shielded Contacts

**Table 89
NECESSARY MATERIALS**

Material	Part Number	Supplier
Heat Shrinkable Sleeve	DWP-125	Raychem
	MWSF	Remtek

- (1) Make a selection of a center contact crimp tool from Table 87.
- (2) Make a selection of an outer contact body crimp tool and a primary die from Table 88.
- (3) If it is specified, make a selection of an outer contact body crimp tool and a secondary die from Table 88.
- (4) If the contact must be installed in a size 5 cavity, install the sealing boot on the wire or cable. Refer to Paragraph 15.D.
- (5) Make a selection of a heat shrinkable sleeve from Table 89.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that the sleeve has the smallest diameter that can be moved over the rear end of the contact.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (6) Put a 1.00 inch ± 0.13 inch length of the heat shrinkable sleeve on the shielded wire or cable.
- (7) Cut the cable to make its end perpendicular to its longitudinal axis.
- (8) Remove 0.50 inch $+0.02$ inch -0.00 inch of the outer jacket. Refer to Figure 91.

CAUTION: DO NOT CAUSE ANY DAMAGE TO THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

CABLE JACKET PREPARATION
Figure 91

- (9) Put the inner ferrule on the cable. Refer to Figure 92.

Make sure that:

- The end of the ferrule that has the shoulder is pointed rearward away from the end of the cable
- The shoulder of the ferrule is against the end of the jacket.

POSITION OF THE INNER FERRULE ON THE CABLE
Figure 92

- (10) Move the strands of the shield apart.
- (11) Fold the strands of the shield back on the ferrule. Refer to Figure 93.

Make sure that:

- The strands of the shield are on the ferrule
- The strands of the shield are symmetrical around the circumference of the ferrule.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE SHIELD ON THE FERRULE

Figure 93

- (12) Remove 0.14 inch \pm 0.02 inch of the dielectric and the conductor from the end of the cable. Refer to Figure 94.

Make sure that the distance from the end of the jacket to the end of the dielectric is 0.34 inch to 0.36 inch.

REMOVAL OF THE END OF THE CABLE

Figure 94

- (13) Remove 0.06 inch +0.02 inch -0.00 inch of the dielectric from the end of the conductor. Refer to Figure 95.

INSULATION REMOVAL LENGTH

Figure 95

- (14) Put the conductor in the crimp barrel of the center contact. Refer to Figure 96.

Make sure that:

- The rear end of the contact is against the end of the dielectric
- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CENTER CONTACT ASSEMBLY
Figure 96

- (15) Crimp the center contact.
- (16) Put the white insulator, large end first, on the center contact assembly until it stops.

INSULATOR ON THE CENTER CONTACT
Figure 97

- (17) Push the center contact assembly into the outer contact body. Refer to Figure 98.

POSITION OF THE OUTER CONTACT BODY ON THE CENTER CONTACT ASSEMBLY
Figure 98

- (18) Remove the unwanted strands of the shield that extend farther than the shoulder of the inner ferrule. Make sure that the end of the shield is aligned with the forward end of the shoulder of the ferrule.
- (19) Crimp the rear end of the outer contact body with the primary crimp die. Refer to Figure 99. Make sure that the distance between the shoulder of the inner ferrule and the rear end of the outer contact body is 0.03 inch maximum.

POSITION OF THE CRIMP ON THE OUTER CONTACT BODY
Figure 99

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (20) If a secondary crimp die is specified, crimp the rear end of the outer contact body again with the secondary crimp die.
 - (21) Push the heat shrinkable sleeve forward on the end of the contact assembly. Refer to Figure 100.
Make sure that the distance from the forward end of the sleeve to the shoulder of the contact body is a maximum of 0.13 inch. Refer to Figure 100.
 - (22) Shrink the sleeve into its position.
- Refer to:
- Figure 100
 - Subject 20-10-14.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONTACT ASSEMBLY
Figure 100

B. Assembly of ITT Cannon 151700-0688 Size 12 Shielded Contacts with AWG 22 Shielded Wire

NECESSARY MATERIALS**

Material	Part Number	Supplier
Heat Shrinkable Sleeve	DWP-125	Raychem
	MWSF	Remtek

- (1) Make a selection of a center contact crimp tool from Table 90.
- (2) Make a selection of an outer ferrule crimp tool from Table 91.
- (3) If the contact must be installed in a size 5 cavity, install the sealing boot on the wire or cable. Refer to Paragraph 15.D.
- (4) Make a selection of a heat shrinkable sleeve from Table 92.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.

- (5) Put a 1 inch length of 3/16 inch diameter heat shrinkable sleeve on the wire.
- (6) Put the ferrule on the wire.
- (7) Prepare the cable. Refer to Figure 101.

**BMS 13-51 WIRE PREPARATION
Figure 101**

- (a) Remove 1/2 inch ± 1/64 inch of the outer jacket from the end of the shielded wire.
 - (b) Remove the necessary length of the shield to make the distance from end of the outer jacket to the end of the shield equal to 9/32 inch +0 inch, -1/64 inch.
 - (c) Remove the necessary length of the primary insulation to make the distance from the end of the conductor to the end of the primary insulation equal to 1/16 inch +0 inch, -1/64 inch.
- (8) Put the conductor into the crimp barrel of the center contact
- Make sure that:
- All of the strands of the conductor are in the crimp barrel
 - The conductor can be seen in the inspection hole of the contact.
- (9) Crimp the center contact.
- (10) Put the contact body on the center contact assembly. Refer to Figure 102.
- Make sure that the shield is on the small end of the contact body.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE CONTACT BODY ON THE CABLE
Figure 102

- (11) Push the ferrule forward on the shield until the forward end of the ferrule is against the rear end of the contact body.
- (12) Crimp the ferrule.
- (13) Remove the unwanted length of the remaining shield.
- (14) Push the heat shrinkable sleeve forward until the forward end of the sleeve is against the rear edge of the contact body.
 Make sure that the sleeve is fully on the ferrule.
- (15) Shrink the sleeve into its position. Refer to Subject 20-10-14.
 Make sure that the forward end of the heat shrinkable sleeve is aligned with the rear edge of the contact body.

C. Assembly of Radiall 618040 Size 12 Coax Contacts with RG-316 Cable

Table 93
CENTER CONTACT CRIMP TOOLS

Coax Contact Size	Crimp Tool		
	Basic Unit		Locator
	Part Number	Setting

Table 94
OUTER CONTACT BODY CRIMP TOOLS

Coax Contact Size	Crimp Tool	
	Basic Unit	Die
12	KTH-1000	KTH-2177

- (1) Make a selection of a center contact crimp tool from Table 93.
- (2) Make a selection of an outer ferrule crimp tool from Table 94.
- (3) If the contact must be installed in a size 5 cavity, install the sealing boot on the wire or cable. Refer to Paragraph 15.D.
- (4) Prepare the cable. Refer to Figure 103.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CABLE JACKET PREPARATION
Figure 103

- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
 - (b) Remove the necessary length of the jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to 0.40 inch ±0.03 inch.
 - (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable equal to 0.13 inch ±0.03 inch.
- (5) Put the ferrule on the cable. Refer to Figure 104.

Make sure that:

- The end of the ferrule that has the larger inner diameter is pointed rearward away from the end of the cable.
- The inner shoulder of the ferrule in the end that has the larger inner diameter is against the end of the jacket.

POSITION OF THE INNER FERRULE ON THE CABLE
Figure 104

- (6) Move the strands of the shield apart.
- (7) Fold the strands of the shield back on the ferrule. Refer to Figure 105.

Make sure that:

- The strands of the shield are on the ferrule
- The strands of the shield are symmetrical around the circumference of the ferrule.

POSITION OF THE SHIELD ON THE FERRULE
Figure 105

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (8) Remove the necessary length of the dielectric to make the distance from the end of the folded back shield to the end of the dielectric equal to 0.04 inch \pm 0.01 inch. Refer to Figure 106.

DIELECTRIC REMOVAL LENGTH

Figure 106

- (9) Put the conductor in the crimp barrel of the center contact. Refer to Figure 107.

Make sure that:

- The rear end of the contact is against the end of the dielectric
- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

CENTER CONTACT ASSEMBLY

Figure 107

- (10) Crimp the center contact.

- (11) Push the center contact assembly into the outer contact body. Refer to Figure 108.

Make sure that the distance from the rear end of the ferrule to the rear end of the outer contact body is 0.05 inch \pm 0.02 inch.

POSITION OF THE OUTER CONTACT BODY ON THE CENTER CONTACT ASSEMBLY

Figure 108

- (12) Crimp the rear end of the outer contact body. Refer to Figure 109.

Make sure that the distance from the rear end of the ferrule to the forward edge of the crimp area is 0.20 inch \pm 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE CRIMP ON THE OUTER CONTACT BODY
Figure 109

(13) If necessary, remove the unwanted length of the shield strands that extend farther than the rear end of the outer contact body. Refer to Figure 109.

10. ASSEMBLY OF S280W554(-) SIZE 8 COAX CONTACTS

A. Assembly of Size 8 Coax Contacts

Table 95
CENTER CONTACT CRIMP TOOLS

Coax Contact Size	Crimp Tool

- (1) Make a selection of a center contact crimp tool from Table 95.
- (2) Make a selection of an outer contact crimp tool from Table 96.
- (3) Put these components on the cable:
 - The seal boot and cable support assembly
 - The outer ferrule.

Refer to Figure 110.

POSITION OF THE SEAL BOOT AND THE OUTER FERRULE ON THE CABLE
Figure 110

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (4) Remove 0.62 inch \pm 0.02 inch of jacket from the end of the cable. Refer to Figure 111.

OUTER JACKET REMOVAL LENGTH
Figure 111

- (5) Cut the outer round shield to make the distance from the end of the cable jacket to the end of the round shield equal to 0.20 inch \pm 0.02 inch. Refer to Figure 112.

REMOVAL OF THE OUTER ROUND SHIELD
Figure 112

- (6) Loosen the round shield and fold it back on the cable jacket.
 (7) Cut the inner flat shield to align the edge of the shield with the edge of the folded back outer round shield. Refer to Figure 113.

OUTER ROUND SHIELD FOLDED BACK
Figure 113

- (8) Push the inner ferrule assembly rearward on the dielectric until it is against the edge of the round shield. Refer to Figure 114.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE INNER FERRULE ASSEMBLY ON THE CABLE
Figure 114

- (9) Remove the length of the dielectric between the end of the inner ferrule assembly and the end of the cable. Refer to Figure 115.

Make sure that the distance from the end of the dielectric to the edge of the inner ferrule assembly is not greater than 0.02 inch.

DIELECTRIC REMOVAL
Figure 115

- (10) Put the conductor into the crimp barrel of the center contact.

Make sure that:

- All of the strands of the conductor are in the center contact
- The conductor can be seen in the inspection hole.

- (11) Push the center contact rearward toward the outer ferrule until the inner ferrule assembly is against the outer round shield. Refer to Figure 116.

POSITION OF THE CENTER CONTACT ON THE CABLE
Figure 116

- (12) Crimp the center contact.

- (13) Symmetrically put the outer round shield around the inner ferrule assembly. Refer to Figure 117.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE OUTER ROUND SHIELD ON THE INNER FERRULE ASSEMBLY
Figure 117

- (14) Push the outer ferrule forward until it is against the inner ferrule assembly. Refer to Figure 118. Make sure that the shield is between the outer ferrule and the inner ferrule assembly.

POSITION OF THE OUTER FERRULE AGAINST THE INNER FERRULE ASSEMBLY
Figure 118

- (15) Remove the unwanted length of the shield strands. Make sure that the end of the shield strands aligns with the rear edge of the shoulder of the inner ferrule assembly.
- (16) Push the cable and the inner contact assembly into the outer contact assembly until it stops. Refer to Figure 119.

ALIGNMENT OF THE CENTER CONTACT AND THE OUTER CONTACT
Figure 119

- (17) Apply pressure on the outer contact toward the outer and inner ferrule and crimp the outer contact. Refer to Figure 120. Make sure that the outer contact is against the outer ferrule during the crimp operation.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

DIRECTION OF PRESSURE DURING THE CRIMP OPERATION
Figure 120

- (18) Examine the crimp area of the outer contact.

Make sure that the length of the crimp area on the outer contact is 0.09 inch or longer. Refer to Figure 121.

CRIMP AREA OF THE OUTER CONTACT
Figure 121

- (19) Push the seal boot and cable support assembly toward the contact assembly until it stops. Refer to Figure 122.

POSITION OF THE SEAL BOOT AGAINST THE CONTACT ASSEMBLY
Figure 122

11. ASSEMBLY OF S280W552-() SIZE 8 TWINAX CONTACTS

A. Twinax Cable Preparation

This paragraph gives the procedure to prepare the S280W502-1 twinax cable for the assembly of the twinax contact.

- (1) Put the seal boot on the cable. Refer to Figure 123.

Make sure that the larger end of the seal boot is pointed forward to the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE SEAL BOOT AND THE FERRULE ON THE CABLE

Figure 123

- (2) Put the shield termination ferrule on the cable. Refer to Figure 123.
Make sure that the larger end of the shield termination ferrule is pointed rearward away from the end of the cable.
- (3) Remove 0.48 inch \pm 0.03 inch of the jacket from the end of the cable.
Refer to Figure 124 and Subject 20-00-15.

CAUTION: DO NOT CAUSE DAMAGE TO THE STRANDS OF THE SHIELD. UNSATISFACTORY PERFORMANCE OF THE CABLE CAN OCCUR.

CABLE JACKET REMOVAL LENGTH

Figure 124

- (4) Fold the shield back against the jacket of the cable.
- (5) Cut the fillers at the necessary location to make the distance from the forward end of the shield to the end of the fillers equal to or less than 0.03 inch. Refer to Figure 125.

REMOVAL OF THE CABLE FILLERS

Figure 125

- (6) Prepare the wires. Refer to Figure 126.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

INSULATION REMOVAL LENGTH

Figure 126

- (a) Cut the white wire 0.25 inch ±0.02 inch from the end of the wire.
- (b) Remove 0.11 inch ±0.02 inch of the insulation from the end of the white wire.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE WIRE CAN OCCUR.

- (c) Remove 0.35 inch ±0.02 inch of the insulation from the end of the blue wire.

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR. UNSATISFACTORY PERFORMANCE OF THE WIRE CAN OCCUR.

B. Assembly of Twinax Contacts

Refer to Paragraph 3.H. for the twinax contact termination identification.

**Table 97
CRIMP TOOLS FOR THE TWINAX CONTACT INNER CONTACTS**

	Code	Component	Conductor Location	Basic Unit	Die	
					Part Number	Cavity
Shield	C	Outer Contact Body	Outer Contact Body	M22520/5-01	Y797	B

- (1) Put the insulator bushing on the cable. Refer to Figure 127.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The white wire is in the hole near the edge of the bushing
- The blue wire is in the hole near the center of the bushing
- The bushing is against the shield.

POSITION OF THE INSULATOR BUSHING ON THE CABLE

Figure 127

- (2) Align the conductor of the blue wire and the longer cavity in the center of the center contact.
- (3) Align the conductor of the white wire and the shorter cavity near the side of the center contact.
Make sure that the conductor of the blue wire stays aligned with the longer cavity in the center of the contact.
- (4) Put the center contact on the wires. Refer to Figure 128.

Make sure that:

- All of the strands of the conductor of the blue wire are in the longer center cavity
- All of the strands of the conductor of the white wire are in the shorter side cavity
- The conductor of the blue wire can be seen in the inspection hole
- The distance between the center contact and the end of the insulation of the white wire is a maximum of 0.02 inch.

POSITION OF THE CENTER CONTACT ON THE CABLE

Figure 128

- (5) Make a selection of a center contact crimp tool for the blue wire from Table 97.
- (6) Put the center contact in the crimp tool.
- (7) Crimp the contact.
- (8) Make a selection of a center contact crimp tool for the white wire from Table 97.
- (9) Put the center contact in the crimp tool. Refer to Figure 129.

Make sure that the contact is correctly aligned in the tool.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE CENTER CONTACT IN THE CRIMP TOOL
Figure 129

- (10) Crimp the contact.
- (11) Examine the crimp area of the contact. Refer to Figure 130.
 Make sure that each crimp area does not have a crack.

CRIMP AREAS OF THE CENTER CONTACT
Figure 130

- (12) Push the shield termination ferrule forward until it is against the insulator bushing. Refer to Figure 131.

POSITION OF THE FERRULE
Figure 131

- (13) Make the shield flat against the outer surface of the ferrule.
- (14) Cut the shield at the forward edge of the shoulder of the ferrule. Refer to Figure 132.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

LOCATION OF SHIELD REMOVAL
Figure 132

- (15) Make a selection of an outer contact body crimp tool from Table 98.
- (16) Align the center contact and the outer body. Refer to Figure 133.

ALIGNMENT OF THE CENTER CONTACT AND THE OUTER BODY
Figure 133

- (17) Push the center contact into the outer body until it stops.
 Make sure that the rear edge of the outer body is against the shoulder of the ferrule. Refer to Figure 134.

POSITION OF THE OUTER BODY ON THE CENTER CONTACT
Figure 134

- (18) Put the contact in the crimp tool. Refer to Figure 135.
 Make sure that the contact is in the small groove of the die.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE CONTACT IN THE CRIMP TOOL
Figure 135

- (19) Push the outer body against the die.
- (20) Continue to push the outer body against the die and crimp the outer body.
 Make sure that the contact stays tight against the die during the crimp operation.
- (21) Examine the crimp area of the contact. Refer to Figure 136.

Make sure that:

- The crimp area does not have a crack
- The distance from the rear edge of the outer body to the forward edge of the shoulder of the ferrule is not more than 0.01 inch.

POSITION OF THE OUTER BODY AFTER THE CRIMP OPERATION
Figure 136

- (22) If the crimp area has deformed metal on the edges, do Step (18) through Step (21) again with the contact turned 60 degrees from its position in the initial crimp operation.
- (23) Remove the unwanted strands of the shield between the outer body and the ferrule.
- (24) Carefully push the seal boot forward until it stops. Refer to Figure 137.

POSITION OF THE SEAL BOOT ON THE CONTACT
Figure 137

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (25) Examine the position of the engaging end of the center contact.
- (26) If the engaging end of the center contact is not located at the center of the outer contact, carefully push it into its correct position.

CAUTION: IF THE ENGAGING END OF THE CENTER CONTACT IS NOT LOCATED AT THE CENTER OF THE OUTER CONTACT, DAMAGE TO THE CONTACT, THE CONNECTOR, OR THE RECEPTACLE CONNECTOR CAN OCCUR.

12. ASSEMBLY OF SIZE 8 QUADRAX CONTACTS

A. Assembly of the BACC47GB1 Quadrax Contact

**Table 99
QUADRAX CONTACT INNER CONTACT CRIMP TOOLS**

Quadrax Contact	Crimp Tool		
	Basic Unit		Locator
	Part Number	Setting	Part Number
BACC47GB1	M22520/2-01	5	K709

QUADRAX CONTACT OUTER CONTACT CRIMP TOOLS**

Quadrax Contact	Crimp Tool		
	Basic Unit	Die	
		Part Number	Cavity
BACC47GB1	M22520/5-01	M22520/5-45	B

- (1) Make a selection of an inner contact crimp tool from Table 99.
- (2) Make a selection of an outer contact crimp tool from Table 100.
- (3) Cut the cable perpendicular to its longitudinal axis.
- (4) Put the seal boot on the cable. Refer to Figure 138.

Make sure that the end of the seal boot that has the smaller diameter points rearward, away from the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

THE SEAL BOOT ON THE CABLE
Figure 138

- (5) Move the seal boot away from the end of the cable.
- (6) Prepare the end of the cable. Refer to Figure 139.

QUADRAX CABLE TRIM DIMENSIONS
Figure 139

- (a) Remove 0.61 inch ± 0.02 inch of the outer jacket from the end of the cable.
- (b) Remove the necessary length of the shield from the end of the cable to make the distance from the end of the outer jacket to the end of the shield equal to 0.56 inch ± 0.02 inch.
- (7) Put the ferrule on the cable. Refer to Figure 140.

Make sure that the end of the ferrule that has the smaller diameter is pointed forward toward the end of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE FERRULE ON THE CABLE

Figure 140

- (8) Push the ferrule rearward until it is against the end of the outer jacket. Refer to Figure 140.
- (9) Fold the outer round shield back on the ferrule. Refer to Figure 141.

INNER CONDUCTOR INSULATION REMOVAL DIMENSIONS AND SHIELD PREPARATION

Figure 141

- (10) Remove the necessary length of the inner flat shield and the tape wrap insulation.
Make sure that the ends of the flat shield and the tape wrap are approximately aligned with the front end of the ferrule.
- (11) Move the four inner conductors apart.
Make sure that:
 - The inner conductors do not cross each other
 - The initial positions of the inner conductors in the cable is not changed.
- (12) Remove the necessary length of the filler rods.
Make sure that the ends of the filler rods are approximately aligned with the front end of the ferrule.
- (13) Remove 0.15 inch \pm 0.02 inch of insulation from each of the four inner conductors.
Refer to:
 - Refer to Figure 141.
 - Subject 20-00-15 for the procedure to remove the wire insulation.
- (14) Crimp an inner contact on each of the four inner conductors.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The distance between the wire insulation and the end of each inner contact crimp barrel is 0.02 inch maximum
- The wire insulation is not in the crimp barrel
- The conductor strands can be seen in the inspection hole
- All conductor strands are in the crimp barrel
- The conductor strands do not go out of the inspection hole
- The plating of each inner contact is not removed
- The inner contacts have no cracks.

(15) Put the inner contacts into the larger end of the insulator. Refer to Figure 142 and Figure 143.

Make sure that:

- The red conductor and the yellow conductor are adjacent to the wiring keyway of the insulator
- The position of the conductors in the insulator is the same as the position of the conductors in the cable
- Each inner contact is fully installed in the insulator
- The conductors do not cross each other.

INSTALLATION OF THE INNER CONTACTS IN THE INSULATOR
Figure 142

INSULATOR REAR VIEW - WIRE SIDE
POSITION OF THE INNER CONTACTS IN THE INSULATOR
Figure 143

(16) Align the wiring key on the outer contact and the wiring keyway of the insulator. Refer to Figure 144.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

ALIGNMENT OF THE OUTER CONTACT AND THE INSULATOR ASSEMBLY
Figure 144

(17) Push the insulator assembly into the outer contact until it stops . Refer to Figure 145.

Make sure that:

- The wiring key on the outer contact and the wiring keyway of the insulator are aligned
- The rear of the insulator is against the shield that is folded back on the ferrule
- The distance from the rear edge of the outer contact to the shoulder of the ferrule is not more than 0.02 inch
- The distance from the rear end of the ferrule to the end of the cable jacket is not more than 0.02 inch.

QUADRAX CONTACT ASSEMBLY
Figure 145

(18) Crimp the outer contact. Refer to Figure 145.

(19) Remove all of the strands of the shield that are between the rear edge of the outer contact and the shoulder of the ferrule.

13. ASSEMBLY OF SIZE 5 COAX CONTACTS

A. Assembly of ITT Cannon Size 5 Coax Contacts

For the assembly of size 5 coax contacts with S280W503(-) coax cable, refer to Paragraph 13.D.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (1) Make a selection of a center contact crimp tool from Table 102.
- (2) Make a selection of an outer contact crimp tool from Table 103.
- (3) In this sequence, put these components on the cable:
 - The seal boot
 - The crimp sleeve.
- (4) Prepare the cable. Refer to Figure 146.
Refer to Table 101 for the trim dimensions.

COAX CABLE PREPARATION
Figure 146

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
- (b) Remove the necessary length of the jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to Dimension A.
- (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.
- (5) Move the end of the shield strands to increase the diameter of the shield at the end of the shield by approximately 50 percent.
- (6) Push the inner ferrule rearward until it stops.
Make sure that all of the strands of the shield are on the ferrule.
- (7) Push the crimp sleeve forward until it holds the shield against the inner ferrule. Refer to Figure 147.

POSITION OF THE SHIELD BETWEEN THE INNER FERRULE AND THE CRIMP SLEEVE

Figure 147

- (8) Remove the unwanted length of the strands of the shield.
Make sure that the end of the shield strands is aligned with the forward shoulder of the inner ferrule.
- (9) Push the crimp sleeve forward until it is against the shoulder of the ferrule.
- (10) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the forward shoulder of the inner ferrule equal to 0.03 inch \pm 0.01 inch. Refer to Figure 148.

DIELECTRIC REMOVAL LENGTH

Figure 148

- (11) Remove the necessary length of the conductor to make the distance from the end of the conductor to the end of the dielectric equal to 0.162 inch \pm 0.030 inch. Refer to Figure 149.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CONDUCTOR REMOVAL LENGTH
Figure 149

(12) Put the center conductor in the crimp barrel of the center contact. Refer to Figure 150.

Make sure that:

- The rear end of the contact is against the end of the dielectric
- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

CENTER CONTACT ASSEMBLY
Figure 150

(13) Crimp the center contact.

(14) Put the rear insulator and the front insulator on the center contact. Refer to Figure 151.

Make sure that the rear end of the rear insulator is against the dielectric.

OUTER CONTACT ASSEMBLY
Figure 151

(15) Push the outer contact rearward on the center contact assembly. Refer to Figure 151.

Make sure that the distance from the forward edge of the shoulder of the crimp sleeve to the rear edge of the outer contact is not greater than 0.030 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (16) Crimp the outer contact.
- (17) Push the seal boot forward until the forward end of the boot is against the rear end of the outer contact.

B. Assembly of ITT Cannon 249-2108-000 Size 5 Coax Contacts with RG-142 Cable

**Table 104
COAX CONTACT OUTER CONTACT CRIMP TOOLS**

Coax Contact	Crimp Tool		
	Basic Unit	Die	
		Part Number	Cavity
249-2108-000	M22520/5-01	M22520/5-45	B

- (1) Prepare the cable. Refer to Figure 152.

**CABLE PREPARATION
Figure 152**

- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
 - (b) In this sequence, put these components on the cable:
 - The seal sleeve
 - The seal bushing
 - The crimp sleeve.
 - (c) Remove 0.60 inch ±0.02 inch of the jacket from the end of the cable.
- CAUTION:** DO NOT CAUSE ANY DAMAGE TO THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE CABLE.
- (d) Remove the necessary length of shield to make the distance from the end of the jacket to the end of the shield equal to 0.25 inch ±0.02 inch.
- (2) Assemble the center contact:
 - (a) Loosen the strands of the shield.
 - (b) Put the inner ferrule on the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The shield makes an overlap with the rear end of the inner ferrule
- The rear end of the inner ferrule is against the end of the jacket
- The shield is smooth and symmetrical around the circumference of the inner ferrule.

- (c) Push the crimp sleeve forward on the shield until it makes an overlap with the end of the inner ferrule. Refer to Figure 153.

POSITION OF THE SHIELD BETWEEN THE INNER FERRULE AND THE CRIMP SLEEVE

Figure 153

- (d) Remove the unwanted length of shield at the rear edge of the shoulder of the ferrule.
- (e) Push the crimp sleeve forward until it is against the shoulder of the inner ferrule.
- (f) Remove the necessary length of dielectric to make the distance from the end of the crimp sleeve to the end of the dielectric equal to 0.03 inch \pm 0.01 inch. Refer to Figure 154.

DIELECTRIC REMOVAL LENGTH

Figure 154

- (g) Put the rear insulator on the cable.
Make sure that the rear end of the insulator is against the inner ferrule.
- (h) Remove the necessary length of the center conductor to make the distance from the forward end of the rear insulator to the end of the conductor equal to 0.14 inch \pm 0.02 inch. Refer to Figure 155.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CENTER CONDUCTOR LENGTH
Figure 155

- (i) Put the center conductor in the solder cup of the center contact.
 Make sure that:
 - The end of the solder cup of the contact is against the rear insulator
 - All of the strands of the conductor are in the solder cup.
- (j) Solder the contact and the conductor. Refer to Subject 20-40-00.
- (3) Put the front insulator on the center contact.
 Make sure that the rear end of the front insulator is against the shoulder of the rear insulator.
- (4) Assemble the outer contact. Refer to Figure 156.

ITT CANNON 249-2108-000 COAX CONTACT ASSEMBLY
Figure 156

- (a) Make a selection of a crimp tool from Table 104.
- (b) Push the outer contact onto the center contact assembly until it stops.
- (c) Crimp the outer contact.
- (d) Push the seal bushing forward on the outer contact until it stops.
- (e) Push the seal sleeve forward into its position.
 Make sure that:
 - The forward edge of the seal sleeve is against the shoulder of the seal bushing
 - The seal sleeve makes an overlap with the seal bushing.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

C. Assembly of AMP, Radiall, and Souriau Size 5 Coax Contacts

For the assembly of size 5 coax contacts with S280W503(-) coax cable, refer to Paragraph 13.D.

**Table 105
CABLE TRIM DIMENSIONS**

Contact			Removal Length

8660-2485	612648	620467

- (1) Make a selection of a center contact crimp tool from Table 106.
- (2) Make a selection of an outer contact crimp tool from Table 107.
- (3) In this order, put these components on the cable:
 - The seal boot
 - The ferrule.

Refer to Figure 159.

- (4) Prepare the cable. Refer to Figure 157.
Refer to Table 105 for the trim dimensions.

**COAX CABLE PREPARATION
Figure 157**

- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
 - (b) Remove the necessary length of the jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to Dimension A.
 - (c) Remove the necessary length of the shield to make the distance from the end of the shield to the end of the cable jacket equal to Dimension B.
 - (d) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension C.
- (5) Put the center conductor in the crimp barrel of the center contact. Refer to Figure 158.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The rear end of the contact is against the end of the dielectric
- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

CENTER CONTACT ASSEMBLY
Figure 158

- (6) Crimp the center contact.
- (7) Move the strands of the shield to increase the diameter of the shield approximately 50 percent at end of the shield.
- (8) Put the outer contact on the center contact assembly.
Make sure that the rear end of the outer contact is between the shield and the jacket.
- (9) Push the outer contact rearward until it stops. Refer to Figure 159.
Make sure that the shield is equal and symmetrical around the circumference of the outer contact.

POSITION OF THE OUTER CONTACT ON THE CENTER CONTACT ASSEMBLY
Figure 159

- (10) Push the ferrule forward until the forward edge of the ferrule is against the rear shoulder of the outer contact. Refer to Figure 160.

OUTER CONTACT ASSEMBLY
Figure 160

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (11) Cut the unwanted length of the shield.
Make sure that the end of the shield is aligned with the end of the ferrule.
- (12) Crimp the outer contact.
- (13) Push the seal boot toward the end of the cable until the forward edge of the boot is against the rear shoulder of the outer contact.

D. Assembly of Size 5 Coax Contacts with S280W503-() Coax Cable

**Table 108
CENTER CONTACT CRIMP TOOLS**

Coax Contact	Coax Cable	Crimp Tool

- (1) Make a selection of a center contact crimp tool from Table 108.
- (2) Make a selection of an outer contact crimp tool from Table 109.
- (3) Put these components on the cable:
 - The seal boot
 - The outer ferrule.

Refer to Figure 161.

**POSITION OF THE SEAL BOOT AND THE OUTER FERRULE ON THE CABLE
Figure 161**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (4) Remove 0.41 inch \pm 0.02 inch of the outer jacket from the end of the cable. Refer to Figure 162.

CABLE JACKET REMOVAL LENGTH
Figure 162

- (5) Fold the outer round conductor shield and the inner flat conductor shield back on the cable jacket. Refer to Figure 163.

If it is necessary, the strands of the inner shield can be moved apart and made straight before they are folded back.

POSITION OF THE OUTER SHIELD AND THE INNER SHIELD FOLDED BACK
Figure 163

- (6) Remove 0.24 inch \pm 0.02 inch of the dielectric from the end of the cable. Refer to Figure 164.

DIELECTRIC REMOVAL LENGTH
Figure 164

- (7) Put the rear insulation bushing on the cable.
Make sure that the large end of the bushing is pointed rearward on the cable.
- (8) Push the bushing rearward until it is against the inner shield. Refer to Figure 165.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE REAR INSULATOR BUSHING AGAINST THE INNER SHIELD
Figure 165

(9) Put the conductor in the crimp barrel of the center contact.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact.

(10) Push the center contact rearward until the end of the contact is against the insulator bushing. Refer to Figure 166.

POSITION OF THE CENTER CONTACT ON THE CONDUCTOR
Figure 166

(11) Crimp the center contact.

(12) Push the outer ferrule forward between the cable jacket and the shields until it is against both shields and the rear insulator bushing. Refer to Figure 167.

Make sure that the both shields are symmetrical around the circumference of the outer ferrule.

POSITION OF THE OUTER FERRULE BETWEEN THE CABLE JACKET AND THE SHIELDS
Figure 167

(13) Remove the unwanted length of the shields. Refer to Figure 168.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that the end of the shield strands is aligned with the front edge of the shoulder of the outer ferrule.

REMOVAL OF THE UNWANTED LENGTH OF THE SHIELDS

Figure 168

- (14) Push the center contact assembly into the outer contact assembly until it stops. Refer to Figure 169.

OUTER CONTACT ASSEMBLY

Figure 169

- (15) Assemble the outer contact. Refer to Figure 170.

DIRECTION OF APPLIED PRESSURE DURING THE CRIMP OPERATION

Figure 170

- (a) At the same time, apply pressure:
- On the outer contact toward the center contact assembly
 - On the center contact assembly toward the outer contact.
- (b) Crimp the outer contact.
- Make sure that the outer contact is tight against the center contact assembly during the crimp operation.

- (16) Examine the contact.

Make sure that the distance between the forward edge of the shoulder of the outer ferrule and the rear end of the outer contact is not greater than 0.01 inch. Refer to Figure 171.

(1) Prepare the cable:

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
- (b) In this order, put these components on the cable:
 - The coupling nut
 - The washer
 - The seal ring.
- (c) For the Souriau 8660-2295A contact with an RG-393 cable, make a selection of a Grade B, Class 1 heat shrinkable sleeve from Subject 20-00-11.
 Make sure that the diameter of the sleeve is the smallest that can easily move on the cable jacket.
- (d) For the Souriau 8660-2295A contact with an RG-393 cable, put a 1.50 inch \pm 0.25 inch length of the heat shrinkable sleeve on the cable.
- (e) Remove the necessary length of the jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to Dimension A. Refer to Figure 173.
 Refer to Table 111 the value of the dimension.

CABLE JACKET REMOVAL LENGTH
Figure 173

- (f) For the Souriau 8660-2295A contact with an RG-393 cable, shrink the sleeve into position. Refer to Subject 20-10-14.
 Make sure that the forward end of the sleeve is aligned with the end of the cable jacket.
- (g) Move the strands of the shield apart.
- (h) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the cable equal to Dimension A. Refer to Figure 174.
 Refer to Table 112 the value of the dimension.

DIELECTRIC REMOVAL LENGTH
Figure 174

- (2) Put the center contact on the conductor.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (3) Solder the contact. Refer to Figure 175 and Subject 20-40-00.

CENTER CONTACT ASSEMBLY
Figure 175

- (4) Put the shield cone on the cable.
Make sure that the forward end of the cone is against the end of the jacket.
- (5) Fold the strands of the shield back on the shield cone.
- (6) Remove the unwanted length of the strands of the shield. Refer to Figure 176.
Make sure that the end of the strands is aligned with the forward edge of the shoulder of the shield cone.

POSITION OF THE SHIELD AND THE SHIELD CONE
Figure 176

- (7) Put the outer contact on the inner contact assembly.
- (8) Engage the threads of the coupling nut and the body of the outer contact. Refer to Figure 177.

OUTER CONTACT ASSEMBLY
Figure 177

- (9) Torque the coupling nut:
- 50 inch-pounds \pm 5 inch-pounds for the ITT Cannon contact
 - 30 inch-pounds \pm 5 inch-pounds for the Souriau contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

B. Replacement of a Size 1 Coax Mounting Block that has Special Hole Spacing

This paragraph gives the procedure to remove a size 1 coax contact mounting block that has special hole spacing, and replace it with a standard size 1 coax contact mounting block.

This procedure is applicable if the Boeing connector part number has insert configuration code 122, 123 or 125. These insert configuration codes indicate a connector that has inserts that fit the standard mounting block of the size 1 coax contact.

Table 113

ITT CANNON SIZE 1 COAX CONTACT MOUNTING BLOCK CONVERSION KIT

Description	Part Number	Supplier
Size 1 Coax Mounting Block Conversion Kit	320-0091-000	ITT Cannon

- (1) Make a selection of a size 1 coax contact mounting block conversion kit from Table 113.
- (2) Remove the size 1 coax contact from the connector. Refer to Paragraph 7.E.
- (3) Remove these components from the contact:
 - The retaining ring
 - The washer
 - The O-ring
 - The second washer
 - The spring
 - The mounting block.

NOTE: The O-ring and the second washer are part of the environmental configuration of the size 1 coax contact only.

- (4) Get the mounting block from the conversion kit.
- (5) In this sequence, put these components on the coax contact:
 - The new mounting block
 - The spring
 - The washer
 - The O-ring
 - The second washer
 - The retaining ring.

NOTE: The O-ring and the second washer are part of the environmental configuration of the size 1 coax contact only.

C. Assembly of Kings 3011-1-103 Size 1 Coax Contact with S280W503-5 Cable

Table 114

**Table 116
NECESSARY MATERIALS**

Material	Part Number	Supplier
Heat Shrinkable Sleeve	DWP-125	Raychem
	MWSF	Remtek

- (1) Prepare the cable:
- (a) Cut the cable to make its end perpendicular to its longitudinal axis.
 - (b) Make a selection of a heat shrinkable sleeve from Table 116.

NOTE: An equivalent heat shrinkable sleeve is a satisfactory alternative. Refer to Subject 20-00-11.
 - (c) Put a 1.5 inch minimum length of heat shrinkable sleeve on the cable. Make sure that the sleeve has the smallest diameter that moves easily on the outer ferrule.
 - (d) Put the outer ferrule on the cable. Refer to Figure 178. Make sure that the end of the ferrule that has the shoulder is pointed forward to the end of the cable.

**POSITION OF THE OUTER FERRULE ON THE CABLE
Figure 178**

**CABLE PREPARATION
Figure 179**

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Refer to Figure 179:

- (e) Remove the necessary length of the jacket from the end of the cable to make the distance from the end of the jacket to the end of the cable equal to 1.50 inches \pm 0.03 inch.
 - (f) Remove the necessary length of the round and flat shields from the end of the cable to make the distance from the end of the shields to the end of the cable equal to 1.20 inches \pm 0.03 inch.
 - (g) Move the strands of the outer shield apart.
 - (h) Remove the necessary length of the dielectric to make the distance from the end of the dielectric to the end of the conductor equal to 0.30 inch \pm 0.03 inch.
- (2) Push the end of the cable into the inner contact body. Refer to Figure 180.

Make sure that:

- The conductor can be seen in the inspection hole of the center contact
- The inner ferrule is between the inner shield and the outer shield.

CENTER CONTACT ASSEMBLY
Figure 180

- (3) Make a selection of a center contact crimp tool from Table 114.
- (4) Crimp the center contact between the contact shoulder and the inspection hole. Refer to Figure 181.

CENTER CONTACT ASSEMBLY
Figure 181

- (5) Push the outer ferrule forward until it is against the shoulder of the contact body.
- (6) Remove the unwanted length of the strands of the shield.
- (7) Make a selection of an outer ferrule crimp tool from Table 115.
- (8) Crimp the outer ferrule. Refer to Figure 182.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CRIMPED OUTER FERRULE ON THE INNER CONTACT ASSEMBLY
Figure 182

- (9) Put the inner contact assembly into the outer contact body.
- (10) Engage the threads of the inner contact body and the threads of the outer contact body. Refer to Figure 183.

CONTACT ASSEMBLY
Figure 183

- (11) Hold the flat areas of the outer contact body and torque the coupling nut of the inner contact to 30 inch-pounds \pm 3 inch-pounds.
- (12) Push the heat shrinkable sleeve forward on the crimped area of the ferrule. Refer to Figure 184. Make sure that the distance from the forward end of the sleeve to the rear shoulder of the contact body is a maximum of 0.13 inch. Refer to Figure 184.
- (13) Shrink the sleeve into its position.

Refer to:

- Figure 184
- Subject 20-10-14.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONTACT ASSEMBLY
Figure 184

- (14) Install the contact assembly in the connector. Refer to Paragraph 15.I.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

D. Assembly of the ITT Cannon 320-1066-006 Size 1 Coax Contact Termination Kit

NOTE: The coax contact termination kit contains the center contact assembly.

**Table 117
CENTER CONTACT CRIMP TOOLS**

Basic Unit		Locator
Part Number	Setting	
M22520/1-01	7	M22520/1-02

- (1) Make a selection of a center contact crimp tool from Table 117.
- (2) Put these components on the cable in this sequence:
 - The clamp nut
 - The gland ring
 - The seal.

Refer to Figure 185.

**POSITION OF THE CLAMP NUT, THE GLAND RING, AND THE SEAL ON THE CABLE
Figure 185**

- (3) Cut the cable to make its end perpendicular to its longitudinal axis.
- (4) Remove 0.50 inch \pm 0.01 inch of the jacket from the end of the cable. Refer to Figure 186.

**CABLE JACKET REMOVAL LENGTH
Figure 186**

- (5) Put the shield clamp on the cable. Refer to Figure 187.
Make sure that the end of the clamp is against the end of the jacket.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE SHIELD CLAMP
Figure 187

- (6) Move the strands of the shield apart.
- (7) Make the strands of the shield straight.
- (8) Move the strands of the shield away from the dielectric. Refer to Figure 188.

POSITION OF THE SHIELD STRANDS
Figure 188

- (9) Remove 0.20 inch \pm 0.01 inch of the dielectric from the end of the cable. Refer to Figure 189.

DIELECTRIC REMOVAL
Figure 189

- (10) Put the conductor in the crimp barrel of the center contact. Refer to Figure 190.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole of the contact
- The end of the conductor is against the bottom of the crimp barrel of the contact.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS****CENTER CONTACT ASSEMBLY****Figure 190**

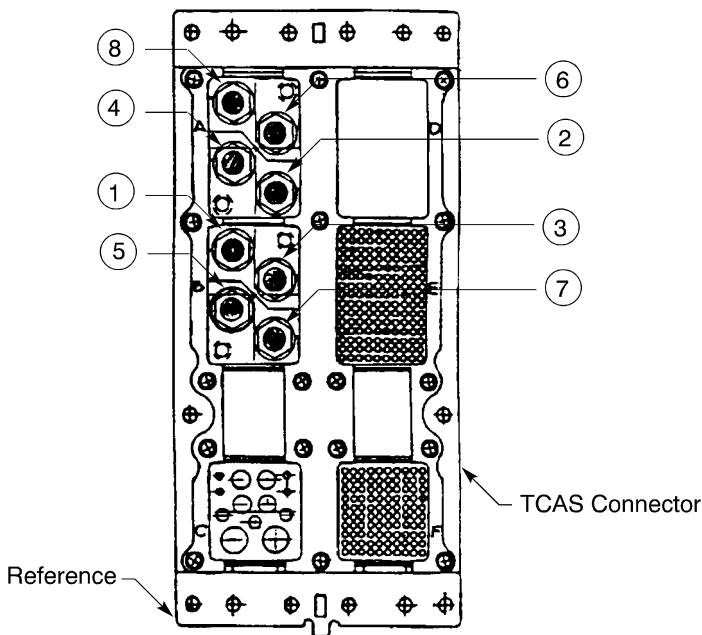

- (11) Crimp the center contact.
- (12) Fold the strands of the shield back on the shield clamp. Refer to Figure 191.

**POSITION OF THE SHIELD ON THE SHIELD CLAMP****Figure 191**

- (13) Remove the length of the strands of the shield that extend farther than the shoulder of the shield clamp. Refer to Figure 191.
Make sure that the ends of the strands are aligned with the forward edge of the shoulder of the shield clamp.
- (14) If the connector is a TCAS connector, find the recommended installation sequence for the 8 coax contacts in the connector. Refer to Figure 192

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

COAX CONTACT INSTALLATION SEQUENCE
Figure 192

- (15) Put the center contact assembly into the outer contact body.
- (16) Engage the threads of the clamp nut and the outer contact body. Refer to Figure 193.

CENTER CONTACT ASSEMBLY INSTALLED IN THE OUTER CONTACT BODY
Figure 193

- (17) Torque the clamp nut 18 inch-pounds to 20 inch-pounds.

E. Assembly of the ITT Cannon 320-1066-015 Size 1 Coax Contact Termination Kit

NOTE: The coax contact termination kit contains the center contact assembly.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

- (1) Make a selection of an insertion tool from Table 120.

NOTE: A tool is not necessary for the insertion of these contacts:

- A size 1616 contact
- A size 1212 contact
- A size 12 coax or shielded contact
- A size 0808 power or ground contact
- A size 8 coax or twinax contact
- A size 5 coax contact.

- (2) Examine the contact.

Make sure that the contact is straight.

- (3) Put the contact assembly in the insertion tool. Refer to Figure 202.

Make sure that the end of the insertion tool is against the rear edge of the shoulder of the contact.

POSITION OF THE CONTACT ASSEMBLY IN THE INSERTION TOOL

Figure 202

- (4) At the rear of the connector, axially align the insertion tool, the contact assembly, and the contact cavity. Refer to Figure 203.

Make sure that the insertion tool is perpendicular to the rear face of the insert.

CAUTION: IF THE INSERTION TOOL AND THE CONTACT ASSEMBLY ARE NOT ALIGNED CORRECTLY, DAMAGE TO THE CONNECTOR INSERT OCCURS.

ALIGNMENT OF THE INSERTION TOOL, THE CONTACT ASSEMBLY, AND THE CONTACT CAVITY

Figure 203

- (5) Carefully push the contact assembly into the contact cavity until it stops. Refer to Figure 204.

Make sure that the insertion tool stays axially aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CONTACT INSERTION
Figure 204

- (6) Carefully pull the insertion tool out of the contact cavity.
- (7) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (3) through Step (7) again.

B. Insertion of a Shield Ground Wire Contact in a Connector Ground Block

- (1) Make a selection of an empty contact cavity in the ground block.
Make sure that the shield ground wire is not pulled tightly when the contact is installed.
- (2) Install the contact. Refer to Subject 20-90-15.

C. Insertion of Size 12 Shielded and Coax Contacts

Table 121
SHIELDED CONTACT INSERTION TOOLS

Shielded Contact	Insertion Tool
151700-0688	CIET-12
249-2203-000	CIET-12

- (1) Make a selection of an insertion tool from Table 121.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CAUTION: MANUAL INSERTION IS NOT AN ACCEPTABLE ALTERNATIVE. MANUAL INSERTION CAN CAUSE DAMAGE TO THE STRANDS OF THE SHIELD OF THE CABLE.

- (2) Insert the contact. Refer to Paragraph 15.A.

NOTE: The size 12 shielded contact is rear release, rear removable.

D. Installation of a Size 12 Contact in a Size 5 Contact Cavity

This procedure is applicable for the installation of a size 12 contact in a size 5 contact cavity.

- (1) Make a selection of a sealing boot from Table 34.
- (2) Make a selection of a cavity reducer from Table 33.
- (3) Put the sealing boot on the wire.
- (4) Assemble the contact.

Refer to:

- Paragraph 8. for standard size 12 contacts
- Paragraph 9. for size 12 coax or shielded contacts.

- (5) Push the cavity reducer into the size 5 coax contact cavity in the connector until it stops.

CAUTION: THE CAVITY REDUCER IS NOT REMOVABLE FROM THE CONNECTOR AFTER IT IS INSTALLED.

- (6) Push the contact into the cavity reducer until it stops.
- (7) Lightly pull the wire to make sure that the contact and the cavity reducer are locked in the contact cavity of the connector.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) Push the sealing boot forward on the wire into the connector grommet.

E. Insertion of Size 8 Power and Ground Contacts

Refer to Paragraph 15.A. for the procedure to insert size 8 power and size 8 ground contacts.

F. Insertion of Size 8 Twinax Contacts

**Table 122
TWINAX CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool
8	M81969/28-03
	RIT-04-C-1

- (1) Make a selection of an insertion tool from Table 122.

NOTE: Manual insertion of size 8 twinax contacts is an acceptable alternative.

- (2) Put the contact assembly in the insertion tool.

Make sure that the end of the insertion tool is against the rear edge of the shoulder of the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (3) At the rear of the connector, axially align the insertion tool, the contact assembly, and the contact cavity.

Make sure that the insertion tool is perpendicular to the rear face of the insert.

CAUTION: IF THE INSERTION TOOL AND THE CONTACT ASSEMBLY ARE NOT ALIGNED CORRECTLY, DAMAGE TO THE CONNECTOR INSERT OCCURS.

- (4) Carefully push the contact assembly into the contact cavity until it stops.

Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the insertion tool out of the contact cavity.

- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:

- (a) Pull the contact assembly out of the contact cavity.

- (b) Do Step (2) through Step (6) again.

G. Insertion of Size 8 and Size 5 Coax Contacts

**Table 123
SIZE 8 AND SIZE 5 COAX CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool
8	M81969/28-03
	RIT-04-C-1
5	MS3178-001

- (1) Make a selection of an insertion tool from Table 123.

NOTE: Manual insertion of size 8 and size 5 coax contacts is an acceptable alternative.

- (2) Put the contact assembly in the insertion tool.

Make sure that the end of the insertion tool is against the rear edge of the shoulder of the contact.

- (3) At the rear of the connector, axially align the insertion tool, the contact assembly, and the contact cavity.

Make sure that the insertion tool is perpendicular to the rear face of the insert.

CAUTION: IF THE INSERTION TOOL AND THE CONTACT ASSEMBLY ARE NOT ALIGNED CORRECTLY, DAMAGE TO THE CONNECTOR INSERT OCCURS.

- (4) Carefully push the contact assembly into the contact cavity until it stops.

Make sure that the insertion tool stays axially aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the insertion tool out of the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (6) again.
- (8) For the size 5 coax contact assembly with a seal bushing and a seal sleeve, install the seal bushing and sleeve, refer to Figure 205.

Make sure that:

- The seal sleeve makes an overlap with the seal bushing
- The forward edge of the seal sleeve is against the shoulder of the seal bushing.

POSITION OF THE SEAL SLEEVE ON THE CABLE
Figure 205

- (a) Push the seal sleeve and boot forward into the contact cavity until it stops.
- (9) For the size 5 coax contact assembly with a seal boot, push the seal boot forward into the contact cavity until the forward edge of the shoulder of the boot is against the connector insert. Refer to Figure 206.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

POSITION OF THE SEAL BOOT ON THE CABLE
Figure 206

H. Installation of Size 8 Quadrax Contacts

Table 124
LUBRICANTS

Lubricant	Specification	Supplier
Alcohol, Isopropyl	TT-I-735	An available source

- (1) At the rear of the connector, align the contact polarization key and the keyway of the quadrax contact cavity.

Make sure that the longitudinal axis of the contact assembly is perpendicular to the rear face of the connector.

Refer to:

- Figure 207 for the polarization key of the quadrax contact
- Figure 208 for the keyway of the quadrax contact cavity.

POLARIZATION KEY OF THE QUADRAX CONTACT
Figure 207

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

KEYWAY OF THE QUADRAX CONTACT CAVITY
Figure 208

- (2) Push the contact into the contact cavity until the contact stops and is locked.

NOTE: A lubricant can be used to make it easier to push the contact into the contact cavity. Refer to Table 124

- (3) Align the seal boot key with the contact cavity keyway. Refer to Figure 208.

- (4) Push the seal boot into the contact cavity.

Make sure that the rear edge of the seal boot key is aligned with the rear face of the connector.

NOTE: A lubricant can be used to make it easier to push the seal boot into the contact cavity. Refer to Table 124.

- (5) Lightly pull on the cable.

Make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (6) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (2) through Step (6) again.

I. Installation of Size 1 Coax Contacts in the BAC10AH05, 08, 09 and 25 Inserts

This paragraph gives the procedure to install size 1 coax contacts and TNC adapters that have a mounting block.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

For the procedure to install:

- A BACA19BK1 TNC adapter in a BACI10AH11 insert, refer to Paragraph 15.K.
 - An ITT Cannon size 1 coax termination kit contact in a BACI10AH11 insert, refer to Paragraph 15.J.
- (1) If the coax cable has a TNC plug, connect the TNC plug to the correct TNC receptacle on the ARINC connector.
 - (2) Install the contact in the connector from the rear. Refer to Figure 209.

POSITION OF THE MOUNTING BLOCK OF THE SIZE 1 COAX CONTACT
Figure 209

- (3) If the mounting block does not easily move in, turn the mounting block 180 degrees.
- (4) Install and tighten the four screws on the front face of the connector.
- (5) Torque each screw 7 inch-pounds \pm 1 inch-pound.

J. Installation of ITT Cannon Size 1 Coax Termination Kit Contacts in the BACI10AH11 Insert

Installation of the size 1 coax termination kit contact is completed during contact assembly. Refer to Table 125.

Table 125
TERMINATION KIT ASSEMBLY AND CONTACT INSTALLATION PROCEDURES

Part Number	Reference
320-1066-006	Paragraph 14.D.
320-1066-015	Paragraph 14.E.

K. Installation of BACA19BK1 TNC Adapters or Coax Outer Bodies in the BACI10AH11 Insert

Table 126
NECESSARY MATERIALS

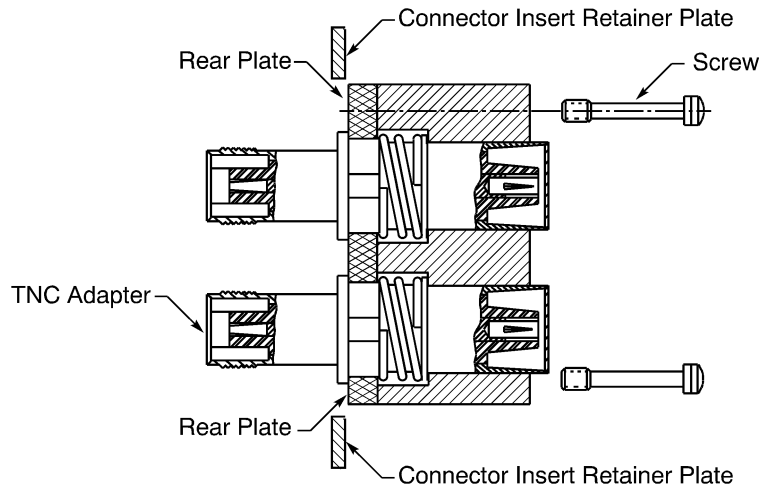

Material	Description	Part Number	Supplier
Lubricant	Oil, Conductive	CRC 3-36	CRC Chemicals

- (1) Remove the screws from the engaging face of the insert. Refer to Figure 210.

NOTE: It is possible that these screws are captivated and cannot be completely removed from the insert.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

BACA19BK1 TNC ADAPTERS IN THE BACI10AH11 INSERT

Figure 210

- (2) If contacts are installed, from the front of the insert, push the engaging ends of the contacts rearward to remove the contact assembly.
- (3) Remove the rear plate from the insert.
- (4) If the connector insert retainer plates prevent the removal of the rear plate from the connector:
 - (a) From the rear side of the connector shell, remove the screws that hold the insert retainer plates.
 - (b) Remove the insert retainer plates from the connector.
 - (c) From the engaging face of the connector, push the insert to the rear and out of the connector shell with the thumbs.
 - (d) Pull the rear plate from the insert.
- (5) Put a TNC adapter contact or a coax outer body in each contact location in the rear plate. Make sure that the springs of the contacts are against the side of the plate that does not have numbers.
- (6) Hold the assembly of the rear plate and the contacts with the hand and push the assembly into the insert from the rear side of the insert. Make sure that the numbers on the rear side of the rear plate can be seen.
- (7) Tighten the screws on the engaging face of the insert. If the insert is removed from the connector, make sure that the position of the edge of the washer below each screw head on the engaging face of the insert is not farther than the edge of the insert.

CAUTION: THE EDGE OF A WASHER THAT IS LOCATED FARTHER THAN THE EDGE OF THE INSERT WILL PREVENT THE INSTALLATION OF THE INSERT INTO THE CONNECTOR SHELL.

- (8) With the finger, push on the engaging end of each of the four size 1 coax contacts in the insert. Make sure that each coax contact returns to its initial position.
- (9) If a contact does not return to its initial position:
 - (a) Make a selection of a conductive lubricant from Table 126.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (b) Remove the screws from the engaging face of the insert.
- (c) Pull the rear plate rearward from the insert.
- (d) Remove the contacts from the rear plate.
- (e) Apply one or two drops of the lubricant to the outside of each contact near the spring to help make sure that the spring can push the contact back to its initial position.
Make sure that no lubricant is on an end of a contact.

CAUTION: DO NOT USE A SILICONE, TEFLON OR OTHER NON-CONDUCTIVE LUBRICANT OR A SPRAY LUBRICANT. A NON-CONDUCTIVE, OR A SPRAY LUBRICANT WILL PREVENT THE SATISFACTORY OPERATION OF THE CONTACT AND THE CONNECTOR.

- (f) Clean unwanted lubricant from each contact with a clean wiper.
- (g) Do Step (5) through Step (8) again.
- (10) Torque each of the two screws 7 inch-pounds \pm 1 inch-pound.
- (11) If the insert is removed from the connector, install the insert in the connector:
 - (a) Align the insert with the shell cavity.
Make sure that the insert polarization key is aligned correctly in relation to the shell cavity.
 - (b) Carefully apply equal pressure with the thumbs on the rear of the insert to fully install the insert in the cavity.
Make sure that when the insert is installed:
 - The surface of the insert is parallel with the rear face of the connector shell
 - The insert flange is aligned with the rear face of the connector shell.
 - (c) Install the retainer plates on the rear surface of the connector shell.
 - (d) Put a screw with a washer in each installation hole of the retainer plates.
 - (e) Tighten each screw.
 - (f) Torque each retainer plate screw 5 inch-pounds \pm 1 inch-pound.

L. Insertion of Fiber Optic Contact Termini

NOTE: A contact terminus can be installed before or after the alignment sleeve insert is installed in the connector.

CAUTION: THE CONTACT TERMINUS MUST HAVE PROTECTION FROM CONTAMINATION WITH A PROTECTION CAP OR A CLEAN PLASTIC BAG WHEN IT IS NOT INSTALLED IN THE CONNECTOR. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

**Table 127
CONTACT TERMINUS INSERTION TOOLS**

Terminus Size	Insertion Tool	
	Part Number	Color
16	M81969/14-03	Blue

- (1) Make a selection of a contact terminus insertion tool from Table 127.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

CAUTION: DO NOT USE AN INSERTION TOOL THAT HAS A DEFECT. DAMAGE TO THE GROMMET OR THE RETENTION CLIPS CAN OCCUR.

- (2) If the contact terminus does not have a protection cap or is not in a plastic bag, examine the contact terminus. Refer to Subject 20-12-20.
- (3) Remove the protection from the contact terminus.
- (4) Carefully put the insertion tool on the cable and the contact terminus.

CAUTION: THE CONTACT TERMINUS MUST BE INSTALLED IN THE CONNECTOR IF IT DOES NOT HAVE PROTECTION FROM CONTAMINATION. CONTAMINATION OF THE CONTACT TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

CAUTION: DO NOT TOUCH THE FRONT FACE OF THE TERMINUS. CONTAMINATION ON THE TERMINUS CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

- (5) At the rear of the connector, axially align the insertion tool and the terminus with the contact terminus cavity.

ALIGNMENT OF THE CONTACT TERMINUS, THE INSERTION TOOL, AND THE CONTACT TERMINUS CAVITY
Figure 211

- (6) If the contact terminus has a key, align the key of the terminus and the keyway of the contact terminus cavity.

NOTE: A contact terminus that has a key can only be installed in a contact terminus cavity that has a keyway.

- (7) Carefully push the insertion tool and the contact terminus into the terminus cavity until it stops.

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

CAUTION: DO NOT PUSH THE CABLE. DAMAGE TO THE FIBER OPTIC CABLE CAN OCCUR.

CAUTION: IF THE INSERTION TOOL IS TURNED WHILE IT IS IN THE CAVITY, DAMAGE TO THE CONNECTOR CAN OCCUR.

- (8) Carefully pull the insertion tool out of the terminus cavity.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The tool stays aligned with the cavity
- The tool is not turned in the cavity.

(9) Lightly pull the cable to make sure that the terminus is locked in the terminus cavity.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE TERMINUS, THE CABLE, OR THE CONNECTOR.

CAUTION: DO NOT MAKE A DENT IN THE CABLE JACKET WITH THE FINGERNAILS. DAMAGE TO THE CABLE JACKET CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

(10) If the terminus is not locked in the cavity:

- (a) Pull the terminus out of the cavity.
- (b) Do Step (4) through Step (9) again.

(11) If the connector is not connected immediately, put a protective cap on the connector.

NOTE: A clean plastic bag is a satisfactory alternative for the protection from contamination.

CAUTION: THE CONNECTOR MUST HAVE PROTECTION FROM CONTAMINATION WHEN THE CONNECTOR IS NOT CONNECTED. UNSATISFACTORY PERFORMANCE OF THE CONNECTOR CAN OCCUR.

M. Installation of the Fiber Optic Alignment Sleeve Insert

NOTE: The alignment sleeve insert can be installed before or after the contact termini are installed in the connector.

**Table 128
NECESSARY TOOLS**

Tool	Type	Size (inch)
Driver	Allen Wrench	5/64
	Screwdriver, Hex	5/64
Torque	Allen Wrench	5/64
	Screwdriver, Hex	5/64

(1) Examine the alignment sleeve insert. Refer to Paragraph 19.

(2) Make a selection of these tools from Table 128:

- A driver
- A torque tool.

NOTE: The driver can have a ball type end.

(3) Align the rear face of the alignment sleeve insert with the engaging face of the connector.

CAUTION: DO NOT SHAKE OR TWIST THE ALIGNMENT SLEEVE INSERT WHEN IT IS INSTALLED IN THE CONNECTOR. DAMAGE TO THE CERAMIC FERRULES OF THE CONTACT TERMINI CAN OCCUR.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

ALIGNMENT SLEEVE INSERT
Figure 212

- (4) Fully engage the threads of the installation screw and the screw hole the connector.
- (5) Torque the screw 8 inch-pounds \pm 1 inch-pound.

N. Seal of an Empty Contact Cavity

Empty size 5 and size 8 cavities must be sealed. Refer to Table 129.

Empty contact cavities that are not specified in Table 129 can stay empty.

Table 129
SEAL PROCEDURES FOR EMPTY CONTACT CAVITIES

Contact Cavity Size	Applicable Insert	Seal Condition	Seal Procedure
8	BACI10AH12	S280W552-109 Conductive Seal Plug	Paragraph 15.O.
	BACI10AH13		
	BACI10AH14		
	BACI10AH20		
	BACI10AH30		
5	All other inserts with a rear grommet	ITT Cannon 225-0090-000 Seal plug Seal Rod	Paragraph 15.P.
	Inserts with a rear grommet	ITT Cannon 225-0090-000 Seal plug Seal Rod	Paragraph 15.P.

O. Seal of an Empty Size 8 Cavity with a Conductive Seal Plug

For the conditions that are applicable for this procedure, refer to Paragraph 15.N.

Table 130
CONDUCTIVE SIZE 8 SEAL PLUG PART NUMBERS

Contact Cavity Size	Boeing Specification	Seal Plug	
		Part Number	Supplier
8	S280W552-109	225-1066-000	ITT Cannon

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

The S280W552-109 seal plug has these technical properties:

- Is a conductive filler plug for size 8 coax or twinax contact cavities
- Is locked in the connector insert by the retention clips of the contact cavity
- Must be removed with a seal plug removal tool.

**Table 131
SIZE 8 SEAL PLUG INSERTION TOOLS**

Contact Cavity Size	Insertion Tool	
	Part Number	Supplier
8	M81969/28-03	QPL
8	RIT-04-C-1	Russtech

- (1) Make a selection of a seal plug from Table 130.
 - (2) Make a selection of a seal plug insertion tool from Table 131.
- NOTE: A plastic awl is a satisfactory alternative to a seal plug insertion tool.
- (3) At the rear of the connector, push the seal plug into the contact cavity until the shoulder of the seal plug is against the surface of the connector insert. Refer to Figure 213.

**POSITION OF THE SEAL PLUG IN THE CONTACT CAVITY
Figure 213**

- (4) Put the insertion tool on the seal plug.
Make sure that the end of the insertion tool is against shoulder of the seal plug.
- (5) Axially align the insertion tool, the seal plug, and the contact cavity.
Make sure that the insertion tool is perpendicular to the rear face of the insert.

CAUTION: IF THE INSERTION TOOL AND THE CONTACT ASSEMBLY ARE NOT ALIGNED CORRECTLY, DAMAGE TO THE CONNECTOR INSERT OCCURS.

- (6) Push the seal plug into the contact cavity until it makes a click.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (7) Carefully pull the insertion tool out of the contact cavity.
- (8) If the seal plug does not make a click:
 - (a) From the front of the connector, put the end of a plastic rod against the seal plug.
Make sure that:
 - The rod has a flat end
 - The diameter of the rod is 0.20 inch minimum to 0.22 inch maximum.
 - (b) Push the seal plug out of the rear of the contact cavity with the rod.
 - (c) From the rear of the connector, push the seal plug into the contact cavity with the rod.
Make sure that the seal plug locks in the contact cavity.

P. Seal of an Empty Size 5 or Size 8 Contact Cavity

For the conditions that are applicable for this procedure, refer to Paragraph 15.N.

**Table 132
SEAL PLUGS FOR SIZE 5 AND SIZE 8 CAVITIES**

Contact Cavity Size	Seal Plug	
	Part Number	Supplier
8	225-0090-000	ITT Cannon
5	225-0090-000	ITT Cannon

**Table 133
SEAL RODS FOR SIZE 5 AND SIZE 8 CAVITIES**

Length (inch)		Diameter (inch)		Material	Specification
Target	Tolerance	Target	Tolerance		
0.50	±0.10	0.313	±0.015	Plastic , polyimide (Nylon)	L-P-410 Type 6/6
				PTFE (Teflon)	AMS 3656
		0.339	±0.015	Silicone rubber	BMS 1-52

- (1) Make a selection of a seal plug from Table 132 or a seal rod from Table 133.
- (2) Put the smaller end of the seal plug in the contact cavity.
- (3) For a size 5 cavity, push the seal plug or the seal rod into the cavity until it stops or until the distance from the rear end of the seal plug or seal rod is less than 0.20 inch from the rear surface of the grommet.
- (4) For a size 8 cavity, push the seal plug or the seal rod into the cavity until it stops or until the distance from the rear end of the seal plug or seal rod is less than 0.35 inch from the rear surface of the grommet.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Q. Installation of Protective Caps

Refer to Subject 20-10-11.

16. INSTALLATION OF CONNECTOR GROUND BLOCKS

A. Installation of Ground Blocks on ARINC 600 Connectors

The ground block for the ARINC 600 connector is installed on the rear face of the plug. The mounting holes are located on the top and the bottom of the connector shell. Refer to Figure 214.

These mounting holes are used to attach:

- The connector to the tray backplate
- The ground block to the connector.

MOUNTING HOLES FOR GROUND BLOCKS ON ARINC 600 CONNECTORS
Figure 214

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

INSTALLATION OF THE GROUND BLOCK ON THE ARINC 600 CONNECTOR
Figure 215

Refer to Figure 215.

- (1) Clean the surfaces of the connector and the ground block that are against each other when the ground block is installed.
 Refer to Subject 20-20-00 Cleaning Procedure 5, the removal of contamination with cleaning solvent.
NOTE: The ground block must be installed on the connector within 30 minutes after the surfaces are cleaned.
- (2) Put the connector against the backplate of the tray.
 Make sure that the A insert is at the top.
- (3) Put the ground block against the rear of the connector.
- (4) Install the screws, washers, and nuts.
- (5) Tighten the screws.
- (6) Torque the screws 6 inch-pounds to 8 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

B. Installation of Ground Blocks on S280W551 Connectors

The ground block for the S280W551 connector is installed on the rear face of the plug. The mounting holes are located on the sides of the connector shell. Refer to Figure 216.

MOUNTING HOLES FOR GROUND BLOCKS ON S280W551 CONNECTORS
Figure 216

Table 134
GROUND BLOCK FASTENERS FOR S280W551 CONNECTORS

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

INSTALLATION OF THE GROUND BLOCK ON THE S280W551 CONNECTOR
Figure 217

Refer to Figure 217.

- (1) Make a selection of a fastener from Table 134.
- (2) Clean the surfaces of the connector and the ground block that are against each other when the ground block is installed.

Refer to Subject 20-20-00 for Cleaning Procedure 5, the removal of contamination with cleaning solvent.

NOTE: The ground block must be installed on the connector within 30 minutes after the surfaces are cleaned.

- (3) Install the screws, washers, and nuts.
 Make sure that the A insert is at the top of the connector.
- (4) Tighten the screws.
- (5) Torque the screws 6 inch-pounds to 8 inch-pounds.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

17. BACKSHELL INSTALLATION

A. Installation of the ITT Cannon 046-1000-000 Backshell on the S280W551-407 Connector

ITT CANNON 046-1000-000 BACKSHELL
Figure 218

- (1) Remove the four screws on the connector shell that hold the insert retainer plates on the shell.
NOTE: Do not remove the retainer plates or the connector insert.
- (2) Discard the screws.
- (3) Put the backshell with captive screws against the retainer plates.
- (4) Align the four captive screws of the backshell with the four holes in the retainer plates. Refer to Figure 218.
- (5) Tighten the screws.
- (6) Torque each screw 5 inch-pounds \pm 1 inch-pound.

B. Assembly of the Glenair 527-187() Backshell on a Shell Size 1 ARINC 600 Plug Connector

Refer to Subject 20-25-14.

C. Assembly of the Glenair 527-212() Backshell on a Shell Size 2 ARINC 600 Plug Connector

Refer to Subject 20-25-14.

18. CONNECTOR INSERT INSTALLATION

A. Insert Replacement

These general conditions are applicable:

- Damaged inserts can be removed and replaced
- If an insert is replaced with another insert that does not have the same configuration, the connector part number must be changed; refer to Paragraph 18.B.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

CAUTION: AN INSERT OF AN ARINC 600 CONNECTOR FROM ONE SUPPLIER MUST BE NOT USED IN A CONNECTOR SHELL FROM AN DIFFERENT SUPPLIER. IF THE SUPPLIER OF THE INSERT AND THE SHELL ARE NOT THE SAME, THE CONNECTOR PLUG AND RECEPTACLE DO NOT SATISFACTORILY ENGAGE.

NOTE: If an insert is replaced with another insert that does not have the same configuration and the insert retainer screws are not long enough to satisfactorily install the new insert, alternative fasteners can be used. Refer to Table 135.

**Table 135
ALTERNATIVE INSERT RETAINER PLATE FASTENERS**

Fastener Hardware	Part Number	Supplier
Lockwasher	MS35333-69	QPL
Pan Head Screw	MS35206-203	QPL

B. Change of the Connector Part Number

- (1) Remove or erase the necessary part of the connector part number on the shell.

NOTE: It is acceptable to remove or erase all of the part number.

- (2) Stamp the new digits or the whole part number with six-point numerals adjacent to the original number.

C. Insert Installation

For the conditions that are applicable to this procedure, refer to Paragraph 18.A.

This paragraph gives the procedure to install:

- An insert in an ARINC 600 non-environmental or Class A, C, D, E, or F connector
- An insert in an S280W551 connector.

For the procedure to install:

- An insert in a sealed ARINC 600 or Class B connector, refer to Paragraph 18.E.
- The wave guide, refer to Paragraph 18.F.

- (1) Make a selection of the new insert.

Refer to:

- Paragraph 2.D. for ITT Cannon ARINC 600 connectors
- Paragraph 2.E. for Souriau ARINC 600 connectors
- Paragraph 2.F. for AMP ARINC 600 connectors
- Paragraph 2.G. for Radiall ARINC 600 connectors
- Paragraph 2.H. for Tri-Star ARINC 600 connectors
- Paragraph 2.I. for S280W551 connectors.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

CAUTION: AN INSERT OF AN ARINC 600 CONNECTOR FROM ONE SUPPLIER MUST BE NOT USED IN A CONNECTOR SHELL FROM AN DIFFERENT SUPPLIER. IF THE SUPPLIER OF THE INSERT AND THE SHELL ARE NOT THE SAME, THE CONNECTOR PLUG AND RECEPTACLE DO NOT SATISFACTORILY ENGAGE.

CAUTION: ONLY THOSE INSERTS THAT ARE SPECIFIED CAN BE USED FOR REPLACEMENT IN THE SPECIFIED SHELL FROM THE SPECIFIED SUPPLIER.

- (2) Remove the new insert from its sealed package.
- (3) Examine the insert.

Make sure that:

- All the contact cavities are clear
- If the insert has a grommet, the seal between the grommet and the insert body is not open.

- (4) Clean the sides of the insert with isopropyl alcohol.
- (5) If the insert has screws on the engaging face near the edge of the insert:
 - (a) Tighten the screws on the engaging face of the insert.

Make sure that the position of the edge of the washer under each screw head is not farther than the edge of the insert.

CAUTION: THE EDGE OF A WASHER THAT IS LOCATED FARTHER THAN THE EDGE OF THE INSERT WILL PREVENT THE INSTALLATION OF THE INSERT INTO THE CONNECTOR SHELL.

- (b) Torque each screw 7 inch-pounds \pm 1 inch-pound.
- (6) Align the insert with the shell cavity.

Make sure that the insert polarization key is aligned correctly in relation to the polarizing rib on the side of the shell cavity.
- (7) Carefully apply equal pressure with the thumbs on the rear of the insert to fully install the insert in the cavity.

Make sure that when the insert is installed:

 - The surface of the insert is parallel with the rear face of the connector shell
 - The insert flange is aligned with the rear face of the connector shell.
- (8) If the insert is an ITT Cannon 71W1() or an ITT Cannon 2W2 insert, install the C-bracket spacer. Refer to Paragraph 18.D.
- (9) Install the retainer plates on the rear surface of the connector shell.
- (10) Put a screw with a washer in each retainer plate hole.
- (11) Tighten each screw.
- (12) Torque each retainer plate screw 5 inch-pounds \pm 1 inch-pound.

D. Installation of the ITT Cannon C-Bracket Spacer on the ITT Cannon 71W1() or 2W2 Insert

This procedure is applicable to the inserts in Table 136.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

Table 136
INSERT PART NUMBERS SUPPLIED WITH C-BRACKET SPACERS

BAC110AH() Insert	ITT Cannon Code	Part Number	Supplier
05	71W1A	143-2085-000	ITT Cannon
		143-2085-001	ITT Cannon
08	71W1B	143-1114-000	ITT Cannon
		143-1113-000	ITT Cannon
09	2W2	144-2944-000	ITT Cannon
25	2W2 SPCL	144-2944-004	ITT Cannon

NOTE: The ITT Cannon C-bracket spacer is supplied with the insert.

This procedure is necessary if:

- The 71W1() or the 2W2 insert is changed to hold a size 1 coax contact that has a standard mounting block
- The C-bracket spacer is missing.

The ITT Cannon C-bracket spacer:

- Is located between the rear surface of the 71W1() or the 2W2 insert and the insert retaining plates
- Keeps the distance between the insert and the plates
- Is located adjacent to the standard mounting block of the size 1 coax contact.

NOTE: Two spacers are required on the 2W2 insert.

- (1) Remove the screws and washers that hold the retainer plates on the rear of the connector.
- (2) Remove the retainer plates from the rear of the connector.
- (3) Remove the screws from the front of the connector that attach the size 1 coax mounting block to the connector insert.
- (4) Pull the size 1 coax contact from the connector.
- (5) Put the C-bracket spacer on the rear of the insert adjacent to the location of the size 1 coax contact. Refer to Figure 219.

Make sure that the short leg of the C-bracket spacer is on the side of the shell cavity that has the polarizing rib.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

THE INSERT, THE C-BRACKET SPACER, AND THE RETAINING PLATES
Figure 219

- (6) Install the retainer plates on the connector shell with the initial screws and washers.
- (7) Torque each retainer plate screw 5 inch-pounds \pm 1 inch-pound.
- (8) Install the size 1 coax contact in the connector. Refer to Paragraph 15.I.

E. Insert Installation in a Sealed or Class B ARINC 600 Connector

For the conditions that are applicable to this procedure, refer to Paragraph 18.A.

Table 137
NECESSARY MATERIALS

Material		Supplier
Description	Part Number	
Catalyst	Catalyst F	Dow Corning
	Catalyst S	
Sealant	3110	Dow Corning

- (1) Make a selection of the new insert.

Refer to:

- Paragraph 2.D. for ITT Cannon ARINC 600 connectors
- Paragraph 2.E. for Souriau ARINC 600 connectors
- Paragraph 2.F. for AMP ARINC 600 connectors
- Paragraph 2.G. for Radiall ARINC 600 connectors
- Paragraph 2.H. for Tri-Star ARINC 600 connectors.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

CAUTION: AN INSERT OF AN ARINC 600 CONNECTOR FROM ONE SUPPLIER MUST BE NOT USED IN A CONNECTOR SHELL FROM AN DIFFERENT SUPPLIER. IF THE SUPPLIER OF THE INSERT AND THE SHELL ARE NOT THE SAME, THE CONNECTOR PLUG AND RECEPTACLE DO NOT SATISFACTORILY ENGAGE.

CAUTION: ONLY THOSE INSERTS THAT ARE SPECIFIED CAN BE USED FOR REPLACEMENT IN THE SPECIFIED SHELL FROM THE SPECIFIED SUPPLIER.

(2) Make a selection of these materials from Table 137:

- A sealant
- A catalyst.

(3) Remove all of the old sealant from the insert cavity with an orangewood stick or cuticle.

CAUTION: DO NOT USE A KNIFE OR ANOTHER SHARP TOOL.

(4) Use a cleaning solvent to fully clean the shell cavity.

CAUTION: DO NOT PERMIT THE CLEANING SOLVENT TO TOUCH ANOTHER PART OF THE CONNECTOR.

(5) Remove the new insert from its sealed package.

(6) Clean the insert flange and the bosses near the flange with isopropyl alcohol.

CAUTION: MAKE SURE THAT THE BOSSES ARE CLEAN. IT IS POSSIBLE THAT THE BOSSES ARE NOT CLEAN WHEN THE NEW INSERT IS REMOVED FROM THE PACKAGE.

(7) If the insert has screws on the engaging face near the edge of the insert:

(a) Tighten the screws on the engaging face of the insert.

Make sure that the position of the edge of the washer under each screw head is not farther than the edge of the insert.

CAUTION: THE EDGE OF A WASHER THAT IS LOCATED FARTHER THAN THE EDGE OF THE INSERT WILL PREVENT THE INSTALLATION OF THE INSERT INTO THE CONNECTOR SHELL.

(b) Torque each screw 7 inch-pounds \pm 1 inch-pound.

(8) Align the insert with the shell cavity.

Make sure that the insert polarization key is aligned correctly in relation to the shell cavity.

(9) Carefully apply equal pressure with the thumbs on the rear of the insert to fully install the insert in the cavity.

Make sure that when the insert is installed:

- The surface of the insert is parallel with the rear face of the connector shell
- The insert flange is aligned with the rear face of the connector shell.

(10) Apply a layer of sealant in the groove around the insert.

Make sure that the top layer of sealant is aligned with the rear face of the shell.

(11) Let the sealant cure until it is not tacky.

(12) Install the retainer plates on the rear surface of the connector shell.

(13) Put a screw with a washer in each retainer plate hole.

(14) Tighten each screw.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

(15) Torque each retainer plate screw 5 inch-pounds \pm 1 inch-pound.

F. Installation of the Wave Guide Insert

INSTALLATION OF THE WAVE GUIDE INSERT

Figure 220

(1) Make a selection of a BAC110AH06 wave guide.

Refer to:

- Paragraph 2.D. for ITT Cannon ARINC 600 connectors
- Paragraph 2.E. for Souriau ARINC 600 connectors
- Paragraph 2.H. for Tri-Star ARINC 600 connectors.

NOTE: A Tri-Star wave guide can be installed in an ITT Cannon connector.

NOTE: The wave guide insert for the Souriau connector is supplied with the connector.

(2) Remove the screws that hold the insert retainer plates. Refer to Figure 220.

(3) Remove the insert retainer plates.

(4) If the flange of the wave guide insert has a keyway, align the keyway with the key in the insert cavity at the rear of the connector shell.

(5) Put the smaller end of the wave guide insert into shell cavity A.

Make sure that the longitudinal axis of the wave guide insert is perpendicular to the rear face of the connector.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

- (6) Install the retainer plates on the rear surface of the connector shell.
- (7) Put a screw and a washer in each retainer plate hole.
- (8) Tighten the screws.
- (9) Torque each retainer plate screw 5 inch-pounds ± 1 inch-pound.

19. INSPECTION AND CLEANING OF A FIBER OPTIC ALIGNMENT SLEEVE INSERT

A. Necessary Tools and Materials

**Table 138
NECESSARY TOOLS**

Tool	Description	Part Number	Supplier
Canned Air	Tetrafluoroethane	ES1620	Chemtronics
Protective Equipment	Finger Cot	-	An available source
	Gloves, Powder Free	-	An available source

**Table 139
SOLVENTS**

Solvent	Specification	Supplier
Alcohol, Ethyl	O-E-760	An available source
Alcohol, Isopropyl	TT-I-735	An available source
Water, Distilled	-	An available source

B. Inspection and Cleaning

**ALIGNMENT SLEEVE INSERT
Figure 221**

CAUTION: KEEP THE ALIGNMENT SLEEVE INSERT IN A CLEAN PLASTIC BAG UNTIL IT IS INSTALLED ON THE CONNECTOR. CONTAMINATION ON THE ALIGNMENT SLEEVE INSERT CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CONNECTOR.

Refer to Figure 221.

- (1) Without magnification, examine each end of the alignment sleeves of the insert.
- (2) If an alignment sleeve has contamination, clean the sleeve without solvent. Refer to Paragraph 19.C.

20-71-14

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS**

- (3) Without magnification, examine each end of the alignment sleeves again.
- (4) If an alignment sleeve has remaining contamination, clean the sleeve with solvent. Refer to Paragraph 19.D.
 - (a) Without magnification, examine each end of the alignment sleeves again.
 - (b) If an alignment sleeve has remaining contamination, clean the sleeve with solvent again. Refer to Paragraph 19.D.
 - (c) Without magnification, examine the alignment sleeves again.
 - (d) If an alignment sleeve has remaining contamination, replace the alignment sleeve insert.

C. Contamination Removal - Without Solvent

For the conditions that are applicable for this procedure, refer to Paragraph 19.B.

Refer to Figure 221.

- (1) Make a selection of canned air from Table 138.

NOTE: An equivalent canned air is a satisfactory alternative.
- (2) Make a selection of a protection equipment from Table 138.

NOTE: A satisfactory alternative is to clean the hands.
- (3) If the hands are not clean, put the protection equipment on.
- (4) Apply the canned air in each alignment sleeve that has contamination.

D. Contamination Removal - With Solvent

For the conditions that are applicable for this procedure, refer to Paragraph 19.B.

WARNING: SOME SOLVENTS ARE FLAMMABLE. MAKE SURE THAT THE QUANTITY OF A FLAMMABLE SOLVENT NEAR THE AIRPLANE IS NOT MORE THAN THE QUANTITY THAT IS NECESSARY TO CLEAN THE ALIGNMENT SLEEVE INSERT.

Refer to Figure 221.

- (1) Make a selection of a canned air from Table 138.

NOTE: An equivalent canned air is a satisfactory alternative.
- (2) Make a selection of these solvents from Table 139:
 - An alcohol
 - Distilled water.
- (3) Make a selection of a protection equipment from Table 138.

NOTE: A satisfactory alternative is to clean the hands.
- (4) If the hands are not clean, put the protection equipment on.
- (5) Put a quantity of alcohol in a small container that can be sealed with a lid.

Make sure that:

 - The container is clean
 - The size of the container is sufficient to hold the alignment sleeve insert
 - The quantity of alcohol is sufficient to put the body of the alignment sleeve insert below the surface of the alcohol.
- (6) Put a quantity of distilled water in a small container that can be sealed with a lid.

20-71-14

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

Make sure that:

- The container is clean
 - The size of the container is sufficient to hold the alignment sleeve insert
 - The quantity of distilled water is sufficient to put the body of the alignment sleeve insert below the surface of the alcohol.
- (7) Put the alignment sleeve insert in the container that has alcohol for 30 seconds minimum.
Make sure that the body of the alignment sleeve insert is below the surface of the alcohol.
 - (8) Remove the alignment sleeve insert from the alcohol.
 - (9) Seal the alignment sleeve insert in the container that has distilled water.
Make sure that the body of the alignment sleeve insert is below the surface of the distilled water.
 - (10) Lightly shake the container for 1 to 3 minutes.
 - (11) Remove the alignment sleeve insert from the water.
 - (12) Dry the alignment sleeve insert with the canned air.
 - (13) Put the alignment sleeve insert in the container that has alcohol for 30 seconds minimum.
Make sure that the body of the alignment sleeve insert is below the surface of the alcohol.
 - (14) Remove the alignment sleeve insert from the alcohol.
 - (15) Dry the alignment sleeve insert with the canned air.

20. CONNECTOR POLARIZATION AND CONNECTOR PART NUMBER

**Table 144
NECESSARY MATERIALS FOR REPLACEMENT FASTENERS**

Description	Part Number	Supplier
Thread Lock Compound	222	Loctite

CAUTION: IT IS POSSIBLE THAT THE POLARIZATION POSTS OF CONNECTORS FROM DIFFERENT MANUFACTURERS ARE NOT INTERCHANGEABLE.

NOTE: If the polarization posts on a connector are changed, the polarization code in the connector part number must be changed. Refer to Paragraph 20.F.

- (1) Identify the polarization code in the connector part number from the equipment list.
- (2) For that code, find the correct post positions on the plug.
Refer to:
 - Figure 222
 - Table 141.
- (3) If the position of any of the posts on the connector is not correct:
 - (a) From the engaging face of the connector, remove the screws from the polarization retainer plate.
NOTE: It is not necessary to remove the connector from its installed location to change its polarization.
 - (b) Remove the polarization retainer plate from the connector.
 - (c) Remove the incorrect polarization post from the hexagonal hole.
 - (d) Align the post in the correct position.
 - (e) Put the post back into the hexagonal hole.
Make sure that the post is in the correct position.
 - (f) Put the polarization retainer plate on the posts.
 - (g) Engage the threads of each polarization retainer plate screw.
 - (h) Tighten the screws.
- (4) If a polarization plate screw is lost or damaged:
 - (a) Make a selection of a screw from Table 143.
 - (b) Make a selection of a thread lock compound from Table 144.
 - (c) Apply one drop of thread lock compound to the threads of the screw.
 - (d) Engage the threads of the screw and the connector.
 - (e) Tighten the screw.

F. Change of the Polarization Code, Any Part of the Connector Part Number, or the Complete Part Number on the Connector Shell

**Table 145
NECESSARY MATERIALS**

Material	Part Number or Specification	Supplier
Clear Paint	683-3-2	Akzo
	Clear Lacquer	Tartan
	EC-776	3M
	BMS10-60, Type 1, Grade D, Clear	Boeing
Ink	No. 68 Fast Dry	Independent
	No. 73X NW Opaque	Independent
	No. 73X Opaque	Independent
Pen	Permanent Ink Pen, Ultra Fine Point	Sanford Sharpie

**Table 146
SUPPLIERS OF BOEING STANDARD CLEAR PAINT**

Part Number or Specification	Supplier
BMS10-60	Akzo
	PRC-DeSoto

- (1) Make a selection of these necessary materials from Table 145:
 - A permanent ink pen
 - A clear paint
 - An ink.

- (2) If the connector does not have a part number or a polarization code, write the part number and polarization code in the correct position on the connector shell.
 Refer to the details of the applicable connector part number:
 - Figure 10 for Boeing ARINC 600 Connectors
 - Figure 11 for the ITT Cannon ARINC 600 Connectors
 - Figure 12 for the Souriau ARINC 600 Connectors
 - Figure 13 for the AMP ARINC 600 Connectors
 - Figure 14 for the Radiall ARINC 600 Connectors
 - Figure 15 for the Boeing S280W551 Connectors.

- (3) If the connector has an incorrect part number or polarization code:
 - (a) Apply a layer of ink on the incorrect part number or polarization code.
 Make sure that the incorrect part number or polarization code cannot be read.
 - (b) Write the new part number or polarization code on the connector shell
 - Adjacent to the location of the incorrect part number or polarization code
 - In the correct position.

- (4) Let the ink dry for 10 minutes minimum.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BACC66F, H, AND K ARINC 600, AND S280W551 RACK AND PANEL CONNECTORS

(5) Paint the new code and the area of the old code with the clear paint.

CAUTION: DO NOT APPLY PAINT ON THE CONTACTS. ANY PAINT ON THE SURFACE OF A CONTACT CAUSES UNSATISFACTORY ELECTRICAL PERFORMANCE OF THE CONTACT.

(6) Let the clear paint dry before the connector shell is touched or moved.

4. CONNECTOR ASSEMBLY

A. Contact Assembly

For the assembly of:

- A Radiall 616366 contact, refer to Paragraph 4.B.
- A Radiall 610020001 coax contact, refer to Paragraph 4.C.
- A Radiall 610040 coax contact, refer to Paragraph 4.D.
- A Radiall 610108 coax contact, refer to Paragraph 4.E.
- A Radiall 610118 coax contact, refer to Paragraph 4.F.
- A Radiall 616021 coax contact, refer to Paragraph 4.G.

20-71-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

- (1) Make a selection of a crimp tool from Table 12.
- (2) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 34
- Table 11 for the insulation removal length
- Subject 20-10-15 for the insulation removal procedures.

INSULATION REMOVAL LENGTH
Figure 34

- (3) If it is necessary, fold the conductor back. Refer to Figure 35.

FOLDED BACK CONDUCTOR
Figure 35

- (4) Put the end of the wire in the crimp barrel of the contact. Refer to Figure 36.

Make sure that:

- All of the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CONTACT CRIMP BARREL
Figure 36

- (5) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

B. Assembly of the Radial 616366 Contact

**Table 13
FILLER WIRE**

Wire Size (AWG)	Filler Wire	
	Size (AWG)	Quantity

CONTACT CRIMP TOOL**

Basic Unit	Die	Locator
400B	414DA-12N-125	4960
WA23	414DA-12N-125	4960

- (1) Make a selection of filler wire. Refer to Table 13.
Make sure that the wire type of the filler wire is the same as the assembly wire.
- (2) Make a selection of a crimp tool. Refer to Table 14.
- (3) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be put on the wire.
- (4) Put a 1.0 inch ± 0.03 inch length of the heat shrinkable sleeve on the wire.
- (5) Remove 0.32 inch ± 0.03 inch insulation from the end of the wire and each filler wire. Refer to Subject 20-00-15.
- (6) If a filler wire is necessary, remove 0.32 inch ± 0.03 inch insulation from the end of the wire. Refer to Subject 20-00-15.
- (7) Put the ends of the wire and the filler wire into the crimp barrel of the contact.

NOTE: If it is possible, put the primary wire in the center of the crimp barrel.

Make sure that:

- All the strands of each conductor are in the crimp barrel
- The end of each conductor is against the bottom of the crimp barrel
- The conductors can be seen in the inspection hole.

- (8) Crimp the contact.
- (9) Remove the unwanted length of the filler wire as close to the end of the crimp barrel as possible.

CAUTION: DO NOT CUT OR CAUSE ANY DAMAGE TO THE STRANDS OF THE PRIMARY WIRE. THE MECHANICAL STRENGTH OF THE WIRE CAN BE DECREASED.

- (10) Push the heat shrinkable sleeve forward on the wire.
Make sure that the sleeve is on the end of the contact crimp barrel and the end of the wire insulation.

20-71-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

(11) Shrink the sleeve in position. Refer to Subject 20-10-14.

C. Assembly of the Radial 610020001 Coax Contact

**Table 15
FERRULE CRIMP TOOLS**

Basic Unit	Die	
	Part Number	Cavity
612648	612673	A

	M22520/5-19	B
	Y142	B
	Y197	A
	Y322	B
ST2966M	ST2966M-6	B

- (1) Make a selection of a ferrule crimp tool. Refer to Table 15.
- (2) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be put on the cable.
- (3) Prepare the cable. Refer to Figure 37.

**COAX CABLE PREPARATION
Figure 37**

- (a) Put a 1.5 inch to 3.0 inch length of the heat shrinkable sleeve on the cable.
- (b) Put the ferrule on the cable.
- (c) Cut the end of the cable.
Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.
- (d) Remove 0.60 inch \pm 0.03 inch of the outer jacket from the end of the cable.
- (e) Remove 0.32 inch \pm 0.03 inch of the shield from the end of the cable.
- (f) Remove 0.14 inch \pm 0.03 inch of the dielectric from the end of the cable.

20-71-15

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

- (4) Put the center contact on the center conductor.
- (5) Solder the center contact.
- (6) Move the strands of the shield apart.
- (7) Put the contact body on the cable.

Make sure that:

- The crimp barrel of the contact body is between the dielectric and the shield
- The crimp barrel of the contact body is against the end of the cable jacket.

- (8) Push the ferrule forward on the shield until it is against the contact body.
- (9) Remove the unwanted length of the strands of the shield.

Make sure that the shield is aligned with the forward end of the ferrule.

- (10) Crimp the ferrule. Refer to Figure 38.

Make sure that the distance between the end of the ferrule and the shoulder of the contact body is not more than 0.07 inch.

POSITION OF THE FERRULE
Figure 38

- (11) Align the forward end of the heat shrinkable sleeve with the forward end of the ferrule. Make sure that no more than 0.05 inch of the ferrule can be seen.
- (12) Shrink the sleeve in position. Refer to Subject 20-10-14.

D. Assembly of the Radiall 610040 Coax Contact

Table 16
FERRULE CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
282293	282246	A
	M22520/5-05	A
M22520/5-01	282246	A
	M22520/5-05	A

- (1) Make a selection of a ferrule crimp tool. Refer to Table 16.
- (2) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

Make sure that the sleeve has the smallest diameter that can be put on the cable.

- (3) Prepare the cable. Refer to Figure 39.

COAX CABLE PREPARATION

Figure 39

- (a) Put a 1.5 inch to 3.0 inch length of the heat shrinkable sleeve on the cable.
- (b) Put the ferrule on the cable.
- (c) Cut the end of the cable.
Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.
- (d) Remove 0.60 inch \pm 0.03 inch of the outer jacket from the end of the cable.
- (e) Remove 0.32 inch \pm 0.03 inch of the shield from the end of the cable.
- (f) Remove 0.14 inch \pm 0.03 inch of the dielectric from the end of the cable.

- (4) Put the center contact on the center conductor.
- (5) Solder the center contact.
- (6) Move the strands of the shield apart.
- (7) Put the contact body on the cable.

Make sure that:

- The crimp barrel of the contact body is between the dielectric and the shield
- The crimp barrel of the contact body is against the end of the cable jacket.

- (8) Push the ferrule forward on the shield until it is against the contact body.
- (9) Remove the unwanted length of the strands of the shield.

Make sure that the shield is aligned with the forward end of the ferrule.

- (10) Crimp the ferrule. Refer to Figure 40.

Make sure that the distance between the end of the ferrule and the shoulder of the contact body is not more than 0.07 inch.

STANDARD WIRING PRACTICES MANUAL

CRIMPED FERRULE
Figure 40

- (11) Align the forward end of the heat shrinkable sleeve with the forward end of the ferrule. Make sure that no more than 0.05 inch of the ferrule can be seen.
- (12) Shrink the sleeve in position. Refer to Subject 20-10-14.

E. Assembly of the Radiall 610108 Coax Contact

Table 17
FERRULE CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
282293	282247	A
	M22520/5-61	A
M22520/5-01	282247	A
	M22520/5-61	A

- (1) Make a selection of a ferrule crimp tool. Refer to Table 17.
- (2) Prepare the cable. Refer to Figure 41.

COAX CABLE PREPARATION
Figure 41

- (a) Put the clamp nut on the cable.
 - (b) Put the ferrule on the cable.
 - (c) Cut the end of the cable.
- Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

- (d) Remove 0.87 inch \pm 0.03 inch of the outer jacket from the end of the cable.
 - (e) Remove 0.60 inch \pm 0.03 inch of the shield from the end of the cable.
 - (f) Remove 0.36 inch \pm 0.03 inch of the dielectric from the end of the cable.
- (3) Move the strands of the shield apart.
- (4) Put the center contact insulator assembly on the cable.
- Make sure that:
- The crimp barrel of the center contact insulator assembly is between the dielectric and the shield
 - The crimp barrel of the center contact insulator assembly is against the end of the cable jacket.
- (5) Solder the center contact on the center conductor.
- (6) Push the ferrule forward on the shield until it is against the contact body.
- (7) Remove the unwanted length of the strands of the shield.
- Make sure the shield is aligned with the forward end of the ferrule.
- (8) Crimp the ferrule. Refer to Figure 42.
- Make sure that the distance between the end of the ferrule and the shoulder of the center contact insulator assembly is not more than 0.07 inch.

POSITION OF THE FERRULE
Figure 42

- (9) Put the outer contact body on the cable assembly.
- (10) Engage the threads of the clamp nut with the threads of the outer contact body.
- (11) Torque the clamp nut 70 inch-pounds \pm 5 inch-pounds.

F. Assembly of the Radiall 610118 Coax Contact

Table 18
FERRULE CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
612648	612807	B

	KTH-2235	A

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

Table 18 (continued)

Basic Unit	Die	
	Part Number	Cavity
M22520/5-01	M22520/5-25	A
ST2966M	ST266M-16	-

- (1) Make a selection of a ferrule crimp tool. Refer to Table 18.
- (2) Prepare the cable. Refer to Figure 43.

COAX CABLE PREPARATION
Figure 43

- (a) Put the clamp nut on the cable.
 - (b) Put the ferrule on the cable.
 - (c) Cut the end of the cable.
Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.
 - (d) Remove 0.87 inch \pm 0.03 inch of the outer jacket from the end of the cable.
 - (e) Remove 0.60 inch \pm 0.03 inch of the shield from the end of the cable.
 - (f) Remove 0.36 inch \pm 0.03 inch of the dielectric from the end of the cable.
- (3) Move the strands of the shield apart.
 - (4) Put the center contact insulator assembly on the cable.
Make sure that:
 - The crimp barrel of the center contact insulator assembly is between the dielectric and the shield
 - The crimp barrel of the center contact insulator assembly is against the end of the cable jacket.
 - (5) Put the center contact on the center conductor.
 - (6) Solder the center contact.
 - (7) Push the ferrule forward on the shield until it is against the contact body.
 - (8) Remove the unwanted length of the strands of the shield.
Make sure the shield is aligned with the forward end of the ferrule.
 - (9) Crimp the ferrule. Refer to Figure 44.
Make sure that the distance between the end of the ferrule and the shoulder of the center contact insulator assembly is not more than 0.07 inch.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

CRIMPED FERRULE
Figure 44

- (10) Put the outer contact body on the cable assembly.
- (11) Engage the threads of the clamp nut with the threads of the outer contact body.
- (12) Torque the clamp nut 70 inch-pounds \pm 5 inch-pounds.

G. Assembly of the Radiall 616021 Coax Contact

Table 19
CENTER CONTACT CRIMP TOOL

Basic Unit		Locator
Part Number	Setting	
282281	8	282974
M22520/2-01	8	282974

Table 20
FERRULE CRIMP TOOLS

Basic Unit	Die	
	Part Number	Cavity
282293	282246	A

- (1) Make a selection of a center contact crimp tool. Refer to Table 19.
- (2) Make a selection of a ferrule crimp tool. Refer to Table 20.
- (3) Make a selection of a heat shrinkable sleeve. Refer to Subject 20-10-14.
Make sure that the sleeve has the smallest diameter that can be put on the cable.
- (4) Prepare the cable. Refer to Figure 45.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

COAX CABLE PREPARATION
Figure 45

- (a) Put a 1.5 inch to 3.0 inch length of the heat shrinkable sleeve on the cable.
- (b) Put the ferrule on the cable.
- (c) Cut the end of the cable.
Make sure that the end of the cable is perpendicular to the longitudinal axis of the cable.
- (d) Remove 0.51 inch ±0.03 inch of the outer jacket from the end of the cable.
- (e) Remove 0.27 inch ±0.03 inch of the shield from the end of the cable.
- (f) Remove 0.16 inch ±0.03 inch of the dielectric from the end of the cable.

- (5) Put the center contact on the center conductor.
- (6) Crimp the center contact.
- (7) Move the strands of the shield apart.
- (8) Put the contact body on the cable.

Make sure that:

- The crimp barrel of the contact body is between the dielectric and the shield
- The crimp barrel of the contact body is against the end of the cable jacket.

- (9) Push the ferrule forward on the shield until it is against the contact body.
- (10) Remove the unwanted length of the strands of the shield.

Make sure the shield is aligned with the forward end of the ferrule.

- (11) Crimp the ferrule. Refer to Figure 46.

Make sure that the distance between the end of the ferrule and the shoulder of the contact body is not more than 0.07 inch.

CRIMPED FERRULE
Figure 46

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

- (12) Align the forward end of the heat shrinkable sleeve with the forward end of the ferrule.
Make sure that no more than 0.05 inch of the ferrule can be seen.
- (13) Shrink the sleeve in position. Refer to Subject 20-10-14.

H. Contact Insertion

For coax contact insertion, refer to Paragraph 4.I.

**Table 21
CONTACT INSERTION TOOLS**

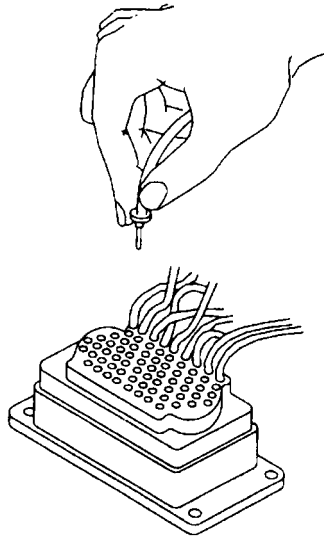

Crimp Barrel Size	Insertion Tool
22	M81969/1-01

	282 945

**INSERTION OF THE CONTACT
Figure 47**

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

CONTACT INSERTION WITHOUT A TOOL

Figure 48

Refer to Figure 47 and Figure 48.

- (1) Make a selection of an insertion tool from Table 21.

NOTE: Contact insertion without a tool is a satisfactory alternative for contact insertion with a tool.

- (2) Put the wired contact in the end of the insertion tool.

Make sure that the end of the tool is against the shoulder of the contact.

- (3) Axially align the tool and the contact with the contact cavity at the rear of the connector. Refer to Figure 49.

ALIGNMENT OF THE INSERTION TOOL AND THE CONTACT CAVITY

Figure 49

- (4) Push the tool straight into the contact cavity until it stops. Refer to Figure 47.

CAUTION: MAKE SURE THAT THE TOOL AND THE CONTACT ARE PUSHED STRAIGHT INTO THE CONTACT CAVITY TO PREVENT DAMAGE TO THE CONNECTOR.

- (5) Carefully remove the tool from the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

STANDARD WIRING PRACTICES MANUAL**ASSEMBLY OF RADIALL DSX SERIES CONNECTORS**

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. DAMAGE TO THE CONTACT CAN OCCUR.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
- (a) Pull the wired contact out of the cavity.
 - (b) Do Step (2) through Step (6) again.

I. Coax Contact Insertion

- (1) Axially align the forward end of the coax contact with the contact cavity.
- (2) Push the coax contact into the contact cavity until it stops.
- (3) Lightly pull on the cable to make sure that the contact is locked.

CAUTION: DO NOT PULL THE CABLE WITH A STRONG OR A SUDDEN FORCE. DAMAGE TO THE CONNECTOR OR THE CONTACT CAN OCCUR.

CAUTION: DO NOT MAKE A DENT IN THE CABLE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE CABLE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE AND RELIABILITY OF THE WIRE.

- (4) If the contact is not locked in the contact cavity, do Step (1) through Step (3) again.

5. CONNECTOR POLARIZATION AND THE CONNECTOR PART NUMBER**A. Connector Polarization and the Connector Part Number**

NOTE: The polarization code in the connector part number identifies the polarization position of the posts and keys.

- (1) Find the polarization code in the connector part number from the equipment list.
- (2) For that code, find the correct connector polarization for the:
 - Post positions on the plug
 - Key positions on the receptacle.

Refer to Figure 50 and Table 22.

- (3) If the polarization position of the posts and keys on the connector do not agree with the polarization code, put the posts and the keys in the correct position.

Refer to Paragraph 5.C.

- (4) If the polarization code in the part number on the connector does not agree with the polarization positions, change the part number on the connector.

Refer to Paragraph 5.D.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

C. Change of the Polarization Posts and Keys

- (1) To change the polarization of a post:
 - (a) Remove the nut and washer from the threaded end of the post.
 - (b) Remove the post from the hexagonal hole in the connector shell.
 - (c) Align the post with the correct position.
 - (d) Put the post back into the hexagonal hole.
Make sure that the post is in the correct position.
 - (e) Put the washer and the nut on the threaded end of the post.
 - (f) Tighten the nut.
- (2) To change the polarization of a key:
 - (a) Remove the necessary screws from the connector shell.
 - (b) Remove the key from the hexagonal hole.
 - (c) Align the key with the correct position.
 - (d) Put the key back into the hexagonal hole.
Make sure the key is in the correct position.
 - (e) Install and tighten the screws.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIAL DSX SERIES CONNECTORS

D. Change of the Polarization Code, Any Part of the Connector Part Number, or the Complete Part Number on the Connector Shell

**Table 23
NECESSARY MATERIALS**

Material	Part Number	Supplier
Ink	No. 68 Fast Dry	Independent
Ink	No. 73X NW Opaque	Independent
Ink	No. 73X Opaque	Independent
Paint, Clear	683-3-2	Akzo
Paint, Clear	Clear Lacquer	Tartan
Paint, Clear	EC-776	3M
Paint, Clear	EC-776SR	3M
Pen	Permanent Ink Pen, Ultra Fine Point	Sanford Sharpie

**Table 24
LOCATION OF CONNECTOR PART NUMBER DATA**

Connector	Number of Inserts	Reference
ARINC 404	1	Figure 1
	2	Figure 2
	3	Figure 3
MIL-C-81659 Type	1	Figure 4
	2	Figure 5
	3	Figure 6

- (1) If the part number on the connector does not have a part number or polarization code:
 - (a) Make a selection of these materials from Table 23.
 - An ink or a permanent ink pen
 - A clear paint.
 - (b) Write the part number and the polarization code on the connector shell in the correct position. Refer to Table 1 and Table 24 for the details of the applicable connector part number.
 - (c) Let the ink dry for a minimum of 10 minutes.
 - (d) Apply a layer of the clear paint on the part number on the connector shell.

CAUTION: DO NOT APPLY PAINT ON THE CONTACTS. PAINT ON THE SURFACE OF A CONTACT CAN CAUSE UNSATISFACTORY ELECTRICAL PERFORMANCE OF THE CONTACT.

- (e) Let the paint dry before the connector shell is touched or moved.
- (2) If the part number or polarization code on the connector is incorrect:
 - (a) Apply a layer of ink on the incorrect part number or polarization code on the connector shell.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF RADIALL DSX SERIES CONNECTORS

Make sure that the incorrect part number or polarization code cannot be read.

- (3) Write the part number and the polarization code on the connector shell in the correct position.
 - Adjacent to the location of the incorrect part number and polarization code
 - In the correct position on the connector shell.

Refer to the details of the applicable connector part number:

- Figure 1 for the One Insert ARINC 404 Connector
- Figure 2 for the Two Insert ARINC 404 Connector
- Figure 3 for the Three Insert ARINC 404 Connector
- Figure 4 for the One Insert MIL-C-81659 Type Connector
- Figure 5 for the Two Insert MIL-C-81659 Type Connector
- Figure 6 for the Three Insert MIL-C-81659 Type Connector.

- (4) Let the ink dry for a minimum of 10 minutes.
- (5) Apply a layer of ink on the incorrect code on the connector shell.

CAUTION: DO NOT APPLY PAINT ON THE CONTACTS. PAINT ON THE SURFACE OF A CONTACT CAN CAUSE UNSATISFACTORY ELECTRICAL PERFORMANCE OF THE CONTACT.

- (6) Let the paint dry before the connector shell is touched or moved.

	Spring Plate	Paragraph 6.B.

3. INSTALLATION HARDWARE ASSEMBLY - JACKSCREW AND JACKPOST

A. Jackscrew Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION****JACKSCREW ASSEMBLY****Figure 10**

Refer to Figure 10.

- (1) Make a selection of a thread lock compound from Table 9.
- (2) Put two hex nuts on the stud.
- (3) From the front of the connector, put a stud in the installation hole in the connector shell.
- (4) Apply a drop of thread lock compound on the threads of the stud.
- (5) Put the jackscrew head on the stud.
- (6) Fully tighten the jackscrew head.
- (7) Remove the two hex nuts from the stud.
- (8) Do Step (2) through Step (7) again to install a jackscrew in the other installation hole of the connector.

B. Jackpost Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

**JACKPOST ASSEMBLY****Figure 11**

Refer to Figure 11.

- (1) From the front of the connector, put a jackpost in the installation hole in the connector shell.
- (2) Put a lockwasher on the jackpost.
- (3) Put the nut on the jackpost.
- (4) Fully tighten the jackpost.
- (5) Do Step (1) through Step (4) again to install a jackpost in the other installation hole of the connector.

20-72-07

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

C. Jackpost Assembly and Connector Installation in a Panel

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

JACKPOST ASSEMBLY AND CONNECTOR INSTALLATION
Figure 12

Refer to Figure 12.

- (1) From the rear of the panel, put the connector in the hole in the panel.
- (2) Align the installation holes in the connector with the holes in the panel.
- (3) Put the jackpost in the hole in the panel and the connector shell.
- (4) Put a lockwasher on the jackpost.
- (5) Put the nut on the jackpost.
 Make sure the jackpost is not fully tightened.
- (6) Do Step (3) through Step (5) again to install a jackpost in the other installation hole of the connector.
- (7) Fully tighten each jackpost.
 Make sure that the connector does not move in the panel.

4. INSTALLATION HARDWARE ASSEMBLY - MALE AND FEMALE SCREW LOCK

A. Single Clip Male Screw Lock Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

SINGLE CLIP MALE SCREW LOCK ASSEMBLY

Figure 13

Refer to Figure 13.

- (1) Put a male screw lock on one end of the connector shell.
- (2) Align the installation hole of the screw lock and the connector shell.
- (3) Put a screw in the screw lock from the rear of the connector.
- (4) Do Step (1) through Step (3) again to assemble a screw lock in the other installation hole of the connector.

B. Double Clip Male Screw Lock Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

DOUBLE CLIP MALE SCREW LOCK ASSEMBLY

Figure 14

Refer to Figure 14.

- (1) Put a male screw lock on one end of the connector shell.
- (2) Align the installation hole of the screw lock and the connector shell.
- (3) Put the screw in the screw lock from the rear of the connector.
- (4) Do Step (1) through Step (3) again to assemble a screw lock at the other installation hole of the connector.

C. Female Screw Lock Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

FEMALE SCREW LOCK ASSEMBLY
Figure 15

Refer to Figure 15.

- (1) Put two spacer washers on a screw lock.
- (2) From the front of the connector, put the screw lock in installation hole in the connector shell.
- (3) Put a lockwasher on the screw lock.
- (4) Put a nut on the screw lock.
- (5) Fully tighten the screw lock.
- (6) Do Step (1) through Step (5) again to install a screw lock in the other installation hole of the connector.

D. Female Screw Lock Assembly and Connector Installation in a Panel

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

Table 11
SPACER WASHERS FOR DIFFERENT PANEL THICKNESSES

Panel Thickness (inch)		Necessary Number of Washers
Minimum	Maximum	
0.000	0.030	2
0.031	0.060	1
0.061	0.090	0

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

FEMALE SCREW LOCK ASSEMBLY AND CONNECTOR INSTALLATION

Figure 16

Refer to Figure 16.

- (1) Measure the thickness of the panel.
- (2) Find the number of washers that are necessary as spacers. Refer to Table 11.
- (3) If one or more washers are specified in Table 11, put the specified quantity of washers on the screw lock.
- (4) From the rear of the panel, put the connector in the hole in the panel.
- (5) Align the installation holes in the connector with the holes in the panel.
- (6) Put the screw lock in the hole in the panel and the connector shell.
- (7) Put a lockwasher on the screw lock.
- (8) Put the nut on the screw lock.
Make sure that the screw lock is not fully tightened.
- (9) Do Step (3) through Step (8) again to install a screw lock in the other installation hole of the connector.
- (10) Fully tighten each screw lock.
Make sure that the connector does not move in the panel.

5. INSTALLATION HARDWARE ASSEMBLY - SLIDE LATCH AND SLIDE LOCK POST

A. Slide Latch Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

SLIDE LATCH ASSEMBLY
Figure 17

Refer to Figure 17.

- (1) Align the installation hole of the slide latch with the installation hole in the connector shell.
- (2) From the front of the connector, put a screw through the hole in the slide latch and the connector shell.
- (3) Put a lockwasher on the screw.
- (4) Put the nut on the screw.
- (5) Fully tighten the screw.
- (6) Do Step (1) through Step (5) again for the other installation hole of the connector.

B. Slide Lock Post Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

SLIDE LOCK POST ASSEMBLY
Figure 18

Refer to Figure 18.

- (1) Put two spacer washers on a slide latch post.
- (2) From the front of the connector, put the slide latch post through the installation hole of the connector shell.
- (3) Put a lockwasher on the post.
- (4) Put the nut on the post.
- (5) Fully tighten the post.

20-72-07

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

- (6) Do Step (1) through Step (5) again to install a slide lock post in the other installation hole of the connector.

C. Slide Lock Post Assembly and Connector Installation in a Panel

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

**Table 12
SPACER WASHERS FOR DIFFERENT PANEL THICKNESSES**

Panel Thickness (inch)		Necessary Number of Washers
Minimum	Maximum	
0.000	0.030	2
0.031	0.060	1
0.061	0.090	0

**SLIDE LOCK POST ASSEMBLY AND CONNECTOR INSTALLATION
Figure 19**

Refer to Figure 19.

- (1) Measure the thickness of the panel.
- (2) Find the number of washers that are necessary as spacers. Refer to Table 12.
- (3) If one or more washers are specified in Table 12, put the specified quantity of washers on the screw lock.
- (4) From the rear of the panel, put the connector in the hole in the panel.
- (5) Align the installation holes in the connector with the holes in the panel.
- (6) Put the slide lock post in the hole in the panel and the connector shell.
- (7) Put a lockwasher on the slide lock post.
- (8) Put the nut on the slide lock post.
Make sure that the slide lock post is not fully tightened.
- (9) Do Step (5) through Step (8) again to install the other slide lock post in the other installation hole of the connector.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION

(10) Fully tighten each slide lock post.

Make sure that the connector does not move in the panel.

6. INSTALLATION HARDWARE ASSEMBLY - SPRING PLATE AND SPRING LATCH PLATE

A. Spring Plate or Spring Latch Plate Assembly

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

SPRING PLATE ASSEMBLY
Figure 20

SPRING LATCH PLATE ASSEMBLY
Figure 21

Refer to Figure 21 and Figure 20.

- (1) Align the installation hole of the spring latch plate or spring plate with the installation hole in the connector shell.
- (2) From the front of the connector, put a screw through the installation hole of the spring latch plate or spring plate and the connector shell.
- (3) Put a lockwasher on the screw.
- (4) Put the nut on the screw.
- (5) Fully tighten the screw.
- (6) Do Step (1) through Step (5) again for the other installation hole of the connector.

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: INSTALLATION HARDWARE ASSEMBLY AND CONNECTOR INSTALLATION****B. Spring Plate Assembly and Connector Installation in a Panel**

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

**SPRING PLATE ASSEMBLY AND CONNECTOR INSTALLATION****Figure 22**

Refer to Figure 22.

- (1) From the rear of the panel, put the connector in the hole in the panel.
- (2) Put a screw in the installation hole of the spring plate.
- (3) Align the installation holes in the connector with the holes in the panel.
- (4) Put the screw in the hole in the panel and the connector shell.
- (5) Put the lockwasher on the screw.
- (6) Put the nut on the screw.

Make sure that the screw is not fully tightened.

- (7) Do Step (2) through Step (6) again for the other installation hole of the connector.
- (8) Fully tighten each screw.

Make sure that the connector does not move in the panel.

3. BACKSHELL ASSEMBLY - JACKSCREW AND JACKPOST INSTALLATION HARDWARE

A. Backshell Assembly with Jackscrew Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY
Figure 16

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

Refer to Figure 16.

- (1) Make a selection of a thread lock compound from Table 12.
- (2) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (3) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (4) Put two hex nuts on the stud.
- (5) From the front of the connector, put a stud in the installation hole in the connector shell.
- (6) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 17.

ROLLOVER TABS OF THE CONNECTOR SHELL

Figure 17

- (a) Make a selection of a flat washer from Table 11.
NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the stud.
- (7) Hold the stud in its position and align the installation hole of the backshell with the stud.
- (8) Apply a drop of thread lock compound on the threads of the stud.
- (9) Put the jackscrew head on the stud.
- (10) Do Step (4) through Step (9) again to install a jackscrew in the other installation hole of the connector.
- (11) Fully tighten each jackscrew head.
- (12) Remove the two hex nuts from each stud.
- (13) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

B. Backshell Assembly with Jackpost Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

BACKSHELL ASSEMBLY
Figure 18

Refer to Figure 18.

- (1) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) From the front of the connector, put a jackpost in the installation hole in the connector shell.
- (4) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 19.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 19

- (a) Make a selection of a flat washer from Table 11.
NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the jackpost.
- (5) Hold the jackpost in its position and align the installation hole of the backshell with the jackpost.
- (6) If the backshell has a captive nut, put the jackpost in the nut.
Make sure that the jackpost is not fully tightened.
- (7) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the jackpost.
 - (b) Put the nut on the jackpost.

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION**

Make sure that the jackpost is not fully tightened.

- (8) Do Step (3) through Step (7) again to install a jackpost in the other installation hole of the connector.
- (9) Fully tighten each jackpost.
- (10) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

C. Backshell Assembly and Connector Installation in a Panel with Jackpost Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION
Figure 20

Refer to Figure 20.

- (1) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) From the rear of the panel, put the connector in the hole in the panel.
- (4) Align the installation holes in the connector with the holes in the panel.
- (5) Put the jackpost in the hole in the panel and the connector shell.
- (6) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 21.

20-72-08

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

ROLLOVER TABS OF THE CONNECTOR SHELL

Figure 21

- (a) Make a selection of a washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.

- (b) Put a washer on the jackpost.
- (7) Hold the installation jackpost in its position and align the installation hole of the backshell with the jackpost.
- (8) If the backshell has a captive nut, put the jackpost in the nut.
Make sure that the jackpost is not fully tightened.
- (9) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the jackpost.
 - (b) Put the nut on the jackpost.
Make sure that the jackpost is not fully tightened.
- (10) Do Step (5) through Step (9) again to install a jackpost in the other installation hole of the connector.
- (11) Fully tighten each jackpost.
Make sure that the connector does not move in the panel.

4. BACKSHELL ASSEMBLY - MALE AND FEMALE SCREW LOCK INSTALLATION HARDWARE

A. Backshell Assembly with Single Clip Male Screw Lock Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY

Figure 22

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION**

Refer to Figure 22.

- (1) Put the connector backshell on the wire harness.

Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.

- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Align the backshell with the connector shell.
- (4) Put a male screw lock on one end of the connector shell and the backshell.
Make sure that the clip of the screw lock holds the connector shell flange and the backshell flange.
- (5) Align the hole in the screw lock with the hole in the backshell flange and the connector shell flange.
- (6) Put the screw in the screw lock.
- (7) Do Step (4) through Step (6) again to install a screw lock in the other installation hole of the connector.
- (8) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

B. Backshell Assembly with Double Clip Male Screw Lock Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY
Figure 23

Refer to Figure 23.

- (1) Put the connector backshell on the wire harness.

Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.

- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Align the backshell with the connector shell.
- (4) Put a male screw lock on one end of the connector shell and the backshell.

Make sure that the clips of the screw lock hold the connector shell flange and the backshell flange.

20-72-08

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

- (5) Align the installation hole of the backshell, the connector shell and the screw lock.
- (6) Put the screw in the screw lock.
- (7) Do Step (4) through Step (6) again to install a screw lock in the other installation hole of the connector.
- (8) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

C. Backshell Assembly with Female Screw Lock Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY
Figure 24

Refer to Figure 24.

- (1) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Put two spacer washers on a screw lock.
- (4) From the front of the connector, put the screw lock in installation hole in the connector shell.
- (5) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 25.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 25

- (a) Make a selection of a flat washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.

- (b) Put the washer on the screw lock.
- (6) Hold the screw lock in its position and align the installation hole of the backshell with the screw lock.
- (7) If the backshell has a captive nut, put the screw lock in the nut.
 Make sure that the screw lock is not fully tightened.
- (8) If the backshell does not have captive nut:
- (a) Put a lockwasher on the screw lock.
- (b) Put a nut on the screw lock.
 Make sure that the screw lock is not fully tightened.
- (9) Do Step (3) through Step (8) again to install a screw lock in the other installation hole of the connector.
- (10) Fully tighten each screw lock.
- (11) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

D. Backshell Assembly and Connector Installation in a Panel with Female Screw Lock Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

Table 14
SPACER WASHERS FOR DIFFERENT PANEL THICKNESSES

Panel Thickness (inch)		Necessary Number of Washers
Minimum	Maximum	
0.000	0.030	2
0.031	0.060	1
0.061	0.090	0

20-72-08

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION
Figure 26

Refer to Figure 26.

- (1) Put the connector backshell on the wire harness.
 Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Measure the thickness of the panel.
- (4) Find the number of washers that are necessary as spacers. Refer to Table 14.
- (5) If one or more washers are specified in Table 14, put the specified quantity of washers on the screw lock.
- (6) From the rear of the panel, put the connector in the hole in the panel.
- (7) Align the installation holes in the connector with the holes in the panel.
- (8) Put the screw lock in the hole in the panel and the connector shell.
- (9) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 27.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 27

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

- (a) Make a selection of a washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.

- (b) Put a washer on the screw lock.
- (10) Hold the installation screw lock in its position and align the installation hole of the backshell with the screw lock.
- (11) If the backshell has a captive nut, put the screw lock in the nut.
Make sure that the screw is not fully tightened.
- (12) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the screw lock.
 - (b) Put the nut on the screw lock.
Make sure that the screw lock is not fully tightened.
- (13) Do Step (7) through Step (12) again to install a screw lock in the other installation hole of the connector.
- (14) Fully tighten each screw lock.
Make sure that the connector does not move in the panel.
- (15) Assemble the strain relief.
For a backshell that has:
 - A right angle configuration, refer to Paragraph 7.A.
 - A round cable clamp, refer to Paragraph 7.B.
 - Two cable clamp bars, refer to Paragraph 7.C.

5. BACKSHELL ASSEMBLY - SLIDE LATCH AND SLIDE LOCK POST INSTALLATION HARDWARE

A. Backshell Assembly with Slide Latch Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY
Figure 28

Refer to Figure 28.

- (1) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Align the installation hole of the slide latch with the installation hole in the connector shell.
- (4) From the front of the connector, put a screw through the hole in the slide latch and the connector shell.
- (5) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 29.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 29

- (a) Make a selection of a flat washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the screw.
- (6) Hold the screw in its position and align the installation hole of the backshell with the screw.
- (7) If the backshell has a captive nut, put the screw in the nut.
 Make sure that the screw is not fully tightened.
- (8) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the screw.
 - (b) Put the nut on the screw.
 Make sure that the screw is not fully tightened.
- (9) Do Step (3) through Step (8) again for the other installation hole of the connector.
- (10) Fully tighten each screw.
- (11) Assemble the strain relief.
 For a backshell that has:
 - A right angle configuration, refer to Paragraph 7.A.
 - A round cable clamp, refer to Paragraph 7.B.
 - Two cable clamp bars, refer to Paragraph 7.C.

B. Backshell Assembly with Slide Lock Post Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

BACKSHELL ASSEMBLY
Figure 30

Refer to Figure 30.

- (1) Put the connector backshell on the wire harness.
Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Put two spacer washers on a slide latch post.
- (4) From the front of the connector, put the slide latch post through the installation hole of the connector shell.
- (5) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 31.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 31

- (a) Make a selection of a flat washer from Table 11.
NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the post.
- (6) Hold the post in its position and align the installation hole of the backshell with the post.
- (7) If the backshell has a captive nut, put the post in the nut.
Make sure that the post is not fully tightened.
- (8) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the post.

20-72-08

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

- (b) Put the nut on the post.
 Make sure that the post is not fully tightened.
- (9) Do Step (3) through Step (8) again to install a slide lock post in other installation hole of the connector.
- (10) Tighten each post.
- (11) Assemble the strain relief.

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

C. Backshell Assembly and Connector Installation in a Panel with Slide Lock Post Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

**Table 15
SPACER WASHERS FOR DIFFERENT PANEL THICKNESSES**

Panel Thickness (inch)		Necessary Number of Washers
Minimum	Maximum	
0.000	0.030	2
0.031	0.060	1
0.061	0.090	0

**BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION
Figure 32**

Refer to Figure 32.

- (1) Put the connector backshell on the wire harness.
 Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION**

- (3) Measure the thickness of the panel.
- (4) Find the number of washers that are necessary as spacers. Refer to Table 15.
- (5) From the rear of the panel, put the connector in the hole in the panel.
- (6) If one or more washers are specified in Table 15, put the specified quantity of washers on the slide lock post.
- (7) Align the installation holes in the connector with the holes in the panel.
- (8) Put the slide lock post in the hole in the panel and the connector shell.
- (9) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 33.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 33

- (a) Make a selection of a washer from Table 11.
NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put a washer on the slide lock post.
- (10) Hold the installation slide lock post in its position and align the installation hole of the backshell with the slide lock post.
- (11) If the backshell has a captive nut, put the slide lock post in the nut.
Make sure that the slide lock post is not fully tightened.
- (12) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the slide lock post.
 - (b) Put the nut on the slide lock post.
Make sure that the slide lock post is not fully tightened.
- (13) Do Step (7) through Step (12) again to install a slide lock post in the other installation hole of the connector.
- (14) Fully tighten each slide lock post.
Make sure that the connector does not move in the panel.
- (15) Assemble the strain relief.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

For a backshell that has:

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

6. BACKSHELL ASSEMBLY - SPRING PLATE AND SPRING LATCH PLATE HARDWARE

A. Backshell Assembly with Spring Plate or Spring Latch Plate Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY WITH SPRING PLATE HARDWARE

Figure 34

BACKSHELL ASSEMBLY WITH SPRING LATCH PLATE HARDWARE

Figure 35

Refer to Figure 35 and Figure 34.

- (1) Put the connector backshell on the wire harness.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.

- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) Align the installation hole of the spring latch plate or spring plate with the installation hole in the connector shell.
- (4) From the front of the connector, put a screw through the installation hole of the spring latch plate or spring plate and the connector shell.
- (5) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 36.

ROLLOVER TABS OF THE CONNECTOR SHELL

Figure 36

- (a) Make a selection of a flat washer from Table 11.
 - NOTE:** A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the screw.
- (6) Hold the installation screw in its position and align the installation hole of the backshell with the screw.
- (7) If the backshell has a captive nut, put the screw in the nut.
 - Make sure that the screw is not fully tightened.
- (8) If the backshell does not have captive nut:
 - (a) Put a lockwasher on the screw.
 - (b) Put the nut on the screw.
 - Make sure that the screw is not fully tightened.
- (9) Do Step (3) through Step (8) again for the other installation hole of the connector.
- (10) Fully tighten each screw.
- (11) Assemble the strain relief.

For a backshell that has:

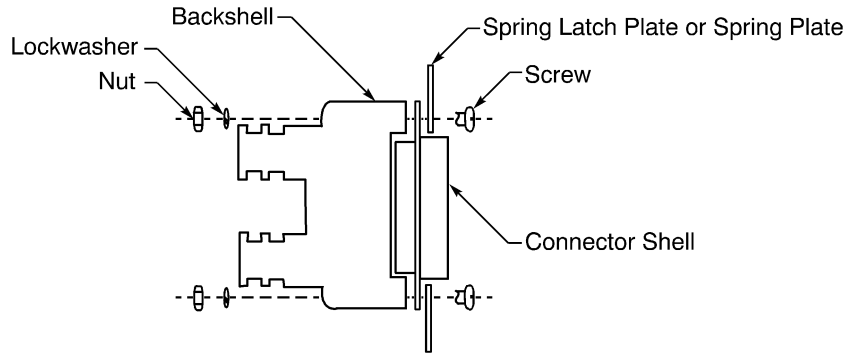

- A right angle configuration, refer to Paragraph 7.A.
- A round cable clamp, refer to Paragraph 7.B.
- Two cable clamp bars, refer to Paragraph 7.C.

B. DSB-() Backshell Assembly with Spring Plate or Spring Latch Plate Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

BACKSHELL ASSEMBLY
Figure 37

Refer to Figure 37.

- (1) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (2) Make a selection of a tape from Table 12.
- (3) Align the installation hole of the spring latch plate or spring plate with the installation hole in the connector shell.
- (4) From the front of the connector, put a screw through the installation hole of the spring latch plate or spring plate and the connector shell.
- (5) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 38.

ROLLOVER TABS OF THE CONNECTOR SHELL
Figure 38

- (a) Make a selection of a flat washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the screw.
- (6) Hold the installation screw in its position and align the installation hole of the backshell with the screw.
- (7) Put a lockwasher on the screw.
- (8) Put the nut on the screw.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

Make sure that the screw is not fully tightened.

- (9) Do Step (3) through Step (8) again for the other installation hole of the connector.
- (10) Fully tighten each screw.
- (11) Assemble the strain relief:
 - (a) Wind 2 layers of tape on the wire harness where the harness is against the tie tab.
 - (b) Assemble a wire harness tie on the wire harness and the tie tab.

Refer to Subject 20-10-11 for the assembly of a wire harness tie.

C. Backshell Assembly and Connector Installation in a Panel with Spring Plate Installation Hardware

For the conditions that are applicable for this procedure, refer to Paragraph 2.A.

BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

Figure 39

Refer to Figure 39.

- (1) Put the connector backshell on the wire harness.

Make sure that the end of the backshell that has the cable clamp is pointed rearward away from the end of the wire harness.
- (2) Install the contacts in the connector. Refer to the Subject that is applicable for the assembly of the connector.
- (3) From the rear of the panel, put the connector in the hole in the panel.
- (4) Put a screw in the installation hole of the spring plate.
- (5) Align the installation holes in the connector with the holes in the panel.
- (6) Put the screw in the hole in the panel and the connector shell.
- (7) If the connector shell has rollover tabs, install a washer as a spacer. Refer to Figure 40.

STANDARD WIRING PRACTICES MANUAL

D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION

ROLLOVER TABS OF THE CONNECTOR SHELL

Figure 40

- (a) Make a selection of a washer from Table 11.

NOTE: A washer that has the same material, thickness, and hole size is a satisfactory alternative.
- (b) Put the washer on the screw.
- (8) Hold the installation screw in its position and align the installation hole of the backshell with the screw.
- (9) If the backshell has a captive nut, put the screw in the nut.
Make sure that the screw is not fully tightened.
- (10) If the backshell does not have captive nut:
 - (a) Put the lockwasher on the screw.
 - (b) Put the nut on the screw.
Make sure that the screw is not fully tightened.
- (11) Do Step (4) through Step (10) again for the other installation hole of the connector.
- (12) Fully tighten each screw.
Make sure that the connector does not move in the panel.
- (13) Assemble the strain relief.
For a backshell that has:
 - A right angle configuration, refer to Paragraph 7.A.
 - A round cable clamp, refer to Paragraph 7.B.
 - Two cable clamp bars, refer to Paragraph 7.C.

7. STRAIN RELIEF ASSEMBLY

A. Strain Relief Assembly - Right Angle Backshell

- (1) Remove one of the screws that hold the saddle bar to the cable clamp.
- (2) Move the saddle bar to open the cable clamp.
- (3) Align the wire harness with the cable clamp.
Make sure that the wires or cables do not go across each other in the clamp.
NOTE: This condition is not applicable for twisted wires.
- (4) Make a mark on the wire harness at the center of the saddle bar of the cable clamp.
- (5) Put the saddle bar that was removed against the other saddle bar in its original position.

20-72-08

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION**

- (6) Push the saddle bars of the cable clamp together.
- (7) If the cable clamp does not hold the wire harness tightly, increase the diameter of the wire harness with tape.
 - (a) Make a selection of a tape from Table 12.
 - (b) Remove the saddle bar.
 - (c) Wind 2 or 3 layers of tape around the wire harness at the mark on the wire harness.

Make sure that:

- The center of the layers of tape is aligned with the mark on the wire harness
- Each edge of the tape is 0.06 inch minimum from the edge of the cable clamp
- The layers of tape make a 100 percent overlap.

- (8) Put the saddle bars in position.
- (9) Engage the threads of each cable clamp screw and the applicable screw hole.
- (10) Tighten the screws until the ends of the saddle bars are against each other.

Make sure that:

- The wires do not have unwanted tension that put strain on the contacts
- The wire harness is tight in the cable clamp
- The saddle bars do not crush or pinch the wire harness
- The cable clamp screws are tight.

B. Strain Relief Assembly - Round Cable Clamp

- (1) Remove the screws and nuts that hold the saddle bars together.
- (2) Align the wire harness with the cable clamp.

Make sure that the wires or cables do not go across each other in the clamp.

NOTE: This condition is not applicable for twisted wires.
- (3) Make a mark on the wire harness at the center of the saddle bars of the cable clamp.
- (4) Push the saddle bars of the cable clamp together.
- (5) If the cable clamp does not hold the wire harness tightly, increase the diameter of the wire harness with tape.
 - (a) Move the backshell rearward on the harness.
 - (b) Make a selection of a tape from Table 12.
 - (c) Wind 2 or 3 layers of tape around the wire harness at the mark on the wire harness.

Make sure that:

- The center of the layers of tape is aligned with the mark on the wire harness
- Each edge of the tape is 0.06 inch minimum from the edge of the cable clamp
- The layers of tape make a 100 percent overlap.

- (6) Put the backshell against the connector shell.
- (7) Engage the threads of each saddle bar screw and the applicable nut.
- (8) Tighten the screws until the ends of the saddle bars are against each other.

STANDARD WIRING PRACTICES MANUAL**D SUBMINIATURE CONNECTORS: BACKSHELL ASSEMBLY AND CONNECTOR INSTALLATION**

Make sure that:

- The wires do not have unwanted tension that put strain on the contacts
- The saddle bars do not crush or pinch the wire harness
- The wire harness is tight in the cable clamp
- The cable clamp screws are tight.

C. Strain Relief Assembly - Two Cable Clamp Bars

- (1) Remove the screws that hold the cable clamp bars on the wire harness.
- (2) Align the wire harness with the cable clamp.

Make sure that the wires or cables do not go across each other in the clamp.

NOTE: This condition is not applicable for twisted wires.

- (3) Make a mark on the wire harness at the center of the cable clamp bars.
- (4) Push the saddle bars of the cable clamp together.
- (5) If the cable clamp does not hold the wire harness tightly, increase the diameter of the wire harness with tape.
 - (a) Make a selection of a tape from Table 12.
 - (b) Remove the backshell from the connector.
 - (c) Wind 2 or 3 layers of tape around the wire harness at the mark on the wire harness.

Make sure that:

- The center of the layers of tape is aligned with the mark on the wire harness
 - Each edge of the tape is 0.06 inch minimum from the edge of the cable clamp
 - The layers of tape make a 100 percent overlap.
- (6) Put the backshell in its position.
 - (7) Engage the threads of each cable clamp screw and the applicable screw hole.
 - (8) Tighten the screws until the cable clamp bars are against each other.

Make sure that:

- The wires do not have unwanted tension that put strain on the contacts
- The wire harness is tight in the cable clamp
- The cable clamp bars do not crush or pinch the wire harness
- The cable clamp screws are tight.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

It is necessary to replace the connector if one or more of these conditions occur:

- If the connector has a grommet, the depth of the damage extends farther than the bottom of the outer seal web; refer to Figure 1
- The damage extends from one contact cavity to a different contact cavity; refer to Figure 2
- The damage extends from one contact cavity to the outer edge of the insert; refer to Figure 2.

Depth of the Damage That is not Farther Than the Bottom of the Seal Web

REAR FACE OF THE ENVIRONMENTAL INSERT - DEPTH OF DAMAGE
Figure 1

REAR FACE OF THE INSERT - LENGTH OF DAMAGE
Figure 2

B. Damage Conditions - Front Face of the Insert

It is necessary to replace the connector if one of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity
- The damage extends from one contact cavity to the outer edge of the insert.

Refer to Figure 3.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

B. Connector Description

The C()MA rectangular connectors have these properties:

- D subminiature rectangular configuration
- Metal shells
- Crimp type, rear release size 16 or size 20 pin contacts in the plug
- Crimp type, rear release size 16 or size 20 socket contacts in the receptacle
- Front release coax pin contacts in the plug
- Front release coax socket contacts in the receptacle
- Size 2018 special purpose contacts that cannot be removed.

4. CONNECTOR DISASSEMBLY

A. Contact Removal

This paragraph gives the procedure to remove standard contacts.

For the procedure to remove coax contacts and special purpose contacts, refer to Paragraph 4.B..

NOTE: Size 2018 special purpose contacts are not removable from the connector.

NOTE: The backshell must be removed from the connector before a contact can be removed.

**Table 15
CONTACT REMOVAL TOOLS**

Crimp Barrel Size	Removal Tool	
	Part Number	Color
20	6500-043-020-628	-
	6500-045-020	-
	CIET-20HD	White
	CET 20-11	-
	M24308/18-2	-
	M81969/1-02	-
	M81969/14-02	-
	MS18278-1	-
	MS27534-20	-
	NAS1664-20	-
16	M81969/14-03	-

- (1) Make a selection of a contact removal tool from Table 15.
- (2) Put the tip of the tool on the wire.
- (3) At the rear of the connector, axially align the tool and the contact cavity.
- (4) Carefully push the tool into the contact cavity until it stops. Refer to Figure 25.
Make sure that the tool stays aligned with the contact cavity.

POSITION OF THE REMOVAL TOOL IN THE CONTACT CAVITY

Figure 25

20-72-10

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out from the contact cavity at the same time.
Make sure that the tool stays aligned with the contact cavity.
- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (2) through Step (6) again.

B. Removal of Size 8 Special Purpose Contacts and Size 8 Coax Contacts

NOTE: Size 2018 special purpose contacts are not removable from the connector.

**Table 16
CONTACT REMOVAL TOOLS**

Contact Cavity Size	Removal Tool
08	DRK38

NOTE: The backshell must be removed from the connector before the contacts can be removed.

- (1) For a size 0808, 0812, 0816 pin contact, or a size 8 coax pin contact, remove the alignment ring from the contact at the front of the connector. Refer to Figure 26.

**REMOVAL OF THE ALIGNMENT RING
Figure 26**

- (2) Make a selection of a contact removal tool from Table 16.
- (3) At the front of the connector, axially align the tool with the engaging end of the contact. Refer to Figure 27.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

ALIGNMENT OF THE REMOVAL TOOL AND THE CONTACT
Figure 27

- (4) Put the tip of the tool on the contact.
- (5) Push the tool forward until the first mark on the tool is aligned with the front face of the connector.

CAUTION: IF THE REMOVAL TOOL IS PUSHED FARTHER THAN THE SPECIFIED MARK, DAMAGE TO THE RETENTION CLIPS OF THE CONTACT CAN OCCUR.

- (6) Hold the tool and the connector tightly in position.
- (7) Push the slider knob forward to release the contact. Refer to Figure 28.

OPERATION OF THE REMOVAL TOOL SLIDER KNOB
Figure 28

- (8) From the rear of the connector, carefully pull the cable or the contact crimp barrel.

5. CONTACT ASSEMBLY

A. Contact Assembly

This paragraph gives the procedure to assemble standard contacts.

For the procedure to assemble:

- Special purpose contacts, refer to Paragraph 5.B.
- Coax contacts, refer to Paragraph 5.C.

STANDARD WIRING PRACTICES MANUAL

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 29
- Table 17 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 29

(2) Make a selection of a crimp tool from Table 18.

(3) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the end of the crimp barrel. Refer to Figure 30.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

POSITION OF WIRE IN THE CRIMP BARREL OF THE CONTACT

(4) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

**Table 21
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	MIL-LT	Raychem
	PLF 100	Plastronic

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 31
- Table 19 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

**WIRE PREPARATION
Figure 31**

(2) Make a selection of a crimp tool from Table 20.

(3) For a size 8 contact, make a selection of 0.5 to 0.75 inch length of heat shrinkable sleeve from Table 21.

NOTE: For equivalent heat shrinkable sleeves, refer to Subject 20-00-11.

(a) Put the sleeve on the wire.

(4) For a 330-5291-001 contact, make a selection of a 0.75 ± 0.12 inch length of heat shrinkable sleeve from Table 21.

NOTE: For equivalent heat shrinkable sleeves, refer to Subject 20-00-11.

(a) Put the sleeve on the wire.

(5) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the end of the crimp barrel. Refer to Figure 32.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

**POSITION OF WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 32**

20-72-10

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

(6) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

(7) For a size 8 contact, install the contact. Refer to Paragraph 6.B.

(a) Move the sleeve forward until the distance from the edge of the sleeve the edge of the connector is 0.06 inch.

(b) Shrink the sleeve into its position. Refer to Subject 20-10-14.

(8) For a 330-5291-001 contact, move the sleeve forward until the forward end of the sleeve is aligned with the forward end of the contact crimp barrel.

Make sure that the sleeve makes a 100 percent overlap with the contact crimp barrel.

(a) Shrink the sleeve into its position. Refer to Subject 20-10-14.

Make sure that the sleeve makes a 100 percent overlap with the contact crimp barrel.

(b) Install the contact in the connector. Refer to Paragraph 6.B.

NOTE: Size 2018 special purpose contacts are not removable from the connector.

C. Coax Contact Assembly

This paragraph gives the procedure to assemble these coax contacts:

- CQME()-200
- CQME()-316
- CQME()-501
- CQME()-502.

For the procedure to assemble:

- CMX006-() contacts, refer to Paragraph 5.D.
- CMX010-() contacts, refer to Paragraph 5.E.

**Table 24
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat Shrinkable	MIL-LT	Raychem
	PLF 100	Plastronic
	RW-175	Raychem

- (1) Make a selection of a center contact crimp tool from Table 22.
- (2) Make a selection of a contact body crimp tool from Table 23.
- (3) Make a selection of a 3/16 inch diameter heat shrinkable sleeve from Table 24.

NOTE: For alternative heat shrinkable sleeves, refer to Subject 20-00-11.

- (4) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
- (5) Put a 1.75 inch \pm 0.13 inch length of the heat shrinkable sleeve on the cable.
- (6) Remove 0.30 inch \pm 0.05 inch of the outer jacket from the end of the cable. Refer to Figure 33.

CAUTION: DAMAGE TO THE SHIELD, THE DIELECTRIC, OR THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

**OUTER JACKET REMOVAL LENGTH
Figure 33**

20-72-10

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

- (7) Align the inner ferrule and the end of the cable. Refer to Figure 34.

ALIGNMENT OF THE INNER FERRULE AND THE END OF THE CABLE
Figure 34

- (8) Push the inner ferrule rearward until the shoulder of the ferrule is against the end of the outer jacket.
- (9) If the cable has a flat conductor outer shield and a round conductor inner shield, cut the flat conductor shield at the forward edge of the inner ferrule.
- (10) Fold the shield back on the outer surface of the inner ferrule.
 Make sure that the strands of the shield are symmetrical around the circumference of the ferrule.
- (11) Cut the strands of the shield at the forward edge of the shoulder of the inner ferrule. Refer to Figure 35.

POSITION OF THE SHIELD ON THE INNER FERRULE
Figure 35

- (12) Remove 0.23 inch \pm 0.03 inch of the dielectric from the end of the cable. Refer to Figure 36.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

DIELECTRIC REMOVAL
Figure 36

- (13) If all of the strands of the center conductor are not together, twist the strands together in their initial direction.
- (14) Push the center conductor into the crimp barrel of the center contact until the end of the dielectric is against the end of the center contact. Refer to Figure 37.
Make sure that the strands of the conductor can be seen in the inspection hole.

POSITION OF THE CENTER CONTACT ON THE CENTER CONDUCTOR
Figure 37

- (15) Crimp the center contact.
- (16) Put the contact body on the center contact.
- (17) Push the center contact into the contact body until the retainer rib of the center contact is locked in the contact body.
- (18) Lightly pull the cable to make sure that the center contact is locked in the contact body.
- (19) If the center contact is not locked in the contact body, do Step (17) and Step (18) again.
- (20) Put the contact in the crimp die.
Make sure that the rear end of the contact is aligned with the edge of the crimp die.
- (21) Crimp the contact body. Refer to Figure 38.
Make sure that the distance from:
 - The forward end of the crimp area to the shoulder of the contact body is not more than 0.06 inch
 - The rear end of the crimp barrel to the shoulder of the inner ferrule is not more than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

POSITION OF THE CONTACT BODY

Figure 38

- (22) Remove the unwanted length of the strands of the shield.
Make sure that the end of the shield is aligned with the rear end of the contact body.
- (23) Push the heat shrinkable sleeve forward until the forward end of the sleeve is 0.07 inch to 0.13 inch from the shoulder of the contact body. Refer to Figure 39.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONTACT ASSEMBLY

Figure 39

- (24) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D. CMX006-() Coax Contact Assembly

	RW-175	Raychem

**COAX CABLE PREPARATION
Figure 40**

- (1) Make a selection of a contact body crimp tool from Table 25.
 - (2) Make a selection of a 3/16 inch diameter heat shrinkable sleeve from Table 26.
- NOTE:** For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (3) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (4) Put a 1.5 inch ± 0.1 inch length of the heat shrinkable sleeve on the cable.
 - (5) Put the ferrule on the cable.
 - (6) Remove 0.32 inch ± 0.03 inch of the outer jacket from the end of the cable. Refer to Figure 40.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

- (7) Remove the necessary length of shield to make the distance from the end of the outer jacket to the end of the shield equal to 0.18 inch ± 0.03 inch.

CAUTION: DO NOT MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (8) Remove the necessary length of dielectric to make the distance from the end of the outer jacket to the end of the dielectric equal to 0.21 inch ± 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (9) Tin these components of the contact cavity:
 - The center conductor
 - The contact solder cup.
- (10) Open the end of the shield.

Make sure that the shield strands are not moved apart.
- (11) Push the contact body on the end of the wire until the dielectric is against the end of the solder cup. Refer to Figure 41.

Make sure that:

 - The crimp barrel is between the dielectric and the shield
 - All of the strands of the center conductor are in the center contact solder cup.

POSITION OF THE CENTER CONDUCTOR IN THE SOLDER CUP
Figure 41

- (12) Solder the end of the center conductor in the solder cup.
- (13) Push the shield against the crimp barrel.

Make sure that the strands of the shield are symmetrical around the circumference of the crimp barrel.
- (14) Push the ferrule forward on the shield until the forward end of the ferrule is against the shoulder of the contact body. Refer to Figure 42.

POSITION OF THE FERRULE AND THE CONTACT BODY
Figure 42

- (15) Crimp the ferrule. Refer to Figure 43.

Make sure that the distance from the forward end of the ferrule to the shoulder of the contact body is less than 0.03 inch.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

POSITION OF THE FERRULE CRIMP

Figure 43

- (16) Push the heat shrinkable sleeve forward until the forward end of the sleeve is 0.07 inch to 0.13 inch from the shoulder of the contact body. Refer to Figure 44.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONTACT ASSEMBLY

Figure 44

- (17) Shrink the sleeve into its position. Refer to Subject 20-10-14.

D-SUBMINIATURE CONNECTORS: TRI-STAR C(M)A AND CORY C(M)A CONNECTORS

COAX CABLE PREPARATION
Figure 45

- (1) Make a selection of a contact body crimp tool from Table 27.
 - (2) Make a selection of a 3/16 inch diameter heat shrinkable sleeve from Table 28.
- NOTE:** For alternative heat shrinkable sleeves, refer to Subject 20-00-11.
- (3) Cut the cable to make the end of the cable perpendicular to the longitudinal axis of the cable.
 - (4) Put the ferrule on the cable.
 - (5) Put a 1.5 inch \pm 0.1 inch length of the heat shrinkable sleeve on the cable.
 - (6) Remove 0.34 inch \pm 0.03 inch of the outer jacket from the end of the cable. Refer to Figure 45.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY CABLE PERFORMANCE OF THE CABLE.

- (7) Remove the necessary length of shield to make the distance from the end of the outer jacket to the end of the shield equal to 0.12 inch \pm 0.03 inch.

CAUTION: DO NOT MAKE A NICK IN THE INNER DIELECTRIC. DAMAGE TO THE DIELECTRIC CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (8) Remove the necessary length of dielectric to make the distance from the end of the outer jacket to the end of the dielectric equal to 0.24 inch \pm 0.03 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.

- (9) Fold the round conductor shield back on the outer jacket. Refer to Figure 46.

ROUND CONDUCTOR SHIELD FOLDED BACK
Figure 46

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

- (10) If the cable has two shields, remove the length of flat conductor shield that extends farther than the end of the folded back edge of the round conductor shield. Refer to Figure 47.

Make sure that the edge of the flat conductor shield is aligned with the folded back edge of the round shield.

FLAT CONDUCTOR SHIELD REMOVAL

Figure 47

- (11) Tin these components of the contact cavity:

- The center conductor
- The contact solder cup.

- (12) Open the end of the round conductor shield.

Make sure that the shield strands are not moved apart.

- (13) Push the contact body on the end of the wire until the dielectric is against the end of the solder cup. Refer to Figure 48.

Make sure that:

- The crimp barrel is between the dielectric and the shield
- All of the strands of the center conductor are in the center contact solder cup.

POSITION OF THE CENTER CONDUCTOR IN THE SOLDER CUP

Figure 48

- (14) Solder the end of the center conductor in the solder cup.

- (15) Push the shield against the crimp barrel.

Make sure that the strands of the shield are symmetrical around the circumference of the crimp barrel.

20-72-10

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

- (16) Move the ferrule forward until the forward end of the ferrule is against the shoulder of the contact body.
- (17) Crimp the ferrule. Refer to Figure 49.
Make sure that the distance from the forward edge of the crimp area to the forward end of the ferrule is 0.16 inch \pm 0.03 inch.

POSITION OF THE FERRULE AND THE CONTACT BODY
Figure 49

- (18) Push the heat shrinkable sleeve forward until the forward end of the sleeve is 0.07 inch to 0.13 inch from the shoulder of the contact body. Refer to Figure 50.

POSITION OF THE HEAT SHRINKABLE SLEEVE ON THE CONTACT ASSEMBLY
Figure 50

- (19) Shrink the sleeve into its position. Refer to Subject 20-10-14.

6. CONNECTOR ASSEMBLY

A. Contact Insertion

This paragraph gives the procedure to install standard contacts.

For the procedure to install coax contacts and special purpose contacts, refer to Paragraph 6.B..

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 6.D.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

- (1) If a backshell is specified, put the backshell on the wire harness.
Make sure that the cable clamp points rearward on the wire harness.
- (2) Axially align the contact assembly and the contact cavity at the rear of the connector.
NOTE: A tool is not necessary for the insertion of a contact assembly.
- (3) Carefully push the contact assembly into the contact cavity until it stops.
- (4) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (5) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (1) through Step (3) again.

B. Insertion of Special Purpose Contacts and Coax Contacts

**Table 29
SPECIAL PURPOSE CONTACT INSERTION TOOLS**

Crimp Barrel Size	Insertion Tool
16	ST2220-2-4
12	ST2220-2-5

**Table 31
CONTACT ALIGNMENT RING INSTALLATION TOOLS**

Contact Size	Contact Type	Installation Tool
8	Pin	M81969/14-04

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS**

(1) Make a selection of a contact insertion tool from:

- Table 29 for a special purpose contact
- Table 30 for a coax contact.

NOTE: A contact insertion tool is not necessary for the installation of:

- A size 8 coax contact assembly
- A size 8 contact assembly.

(2) Put the contact assembly in the insertion tool. Refer to Figure 51.

**POSITION OF THE CONTACT ASSEMBLY IN THE INSERTION TOOL****Figure 51**

(3) At the rear of the connector, axially align the contact assembly, the insertion tool, and the contact cavity. Refer to Figure 52.

**ALIGNMENT OF THE CONTACT ASSEMBLY, THE INSERTION TOOL, AND THE CONTACT CAVITY****Figure 52**

(4) Carefully push the tool into the contact cavity until it stops.

If a tool is not used, carefully push the contact assembly into the contact cavity until it stops.

Make sure that the tool and the contact stay aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) If an installation tool is used, carefully pull the tool from the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. DAMAGE TO THE CONNECTOR OR THE CONTACT CAN OCCUR.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the cavity.
 - (b) Do Step (2) through Step (6) again.
- (8) For a size 8 coax pin contact or a size 8 pin contact:
 - (a) Make a selection of a contact alignment ring from Table 12.
 - (b) Make a selection of a contact alignment ring installation tool from Table 31.
 - (c) Put the alignment ring on the engaging end of the contact. Refer to Figure 53.

INITIAL POSITION OF THE ALIGNMENT RING

Figure 53

- (d) Put the end of the alignment ring installation tool on the engaging end of the contact.
- (e) Push the alignment ring forward to the engaging face of the connector. Refer to Figure 54.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS

POSITION OF THE ALIGNMENT RING AGAINST THE FACE OF THE CONNECTOR
Figure 54

(f) Remove the tool from the engaging end of the contact.

C. Seal of an Empty Contact Cavity

For environmental connectors, an empty contact cavity must be sealed with a seal rod or a seal plug. Refer to Figure 4 and Subject 20-60-08.

D. Backshell Assembly

(1) If a backshell is specified, assemble the backshell. Refer to Subject 20-72-08.

E. Connector Installation Hardware Assembly

(1) If a backshell is not specified, assemble the connector installation hardware. Refer to Subject 20-72-07.

NOTE: If a backshell is specified, the connector installation hardware is assembled when the backshell is assembled. Refer to Paragraph 6.D.

7. CONNECTOR INSTALLATION

A. Connector Installation in a Panel

For installation of a connector:

- With a backshell, installation in a panel occurs when the backshell is assembled. Refer to Paragraph 6.D.
- Without a backshell, the installation in a panel occurs when the connector installation hardware is assembled. Refer to Paragraph 6.E.

B. Connection of the Plug and the Receptacle

Table 32
NECESSARY TOOLS

Tool	Type
Screwdriver	Flat Tip

(1) For connectors with jackscrew and jackpost installation hardware:

- (a) Make a selection of a tool from Table 32.
- (b) Align the engaging face of the plug with the engaging face of the receptacle.

20-72-10

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: TRI-STAR C()MA AND CORY C()MA CONNECTORS**

- (c) Push the plug into the receptacle.
Make sure that connectors are fully engaged.
 - (d) Put each jackscrew in the applicable jackpost.
 - (e) Turn one jackscrew clockwise two or three turns.
 - (f) Turn the other jackscrew clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the jackscrews are fully engaged.
 - (h) Tighten each jackscrew.
- (2) For connectors with male and female screw lock installation hardware:
- (a) Make a selection of a tool from Table 32.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (d) Put each screw in the applicable female screw lock.
 - (e) Turn one screw clockwise two or three turns.
 - (f) Turn the other screw clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the screws are fully engaged.
 - (h) Tighten each jackscrew.
- (3) For connectors with spring plate and spring latch plate installation hardware:
- (a) Align the engaging face of the plug with the engaging face of the receptacle.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage each spring with the applicable spring latch plate.
- (4) For connectors with slide latch and slide lock post installation hardware:
- (a) Align the engaging face of the plug with the engaging face of the receptacle.
Make sure that the slide latch is retracted to the open position.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage the slot in the slide latch with the slide lock posts.
 - (d) Push the slide latch to the closed position. Refer to Figure 55.
Make sure the connectors are locked together.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

It is necessary to replace the connector if one or more of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity; refer to Figure 1
- The damage extends from one contact cavity to the outer edge of the insert; refer to Figure 1.

REAR FACE OF THE INSERT - LENGTH OF DAMAGE
Figure 1

B. Damage Conditions - Front Face of the Insert

It is necessary to replace the connector if one of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity
- The damage extends from one contact cavity to the outer edge of the insert.

Refer to Figure 2.

B. Connector Description

The 17-() connectors have these properties:

- D subminiature rectangular configuration
- Metal shells
- Crimp type, and solder type, front release pin contacts in the plug
- Crimp type, and solder type, front release socket contacts in the receptacle
- Size 2020 and size 2016 crimp type contacts
- Size 2020 solder type contacts

C. Contact Part Numbers

**Table 5
CRIMP CONTACT PART NUMBERS**

Contact Size		Contact Type	Part Number	Supplier
Engaging End	Crimp Barrel			
20	20	Pin	17-766-2	Amphenol
			17-766-2	WPI
		Socket	17-763-2	Amphenol
			17-763-2	WPI
	16	Pin	17-1005	Amphenol

17-766-2	Amphenol	17-766-2	WPI

3. INSERT CONFIGURATIONS

A. 17-() Connectors

NOTE: The contact cavity size that is specified in Table 8 is equivalent to the size of the engaging end of the contact.

NOTE: Figure 3 through Figure 7 show the rear face of an insert that has pin contacts. The view of the rear face of an insert that has socket contacts is the mirror image of this view.

**Table 8
CONNECTOR INSERT CONFIGURATIONS**

Insert Configuration	Contact Cavity		Reference
	Count	Size	
9	9	20	Figure 3
15	15	20	Figure 4
25	25	20	Figure 5

4. CONNECTOR DISASSEMBLY

A. Contact Removal

**Table 9
CONTACT REMOVAL TOOLS**

Engaging End Size	Wire Barrel Size	Contact Type	Removal Tool	
			Handle	Bit
20	20	Pin	ATA 2040	-
			356-200	356-400-6
		Socket	ATA 2040	-
			356-200	356-400-5
	16	Pin	356-200	356-400-6
		Socket	356-200	356-400-5

NOTE: The backshell must be removed from the connector before the contacts can be removed.

- (1) Make a selection of a removal tool from Table 9.
- (2) Axially align the tool and the contact cavity at the front face of the connector.
- (3) Push the tool into the contact cavity until the contact moves out from the rear of the connector.
Make sure that the removal tool stays axially aligned with the contact cavity.

**POSITION OF THE REMOVAL TOOL IN THE CONTACT CAVITY
Figure 8**

- (4) Carefully remove the tool from the contact cavity.
- (5) Pull the contact out of the contact cavity from the rear of the connector.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

5. CONNECTOR ASSEMBLY

A. Crimp Contact Assembly

**Table 10
INSULATION REMOVAL LENGTH**

Wire Size	Crimp Barrel Size	Removal Length L (inch)	
		Target	Tolerance
24	20	0.19	± 0.03
22	20	0.19	± 0.03
20	20	0.19	± 0.03
18	16	0.19	± 0.03
16	16	0.19	± 0.03

**Table 11
CONTACT CRIMP TOOLS**

Wire Size (AWG)	Crimp Barrel Size	Crimp Tool		
		Basic Unit		Locator
		Part Number	Setting	
24	20	357-100	5	357-300-02
22	20	357-100	6	357-300-02
20	20	357-100	7	357-300-02
18	16	357-105	0.053 inch ± 0.003 inch	357-305-03
16	16	357-105	0.058 inch ± 0.003 inch	357-305-03

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 9
- Table 10 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedure.

**INSULATION REMOVAL LENGTH
Figure 9**

- (2) Make a selection of a crimp tool from Table 11.
 (3) Put the conductor in the crimp barrel of the contact.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

Make sure that:

- All the strands of the conductor are in the crimp barrel.
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

POSITION OF THE WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 10

(4) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel.
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Solder Contact Assembly

CAUTION: THE CONDUCTOR MUST BE SOLDERED IN THE CONTACT BEFORE THE CONTACT IS INSTALLED IN THE CONNECTOR.

Table 12
INSULATION REMOVAL LENGTH

Wire Size	Crimp Barrel Size	Removal Length L (inch)	
		Target	Tolerance
24	20	0.12	± 0.03
22	20	0.12	± 0.03
20	20	0.12	± 0.03

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 11
- Table 12 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedure.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

INSULATION REMOVAL LENGTH

Figure 11

- (2) Solder the conductor in the contact.
 - (a) Tin these components of the contact assembly:
 - The wire
 - The contact solder cup.
 - (b) Solder the end of the wire in the solder cup. Refer to Figure 12.

Make sure that the distance from the forward end of the insulation to the end of the solder cup is not more than 0.06 inch.

CAUTION: DO NOT APPLY MORE THAN THE NECESSARY AMOUNT OF HEAT. DAMAGE TO THE CONTACT OR THE WIRE CAN OCCUR.

CAUTION: DO NOT LET THE STRANDS OF THE CONDUCTOR THAT ARE IN THE INSULATION OF THE WIRE ABSORB THE SOLDER. THE WIRE:

- CANNOT BEND AT THE NECESSARY LOCATION
- CAN BREAK AT THE END OF THE SOLDER.

POSITION OF THE WIRE IN THE CONTACT

Figure 12

C. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.E.

**Table 13
CONTACT INSERTION TOOLS**

Crimp Barrel Size	Insertion Tool
20	356-400-1
	356-400-10
	ATA 1040
16	356-400-2

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

**Table 14
NECESSARY MATERIALS**

Material	Part Number	Supplier
Sleeve, Heat shrinkable	MIL-LT	Raychem
Sleeve, Heat shrinkable	PLF 100	Plastronic

- (1) Make a selection of a heat shrinkable sleeve from Table 14.
Make sure that the sleeve has the smallest diameter that will move easily on the wire.
NOTE: An equivalent sleeve is a satisfactory alternative. Refer to Subject 20-00-11.
- (2) Make a selection of a contact insertion tool from Table 13.
- (3) Put a 0.75 inch to 1.0 inch length of the heat shrinkable sleeve on the wire.
- (4) Put the contact assembly in the insertion tool.
Make sure that the end of the insertion tool is against the contact shoulder.
- (5) At the rear of the connector, axially align the insertion tool and the contact cavity.

**ALIGNMENT OF THE CONTACT ASSEMBLY, THE INSERTION TOOL, AND THE CONTACT CAVITY
Figure 13**

- (6) Carefully push the insertion tool and the contact assembly into the contact cavity until it stops.
Make sure that the insertion tool stays axially aligned with the contact cavity.
- (7) Carefully pull the tool out of the contact cavity.
- (8) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (9) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the contact cavity.
 - (b) Do Step (4) through Step (8) again.

20-72-11

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

- (10) Move the heat shrinkable sleeve forward until it is against the rear of the connector.
Make sure that the distance from the rear of the connector to the forward end of the sleeve is less than 0.06 inch.
- (11) Shrink the sleeve into its position. Refer to Subject 20-10-14.
Make sure that the distance from the rear of the connector to the forward end of the sleeve is less than 0.06 inch.

NOTE: If more than one contact must be installed in the connector, all of the sleeves can be shrunk at the same time.

D. Seal of an Empty Contact Cavity

The seal of an empty contact cavity is not necessary.

E. Backshell Assembly

- (1) If a backshell is specified, assemble the backshell. Refer to Subject 20-72-08.

F. Connector Installation Hardware Assembly

- (1) If a backshell is not specified, assemble the connector installation hardware. Refer to Subject 20-72-07.

NOTE: If a backshell is specified, the connector installation hardware is assembled when the backshell is assembled. Refer to Paragraph 5.E.

6. CONNECTOR INSTALLATION

A. Connector Installation in a Panel

For installation of a connector:

- With a backshell, installation in a panel occurs when the backshell is assembled. Refer to Paragraph 5.E.
- Without a backshell, the installation in a panel occurs when the connector installation hardware is assembled. Refer to Paragraph 5.F.

B. Connection of the Plug and the Receptacle

**Table 15
NECESSARY TOOLS**

Tool	Type
Screwdriver	Flat Tip

- (1) For connectors with jackscrew and jackpost installation hardware:
 - (a) Make a selection of a tool from Table 15.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that connectors are fully engaged.
 - (d) Put each jackscrew in the applicable jackpost.
 - (e) Turn one jackscrew clockwise two or three turns.
 - (f) Turn the other jackscrew clockwise two or three turns.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: WPI 17-() AND AMPHENOL 17-() CONNECTORS

- (g) Do Step (e) and Step (f) again until the jackscrews are fully engaged.
- (h) Tighten each jackscrew.
- (2) For connectors with male and female screw lock installation hardware:
 - (a) Make a selection of a tool from Table 15.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (d) Put each screw in the applicable female screw lock.
 - (e) Turn one screw clockwise two or three turns.
 - (f) Turn the other screw clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the screws are fully engaged.
 - (h) Tighten each jackscrew.
- (3) For connectors with spring plate and spring latch plate installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage each spring with the applicable spring latch plate.
- (4) For connectors with slide latch and slide lock post installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
Make sure that the slide latch is retracted to the open position.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage the slot in the slide latch with the slide lock posts.
 - (d) Push the slide latch to the closed position. Refer to Figure 14.
Make sure the connectors are locked together.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

It is necessary to replace the connector if one or more of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity; refer to Figure 1
- The damage extends from one contact cavity to the outer edge of the insert; refer to Figure 1.

REAR FACE OF THE INSERT - LENGTH OF DAMAGE

Figure 1

B. Damage Conditions - Front Face of the Insert

It is necessary to replace the connector if one of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity
- The damage extends from one contact cavity to the outer edge of the insert.

Refer to Figure 2.

FRONT FACE OF THE INSERT - LENGTH OF DAMAGE

STANDARD WIRING PRACTICES MANUAL

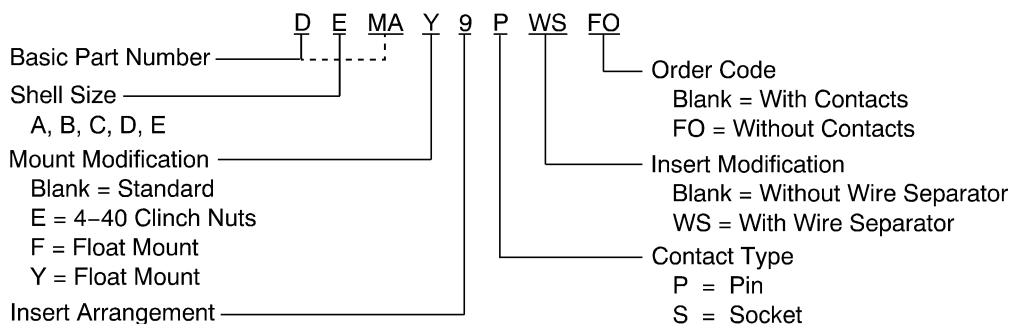

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

B. Connector Description

The D()MA() rectangular connectors have these properties:

- D subminiature rectangular configuration
- Metal shells
- Crimp type, rear release pin contacts in the plug
- Crimp type, rear release socket contacts in the receptacle
- Rear release coax pin contacts in the plug
- Rear release coax socket contacts in the receptacle.

	M81969/14-02	-
	MS18278-1	-
	MS27534-20	-
	NAS1664-20	-

NOTE: The backshell must be removed from the connector before the contacts can be removed.

- (1) Make a selection of a contact removal tool from Table 9.
- (2) Put the tip of the tool on the wire.
- (3) At the rear of the connector, axially align the tool and the contact cavity at the rear of the connector.
- (4) Carefully push the tool into the contact cavity until it stops. Refer to Figure 22.

Make sure that the tool stays aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

POSITION OF THE REMOVAL TOOL IN THE CONTACT CAVITY
Figure 22

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out from the contact cavity at the same time.
 Make sure that the tool stays aligned with the contact cavity.
- (7) If the contact is not released:
 - (a) Carefully remove the tool.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (2) through Step (6) again.

B. Coax Contact Removal

- (1) Push the flange of the extraction tip of the contact to the rear face of the connector. Refer to Figure 23.

COAX CONTACT EXTRACTION TIP
Figure 23

- (2) Carefully pull the coax contact assembly from the connector. Refer to Figure 24.

COAX CONTACT REMOVAL
Figure 24

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

5. CONNECTOR ASSEMBLY

A. Contact Assembly

This paragraph gives the procedure to assemble standard contacts with stranded wire. For the procedure to assemble:

- Standard contacts with solid conductor wire, refer to Paragraph 5.B.
- Coax contacts, refer to Paragraph 5.C.

**Table 10

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 25
- Table 10 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 25

(2) If it is specified, fold the conductor back on itself.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

Refer to:

- Table 10
- Figure 26.

FOLDED BACK CONDUCTOR
Figure 26

- (3) Make a selection of a crimp tool from Table 11.
- (4) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the end of the crimp barrel. Refer to Figure 27.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

POSITION OF WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 27

- (5) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Assembly of a Contact with Solid Conductor Wire

This paragraph gives the procedure to assemble contacts with solid conductor wire and stranded filler wire.

NOTE: Only stranded wire can be used for the filler wire.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

- (1) Make a selection of a crimp tool from Table 13.
- (2) Remove the necessary length of insulation from the end of the solid conductor wire.
Refer to:
 - Table 12 for the insulation removal length
 - Subject 20-00-15 for the insulation removal procedures.
- (3) Remove 0.5 inch of insulation from the end of the specified filler wire.
Refer to:
 - Table 13 for the size of the specified filler wire.
 - Subject 20-00-15 for the insulation removal procedures.
- (4) Put the end of the solid conductor wire and the filler wire in the crimp barrel of the contact.
Make sure that:
 - All of the strands of the filler wire and the solid conductor are in the crimp barrel of the contact
 - The strands of the conductors are visible in the inspection hole of the contact
 - The distance between the end of the crimp barrel and the insulation of the primary solid conductor wire is a maximum of 0.03 inch.
- (5) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

- (6) Carefully remove the unwanted length of the strands of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 28.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 28

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR OF THE PRIMARY WIRE. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

C. Coax Contact Assembly

Table 14
COAX CONTACT FERRULE CRIMP TOOLS

	Part Number	Cavity
CCT-DM	Y322	A
HX4	Y322	A

Table 15
NECESSARY MATERIALS

Material	Part Number	Supplier
Heat Shrinkable Sleeve	RW-175	Raychem

- (1) Make a selection of a ferrule crimp tool from Table 14.
- (2) Make a selection of a heat shrinkable sleeve from Table 15.
- (3) In this sequence, put these components on the cable:
 - The extraction tip
 - A 1.5 inch length of heat shrinkable sleeve
 - The ferrule
 - A 0.75 inch length of heat shrinkable sleeve
 - A 0.75 inch length of heat shrinkable sleeve.

Make sure that each sleeve that has the smallest diameter that can be moved easily on the cable.

- (4) Prepare the cable. Refer to Figure 29.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

COAX CABLE PREPARATION

Figure 29

- (a) Remove 0.50 inch ±0.03 inch of the outer jacket from the end of the cable.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE SHIELD. DAMAGE TO THE SHIELD CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (b) Remove the necessary length of the shield to make the distance from the end of the outer jacket to the end of the shield to equal to 0.38 inch ±0.03 inch.
- (c) Remove the necessary length of the dielectric to make the distance from the end of the to outer jacket to the end of the dielectric equal to 0.38 inch ±0.03 inch.

CAUTION: DO NOT CUT OR MAKE A NICK IN THE CENTER CONDUCTOR. DAMAGE TO THE CENTER CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE CABLE.
- (d) Remove the necessary length of the conductor to make the distance from the end of the dielectric to the end of the conductor equal to 0.13 inch ±0.03 inch.
- (5) Align the forward edge of the first 0.75 inch length of heat shrinkable sleeve with the end of the outer jacket.
- (6) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (7) Align the forward edge of the second 0.75 inch length of heat shrinkable sleeve with the end of the outer jacket.
- (8) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (9) Tin these components:
 - The center conductor
 - The solder cup of the contact.
- (10) Open the end of the shield.

Make sure that the strands of the shield are not moved apart.
- (11) Push the contact body on the end of the cable until the dielectric is against the end of the solder cup.

Make sure that:

 - The crimp barrel of the contact is between the dielectric and the shield
 - The center conductor is in the solder cup.
- (12) Solder the conductor to the solder cup.
- (13) Align the forward end of the ferrule with the shoulder of the contact body.

Make sure that the strands of the shield are symmetrical around the circumference of the contact body.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

- (14) Crimp the ferrule.
- (15) Remove the unwanted shield strands that extend farther than the forward end of the ferrule.
- (16) Align the forward end of the 1.5 inch length of sleeve with the shoulder of the contact body.
- (17) Shrink the sleeve into its position. Refer to Subject 20-10-14.
- (18) Push the extraction tip forward on the contact body until the flange of the extraction tip is against the shoulder of the contact body.

D. Contact Insertion

This paragraph gives the procedure to insert standard contacts. For the procedure to insert coax contacts, refer to Paragraph 5.E.

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.G.

**Table 16
CONTACT INSERTION TOOLS**

Contact Size	Insertion Tool	
	Part Number	Color
22D	CIET-22D	Green

	M81969/14-02	-
	MS18278-1	-
	MS27534-20	-
	NAS1664-20	-

- (1) Make a selection of an insertion tool from Table 16.

NOTE: Contacts can be inserted by hand.

- (2) Put the contact assembly in the insertion tool. Refer to Figure 30.

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS****POSITION OF THE CONTACT ASSEMBLY IN THE INSERTION TOOL****Figure 30**

- (3) At the rear of the connector, axially align the contact assembly, the insertion tool, and the contact cavity. Refer to Figure 31.

**ALIGNMENT OF THE CONTACT ASSEMBLY, THE INSERTION TOOL, AND THE CONTACT CAVITY****Figure 31**

- (4) Push the tool into the contact cavity until it stops.

Make sure that the tool stays aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool out of the contact cavity.

- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:

20-72-12

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS**

- (a) Pull the contact assembly out of the contact cavity.
- (b) Do Step (1) through Step (6) again.

E. Coax Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.G.

- (1) Axially align the coax contact assembly and the contact cavity at the rear of the connector.

NOTE: A tool is not necessary for the insertion of a coax contact assembly.

- (2) Carefully push the coax contact assembly into the contact cavity until it stops.

NOTE: The retention clip in the connector engages with the shoulder of the contact when the contact is fully inserted.

- (3) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (4) If the contact is not locked in the contact cavity:

- (a) Pull the contact assembly out of the contact cavity.
- (b) Do Step (1) through Step (3) again.

F. Seal of an Empty Contact Cavity

The seal of an empty contact cavity is not necessary.

G. Backshell Assembly

- (1) If a backshell is specified, assemble the backshell. Refer to Subject 20-72-08.

H. Connector Installation Hardware Assembly

- (1) If a backshell is not specified, assemble the connector installation hardware. Refer to Subject 20-72-07.

NOTE: If a backshell is specified, the connector installation hardware is assembled when the backshell is assembled. Refer to Paragraph 5.G.

6. CONNECTOR INSTALLATION**A. Connector Installation in a Panel**

For the installation of a connector:

- With a backshell, installation in a panel occurs when the backshell is assembled. Refer to Paragraph 5.G.
- Without a backshell, the installation in a panel occurs when the connector installation hardware is assembled. Refer to Paragraph 5.H.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

B. Connection of the Plug and the Receptacle

**Table 17
NECESSARY TOOLS**

Tool	Type
Screwdriver	Flat tip

- (1) For connectors with jackscrew and jackpost installation hardware:
 - (a) Make a selection of a tool from Table 17.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that connectors are fully engaged.
 - (d) Put each jackscrew in the applicable jackpost.
 - (e) Turn one jackscrew clockwise two or three turns.
 - (f) Turn the other jackscrew clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the jackscrews are fully engaged.
 - (h) Tighten each jackscrew.
- (2) For connectors with male and female screw lock installation hardware:
 - (a) Make a selection of a tool from Table 17.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (d) Put each screw in the applicable female screw lock.
 - (e) Turn one screw clockwise two or three turns.
 - (f) Turn the other screw clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the screws are fully engaged.
 - (h) Tighten each jackscrew.
- (3) For connectors with spring plate and spring latch plate installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage each spring with the applicable spring latch plate.
- (4) For connectors with slide latch and slide lock post installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
Make sure that the slide latch is retracted to the open position.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage the slot in the slide latch with the slide lock posts.
 - (d) Push the slide latch to the closed position. Refer to Figure 32.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: ITT CANNON D()MA CONNECTORS

Make sure the connectors are locked together.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

1. GENERAL DATA

A. Damage Conditions - Rear Face of the Insert

It is necessary to replace the connector if one or more of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity; refer to Figure 1
- The damage extends from one contact cavity to the outer edge of the insert; refer to Figure 1.

REAR FACE OF THE INSERT - LENGTH OF DAMAGE
Figure 1

B. Damage Conditions - Front Face of the Insert

It is necessary to replace the connector if one of these conditions occur:

- The damage extends from one contact cavity to a different contact cavity
- The damage extends from one contact cavity to the outer edge of the insert.

Refer to Figure 2.

FRONT FACE OF THE INSERT - LENGTH OF DAMAGE

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

B. Connector Description

The M24308 series connectors have these properties:

- D subminiature rectangular configuration
- Metal shells
- Crimp type, rear release pin contacts in the plug
- Crimp type, rear release socket contacts in the receptacle

C. Contact Part Numbers

**Table 3
CONTACT PART NUMBERS**

Contact Size	Contact Engaging End Size	Contact Crimp Barrel Size	Contact Type	Part Number	Supplier
22D	22	22	Pin	M39029/58-360	QPL

	MS18278-1	-
	MS27534-20	-
	NAS1664-20	-

NOTE: The backshell must be removed from the connector before the contacts can be removed.

- (1) Make a selection of a contact removal tool from Table 6.
- (2) Put the tip of the tool on the wire.
- (3) At the rear of the connector, axially align the tool and the contact cavity.
- (4) Carefully push the tool into the contact cavity until it stops. Refer to Figure 14.
Make sure that the tool stays aligned with the contact cavity.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

POSITION OF THE REMOVAL TOOL IN THE CONTACT CAVITY

Figure 14

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Hold the wire against the tool.
- (6) Pull the tool and the wire out of the contact cavity at the same time.
Make sure that the tool stays aligned with the contact cavity.
- (7) If the contact is not released:
 - (a) Carefully pull the tool out of the contact cavity.
 - (b) Turn the tool approximately 90 degrees.
 - (c) Do Step (2) through Step (6) again.

5. CONNECTOR ASSEMBLY

A. Contact Assembly

This paragraph gives the procedure to assemble standard contacts with stranded wire. For the procedure to assemble Standard contacts with solid conductor wire, refer to Paragraph 5.B.:

**Table 7

(1) Remove the necessary length of insulation from the end of the wire.

Refer to:

- Figure 15
- Table 7 for the insulation removal length
- Subject 20-00-15 for the insulation removal procedures.

WIRE PREPARATION
Figure 15

(2) If it is necessary, fold the conductor back on itself.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

Refer to:

- Table 7
- Figure 16.

FOLDED BACK CONDUCTOR
Figure 16

- (3) Make a selection of a crimp tool from Table 8.
- (4) Push the conductor into the crimp barrel of the contact until the end of the conductor is against the end of the crimp barrel. Refer to Figure 17.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

POSITION OF WIRE IN THE CRIMP BARREL OF THE CONTACT
Figure 17

- (5) Crimp the contact.

Make sure that:

- All the strands of the conductor are in the crimp barrel
- The conductor can be seen in the inspection hole
- The distance from the end of the insulation to the end of the crimp barrel is not more than 0.03 inch.

B. Assembly of a Contact with Solid Conductor Wire

This paragraph gives the procedure to assemble contacts with solid conductor wire and stranded filler wire.

NOTE: Only stranded wire can be used for the filler wire.

STANDARD WIRING PRACTICES MANUAL

- (1) Make a selection of a crimp tool from Table 7.
- (2) Remove the necessary length of insulation from the end of the solid conductor wire.
Refer to:
 - Table 9 for the insulation removal length
 - Subject 20-00-15 for the insulation removal procedures.
- (3) Remove 0.5 inch of insulation from the end of the specified filler wire.
Refer to:
 - Table 7 for the size of the specified filler wire.
 - Subject 20-00-15 for the insulation removal procedures.
- (4) Put the end of the solid conductor wire and the filler wire in the crimp barrel of the contact.
Make sure that:
 - All of the strands of the filler wire and the solid conductor are in the crimp barrel of the contact
 - The strands of the conductors are visible in the inspection hole of the contact
 - The distance between the end of the crimp barrel and the insulation of the primary solid conductor wire is a maximum of 0.03 inch.
- (5) Crimp the contact.

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

- (6) Carefully remove the unwanted length of the strands of the filler wire as close as possible to the end of the crimp barrel. Refer to Figure 18.

REMOVAL OF THE UNWANTED LENGTH OF THE FILLER WIRE
Figure 18

CAUTION: DO NOT CAUSE DAMAGE TO THE CONDUCTOR OF THE PRIMARY WIRE. DAMAGE TO THE CONDUCTOR CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

C. Contact Insertion

NOTE: If a backshell is specified, the necessary backshell components must be installed on the wire harness before the insertion of the contacts into the connector. Refer to Paragraph 5.E.

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS**

- (1) Make a selection of the contact insertion tool from Table 11.

NOTE: Contacts can be inserted by hand.

- (2) Put the contact assembly in the insertion tool. Refer to Figure 19.

**POSITION OF THE CONTACT ASSEMBLY IN THE INSERTION TOOL****Figure 19**

- (3) At the rear of the connector, axially align the contact assembly, the insertion tool, and the contact cavity. Refer to Figure 20.

**ALIGNMENT OF THE CONTACT ASSEMBLY, THE INSERTION TOOL, AND THE CONTACT CAVITY****Figure 20**

- (4) Push the tool into the contact cavity until it stops.

Make sure that the tool stays aligned with the contact cavity.

CAUTION: DO NOT USE MORE THAN THE NECESSARY AMOUNT OF FORCE TO PUSH THE TOOL INTO THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

CAUTION: DO NOT TURN THE TOOL CLOCKWISE OR COUNTERCLOCKWISE WHEN IT IS IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (5) Carefully pull the tool from the contact cavity.
- (6) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

20-72-13

STANDARD WIRING PRACTICES MANUAL

D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. DAMAGE TO THE CONNECTOR OR THE CONTACT CAN OCCUR.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (7) If the contact is not locked in the contact cavity:
 - (a) Pull the contact assembly out of the cavity.
 - (b) Do Step (3) through Step (6) again.

D. Seal of an Empty Contact Cavity

The seal of an empty contact cavity is not necessary.

E. Backshell Assembly

- (1) If a backshell is specified, assemble the backshell. Refer to Subject 20-72-08.

F. Connector Installation Hardware Assembly

- (1) If a backshell is not specified, assemble the connector installation hardware. Refer to Subject 20-72-07.

NOTE: If a backshell is specified, the connector installation hardware is assembled when the backshell is assembled. Refer to Paragraph 5.E.

6. CONNECTOR INSTALLATION

A. Connector Installation in a Panel

For the installation of a connector:

- With a backshell, installation in a panel occurs when the backshell is assembled. Refer to Paragraph 5.E.
- Without a backshell, the installation in a panel occurs when the connector installation hardware is assembled. Refer to Paragraph 5.F.

B. Connection of the Plug and the Receptacle

**Table 12
NECESSARY TOOLS**

Tool	Type
Screwdriver	Flat tip

- (1) For connectors with jackscrew and jackpost installation hardware:
 - (a) Make a selection of a tool from Table 12.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that connectors are fully engaged.
 - (d) Put each jackscrew in the applicable jackpost.
 - (e) Turn one jackscrew clockwise two or three turns.
 - (f) Turn the other jackscrew clockwise two or three turns.

STANDARD WIRING PRACTICES MANUAL**D-SUBMINIATURE CONNECTORS: M24308 SERIES CONNECTORS**

- (g) Do Step (e) and Step (f) again until the jackscrews are fully engaged.
- (h) Tighten each jackscrew.
- (2) For connectors with male and female screw lock installation hardware:
 - (a) Make a selection of a tool from Table 12.
 - (b) Align the engaging face of the plug with the engaging face of the receptacle.
 - (c) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (d) Put each screw in the applicable female screw lock.
 - (e) Turn one screw clockwise two or three turns.
 - (f) Turn the other screw clockwise two or three turns.
 - (g) Do Step (e) and Step (f) again until the screws are fully engaged.
 - (h) Tighten each jackscrew.
- (3) For connectors with spring plate and spring latch plate installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage each spring with the applicable spring latch plate.
- (4) For connectors with slide latch and slide lock post installation hardware:
 - (a) Align the engaging face of the plug with the engaging face of the receptacle.
Make sure that the slide latch is retracted to the open position.
 - (b) Push the plug into the receptacle.
Make sure that the connectors are fully engaged.
 - (c) Engage the slot in the slide latch with the slide lock posts.
 - (d) Push the slide latch to the closed position. Refer to Figure 21.
Make sure the connectors are locked together.

B. Contact Insertion

Table 5
CONTACT INSERTION TOOLS

Insertion Tool	Color	Supplier
CIET-20HD	Red	ITT Cannon

- (1) Make a selection of the insertion tool from Table 5.

NOTE: Contacts may be inserted by hand.

- (2) Examine the contact.

Make sure that the contact is straight.

- (3) Put the contact assembly in the insertion tool.

- (4) At the rear of the connector, axially align the insertion tool, the contact assembly, and the contact cavity.

Make sure that the insertion tool is perpendicular to the rear face of the insert

- (5) Carefully push the contact assembly into the contact cavity until it stops.

Make sure that the insertion tool stays axially aligned with the contact cavity.

CAUTION: DO NOT TURN THE INSERTION TOOL IN THE CONTACT CAVITY. DAMAGE TO THE CONTACT RETENTION CLIPS CAN OCCUR.

- (6) Carefully pull the insertion tool out of the contact cavity.

- (7) Lightly pull the wire to make sure that the contact is locked in the contact cavity.

CAUTION: DO NOT PULL THE WIRE WITH A STRONG OR A SUDDEN FORCE. THE FORCE CAN CAUSE DAMAGE TO THE CONNECTOR OR THE CONTACT.

CAUTION: DO NOT MAKE A DENT IN THE WIRE INSULATION WITH THE FINGERNAILS. DAMAGE TO THE WIRE INSULATION CAN CAUSE UNSATISFACTORY PERFORMANCE OF THE WIRE.

- (8) If the contact is not locked in the contact cavity:

(a) Pull the contact assembly out of the contact cavity.

(b) Do Step (3) through Step (7) again.

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 280U00()-() AND 284U1147()-() CONNECTORS

1. GENERAL DATA

A. Conditions for Repair and Replacement of a Wire Wrap Pin

If the post of a wire wrap pin is bent, it is permitted to make the post straight.

A wire wrap pin that has any of these types of damage must be replaced:

- The post is broken
- The engaging end is broken
- The post is bent so that it is not possible to make it straight again
- The engaging end is bent so that it is not possible to make it straight again.

If it is necessary to replace the same wire wrap pin more than three times, the wafer must be replaced.

CAUTION: IF THE SAME WIRE WRAP PIN MUST IS REPLACED MORE THAN THREE TIMES. THE STRENGTH OF THE CONTACT RETENTION OF THE WAFER CAN BE DECREASED SO THAT IT IS NOT SUFFICIENT TO HOLD THE WIRE WRAP PIN IN POSITION.

4. CONNECTOR DISASSEMBLY

This paragraph gives the procedures to disassemble both the 280U00()-() and the 284U1147()-() connector plug modules.

A. Separation of the Plug from the Receptacle

- (1) Turn off all power to the Wire Integration Unit (WIU). Refer to the decal on the WIU cover.

WARNING: IF THE POWER IS NOT TURNED OFF, PHYSICAL HARM TO PERSONNEL CAN OCCUR.

CAUTION: IF THE POWER IS NOT TURNED OFF, DAMAGE TO THE EQUIPMENT CAN OCCUR.

- (2) Remove the protective cover from the back of the WIU.
- (3) Pull the AIE rod assembly from both end blocks on both sides of the connector plug. Refer to Figure 45.
- (4) Loosen the jackscrews of the lifter blocks on both sides of the connector plug at the same time. Refer to Figure 22.

LOCATION OF THE LIFTER BLOCK JACKSCREWS
Figure 22

STANDARD WIRING PRACTICES MANUAL

ASSEMBLY OF BOEING 280U00()-() AND 284U1147()-() CONNECTORS

(5) Move the lifter blocks away from the connector plug. Refer to Figure 23.

LATCH HOOKS RELEASED FROM THE LIFTER BLOCKS

Figure 23

(6) Pull the plug from the receptacle.

B. Disassembly of a Plug with More Than One Wafer

- (1) Remove each polarization post.
- (2) Remove each wafer plug latch or latch hook.

Refer to:

- Figure 29 for a plug assembly with plug latches
- Figure 31 for a plug assembly with latch hooks.

C. Contact Removal

This paragraph gives the procedure to remove crimp contacts. Refer to Paragraph 4.D. for the procedure to remove wire wrap pin contacts.

**Table 11
CONTACT REMOVAL TOOLS**
